The next thing that Witness Cole suggests as being a difference caused by consist of the car fleets is the age of the Official territory rail carriers car fleet in 1956 and that it was considerably greater than that of the Southern carriers. He then presents a table purporting to show the percentage of owned cars in excess of 25 years old and further mentions that an even greater percentage of Pennsylvania Railroad open hopper cars are in excess of that age. I would suggest that the point which Mr. Cole tries to make here is valueless because the statistics that are available and from which he made his computations are based on the years that the cars were originally built. These statistics do not recognize and moreover they cannot recognize that the repair costs incurred in connection with these alleged old cars are not as great as Mr. Cole would lead us to believe, because many of these cars have

[10]

been rebuilt. This is true not only with respect to hopper cars but all freight cars, and the rebuilding, at least from a cost standpoint, puts so much new material into an old car that in my opinion it may be considered as a new car. Unfortunately, statistics are not available to show this information and make any meaningful indication of the age of the cars as affected by rebuilding.

Mr. Cole concludes this section of his statement by saying that "Rail Form A application to carriers in the North, which develops the same car costs for all per diem cars

irrespective of consist, utilization or age reflects to a substantial extent the expenses incurred for the handling of open hopper cars within the North." His conclusion then is that it is improper to use northern lines' costs which he says are so affected by open top hopper cars which are not used to any appreciable extent in the traffic here in issue. I cannot agree with this conclusion because if such were the case I would expect that Pocahontas Region car mile costs would be substantially greater than those for the Eastern District. From Rail Form A as applied by the Commission's Cost Section for the Pocahontas Region, the total loaded and empty car miles other than mileage car miles which are the service units used to develop Group I car mile costs amount to 2,224,075,488 miles. Apportioning this total to types of cars based on the 7-day study, open

[11]

hopper cars made 1,605,521,263 miles which is 72 percent of the total. The car mile cost developed in this Rail Form A was 1.79 cents. The comparable cost for the Eastern District was 3.27 cents where the percentage of open top hopper car miles to total car miles is only 34 percent.

In here taking the position that hopper car costs are a major factor in making Eastern District car costs higher than those in the Southern Region, Witness Cole is inconsistent with his testimony in I.&S. No. 6177, Crude Sulphur-Louisiana and Texas to Virginia, wherein, at the hearing on April 2, 1954, he testified at page 435 of the transcript as follows:

> "I previously testified in the Grain Case, Docket No. 30744, that in my opinion the cost of maintaining a box car was considerably higher than the cost of maintaining an open trap [top] car."

And certainly the difference in cost (which influences the return and depreciation factors) as between the purchase of a box car and that of an open hopper or gondola is not in favor of Mr. Cole's contention that average car

costs deal unfairly with box cars. In 1959, for example, the average cost of general service box cars in the United States was $9,851; that of open hoppers, $8,715; and gondolas, $8,409. (Railroad Car Facts, 1959, American Railway Car Institute, p. 53.)

[12]

Witness Cole's second reason for using United States car costs rather than territorial car costs is as follows:

> "(2) The system average car cost developed in Rail Form A is strongly affected by per diem debits and credits. This has a distorting effect because the basis used in computing Rail Form A costs differs from that used in determining per diem rates."

Of course, car costs are affected by per diem debits and credits and properly so. It is incorrect to say that per diem debits and credits have a distorting effect when the fact is that failure to reflect per diem in the costs would have a distorting effect. Every traffic study movement involves per diem since at least two carriers participate in the haul and at least one uses a foreign car. I do not know upon what basis Mr. Cole either computed or assumed the rates of $1.50, $2.00, and $2.40 used in his illustrations. If he is using these costs which he applies to car days as being representative of the per diem charges in effect during 1956 and prior thereto, I would like to point out that only a portion (about 45%) of these costs represent depreciation and return based on reproduction costs new and not the full amounts used in his illustrations. Also I would suggest, that since the costs included on a territorial basis are net debits and credits, the greater part of these costs are offset and that to the extent a different valuation base is used in developing per diem rates as contrasted with depreciation and return costs in the several territories the effect is not as great

[13]

as his illustrations would seem to indicate when considering total car costs.

Witness Cole summarizes his third reason in the following words:

> "(3) The unit cost for car costs is determined by dividing cost of cars owned by the car miles operated. The numerator and the denominator do not represent the same cars in any given territory."

I disagree with this statement. Territorial average Form A unit car costs reflect the total net costs and the car miles operated in the territory. The numerators and denominators are consistent.

Mr. Cole reiterates on more than one occasion that Rail Form A costs include repairs made by the owning road to its own cars or paid by the owning road for repair work performed off line. He seems to gloss over the fact that there is a substantial cost of operating cars other than a railroad's own ownership included in the accounts. As a matter of fact the costs which are included in the accounts of the railroads in each of the territories are costs which must be met from its own cash, the source of which must be its freight revenues and certainly include its share of revenues from handling interterritorial traffic. The miles included in the accounts represent miles operated by all cars regardless of ownership and these miles must be used as a basis for determining costs and the pricing of traffic which moves over a particular railroad or territory. To illustrate this point I

[14]

would again like to refer to the Commission's application of Rail Form A for the Eastern District and the Pocahontas Region. The car mile costs included in Group I for running service, interchange switching, and intertrain and intratrain switching total approximately $291 million.

Using the United States car costs computed by Witness Remington applied to the miles for the Eastern District and Pocahontas Region produced $250 million which is short of the total dollars expended by these lines by an amount of nearly $41 million. While we are here involved with traffic moving between the North and South the Official territory lines participate to a substantial degree in interterritorial traffic to Transcontinental, Western Trunk Line, and Southwestern teritories, and, if the theory espoused by Mr. Cole with respect to U.S. car costs were carried to its ultimate conclusion, all of these traffics would have to be priced on the same basis, thereby leaving Official territory intraterritorial traffic to bear not only the burden of car costs associated with the handling of that traffic, but also a part of the burden of car costs properly assignable to the interterritorial traffic. This, of course, is improper.

[15]

A similar computation made for the Eastern District lines shows that U.S. car costs would leave almost $62 million that Eastern District lines would have to absorb by their own intraterritorial traffic. This figure represents 25 percent of the total car mile cost of the Eastern District lines.

On the other hand U.S. car costs applied to the Southern Region statistics would add costs amounting to nearly $9 million which were never in fact incurred by those lines.

The car mile costs used above are as follows:

Eastern District	3.27046 ¢
Official Territory	2.94081 ¢
Southern Region	2.31045 ¢

I have also applied the Official territory and Southern Region car mile costs to loaded car miles for per diem cars shown in Witness Luckett's Exhibit 4 to V.S. No. 36 after increasing them to reflect the empty return ratios from the 7-day study except for box cars. In the latter case I used without in any way adopting the equalized empty return

ratios of 30 percent for general purpose box cars and 100 percent for special device box cars to Southern automobile assembly points as used by Witness Remington. To the same car miles I applied the average U.S. car mile costs by type of car. The results of these computations are shown below.

[16]

TOTAL CAR MILE COSTS

	Official Territory	Southern Region
Territorial average cost	$14,313,261	$15,086,878
U. S. average cost	10,561,338	14,738,504
Difference	3,751,923	348,374

This shows that the U.S. average car mile cost reduces the Official territory costs to a very substantial degree. The Southern Region costs are reduced because of the preponderance of box car miles priced at a U.S. cost of 2.008¢ which is below that of the Southern Region territorial Rail Form A cost. Going one step further I have used the same unit costs applied to the same loaded car miles but in addition the box car miles were increased by the territorial empty return ratios as well.

TOTAL CAR MILE COSTS

	Official Territory	Southern Region
Territorial average cost	$15,056,900	$15,196,570
U. S. average cost	11,421,964	14,833,856
Difference	3,634,936	362,714

In this instance the territorial average costs including the proper empty return ratios more nearly reflect the costs of doing business in each of the territories. The territorial average costs shown immediately above divide 49.77 percent North and 50.23 percent South whereas the U.S. average costs divide 43.50 percent North and 56.50 percent South. Moreover, the use of U.S. average car costs reduces the cost

of doing business in the North when compared with the territorial Rail Form A basis by 24 percent and the reduction in the South is but 2.39 percent.

[17]

The Southern lines' treatment of the car cost portions of switching costs developed in Rail Form A, Group VI, for switching road train to industry also produce drastic results to the Official territory lines. I have used the per diem cars originated or terminated listed in Witness Cole's V.S. 39, Appendix I, to which I have applied the unit costs per car by type at U.S. averages shown in Witness Remington's V.S. 40, Exhibit C, page 18, Table C. The resulting total cost is $2,920,914 which amount is assigned to both Northern and Southern lines so that costs are equalized for both territories. I have also applied to the same number of cars unit costs of $4.552 for box cars and $5.058 for all other types for Official territory and $3.121 and $3.468, respectively, for the Southern Region. The results are as follows:

Official Territory	$3,824,520
Southern Region	2,622,227

These costs divide 59.32 percent North and 40.68 percent South which is substantially different from the 50-50 split used by the Southern lines. In addition $903,606 are excluded from Northern line's costs and $298,687 are added to Southern lines' costs by this device.

The above car mile and car costs represent only the out-of-pocket portion of the costs. I have not dealt with the constant costs at all even though similar infirmities are involved in the use of such costs on a U.S. average basis.

[18]

Mr. Cole then suggests that because the present Rail Form A procedure, as used by both Mr. Heywood and the Interstate Commerce Commission, uses a national tare weight figure in developing Rail Form A costs, that logic would suggest the use of national average car costs by type

of car. In my opinion the use of tare weights on a U.S. basis furnishes no reason for applying car costs on a U.S. basis. In fact, except as to the development of the percentages for the separation of costs between mileage and time portions for depreciation, tare weights never enter into car cost development in Rail Form A.

At page 45 Witness Cole describes Mr. Heywood's territorial average Form A car costs as measuring "the composite effect of the car fleet owned by the respective groups of roads:". He repeats his error of including only ownership costs and ignoring the users costs, per diem debits and per diem credits. In Appendix B I have compiled from data in Appendix J of Witness Cole's Verified Statement an analysis of the car miles handling North-South traffic. From this it will be noted that the use of Official Territory equipment predominates. For example, column (c) indicates that 40.77 percent of Official Territory car miles were in Official Territory equipment and 34.04 percent in equipment owned by Southern Region carriers. Column (e) shows that 39.97 percent of Southern car miles were in Official Territory

[19]

equipment and 34.61 percent in Southern cars. Column (g) shows that of the total car miles 40.30 percent were in equipment owned by the North and 34.38 percent in Southern cars. Of the total miles in equipment owned by the North or South 53.96 percent was in Northern owned equipment and 46.04 percent in Southern owned equipment, as shown in column (h). Yet the participation in the line-haul, as indicated in line 6 is 40.81 percent North and 59.19 percent South. Thus, disregarding equipment of other territories, Northern lines furnished cars for 53.96 percent of the total car miles although having only 40.81 percent of such car miles in the North. This is a ratio of 134 to 100. But Southern lines furnished cars for only 46.04 percent of such total car miles although having 59.19 percent of such car miles in the South. This is a ratio of only 78 to 100.

As shown by my Exhibit A the significance of the contribution of the northern lines to the car fleet and car miles in North-South traffic is all the more important when considering the usage advantage indicated by the car miles per serviceable car per day of 49.5 for the Southern Region but only 39.4 for the Official Territory.

Mr. Heywood in his V.S. No. 80, Exhibit F-2, shows average compensation for all classes of employes comparing Eastern District and Southern Region. I would call attention to this Exhibit, particularly the divisions representing maintenance of equipment employes which

[20]

indicate another area of cost difference between territories which the U.S. average cost ignores.

At page 45 of V.S. 39 J. P. Cole sets forth two tables, the first comparing the per diem car fleets of Official territory and Southern territory and the second comparing car miles by type of per diem car for the same territory. Taken as they stand, and assuming that the car miles under the 7-day study show a utilization also attributable to the owned car fleets, it appears that Official territory with 40.4 percent open hoppers and utilization of 40.0 percent in car miles, obtained a better utilization than the South with an ownership of 32.8 percent of open hoppers and a car mile result of 23.6 percent.

When Witness Cole's figures for Official territory are separated into those for the Eastern District and the Pocahontas Region, the better performance of the Northern lines is also shown. For more ready comparison Mr. Cole's figures from page 45 and the separated figures described are compared in my Appendix A. As there shown, Eastern District lines with an open hopper ownership of 33.5 percent secured a utilization of 30.6 percent as compared with Southern ownership of 32.8 percent and utilization of 23.6 percent. By comparison the Pocahontas Region with 67.5 percent of its ownership of per diem cars in open hoppers secured a utilization of 72.2 per cent. The poorer

[21]

utilization is therefore in the South, and Southern lines have no proper objection to a comparison of group costs on this basis.

Further, 41.2 percent of the Eastern District per diem fleet consisted of box cars yet the Eastern District had 51.9 percent of its car miles in box car equipment. In the case of the Pocahontas Region 19.8 percent of their per diem car fleet consisted of box cars and 20.5 percent of their car miles were in that class of equipment.

At page 47 Witness Cole points out that in splitting car costs between mileage and time, national factors are used and contends that the factors can be validly applied only on a national basis. This is another example of this witness' inconsistency. Group Form A factors are found acceptable and used when Witness Cole chooses to use separate territorial average Form A costs but are unacceptable when they result in higher costs in the North than in the South.

At pages 48-53 Witness Cole speaks of "The Distorting Effect of Per Diem Debits and Credits". As I have previously stated, this is incorrect. The fact is that failure to reflect per diem debits and credits in the costs would have a distorting effect.

At page 53 Witness Cole seeks to discount the use of territorial car costs on the ground that the same method of cost computation as applied to the Clinchfield Railroad individually would produce a negative unit cost for *return* on its equipment. However, if group costs are em-

[22]

ployed, as in my opinion they should be in this case, the results for individual road Form A applications are not significant.

The Southern lines' presentation from a seemingly theoretical standpoint was discussed by Witness Cole. The development of the unit costs for the U.S. average car by type of car was made by Witness Remington. In doing this he has endeavored to recognize all of the factors which

Mr. Cole discussed and which I have criticized above. The first step in his computation after aggregating all of the cost data from the several Rail Form A computations was to allocate those costs among the several types of cars. To do this he has assumed that the average cost for expenses, rents, and return on investment is the same per car regardless of the type of car. He says further that the differences as between the several types of cars is insignificant. I fail to see where there is any substantial difference from a theory standpoint as between Witness Remington's average cost per car and the unadjusted Rail Form A costs per car mile which is the same for each type of car in one territory and influenced only by the empty return ratio when applying costs to a particular traffic.

Mr. Remington claims that he has produced "refined" U.S. car costs with a step to separate the costs by type of car. The step involves elaborate computations. The separation relies heavily on his Table A in Section 5 of Exhibit C to V.S. 40. This table shows car miles per car

[23]

owned per year for 7 types of cars and is based on cars owned, U.S., and a separation of car miles, total U.S., based on the 7-day study car miles. The total U.S. car miles exclude car miles made in Canada or Mexico by cars of U.S. ownership and include car miles in the U.S. made by cars of non U.S. ownership (Canada and Mexico). No attempt is made to exclude bad-order cars. Of course these make no mileage and the relative percentage of bad-order cars varies by type of car.

Mr. Remington starts with basic data prepared by the Cost Finding Section of the Interstate Commerce Commission. The Cost Finding Section requested an engineering study to indicate the approximate separation of freight car repairs between that chargeable to car miles and that chargeable to car days. As a result the Engineering Section made an analysis and concluded that the separation should

be 75 percent use and 25 percent time. The analysis was based on box cars. The use portion included expenses due to wear and tear resulting from loading and unloading. When this portion was transferred to time and rounded off the final percentages were 70 percent use and 30 percent time.

Examination of Witness Remington's Table B, lines 5 and 6, which is part of Exhibit C, shows that Mr. Remington's formula changes the

[24]

split for box cars from 70-30 to 75-25. At lines 10 and 11 Witness Remington has developed percentages to allocate car depreciation costs between mileage and time portions for the box car. These were 51 percent and 49 percent, respectively, and for the open hopper car were 39 percent and 61 percent. Rail Form A for depreciation costs uses 45 percent mileage and 55 percent time which was based on studies and judgment by the Engineering Section at the request of the Cost Finding Section and uses both box cars and hopper cars in arriving at the results to be used in Rail Form A. For box cars the costs were found to be 50 percent use and 50 percent time whereas the hopper cars were found to be 55 percent use and 45 percent time. These figures were averaged as to use and time and an adjustment made to reduce the mileage portion for wear and tear incidental to car loading and unloading based on a study for box cars. There is no information given in Statement No. 4-54 entitled "Explanation of Rail Cost Finding Procedures and Principles Relating to the Use of Costs Prepared by the Cost Finding Section" as to wear and tear incidental to car loading and unloading for hopper cars. However, Mr. Remington's figures are so different from the results developed for the Cost Finding Section and are so dependent upon inconsistent statistics and arbitrary assumptions as to be of no value in my opinion.

[25]

In conclusion it is my opinion the unit car costs associated with the costs and transportation service for each of the two territories are more appropriate for use in a North-South Divisions Case than a nationwide average car cost which ignores the differences in territorial costs that do exist.

VERIFIED STATEMENT No. 80
OF J. L. HEYWOOD

Section A

[1]

COUNT OF CARS

Under the heading "Consistent Count of Cars Originated and Terminated", Mr. Remington, in Exhibit C of his Verified Statement No. 40, makes certain adjustments in the count of cars developed from the Freight Commodity Statistics, which are used in computing costs under Rail Form A. These adjustments add a portion of the cars therein reported as interchanged to the number of cars reported as given terminal handling. So increasing the number of cars counted as given terminal handling, and decreasing the number counted as given interchange service operates, under Rail Form A, to assign less switching expense to interchange, which is a line haul item, and thereby to reduce line haul costs. The transfer of switching expense to terminal does not much affect the terminal unit cost per car, because of the increase of the count of cars given terminal service.

This adjustment relates principally to lake cargo coal, tidewater coal and ex-lake ore. It is based upon the theory that, "For cost purposes a car is originated when lading is placed in a car for outbound movement, and car terminated is a car in which lading is removed and the car made empty." (Exhibit C, p. 5) Thus, the sole test as to whether a shipment is interchanged or is originated or terminated is whether the lading was put into or taken from a car. All other characteristics of the operation would be disregarded. Such a test obviously has no relation to cost. It has no relation to whether a given operation is more like an interchange from the standpoint of the service

[2]

performed and, hence, of the costs incurred, or more like an origination or termination of a shipment.

That the service at tidewater ports on coal, and at the lake ports on coal and ore, is interchange rather than terminal is apparent from the facts with respect to these services. Taking lake cargo coal as an example, the coal trains go to the railroads' lake front yards at the ports. Unlike cars which are to be terminated, the lake cargo coal cars are not then moved to various industries in transfer runs and then switched to effect delivery at the consignee's plant. Rather, they are moved to a dumping machine at the railroads' water front yards and there dumped into the lake vessel. It is obvious that this service is much more akin to a movement to an interchange track than to a transfer and switching movement to effect delivery to a consignee. The fact that the car is not given over to the boat line along with the lading cannot, in itself, mean that the shipment is not interchanged. The interchange of an l.c.l. shipment between railroads is not accompanied by a delivery of the car which carried the shipment; but, nevertheless, it is an interchange. Also, the fact that the interchange is with a boat rather than with a railroad—that the movement is to a dumping machine rather than to an interchange track with another railroad—cannot detract from the essentials of the operation and their significance from a cost standpoint.

[3]

In *Lake Cargo Coal Rates, 1925,* 126 I.C.C. 309, the Commission stated at p. 313, with respect to lake cargo coal rates:

> "The rates thereon apply from the mines to the raised or hump tracks beyond the classification yards at the Lake Erie ports. From these tracks the loaded cars are dropped by gravity to dumping machines at the docks. A separate tariff charge for transferring

the coal from cars to vessels is not in issue. The rates on lake-cargo coal are treated as in the nature of proportional rates to the ports for part of a through movement to cross-lake destinations. They include no terminal delivery to consignees at the ports. The local rates on so-called commercial coal to the port cities cover such delivery. For this and other reasons as, for example, concentrated movement at times when commercial coal is not moving heavily, rates on lake-cargo coal always have been lower than the local rates on commercial coal."

On lake cargo coal, even the rates indicate interchange rather than delivery, because they are either: (1) proportional rates, the application of which is conditioned upon further movement from the port by water and differing from the rates to the port cities for local deliveries; (2) lower proportionals than those just mentioned, if the shipment is to have a further movement at the termination of the water haul, or (of more recent origin) (3) joint rail-water, or rail-water and rail rates.

What I have said with respect to lake cargo coal is true, in its essentials, with respect to iron ore (moving in the reverse direction) and tidewater coal.

The fact that the Commission has so carefully differentiated these movements from ordinary movements to and from water lines attests

[4]

to the fact that they are different in character than those ordinary movements. The Commission having, by its definitions used in connection with freight commodity statistics (V.S. 40, Ex. C, p. 6), prescribed that shipments delivered to water lines are to be regarded as terminated on line, and having prescribed that shipments received from water lines should be classified as having originated on line and yet, in the same order, having prescribed that "lake cargo coal delivered to Lower Lake and St. Lawrence River ports for

transshipment by vessel" and "tidewater coal to Atlantic ports", and iron ore received at Lower Lake and St. Lawrence River ports and tidewater coal from Atlantic ports should all be classified as interchange traffic, could only mean that the Commission saw an essential difference in this traffic as compared with the ordinary traffic delivered to and received from water lines.

Of course, interchange service may involve high, low or average expense, just as terminal service may involve high, low or average expense. For example, the interchange of cars between railroads in New York Harbor necessitates the expense of floating service. So does the interchange of cars between the Pennsylvania and connecting lines at Norfolk. Another illustration of an expensive interchange service of cars is in the case of traffic which formerly moved between interior

[5]

points in the East and interior points in the Southwest over the so-called break bulk water routes. This traffic, even where moving under joint rates (like some of the lake cargo coal traffic) required transfer from car to vessel at the ports.

The Remington car-count adjustment is unsound not only in theory but in application. Based on information furnished by the carriers to the Commission at its request to enable it to reconcile its One Percent Waybill statistics with the Freight Commodity Statistics, Witness Remington transfers to an originated or terminated basis certain cars which by reason of transloading of through traffic at the ports was reported as interchanged. But the information so requested by the Commission and furnished by the carriers is not sufficiently complete to permit the making of the adjustment even if it were otherwise appropriate, which in my opinion it is not. Because such information is not complete, Witness Remington's method of re-stating the car-count involves the estimating of a substantial portion of the cars which, according to his theory, should be classi-

fied as having been given terminal rather than interchange service. But these estimates along with other computations made by the witness in developing the adjustment of the car-count used by him in his revised I.C.C. cost applications involve many assumptions which make his resulting conclusions wholly unreliable.

The fact is that even if it were desired to make an adjustment along

[6]

the lines of the Remington theory, it would be impossible to do so because the information to accomplish that adjustment is not available. The only definite figures available to the witness relate to cars reported to the Commission as cars terminated in connection with the one percent waybill sample. To obtain figures for the other categories of cars Witness Remington resorted to estimates which cannot be considered as of any value for the purpose. Further, the witness has made no attempt to eliminate company material cars from the car counts other than where the carriers' only adjustment reported covered such cars. Company material cars cannot be considered as a part of any such adjustment as they are not included in the car count in the Freight Commodity Statistics.

The supplemental information furnished by the railroads at the Commission's request as a basis for its verification of the representative character of the one percent waybill sample is not intended as a means of "correcting" the Freight Commodity statistics. If such statistics as now reported were regarded by the Commission as improperly stated as between cars reported as given interchange or terminal service, it could readily revise its requirements for the reporting of such information. But the fact is that although the Commission has from time to time issued orders relating to the reporting of Freight Commodity Statistics, it has never sought to change the car counts along the lines Witness Remington suggests. On the contrary

throughout the period its Cost Section has been issuing its annual statements of relative costs

[7]

for the several carrier groups the Commission has continued to require the reporting of freight commodity statistics in the same fashion as is currently done.

Further, the lack of value of such an adjustment if all necessary information were secured is indicated, in my opinion, by the fact that since the Cost Section of the Commission began its annual issuance of group cost data, beginning with the year 1947, it has never required the carriers to furnish such information and has continued to compute its regularly issued data on group costs with reference to the car counts derived from the Freight Commodity Statistics.

Section F

[1]

DIFFERENCES IN WAGES AND TAXES— NORTH v. SOUTH

Beginning at page 62 of his Verified Statement No. 39, Mr. Cole purports to identify "the source of the differences in Official and Southern costs". Mr. DeButts stated at page 3 of V.S. No. 14, "My purpose in this statement is to highlight some of the factors affecting cost . . . in freight service." Also, at page 2 of Exhibit 3 to Mr. Luckett's Verified Statement 36, index figures relating to prices of railway materials and supplies are shown for the Southern and Eastern lines, respectively. Nowhere in these endeavors of Southern lines is any mention made of the higher wage rates and taxes paid by the Northern lines as compared with the Southern lines. While I do not believe it to be necessary to go behind the reported expense figures and point out basic differences in transportation conditions which give rise to differences in costs, nevertheless in view

of Mr. Cole's attempt to identify "the source of the differences" in costs, Mr. DeButt's purpose as above quoted, and Mr. Luckett's apparent attempt to indicate a difference in prices, in this section of my statement I desire to indicate how just two items, namely, wage rates and taxes (not including wage and income taxes) affect the relative cost levels, comparing the North and the South.

[2]

Although in recent years wage negotiations have been on a national basis, the wage increases are applied to existing wages which are not uniform nationally. As the statistics compiled by the Commission demonstrate, wage rates paid by the railroads of the Eastern District and Pocahontas Region exceed those paid by the railroads of the Southern Region. This is shown for the year 1956 by Exhibit F-1 to this section of my statement, a reproduction of page 50, Table 67 of the ICC's "Transport Statistics in the United States."

That these differences substantially affect the operating results of the Northern lines is shown by Exhibit F-2 to this section of my statement. In that exhibit is shown the average compensation on the basis of straight time, overtime, and time paid for but not worked for the railroads of the Eastern District, those of the Pocahontas Region and those of the Southern Region. The exhibit shows that, on the whole, the rates of compensation in the North are so much higher than those in the South that if the Eastern District lines, in the year 1956, had had the same wage levels as those of the Southern Region lines, the total wages paid by Eastern District lines would have been $52,128,388 less than what they actually did pay. Likewise, it is shown by Exhibit F-3 that on the same premise the total wages paid by the Pocahontas lines would have been $5,609,060 less than they actually were.

[3]

I have examined also the relative taxes paid by the several groups of railroads in categories other than federal income and payroll taxes. This study is set forth in Exhibit F-4. It shows that in 1956 the taxes per mile of road for the Eastern District lines were $2,960.83, for Eastern District including Pocahontas $3,070.41, and for the Southern Region roads, $1,647.62. If the tax basis of the Southern lines had prevailed in the North, the Eastern District railroads would have paid $83,080,412 less than they did in 1956, and the roads of the Eastern District plus Pocahontas Region would have paid $110,861,289 less than they did.

The sum of the wage and tax items of savings is $135,208,800 for the railroads of the Eastern District alone, and $168,598,737 for the lines of the Eastern District including Pocahontas.

Section G

Relation Between Southern Lines' Intrastate Traffic and Other Southern Region Interstate Traffic

[1]

This section of my statement is in rebuttal of V.S. 29 (Broetzman), V.S. 30 (Waters), V.S. 31 (Small), V.S. 32 (Waters), V.S. 33 (Buelow), V.S. 34 (Stewart), V.S. 40 and 40-A (Remington), and V.S. 41 (Burroughs). Evidence of the Southern lines in the statements just enumerated, is to the effect that traffic movements within the South, particularly on volume commodities, have certain characteristics which result in lower operating costs than the average traffic on the Southern Region lines and that, therefore, the average Southern Region costs, as shown in Form A applications, are understated as to North-South traffic. In rebuttal of this contention, I show in Table G-1 to this section of my statement the percentage relationship between intra-

state traffic within the Southern states and the total traffic of the Southern region, both as to all commodities and the so-called volume commodities of gravel and sand, crushed stone, phosphate rock and pulpwood. I have shown the percentages including and excluding Louisiana, because part of Louisiana is in Southwestern Territory.

The facts shown on this exhibit are to be considered in connection with the evidence, being offered in this record, of Southern lines' operating witnesses in various 13th Section cases wherein it was testified that intrastate operations of Southern lines are more expensive than their interstate operations. It will be noted that, including Louisiana, the percentage relation between intrastate movements and Southern Region interstate movements amount to 87.78% for sand and gravel, 89.63% for crushed stone, 88.69% for phosphate rock, 65.79% for pulpwood and 67.34% for all commodities. Excluding Louisiana, the percentages vary slightly, but not materially, being 67.66% for all commodities.

[2]

The testimony of Southern lines' operating witnesses from various 13th Section cases which I mentioned in the last paragraph is contained in the exhibits which I now identify:

Docket 29845—Alabama (Marks' testimony and exhibits)	Exhibit G-12

Section H

List of Citations.

My Exhibit No. H-1 is a list of citations of proceedings in which representatives of Southern lines have used regional average Form A costs in support of their position in the respective cases without any modifications such as are suggested by Southern lines in this proceeding. This list is not an exhaustive compilation of the use of such costs by representatives of the Southern lines. It is sufficient, however, to illustrate how these costs are used by Southern lines, as a matter of established practice, month in and month out before the Commission.

Exhibit H-1

[1]

I & S 6739, Aluminum, Louisiana to West Virginia.

Form A costs based on I.C.C. Statement 5-56 used in reply to Petition for Suspension by S. R. Goodman, of Southern Railway. (Reply dated March 12, 1957)

Suspension Case No. 17607, Crude Phosphate Rock from ACL and SAL Mines in Florida to East St. Louis.

Form A costs based on Statement 5-58 used in reply to Petition for Suspension by G. M. Mann of ACL and J. A. Kane, of SAL. Reply dated December 19, 1958. The statement said, with respect to these costs: "The methods used conform to those generally followed by the Cost Section and reflect the proper ascertainment of costs for the phosphate rock traffic."

Suspension Case No. 16284 and *F.S.A. Nos. 34843 and 34847, Pig Iron from Calvert, Ky. to Detroit and Saginaw, Mich., from Keokuk, Ia. to Detroit.*

Form A costs from I.C.C.'s Statement 2-58 used in reply to Petition for Suspension by A. A. Koch, Illinois-Central Railroad (Effective date—August 27, 1958).

Suspension Case No. 18062, Cement and Related Articles from Southern Territory Producing Points to Ironton, Ohio, Hagerstown, Md., Fordwick and Lone Star, Va. to Destinations in Florida.

Form A costs based on I.C.C. Statement 2-58 used in reply to Petition for Suspension by Rudd K. Parsons, of Florida East Coast (Jan. 8, 1959).

Suspension Case No. 18486, Alcoholic Liquors from Gulf, Southern Florida and South Atlantic Ports to Points in Indiana and Kentucky.

Form A costs based on I.C.C. Statement 2-58 used by H. M. Engdahl, of Southern Ports Foreign Freight Committee, February 14, 1959.

---

[2]

Suspension Case No. 19190, Phosphate Rock from ACL and SAL Florida Mines to Points in Louisiana and Texas.

Form A costs based on I.C.C. Statement 5-58 used in reply to Petition for Suspension; said reply filed by Messrs. Kane and Mann, with Messrs. Beverly and Turkal, of ACL and SAL, as counsel. Filed April 7, 1959. In the reply it was stated, "The methods used conform with those generally followed by the Cost Section and reflect the proper ascertainment of costs for the phosphate rock traffic."

Suspension Case 19172, Glassware from Jackson, Miss., to Atlanta.

Form A costs used in reply filed by A. A. Koch, of Illinois-Central, reply incorporating letter dated April 3, 1959 and exhibits by John P. Cole correcting the protestants' exhibits; Mr. Cole using I.C.C. Statement 5-58.

Suspension Case No. 19667, Ester Gum from Goodyear and Picayune, Miss. to Jersey City, Newark, New Brunswick, Oak Tree, N. J., Phila.

Form A costs based on I.C.C. Statement 5-58 used in reply filed by S. R. Goodman of Southern Railway to Petition for Suspension on May 14, 1959.

Suspension Case No. 20239, Aluminum and Aluminum Articles from Southern Points to Northern Points.

Form A costs based on Statement 5-58 shown from two principal origins, Listerhill, Ala. and Alcoa, Tenn. to Boston, New York, Baltimore, Pittsburgh, Buffalo, Clarksburg, W. Va., Canton, Ohio, Lafayette, Ind. and Chicago, Ill.

---

[3]

I.C.C. Docket No. 32816—Canned Foodstuffs, Florida to the North.

I.C.C. Form A costs based upon Statement 5-58 introduced in Exhibit 4 by Witness R. L. Cornelius, of ACL on July 21, 1959. At pages 57-58 of the record, Mr. Cornelius stated that the original exhibit was prepared jointly with Mr. Cole.

Suspension Case No. 20441, Brass, Bronze or Copper Scrap from W. Rome, Ga. to Carteret and Perth Amboy, N. J. and Nichols Siding, N. Y.

In reply to Petition for Suspension, Form A costs were used by Mr. Goodman, of Southern Railway on July 16, 1959, based upon I.C.C. Statement 5-58.

Suspension Case No. 20702, Telephone Directories from Atlanta to Miami.

Mr. Goodman, of Southern Railway, filed reply to Petition for Suspension and showed Form A costs, based upon I.C.C. Statement 5-58, Aug. 17, 1959.

Suspension Case No. 20909 (September 14, 1959), *Petroleum and Products, In Packages,* from Origins in Delaware, Maryland, New Jersey, New York, Pennsylvania and West Virginia to all Points in Southern Territory (not in tank cars).

Reply to Petition for Suspension was submitted by S. R. Goodman, of Southern Railway and used Form A costs based upon Statement 5-58.

Suspension Case No. 22039, Candy or Confectionery from Chicago to Various Points in the South. Form A costs based upon I.C.C. Statement 5-59 used by S. R. Goodman, of Southern Railway in reply to Petition for Suspension on January 5, 1960.

---

[4]

I & S No. 6914—Sugar from Gulf and South Atlantic Ports to Ohio River Crossings.

Exhibit 9 of Witness R. L. Cornelius, of Association of Southeastern Railroads, showed Form A costs based upon I.C.C. Statement 2-58. Witness used for the haul in way trains the regional average haul in way trains for all traffic, increased for average circuities. At Tr. 72, 73, in response to the Examiner's question as to why he used the average regional costs, Mr. Cornelius stated, "Sir, I do not have any costs for any particular carrier. This is my only source, sir, is the regional average. I assume that even though it travels on one railroad it experiences perhaps all of the various differences in operating characteristics that other railroads experience."

I & S 6177—Crude Sulphur, Louisiana and Texas to Virginia.

At the hearing on April 2, 1954 in this proceeding, Mr. John P. Cole, of the Southeastern Association of Railroads, in criticizing the use of Form A costs for measuring the cost of handling a specific commodity between two points, also stated at R. 389-399:

"I would like to make a few comments with respect to Rail Form A: In 1942 and '43 I was employed as senior transportation cost analyst for the Board of Investigation and Research, and one of the duties of that organization was to determine the relative economy and fitness by carriers by rail, water and truck. Among other things, I made a very intensive study of Rail Form A as it existed at that time. I pointed out to the public, through a report that was circulated to the railroad industry, and was also given to Dr. Edwards for criticism, and to Dr. Lorenz, who was Chief Statistician for the Commission at the time, that the method used in Form A, the cost formula, certainly had a tendency to overstate long-haul costs and understate short-haul costs, for this reason: Once a long-haul shipment makes its first junction point it tends to move by two through routes to its final destination, or to the last junction point."

And at R. 406-A:

"Q. Do you have any comments you would care to make, Mr. Cole?

"A. None, except that I want it clearly understood that I do not approve of Form A in any way whatsoever except as a method of producing average costs.

[5]

"Q. Let me ask you this: Wasn't the purpose of Form A to determine more or less accurately the comparative costs of handling traffic in different types of equipment in different territories?

"A. That is correct. In Docket 28300, that is when Form A was in its infancy, and it does have some value for that purpose.

Mr. Schlifer: What was that purpose again?

Mr. Reynolds: The comparative costs of handling different types of traffic in different types of equipment in different territories."

Section J

Statistics, Passenger Deficit and Costs

[1]

In Verified Statement No. 14 of Mr. DeButts, it is contended that the Southern lines should not be made to bear any part of the passenger deficit of the Eastern railroads which results from commutation service. In rebuttal of this point I desire to show the over-all passenger service deficits of the Eastern and Southern lines and the freight net railway operating income and rates of return of the several groups. My Exhibit 1 also shows passenger service net railway operating deficit and freight net railway operating income for the years 1948 through 1959. The figures show that the Eastern lines have done better in coping with the passenger deficit than the Southern lines.

Moreover, taking the entire passenger deficit out of the figures and making a comparison only on the results of freight operation, my Exhibit 1 also shows that the rates of return from freight operation for the Eastern lines are lower than those of the lines of the Southern Region.

Exhibits identified as number R-11 and R-12 were offered by counsel (Mr. Kaier) at an earlier hearing but they have not been received because not verified by a witness. These figures were taken by me from the reports of the railroads to the Interstate Commerce Commission and are true and correct.

In rebuttal of Mr. De Butt's V.S. 14, Mr. Smith's V.S. 16, Mr. Cole's V.S. 39, Mr. Luckett's V.S. 36 and exhibits thereto, and of the contention of Southern lines that 1956 costs and statistics for that and other years shown in Exhibit A to my Verified Statement No. 3 are not proper because of such factors as the effect on costs of capital improvements and other changes since that time, as well as the alleged abnormally high locomotive repair expense of the New York Central and car

[2]

maintenance expense of the Pennsylvania in 1956 and other recent years shown in our opening testimony, I submit my Exhibit J-2 and my Exhibit J-3.

The first of these exhibits shows certain statistics for 1959 and, as far as available, for 1960, similar to statistics shown in Exhibit A to my Verified Statement No. 3.

The second exhibit shows the application of unit costs for the years 1956, 1957, 1958, and 1959 as developed by the ICC's Cost Finding Section, to Mr. Butler's two-month (five months as to perishables) traffic study, his study for the entire year 1956, and Southern lines' traffic study.

Section L

Debt Reduction

In rebuttal of Mr. DeButt's Verified Statement No. 14 I show in my Exhibit No. L-1 excerpts from Annual Reports of the Southern Railway concerning debt reduction programs of that road. The total debt reduction of the Pennsylvania in the period 1953 through 1958 was $203,300,000, of which only $65,800,000 was voluntary, the remainder being required by the operation of sinking funds and the maturity of bonds and equipment obligations. The figures for the period 1953 through 1959 are $233,500,000 total, of which only $76,900,000 was voluntary, the balance being the result of the factors which I have just mentioned.

Exhibit L-1

[1]

Excerpts From Annual Reports of Southern Railway Company

1953

Debt Reduction

The maturities of long-term debt of the years 1953 and 1956, which amounted to $89,605,000 as of December 31, 1952, and had been reduced to $66,660,000 as of February 12, 1953, through the financing described in the Annual Report for 1952, were still further reduced by December 31, 1953, to $59,286,000, consisting of an aggregate balance outstanding as of that date of the Development and General Mortgage Bonds maturing April 1, 1956, in the aggregate amount of $50,990,000, and $8,296,000 remaining principal amount of the East Tennessee, Virginia and Georgia 5's maturing November 1, 1956.

The Company expects to pay these maturing bonds (less any acquired in the interim) at maturity from treasury cash, or from the proceeds of such new refunding issues as might be determined to be advantageous or advisable, although it has no present plan for any such financing.

[2]

1954

USE IN 1954 OF THE COMPANY'S FINANCIAL RESOURCES

In addition to meeting all of its current expenses, taxes and fixed payments, the Company paid from its treasury cash the following conspicuous items:

(1) For capital improvements to Road and Structures, $7,541,885; for Equipment, $13,780,111, consisting of installments of Equipment Obligations, $9,525,860 and for additions and betterments to equipment $4,254,251, making an aggregate of $21,321,996 capital expenditures for the year, as compared with $21,979,076 in 1953;

(2) For dividends, $12,087,400, being $2,596,400 more than in 1953;

(3) For advances to its real estate subsidiary of moneys for the acquisition and construction of new industrial facilities to produce income to the Company, $916,405; and

(4) For the acquisition and cancellation of $2,605,000, principal amount of the Company's Development and General Mortgage Bonds, and the acquisition by a subsidiary of $45,000, principal amount of the Company's East Tennessee, Virginia and Georgia Bonds, both issues maturing in 1956, $2,744,059.

The Company had left on December 31, 1954, (a) investments in United States Government securities in the principal amount of $71,601,500, held in reserve for the acquisition of debt or reduction of maturing obligations, subject to further order of the Board of Directors, and (b) cash of $28,811,809, as shown in the balance sheet, the latter being reducible by items which were not cleared through the banks at the close of business for the year.

[3]

1954

DEBT REDUCTION AND THE 1956 MATURITIES

From January 1, 1938, to December 31, 1954, inclusive, the Company and its affiliates retired securities, on which they were required to pay fixed charges, theretofore outstanding in the hands of the public in the amount of approximately $168,786,500.

Included in this aggregate were $62,948,000 principal amount of the Company's Development and General Mortgage 4%, 6% and 6½% Bonds due April 1, 1956, and $4,519,000 principal amount of its East Tennessee, Virginia and Georgia 5% Bonds due November 1, 1956.

There remained of these two issues, originally outstanding on January 1, 1942, in the aggregate principal amount of $124,103,000, a balance of $56,636,000 at December 31, 1954, a reduction during 1954 of $2,650,000.

The Company expects to pay these bonds (less any acquired in the meantime), at their respective maturities, from treasury cash. If this be done, fixed charges will be reduced by approximately $2,785,000 annually from this source.

[4]

1955

DEBT REDUCTION AND THE 1956 MATURITIES

Long-term debt (exclusive of equipment debt) and securities on Leasehold Estates were reduced in the principal amount of $17,300,400 during 1955.

Included in this amount was the acquisition and cancellation of $15,582,000, principal amount of the Development and General Mortgage Bonds, maturing April 1, 1956 ($10,576,000 thereof having been acquired under the Company's Offer, effective between July 1, 1955, and October 31, 1955, to purchase any or all of such outstanding Bonds on the basis of a yield of 2% to maturity), thereby reducing the amount of this issue outstanding to $32,803,000 at December

31, 1955, as compared with $111,333,000 outstanding on January 1, 1942.

Also included in 1955 debt reduction was the acquisition by a subsidiary of $788,000 of the East Tennessee, Virginia and Georgia Bonds maturing November 1, 1956, reducing the amount outstanding in the hands of the public to $7,463,000 at December 31, 1955, as compared with the original maturity of $12,770,000.

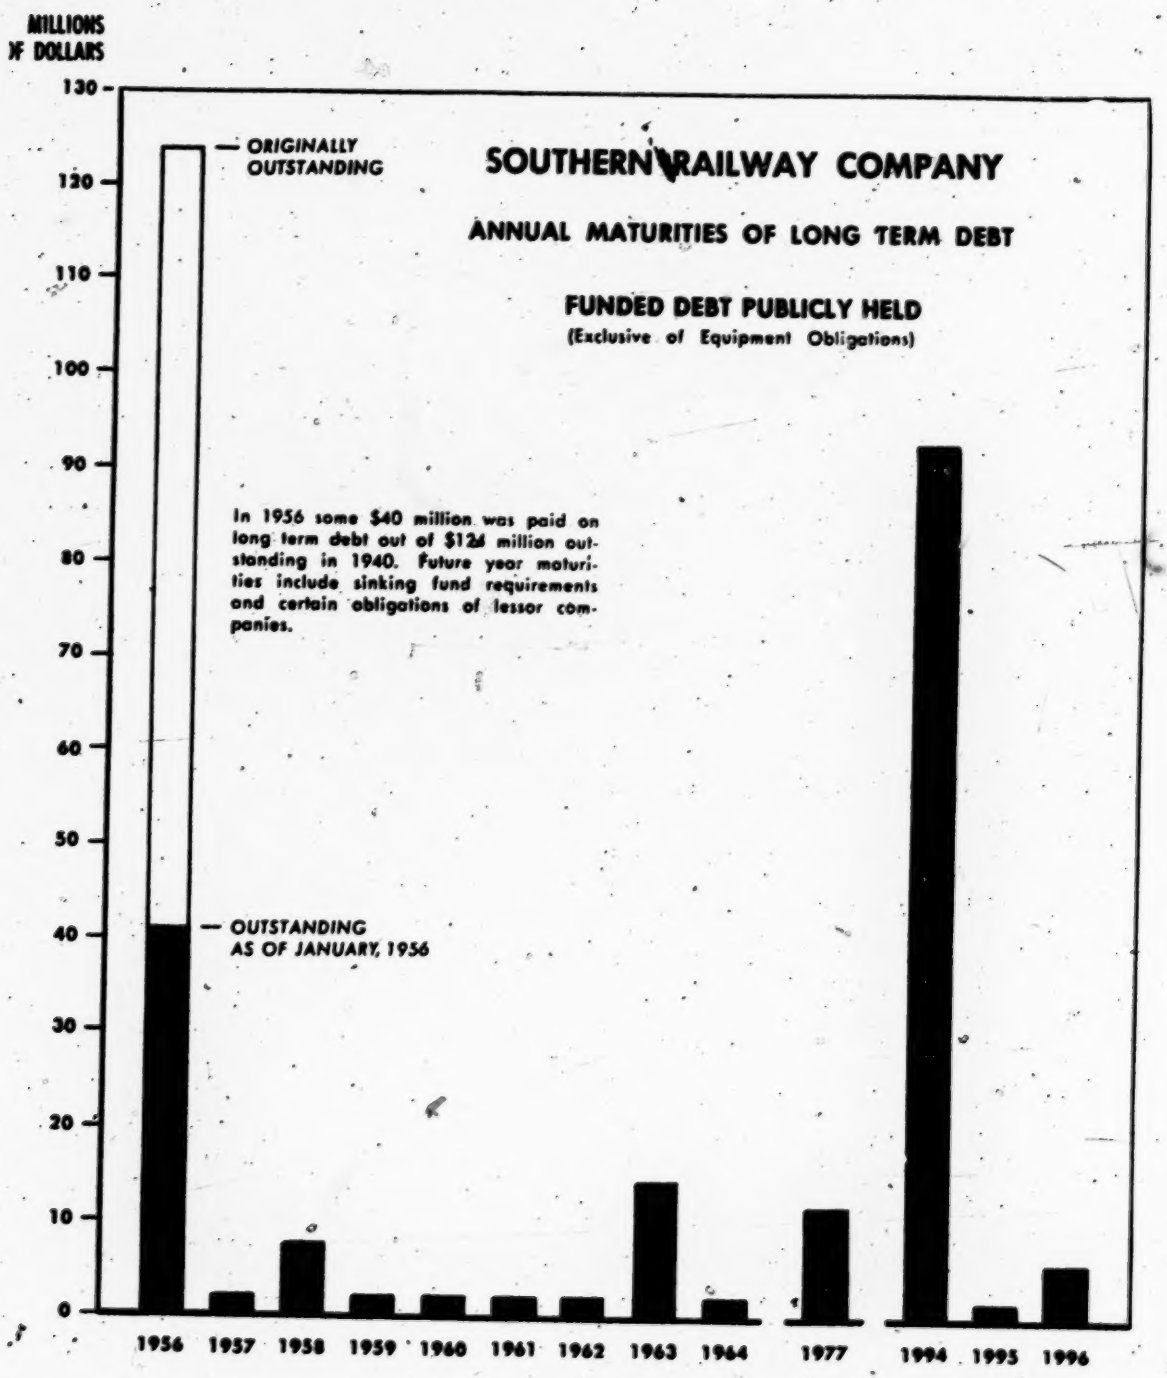
The maturities of 1956 were thus reduced to an aggregate principal amount outstanding on December 31, 1955, of $40,266,000.

United States Government securities, included in the Company's reserves, and appropriately maturing, are held in the Company's treasury to pay this aggregate off in cash. Such payment will effect a further reduction in the Company's annual fixed charges in the amount of $2,007,840.

1956

NET FUNDED DEBT AND FIXED CHARGES

The Company's fixed charges, as defined by the Interstate Commerce Commission (less charges on the Company's bonds held by a subsidiary and income from securities of its Leasehold Estates owned by the Company), were at the annual rate of approximately $10,648,000 on December 31, 1956, as compared with $11,810,000 at the end of 1955. These totals exclude charges on the Company's bonds held by a subsidiary.



The all-time high for the Company's net fixed charges was approximately $18,000,000 in 1930, to be serviced out of gross revenue at that time of $118,868,608. The current figure of $10,648,000 not only shows a reduction of more than 40% from the all-time high of fixed charges but the reduced amount is payable out of gross revenue which for the last five years has averaged $269,643,070.

The current net fixed charges are equivalent to 3.87% of the 1956 gross revenues, as compared with 4.26% in 1955 and 4.93% in 1954. Fixed charges were equivalent to more than 15% of gross revenue in 1930.

[5]

1956

The debt of the Company outstanding in the hands of the public at December 31, 1956, amounted to $125,926,500 of Funded Debt, as compared with $166,995,500 of such debt at December 31, 1955, and $75,513,255 of Equipment Obligations, as compared with $86,482,460 of such obligations at the end of the previous year. Payments and accruals for interest, rent for leased lines, Equipment Obligation maturities and Sinking Fund payments to be provided in the year 1957 amounted to approximately $22,700,000, as compared with $23,166,778 for the year 1956.

1957

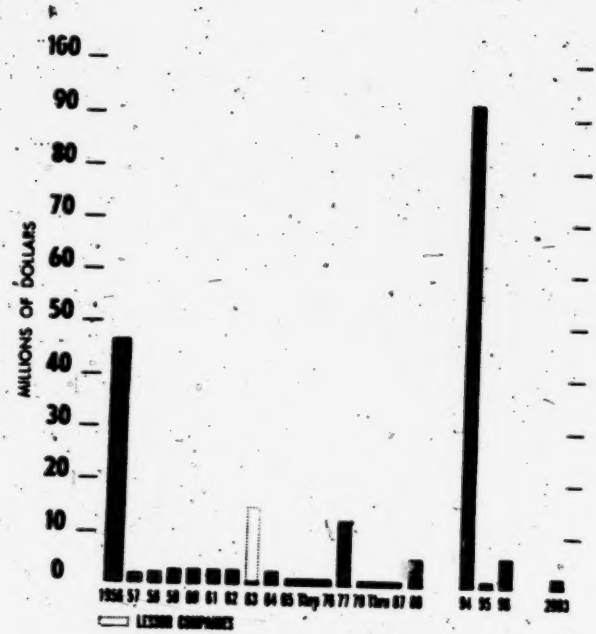
NET FUNDED DEBT AND FIXED CHARGES

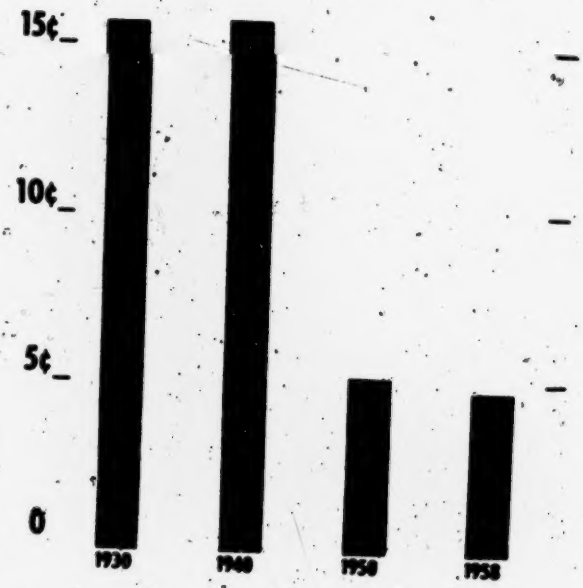
The Company's fixed charges, as defined by the Interstate Commerce Commission (less charges on the Company's bonds held by a subsidiary and income from securities of its Leasehold Estates owned by the Company), were at the annual rate of approximately $10,332,000 on December 31, 1957, as compared with $10,648,000 at the end of 1956, and $11,810,000 at the end of 1955.

The current net fixed charges are equivalent to 3.9% of the 1957 gross revenues, as compared with 3.9% in 1956 and 4.4% on the average over the five years, 1952-56. Fixed charges were equivalent to more than 15% of gross revenue in 1930.



The funded debt of the Company outstanding in the hands of the public at December 31, 1957, amounted to $124,012,500 as compared with $125,926,500 at the end of 1956 and $166,995,500 at the end of 1955. Payments and accruals for interest, rent for leased lines, Equipment Obligation maturities and Sinking Fund payments to be provided in the year 1958 amount to approximately $23,150,000 as compared with $22,550,000 for the year 1957 and $23,166,778 for the year 1956.

[7]



1958

The funded debt of the Company outstanding in the hands of the public at December 31, 1958, amounted to $144,099,500 as compared with $124,012,500 at the end of 1957. Payments and accruals for interest, rent for leased lines, Equipment Obligation maturities and Sinking Fund payments to be provided in the year 1959 amount to approximately $22,100,000 as compared with $23,450,000 for the year 1958 and $22,826,300 on the average for the years 1954-58.

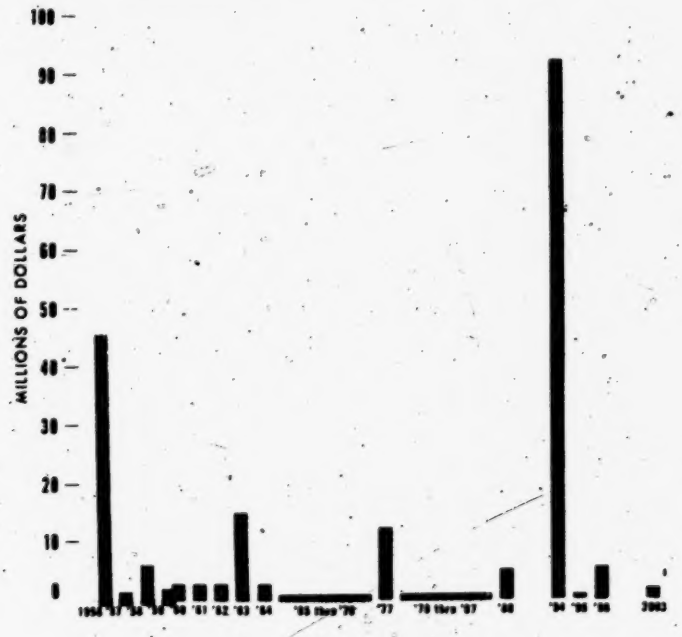
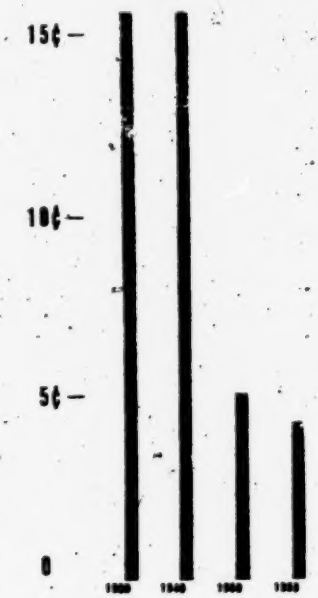
1959



NET FUNDED DEBT AND FIXED CHARGES

The Company's fixed charges, as defined by the Interstate Commerce Commission (less charges on the Company's bonds held by a subsidiary and income from securities of its Leasehold Estates owned by the Company), were at the annual rate of approximately $10,998,000 on December 31, 1959, as compared with $11,317,000 at the end of 1958 and $12,312,000 at the post-war high point which was reached in 1953.



The current net fixed charges are equivalent to 4.04% of the 1959 gross revenues, as compared with 4.41% in 1958 and 4.08% on the average over the five years 1955-59.

The funded debt of the Company outstanding in the hands of the public at December 31, 1959, amounted to $141,476,500 as compared with $144,099,500 at the end of 1958. Payments and accruals for interest, rent for leased lines, Equipment Obligation maturities and Sinking Fund payments to be provided in the year 1960 amount to approximately $22,014,000 as compared with $22,100,000 for the year 1959 and $22,787,000, on the average, for the years 1955-59.

[1]

INTERSTATE COMMERCE COMMISSION
Bureau of Transport, Economics and Statistics
WASHINGTON

August 23, 1948

TO THE CHIEF ACCOUNTING OFFICER
OF THE CLASS I RAILROAD ADDRESSED:

Please refer to our letter of June 25, 1947, requesting a brief statement each month showing the grand total of carloads terminated on line, separated between those originated on line and those received from connecting carriers. The purpose of this request was to secure a total to which we could compare the results of the carload waybill sample in order to check the completeness of the sample. Further experience has shown that certain adjustments are sometimes required to make the totals as reported in the freight commodity statistics agree with the terminations as reported on the waybills. The waybill data are based on the billed origin and destination so most of the differences are caused by

(a) Rebilling the traffic either at point of receipt or point of delivery to connecting carrier.

(b) Lake or tidewater traffic reported in freight commodity statistics as received from or delivered to connecting carrier.

(c) Traffic moving on revenue bills not reported in freight commodity statistics.

(d) Revenue traffic moving on cards or memo bills.

Various combinations of these causes will affect the sample results differently and it is suggested that the following

form be used in reporting the carloads terminated on line in order to make allowances for the differences in reporting for the freight commodity statistics. One percent of the number of cars shown for "waybill termination" should give us the expected value of the waybill sample.

Carloads terminated on line for the month of ...., 1948.

Item	Originated on line	Received connections from
Reported in Freight Commodity Statistics ...		
Additions		
Deductions		
Waybill terminations		

It will not be necessary for our purpose to report the details of adjustment figures, but if you wish to do so, they may be included in a footnote. Where there is no difference between the method of reporting for the commodity statistics and the waybill data, the present form will be satisfactory with the statement "no adjustments required" added.

Additions to local terminations will include traffic reported as received from connecting carriers in the freight commodity satistics.

[2]

but terminating on local bills because of rebilling or receipt at a lake or tidewater port. Deductions from local terminations will include traffic reported as originated and terminated on line in freight commodity statistics but which moves on a foreign bill such as traffic received from a small road under a switching arrangement.

Additions to interline terminations include traffic which would be reported as received from connecting carriers and delivered to connecting carriers but which would be terminated on an interline waybill because of delivery to a lake

or tidewater port, or because of rebilling by the connecting carrier at the junction. It might also include company material moving on interline revenue bills which would not be reported in the freight commodity statistics. Deductions to the interline terminations would be made for that traffic reported as received from connecting carriers and terminated on line which moved on a local waybill because of receipt at a lake or tidewater port having been rebilled at a junction.

These reasons are not exhaustive but include the major causes determined so far for the apparent discrepancies between the sample and the commodity statistics. The adjustment figures should include all that traffic which would show in the waybill sample as a local or interline termination but which would be reported under a different category in the commodity statistics.

There may be cases where the desired information is not readily available. In this event a reasonably accurate estimate of the volume will be satisfactory for our sole purpose is to get a figure against which we can check the waybill sample. Significant differences between the sample and the check figure will have to be investigated but, since the sample is on a one percent basis, differences of less than 50 cars in the check total would not be reflected in the comparison.

We will appreciate your cooperation in this matter and will be glad to answer any questions you may have.

Very truly yours,

W. H. S. STEVENS,
Director.

TESTIMONY OF NORTHERN LINES' WITNESS MR. NANCARROW

Cross Examination (November 18, 1959):

* * *

[R-459]

Q. [By Mr. Trienens] As far as the Pennsylvania Railroad's service, are we correct in reading Exhibit "M", that you had 135 cars in the train as it was made up in Potomac Yard?

Mr. Clark: Look at your chart, Exhibit "M", Mr. Nancarrow.

The Witness: 132 loads and three empties.

Q. [By Mr. Trienens] That is the way the train was made up in Potomac Yard for you?

[R-460]

A. Yes, sir.

Q. It goes through Baltimore, it says relay. What does the term "relay" mean?

A. Through train.

Q. What did they do to it at Baltimore, if anything?

A. Nothing.

Q. Does it mean the same thing at Philadelphia?

A. Yes, sir.

Q. Trenton?

A. Yes, sir.

Q. Newark?

A. Yes, sir.

Exam. Barber: Don't you change crews or take off the caboose or anything?

The Witness: No, sir.

Exam. Barber: Go right through.

The Witness: Through crews.

Q. [By Mr. Trienens] What is your system average train in cars per train, Mr. Nancarrow?

A. I don't know from memory and I don't have the supporting papers to answer that.

Q. Would 135 be maybe about double the size of your average train?

A. No.

Q. System average? I am not talking about your—

[R-461]

Mr. Clark: He heard you.

Mr. Kaier: I think it shows in Mr. Heywood's Exhibit "A".

Mr. Trienens: We will check that.

Q. [By Mr. Trienens] How many miles is this between Potomac Yard and Greenville, about 230, maybe?

A. Potomac Yard and Greenville? Roughly 233 miles.

Q. Of the 135 cars that went through that distance untouched, you show 95 were Southern-Official cars, correct?

A. Yes, sir.

Q. Let's turn to MD-18, which is Exhibit "K".

A. MD-18?

Q. Yes, sir, "K".

A. Yes, sir.

Q. It goes without saying these aren't drawn to scale?

A. No, sir.

Q. Give us an idea of the geography here. You have 113 cars going from Potomac Yard to Greenville, ultimately?

A. Yes, sir.

Q. You don't have the word "relay" in there for Baltimore, Philadelphia, and Trenton, but is there anything different about this operation than there was from MD-6, at those points?

A. No, sir.

Q. Give us some idea of the geography, how far Waverly Yard is from Greenville?

A. About six miles.

[R-462]

Q. So that it would be about 227 miles from Potomac Yard to Waverly, roughly?

A. Yes, roughly.

Q. All right. Let's look at Exhibit "G" which is MD-12.

A. Yes, sir.

Q. Again we have the train, this time it is 110 cars, 109 loads and one empty, 97 of the loads are Southern-Official?

A. Yes, sir.

Q. Again is the situation the same that we have that train made up in that form in Potomac Yard, goes through Baltimore, Philadelphia, Trenton, untouched to Waverly?

A. That is correct.

• • •

[R-495]

A. I am talking about some, not all of the accounts.

Q. What classes of expense are you talking about when you use the term costs?

A. Train operation, floating service.

Q. Would that—you said train operations, floating service. Would your costs include origin and destination terminal costs?

A. Certainly, all of it is involved in the movement of your traffic.

Q. Would it include interchange costs?

A. Yes, sir.

Q. It would include the train costs such as wages, fuel?

A. Yes, sir.

Q. And the maintenance-of-way costs?

A. Yes, sir.

Q. Would it include car repairs, depreciation and return?

A. Yes, sir.

Q. Would it include platform costs?

A. Yes, sir.

Q. Would the costs be included in any way by the empty return ratios?

A. The empty return what?

Q. The ratio of empty to loaded movements?

A. Well, it would depend on whether or not it was on a loaded car or an empty car basis. You could determine that by a special study but on the Pennsylvania we use average costs.

• • •

[R-499]

I want to find out specifically, as to the elements when we get to the cost issue, what kind of average costs he is talking about, if he knows.

I am asking about the extent to which empty return enters into his use of average cost and I think I am entitled to an answer.

Exam. Barber: Do you know anything about that, Mr. Nancarrow? Do you know anything about empty return ratio in the determination of average costs?

The Witness: No, sir, I do not.

Q. [By Mr. Trienens] So that to conclude that subject entirely, you have no knowledge on whether average costs should commingle all types of cars, reefers, box and hoppers together, whether there should be a separation by type of car or what, if any, separation should be made? You have no knowledge or information on that subject whatever?

A. No, sir. I think Mr. Heywood is qualified to give you that.

Exam. Barber: Is your statement there, "In my opinion Eastern lines are fully justified in attributing to the Official-Southern traffic the average costs of handling all traffic,"—

• • •

(November 19, 1959):

[R-548]

Q. [By Mr. Trienens] I want to get the operating facts as to one other point, Mr. Nancarrow. You referred yester-

day to an important volume of interchange work between the L&N and the Pennsylvania at Cincinnati. You have no joint facility at Cincinnati, do you?

A. No, sir.

Q. Please tell us just from an operating and physical point of view what happens in the interchange at Cincinnati?

A. First, the L&N handles the interchange from January to June, inclusive, in both directions. P.R.R. handles July to December, inclusive, in both directions. The interchange run is between the

[R-549]

L&N, South Louisville Yard, and the P.R.R. at Jeffersonville, Indiana, Yard.

Mr. Kaier: Pardon me, Mr. Witness, but aren't you describing Louisville rather than Cincinnati?

The Witness: Oh, yes. Excuse me, excuse me.

The interchange is between the DeCoursey Yard of the L&N located in Kentucky and the Under Cliff Yard, Cincinnati.

Q. (By Mr. Trienens) Which crews handle that interchange?

A. Both.

Q. How is a separation made?

A. The record is kept of the time passing the O.A. tower, north of the Ohio River bridge and an endeavor is made to keep the times on each side of O.A. balanced by the adjustment of crews and power as required.

Q. In other words, you have an arrangement whereby you equalize the engine hours in interchanging this traffic?

A. To the best of our ability.

• • •

TESTIMONY OF NORTHERN LINES' WITNESS J. L. HEYWOOD

Direct Examination (November 19, 1959):

[R-569]

Q. (By Mr. Eshelman) And that Appendix E, which was an application of composite costs from page 17 of your Exhibit B, to Butler's traffic study, and Exhibit C, of Verified Statement No. 1, that there was only one work sheet needed in addition to the actual Appendix E, itself?

A. Yes, sir.

Q. Is there anything complex about your cost showing?

A. No, we think not.

Q. Well, are they not the customary Form A territorial costs which you have used?

A. Yes, sir; they are.

Q. And would it be a simple matter, for example, to check a Form A result either against the Commission's Form A results, or against Southern Lines' Form A results to determine readily whether your results were out of line with the Commission's or with theirs?

A. That is true.

Mr. Eshelman: Mr. Examiner, at this time I should like to submit that there is no good reason why Mr. Heywood's cross-examination should be deferred.

Exam. Barber: Do we know for sure it is going to be?

Mr. Eshelman: No. Perhaps I am ahead of my story. Thank

• • •

Cross-Examination (January 12, 1960):

[R-777]

Q. (By Mr. Trienens) Page 13.

A. Page 13?

Q. Last paragraph, dealing with loss and damage.

A. Wait a minute. Page 13. Did I understand you to say page 13 of Exhibit C?

Q. No, page 13 of your verified statement, the text.

A. Oh, I beg your pardon. I am looking at C.

Q. You might as well have page 10 of C in front of you, too. That is what we are talking about.

A. This is starting with page 10.

Q. In other words, you throw it in separately on a separate line, beginning at page 10, don't you?

A. That is what I am trying to find. Just a moment, please, until I get that page 10. Oh, yes, we throw that in separately there. I was thinking back in the scales when I said none.

Q. All right. So let's go back to the first question now.

Now, when the cost section is pricing out this car of north-south traffic they are dealing only with the total haul and they put in a certain dollar figure per ton. Now, you speak at page 13 of your development of a figure per ton based on work papers for ICC Statement 2-58. That is a cost section statement, is it not?

A. Yes, sir.

• • •

(January 13, 1960):

[R-841]

Q. Does the proportion of the car miles in special purpose boxcars, meaning those with special devices rendering them unfit for return loading, does the proportion of the—

Mr. Kaier: Pardon me, what was that? That were unfit—

Mr. Trienens: For return loading.

Mr. Kaier: I don't think it has been established that any of these cars are unfit for return loading. I submit it has not been.

Mr. Eshelman: You also agreed that there are special cars that are suitable for return loading.

Mr. Trienens: My question deals with the type of car with which we are all familiar, that is equipped with racks for fenders or racks for motors and that is used exclusively in that service to Metuchen and Linden, New Jersey, for example, and is returned in assigned service back to Detroit

for some more motors or fenders. That is the only car I am talking about.

Mr. Kaier: As to which I submit there is no foundation in the record.

Mr. Trienens: Other than the testimony of Mr. Nancarrow.

Q. (By Mr. Trienens) Now, you recognize, Mr. Heywood, that the proportion that the car miles of such special device cars bear to the total boxcar miles would influence the system average boxcar figure which you applied in your study?

[R-842]

A. Yes, it will influence it, certainly.

Q. And just as a hypothetical calculation of the effect of the proportions, we find on page 2 of the illustration marked as Exhibit R-10 that given special purpose boxcars that move 100 percent empty and given boxcars, which we assume here move at a 30 percent empty return ratio for such general purpose cars, that it is the proportion of the special purpose cars to the total that makes the system average box, say, 39 percent for the group indicated as north on page 2 and substantially less or 33 percent for the group headed south. It is the proportions alone that cause that, isn't that correct, as a matter of arithmetic?

Mr. Kaier: I object to the question and to the use of page 2 of Exhibit R-10 on the ground that the facts have been developed that this does not relate to direct examination, and it is a hypothetical case, obviously slanted in favor of the south.

Mr. Trienens: Well, I am asking a witness about the arithmetic of what he has done. He said generally, yes. I ask him in specific example terms if that isn't the same arithmetic and all of a sudden I can't ask a hypothetical question of an expert witness. I don't quite understand that limitation on the right of cross-examination.

• • •

STATEMENT BY COUNSEL FOR SOUTHERN LINES (January 13, 1960):

[R-845]

Mr. Trienens: Mr. Examiner, we have a request to make. It is a request that bears upon this subject we have just been through with the Witness, based upon the facts developed of record.

I would like to make a short statement of our request on the record. I would like, so there be no ambiguity about it, so that the Eastern Lines can give it careful consideration, I would like to put it in their hands in writing and I will state briefly what our request is.

I am not asking this be an exhibit or offered in the record. I want everyone to see what it is and then we will state it briefly on the record.

Our request is that the Northern Lines join with us in developing a breakdown of the data now shown for boxcars as a group in the form shown on Exhibit R-9, that the data be developed, on, I believe, a much shorter period than would be required for all of the data covered by the 7-day request, and that further, to reduce the burden of developing this necessary data, that three days in the very near future be used as a test.

Now, specifically we are asking that the form that appears at the third page of this exhibit be filled out using the same definition of days and trains and miles as was used in the Commission's order,

[R-846]

the 7-day study order, instructions of which are Exhibit R-9. The data requested is very simple. The data requested would be for each train—which is the same basis upon which the 7-day study was made—for each train the carriers simply list the boxcars by initial and number and, for each, fill out the loaded, empty and total car-miles which would be required in any event for a 7-day study.

It is a very abbreviated 7-day study, the sole purpose of which is to carry one step further the refinement that the Cost Section has already made from its 1948 study in breaking apart flatcars and breaking apart hopper cars.

We are asking that the boxcar traffic, which is extremely important in this particular case, be simply broken.

Now, I ask the Eastern Lines to give this request their careful and cooperative consideration in developing these facts. I call the Eastern Roads' attention to page 2 which is a calculation based upon annual reports and which they can check our data, check it, themselves, quite readily.

It shows very vividly, we believe, the necessity for this separation, because it shows that instead of the very much higher empty return ratio which has been applied in the Heywood exhibits based on the total Official and Southern Region figures, that in reality, there are two types of carriers within the north. There are those that

[R-847]

have the heavy proportion of this vehicle parts traffic that has these special device cars that are going back and forth 100 percent empty, and that those five roads which you will recognize as Detroit roads, and just looking at the geography, you will notice those roads would have a greater proportion of this traffic, those roads have an empty return ration that very greatly increases the Official Territory average.

Now, there is a strong correlation as you will see, in the high empty return ratios to the percent that the vehicle parts boxcar traffic is to their total boxcar traffic.

Now, when you exclude those heavy vehicle parts roads as we have done, just to illustrate the necessity for the request we are making, you find that the differences between the other Official roads and the Southern Region roads in the boxcar empty return ratio is nil, despite the fact that the remaining Eastern Roads still have a somewhat higher proportion of this vehicle parts traffic to their total.

Now, we believe that we could put on a witness who would testify that as a matter of judgment, these figures show that the empty return ratio is not higher in the north, but is 32 percent in both territories for general purpose and 100 for special purpose.

Now, in order that this not be left a matter of opinion and expert judgment, just as the present separation of hopper cars between

[R-848]

covered and open top is not left to judgment and opinion, we think in this case, which involves so much boxcar traffic, and where a comparison, not the level, but the comparison of the Official and the Southern carriers, that these figures illustrate, just as a knowledge of the auto parts movement and its concentration in Detroit would indicate, that a separation of this character is critical in a case involving comparisons.

Now, rather than leave this as a matter of opinion or leave at loose ends in any way, we ask the Northern Lines to join with us in carrying the Cost Section's refinement of these empty return ratios one step further and to do to boxes what they have done to hopper and flatcars already in their 1956 study as compared with their '48 study.

Now, if the data is completed and furnished by each road for the several days indicated—and we would be glad to accommodate the days to the convenience of the roads—just a listing of the boxcar initials and number together with the loaded and empty characterization and the miles as called for by the 7-day study form, will permit the calculation with reference to the equipment register, of how many of the loaded and empty boxcar miles are general purpose and how many are auto parts of a particular type and how many are of any other character of boxcar.

We feel that that information will be clearly in the same direction as the breakdowns that have already been made in these empty

[R-849]

return ratios. And we feel that the relationships shown by the system figures we have analyzed indicate the necessity of it.

Now, it is only to get a precise measure of it, so there won't be any controversy as to the direction and magnitudes of the numbers to be used that we ask this. We think that that will provide the figures and will end that controversy in a proceeding where there is no question of principle, it is just carrying out the refinement that the Cost Section made, one step further.

We ask that the East give it their careful consideration and join with us in this endeavor.

Exam. Barber: All right. Go ahead.

Mr. Trienens: Yes.

• • •

TESTIMONY OF SOUTHERN LINES' WITNESS HARRY A. DE BUTTS

Cross-Examination (August 2, 1960):

[R-919]

Q. [By Mr. Kaier] I would like to show you a photostat of an article from the July, 1957 issue of that magazine. I wonder if you would recall seeing that?

A. Yes.

Q. Does that show a picture of you pointing to a chart which is headed "Annual Maturities of Long-Term Debt"?

A. Right.

Q. Now, down in the bottom, the last line on page 5, does it say that you and your operating vice president, Mr. Brosnan, Mr. King, your traffic vice president, Mr. Davison, your vice president for finance, and Mr. Curry, your comptroller, sketched a clear and detailed picture of the Railway's prospects, accomplishments, and problems?

A. Yes.

Q. Does it then say, "Some of the highlights:", and then a colon after that?

A. Right.

Q. What is the first fact that is listed under the "highlights"? Will you please read that first paragraph?

A. "Reduction of debt and fixed charges places Southern in a position to devote more of its earnings to building up the railway.

• • •

[R-945]

Q. Aren't they put into your annual report of the Southern Railway every year?

A. I am not an accountant, and I'm sure I wouldn't be familiar with the detail of our accounts.

Q. Would you regard that as a detail?

A. Well, the way it is put in, yes.

Q. The passenger service deficit, isn't that one of the most important problems of the railroads today?

A. Yes, that is a fact.

Q. You wouldn't characterize it as a detail, a fact which—

A. As to how the figures are put in, yes.

Q. Not how, but what they are.

A. You asked me if they were not put in that way.

Q. You do have in the south, don't you, Mr. DeButts, local and branch line passenger trains which represent a serious drain against the railroad's other revenues?

A. Yes.

However, I might add that the Southern has found the state commissions in the south very reasonable. We have our differences, it is true, but we haven't bothered the Interstate Commerce Commission with any of our passenger problems, and we have been successful in taking off a number of local passenger trains. We have a number remaining that are losing lots of money, but we made considerable headway.

• • •

MOTIONS MADE BY COUNSEL FOR THE SOUTHERN LINES

(August 5, 1960):

• • •

[R-1486]

Mr. Smith: Mr. Examiner, the southern roads want to make and record three motions to the Examiners. Would this be an appropriate time to get that record?

Exam. Barber: I presume so, go ahead.

Mr. Smith: In view of the primary importance of the cost evidence which I think is acknowledged now by both sides, either explicitly or tacitly, we ask the Examiners, by motion, to request the Com-

[R-1487]

mission's cost finding section to review and analyze the cost evidence in the case when the record is completed, and to report their conclusions of their review and study and analysis to the Examiners.

We request and move separately and independently that that report to the cost section on its analysis of the cost evidence be made a part of the record and subject to examination by any counsel and to rebuttal.

Third, we wish to offer here and now at this time the underlying calculations or memoranda corollary to the cost exhibits which have been offered in the case.

We wish to have those a part of the record for the use of all parties, and indeed they have been already handed to the eastern roads.

We want them in the record likewise for the purpose of permitting the cost section to have the same data, information, and record which the parties here have.

I should like to state those motions in somewhat different sequence, in more precise and formal language, and we have done that quite briefly on a page and a half, and I will be

glad to have the reporter copy that in the record rather than read it, although I can do the latter if it is desired.

Exam. Barber: Has Mr. Kaier a copy?

Mr. Smith: Yes.

(The document referred to follows:)

[R-1488]

The cost evidence of the Southern lines has been presented through the Verified Statements of Messrs. Cole, Wooden, Seigler, Burroughs and Remington. The Verified Statements explain the bases used in applying Rail Form A so as to reflect the costs of the Official-Southern traffic here at issue and also show the results of applying those costs to our traffic study.

I.

The preparation of the cost evidence necessarily involves certain drawoff sheets and subsidiary calculations which trace the development of the cost results set forth in the Verified Statements. Copies of such papers, commonly referred to as "working papers" have been made and furnished to the Northern lines in the weeks preceding this hearing. In order that the Commission, the Examiners and the Cost Finding Section may also have ready access to these papers, the Southern lines herewith offer as an exhibit a set of the basic cost study working papers. The exhibit has been handed to the reporter and a copy is herewith furnished to the Examiners.

II.

In view of the primacy of the cost issues in this proceeding, the Southern lines move and request that the Cost Finding Section of the Commission's Bureau of Accounts, Cost Finding and valuation fully consider the cost evidence in this record and present for the use of the Examiners and the Commission in review, analysis, advice and report in respect to this evidence.

III.

[R-1489]

The Southern lines move and request that such advice, report, consultation, or any other communication of the Commission's Cost Finding Section, or of any other technical staff of the Commission, relating to, or expressing opinions with respect to, any of the issues in this proceeding be made part of the record, subject to cross-examination and rebuttal.

The making of such consultation or communication a matter of record as requested is an essential part of the full and fair hearing required by law, as provided in Section 15 of the Interstate Commerce Act, Sections 5 and 7 of the Administrative Procedure Act and the Fifth Amendment of the Constitution.

• • •

TESTIMONY OF SOUTHERN LINES' WITNESS DR. W. EDWARD DEMING

Cross-Examination (September 27, 1960):

[R-1563]

Q. [By Mr. Clark] When you began selecting for the purposes of study, and this selection was for the cars that were actually to be studied, was it not—

A. Yes, sir.

Q. When you began selecting for that purpose, you didn't have the "X" and "Y" breakdown at all, did you?

A. No, I didn't, sir.

Q. That didn't come along until after you had selected six batches?

A. I am sure that you are right, sir.

Q. And what caused this changing of sample design in terms of the volume in midstream, so to speak, Dr. Deming?

A. Mr. Remington informed me that the study of switching was moving a bit slow, and he would like to cut down

the size of the sample. I was prepared, and in my book I state that it is a good idea to have such a sample prepared in two batches, and to do the first batch, the first portion, I call it, to study it, to see the information in it, to proceed into the second portion if you require it.

I thereupon had already provided myself with random numbers, and the procedure by which to break this sample of one in six into two portions, which I called "X" and "Y".

Q. That is small "x" and small "y", isn't it, to be distinguished from the large "Y" on the work papers which you indicated yard switching?

• • •

[R-1569]

A. Sir, you don't need to conjecture what it would be, because I have the results of the 83 cars here, and the result of the entire sample of 83 cars is 25.0 minutes per car.

Q. You mean there has been made switching studies on the entire 83 cars?

A. This was handed to me, sir, for the results of the 83 cars. You do not need to conjecture, I know what it is.

Mr. Trienens: What is the standard error?

The Witness: 1.7.

Mr. Trienens: Thank you.

• • •

[R-1580]

[Q.] . . . is it your professional opinion that this Commission can make reliable estimates or predictions based on this 41 car sample out of Witness Wolford's projected estimate of 906,554 cars?

A. The 900,000 cars has nothing to do with the usability, utility, or reliability of the 41 cars. The sampling variation of the 41 cars I have computed as 2.2 minutes for standard error. That is merely a mathematical consequence. I care not how many cars were in the original pile.

Q. Does the fact that the Witness Seigler's Appendix A shows a variation in minutes based upon his studies from somewhat over three minutes per car to 72 indicate the desirability of a greater sample or larger sample before making any predictions?

A. Well, sir, I know what the standard error is of the 41, and I don't need to conjecture. I could compute from the distribution of the 41 cars the size sample required to get a standard error of 2.2 by the method I prescribed, and it would turn out to be 41 cars.

Q. You are satisfied, then, Doctor, that the 41 cars are representative of official Southern traffic?

A. Sir. I do not use the word "representative", and I do not know what it means. I can tell you the standard error of the 41 cars, 2.2 minutes, and that has a certain interpretation.

• • •

(Recross Examination September 27, 1960):

[R-1602]

Exam. Barber: Well, I will permit Mr. Deming to make a statement as to what that 83 cars indicated to him, and we will let it go at that.

Mr. Kaier: Pardon me, sir, may I have what you said?

Exam. Barber: what is from his investigation or sampling study on the 83 cars was indicated as compared with the 41. Is that what you wanted to know?

Mr. Smith: Yes, I want him to have an opportunity to finish his answer that the second study of 42 cars showed a slightly smaller sample error, but one that was close enough to vindicate the integrity of the standard error that he got from the first 41.

Exam. Barber: Do you agree with that?

The Witness: Yes, I do.

Exam. Barber: All right, that is all.

Is there anything else? How about the exhibits?

Mr. Clark: I offer Exhibits E-14, 15 and 16, Mr. Examiner.

Exam. Barber: They are received.

• • •

TESTIMONY OF SOUTHERN LINES' WITNESS JOHN P. COLE

Cross-Examination (September 28, 1960):

[R-1694]

Mr. Trienens: And general purpose cars. That goes to both of them, does it not?

The Witness: Yes.

Mr. Clark: When you say "both", you mean both territories?

Mr. Trienens: You say applicable to this traffic. One hundred per cent is applicable to this traffic if it is auto parts in special device cars, and thirty per cent if it is in general purpose cars.

Mr. Clark: Yes, I understand that. Thank you, Mr. Trienens, we are talking about the thirty per cent developed for general purpose cars.

Q. (By Mr. Clark) Now, I had difficulty—although I follow you fairly well, Mr. Cole—I had difficulty in making the jump with you from 32.53 per cent to 30 per cent for the north. You make that giant stride at page 32.

A. Well, you have to take into consideration that the north is more highly industrialized than the south, and there are many commodities other than vehicle parts that move in special device cars, or assigned service, and I don't think it is unreasonable to assume that those cars would further reduce the eastern or northern percentage by two and a half percentage points.

Q. Well, you have used the word "assume". Then I take it this is an assumption. You haven't made any calculation that would lead you from 32½ to 30 per cent?

[R-1695]

A. It is an assumption.

Q. And the basis of that assumption is that there is assigned box car service within the north, on traffic moving within the north?

A. To a greater extent than in the south.

Q. And you have made an investigation of that in both territories?

A. I have not.

Q. So that is another assumption?

A. Yes.

Q. Will you turn to page 36, please, Mr. Cole? You have a table at the top of page 36, and I simply wanted to clarify what it shows.

Do I understand the table at the top of page 36 is based upon southern lines traffic study?

A. Yes.

Q. And the miles shown by car ownership are the miles both north and south?

A. Yes.

[R-1699]

Q. The figure that you are referring to is a figure for the refrigerator cars of one car owning company for all categories of traffic made by that car owning company, isn't that right?

A. That is correct, but you will have to bear in mind that in all of the northern lines cost studies presented by Mr. Halen, the assumption is that the north-south traffic has the same empty ratio as all of the traffic which includes the transcontinental traffic, and the traffic entirely local to Official Territory.

Q. And so you have counted that with your own assumption that the empty return ratio is more properly the ratio made by Fruit Growers Express cars alone on these same categories of all inclusive traffic?

A. Because the Fruit Growers Express cars predominate in the north-south traffic.

Q. Well, if they predominate in north-south traffic, Mr. Cole, how did they make 17 or 18 million miles on the Great Northern?

A. I don't say that they didn't make 17 or 18 million miles on the Great Northern, but those 17 or 18 million miles are not included in the calculation of the 75 per cent.

Q. Yes, but the other end of those miles is included, isn't it, Mr. Cole—the Great Northern didn't terminate those cars. You know that, don't you? They all moved into the east, very largely?

• • •

TESTIMONY OF SOUTHERN LINES' WITNESS M. G. SEIGLER

Direct Examination (September 28, 1960):

[R-1819]

Q. [By Mr. Trienens] And with the devotion of that energy to this project, when was it that you actually completed the switching studies of the 41 points and 41 cars indicated in your Appendix A?

A. During the latter part of the last week in July.

Q. Now, are these the same cars that are covered by an exhibit that has been identified and received as R-16 of Counsel Clark?

A. Yes, sir, they are.

Q. Subsequent to the August 2 hearing, did you develop the data as to the 83 cars covered by Exhibit R-15, also of Counsel Clark?

Mr. Clark: I object.

Mr. Kaier: Objection, Mr. Examiner.

Exam. Barber: Sustained.

Mr. Trienens: Your Honor, at this time I would like to offer in evidence, or ask that there be marked and received, Appendices A and B supplemented to include the 83 cars, and I want to state in that connection, sir, that these 83 cars are the cars covered by Exhibit R-15. They show in detail, car by car, the results of each of the 83 cars covered by Exhibit R-15.

Now, this is a Commission investigation. We have the facts as to each of those cars. We have the witness here that prepared the

[R-1820]

details on them, and we want to offer for the record, so that there will be no conjecture or speculation about the results as to the cars covered by R-15, just exactly all the facts in our possession. We feel that in this Commission investigation it is our obligation to tender to the Commission facts bearing on the handling of this traffic, and that that is particularly so as to a contest that has arisen as to the particular 83.

Now, in addition to forestalling any claim that when the witness was on the stand we did not offer the details as to these 83 cars, in addition to avoiding that problem we feel that the Commission ought to have every fact that we can develop pertaining to this traffic. We feel that we can show, and will offer to prove through this witness the utmost diligence finishing this additional refinement, this additional detail bearing on this traffic.

We can't see the slightest prejudice to the Northern lines by having the facts laid out on the record at this time, and on that basis I would like to ask that there be marked as an exhibit Appendix A and Appendix B, A consisting of three sheets and B consisting of one, that shows the detail as to each of these 83 cars that were drawn in question.

Mr. Kaier: If Your Honor please, there is an obvious prejudice to the Eastern lines in what Mr. Trienens requests, and that prejudice is that it will take the Eastern lines additional time to check this

[R-1821]

additional information that is now tendered, and time to the Eastern lines in this case, if they prevail, means a very large amount of money.

Dates were fixed for the Southern lines to present their evidence, dates which when they were fixed were characterized Your Honor as being a very liberal allotment of time. The evidence should have been in on that date.

Mr. Trienens says they are anxious to give the Commission every fact that they can give them. Certainly they are, if it is going to be at our expense. We therefore object to the offer.

Mr. Trienens: I want it perfectly plain, Your Honor, that we stand on Exhibit 42, on the result, not only the switching result but the testimony of Dr. Deming as to the reliability of the sample.

This additional detail is a slight refinement. It is our interest to block off any claim that when this witness was on the stand we didn't give to the Commission the full facts as to each of these 83 cars.

Now, we think it is desirable information for the record to have, and I also state in connection with the absence of prejudice to the Northern lines that in connection with the 41 cars covered by Statement 42, there was a request of course at the time for the work papers. There was a meeting in the offices of Mr. Seigler with Mr. F. H. Clark as to the working papers. The working papers were made

[R-1822]

available as to those 41 cars, but not to this day, seven weeks after, has anyone asked to see them after they were told they were available.

I can't see it is the slightest prejudice to them. It isn't any different than if they had had it for seven weeks.

Mr. Clark: Mr. Examiner, while our treatment of Southern lines evidence might not accord with the timetable and procedure that Mr. Trienens thinks appropriate, I think we should be permitted to proceed with our examination of the work papers and our examination of the witnesses in the order in which we think is appropriate, and I am prepared to do so now on the basis of the evidence that has been submitted in this proceeding.

Exam. Barber: I believe the benefit to the Commission from the submission of this material would not be as great as the damage that might be done by delay. Whether there would be damage or not, there would be delay according to Mr. Kaier, and I don't think it should be received in evidence.

It is further my understanding that at the close of the August 5 session, that is the August 2 session on August 5, the Southern lines indicated that they had at that time rested.

Mr. Trienens: And we stand on the Verified Statement 42, and the integrity of that result.

Exam. Barber: I think to receive anything more at this time would violate that understanding.

* * *

Cross-Examination (September 28, 1960):

[R-1834]

Q. [By Mr. Clark] You, then, studied other cars, obviously, moving in 1960?

A. We had to.

Q. Yes, and you undertook on the basis of your study of the other cars in 1960 to select cars that you believed had received a movement similar to that given the study cars in 1958 and 1959?

A. That is completely incorrect, Mr. Clark, and let me straighten that out for the record.

Q. Yes, I wish you would.

A. In the switching study we selected no cars. We made a study of the switching that was done with respect to all cars that were switched in any manner whatsoever during the switching study period. No cars were selected.

Q. So at a given point for a given railroad—let's take the first one in your Appendix A, the Southern station shown is Memphis, Tennessee.

You studied all cars at Memphis, Tennessee, on the S&LSF.

A. That factor there was based on a Rail Form S switching cost study made by the Frisco from which we were able to get the necessary minute factors, and thereby save having to make a new switching cost study, or switching cost survey at Memphis.

Q. I believe I selected one of the situations that is not typical of the other stations, isn't that so?

A. That is quite correct.

* * *

[R-1839]

Q. And then you undertook in 1960 to determine the switching minutes attributable to each of the services at the 41 stations in which you were interested?

A. That is correct, on the basis of the studies made in 1960, we could establish minute factors to show what minutes were required to move a car from the point at which it was broken out of a road train to the industry, and back again.

Q. Assuming there were no differences in the operation between 1958, 1959 and 1960?

A. Well, I didn't assume that. I am in no position to assume that, and I don't think anybody else is.

Q. How did you check that?

A. I didn't check it. We made a study and based it on what factors were produced in our 1960 study. How could we produce a factor on the traffic in 1960 to indicate what it actually was in 1958? That is out of all reason. In fact it is impossible.

Q. I don't think we are understanding each other here, Mr. Seigler. When you develop a factor for a particular operation based upon all of the cars moving in 1960, you then assumed that when one of the study cars received that identical service, it might be charged with the same number of minutes, isn't that right?

A. That is right.

• • •

(September 29, 1960):

[R-1886]

Q. Do you mean that in studying one of the sample cars at a particular point, you studied a complete cycle of switching and did not attempt to develop whether or not the particular study car had been terminated or originated?

A. The people that made these studies, Mr. Clark, at the time they were made had no idea whatsoever what industry was involved, in no single instance when I asked for a switch study did I inform the railroad what the study car was, or what industry was involved.

I wanted a switching study which would adhere strictly to the facts, regardless of who they switched.

Q. So that you would have in the pot, so to speak, at this study point, all of the switching service, whether attributable to an originated car or a terminated car.

A. Absolutely. You couldn't get an accurate factor otherwise.

Q. You made no effort, then, to further define the scope of your study so that if a car were terminated at a particular

[R-1887]

plant, a study car were terminated at a particular plant, you made no effort to study terminations at that plant?

A. No, on the contrary, when the switching study was finished, and the summarization was run off, we knew how many minutes to charge against that study car for breaking it out of a train on the yard. We knew how many minutes to charge it in transfer movement up to the study industry. We know how many minutes it took to spot the car. When it was released, if it was released, we knew how many minutes it took to go back and pull the car, how many minutes to transfer it back to the yard, and so forth. Those are factors the switching study develops.

Q. I think perhaps we have been misunderstanding each other. I think what you are telling me, Mr. Seigler, is this, isn't it, that initially in making your study and developing minutes for various operations, you studied all the cars in the terminal.

A. Every single minute of operation of the switch engine on every car it handled.

Q. Then you determined, or you developed in this manner minutes for various operations?

A. That is right.

* * *

TESTIMONY OF SOUTHERN LINES' WITNESS J. J. REMINGTON.

Cross-Examination (September 29, 1960):

* * *

[R-1968]

Q. Is this true, that without discussing the question as to the propriety of your reason, but just assuming your reason for the purpose of the question, the fact is, is it not, in the way in which you apply the costs to the traffic that whatever amount of money is thereby included, we will say for the Chicago or East St. Louis operation for the southern

region roads, that amount would be in their costs for the pricing out of traffic south as distinguished from north, is that not so?

A. Sir, I believe I will have to hear that question.

Q. If you didn't understand that, maybe I can state it more plainly.

A. All right.

Q. As I understand your explanation, the certain monies

[R-1969]

which Mr. Cole or yourself thought ought to be taken from Eastern district allocation of switching and terminal company monies and be placed in the Southern Region, for whatever reasons you or he may have had?

A. Yes, sir.

Q. When you came to apply that to the traffic, as I understand it, you applied—whatever unit costs you applied to north and south of the present gateway primary break points, isn't that right?

A. Yes, sir.

Q. For example, none—

A. In some of the tables.

Q. Well, were there any exceptions to that? Did you make any primary split of divisions, for example, on Chicago in the case of the Illinois Central?

A. I had nothing to do with the divisions.

Q. I mean the application of costs.

A. When I apply costs, I apply—on some of the tables, Illinois Central costs on a movement—

Q. Let's take the regional ones, sir, first. Wouldn't that be simpler?

A. All right. For example, table 6 on page 13.

Q. That is based on Exhibit B, page 3, is it not?

A. Yes, sir.

• • • •

TESTIMONY OF NORTHERN LINES' WITNESS R. C. GILL

Cross-Examination (February 8, 1961):

[R-2297]

Q. [By Mr. Trienens] Yes. What number does it show?
A. $104.
Q. $104 million?
A. $104 million, yes.
Q. Is the routing of outbound iron and steel from steel plants in the north and, by outbound routing, I mean whether by rail or truck determined by whether the railroad or the trucks brought the commodity coal into that steel plant?
A. No.
Q. By whether the railroads, trucks or other means brought the commodity, fluxing steel, into the steel plant?
A. No.
Q. Coke?
A. No.
Q. Iron ore?
A. No.
Q. Any of the commodities listed on page 1?
A. No, the outbound rates on iron and steel are not conditioned on the regular run of rates. They are basically prescribed by the Commission and do not require that.

• • •

TESTIMONY OF NORTHERN LINES' WITNESS F. H. CLARK

(Cross-Examination February 9, 1961):

[R-2355]

Q. [By Mr. Trienens] I would like to have the record clear at the outset as to what the term "assignment" means and I would like to contrast that, if I may, with your general discussion at page 5 about cars designed for General roading.

You will notice at the top of page 5 you are talking about box cars and you say particularly those designed for general loading.

A. Yes, sir.

[R-2356]

Q. You talk about these cars gravitating toward the area of potential demand and so forth.

A. Yes, sir.

Q. Assigned cars have a somewhat different experience, do they not? They do not simply gravitate—they are assigned to go back to a particular plant?

A. They would depend upon conditions. I have known in my experience of assigned cars not gravitating back in volume.

Q. Let us see, we are going to go at some length in your experience and studies as to exceptions from this. But let us describe the physical situation on assigned cars and we will use as an example vehicle parts and we will get to refrigerators. We were furnished as part of our working sheets a list of—a photostat that I gather is a photograph of a series of cards.

A. That is right.

Q. And that is from a card file you maintain of your assigned cars?

A. Assigned and unassigned.

Q. But the card file does show the assignments, if any.

A. Yes, sir, and unassigned.

Q. I will take the first card that happens to be on this photostat. Perhaps you will read it and explain just what that language means.

A. This is car 604-301, Pennsylvania Car 2155, equipped at

[R-2357]

Altoona with 19-Belt DF fittings for loading by Fisher Body Company; Grand Rapids, Michigan 6-4-59 Class No. 3 re-

pairs Fort Wayne shop found stenciled, returned when empty to Pennsylvania Railroad, Grand Rapids, Michigan.

Q. Do you recognize by the 19-belt D.F. Fitting that would probably be an XL Car?

A. I would prefer to check the equipment register on it before.

Q. I thought you would know from the description?

A. No.

Q. We can check at the recess and advise you. This "Return when empty Grand Rapids, Michigan" means that it is assigned to a particular Fisher Body Plant at Grand Rapids?

A. It is assigned to Grand Rapids.

Q. The assignments are to the Parts Plants where the engines or transmissions or the fenders are made.

A. It is assigned to the area in which that particular production plant is located.

Q. As a matter of fact, it is assigned to a particular plant, is it not—one of your cars that on May 13, 1960 the car was transferred from plant 1 Grand Rapids Michigan to plant 2, Grand Rapids, Michigan?

A. It is used by that particular party; that particular firm.

[R-2358]

A. That particular plant?

A. This particular office makes that assignment because ordinarily that car would go to the Fisher Body Company.

Q. Plant No. 1 or 2, Grand Rapids.

A. Right, but the assignment is generally to the location, that does not mean John Smith can not use that car.

Q. But it does mean when that car filled with fenders reaches Atlanta, the Southern Railway cannot load it with textiles going to Texas.

A. Sure, they can if they want to. If they want to abide by the instructions to return it, that is one thing. If they want to load it somewheres else, what is to stop them?

Q. Mr. L. L. Waters of the Southern Railway, who testified in this proceeding, Verified Statement 30, page 16, testified that the assigned cars were returned to origin. Do you question the testimony as to what he does with the cars or do you testify he regularly appropriates them for other loading?

A. It is an unfair question.

Q. It is prompted by your answers.

A. No, Mr. Waters is testifying for himself and I am testifying for myself.

The fact that our exhibits show that those cars are used for

[R-2359]

other than the assignments they are used for shows that they are used for other than auto parts.

Q. We will get to that in just a moment as to what your samples show and do not show in just a moment.

The particular car that I showed you from your assignment records being a D.F. car was physically suitable for the loading of other commodities.

A. It can be, yes.

Q. There are, in fact, other cars assigned to particular vehicle parts plants which are so constructed that only engines or transmissions or axles or some particular part can be set in the racks, is that correct?

A. While they are confined to the auto parts movement, yes.

Q. And while the racks are in the car?

A. Other commodities can fit in the same racks that are not auto parts.

Q. Let us see whether you have any examples of that. Take a typical car and we will talk in the "XAP" class.

This code that we are forced to deal with in connection with these cars. I think it would be convenient for all concerned if we have in the record and have in front us the definitions copied out of the Equipment Register which this

witness has used, and, subject to check as to its being accurately quoted. I would like to have this marked as an exhibit.

[R-2360]

Exam. Barber: Any objection?

Mr. Clark: No objection.

Exam. Barber: R-28, counsel Trienens.

(Exhibit R-28, Counsel Trienens is marked for identification.)

Q. (By Mr. Trienens) Refer to the top one on the list you gave us, Mr. Clark.

Mr. Clark: While we are doing that, may I ask a question?

You called five so-called—you called them special service—previously you called them "special device cars." My recollection is that there are six.

Mr. Trienens: There is an "XT". We copied only the Code in those exhibits.

There are no "XT"s involved in this exhibit.

I am trying to define the ones in which—the ones which this witness is using as an example.

Mr. Clark: I was just inquiring.

Mr. Kaier: I take it, Mr. Trienens, this is designed simply to show definitions and you are not trying to establish facts by this exhibit.

Mr. Trienens: No, the only fact I am trying to establish, that this is a true copy of definitions in the equipment register.

Mr. Clark: On that basis, it is marked.

The Witness: Apparently that is an XM car.

[R-2361]

Q. (By Mr. Trienens) XML.

A. No, sir. XM. It does not appear in the notes.

Q. Yes, it does. Mr. Remington will point out where it appears in the notes.

Exam. Barber: Off the record.

(Discussion was off the record.)

The Witness: I stand corrected. It is an XML car.

Q. By it we mean the first car in your photostat of cards from which you read previously.

Exam. Barber: XML.

Q. (By Mr. Trienens) I believe you stated that is SML car. And that it is such a car as can load other commodities, canned goods or what-have you. I want to turn now to the "XAP" cars and I will ask you to give us a physical description of what these racks are. Take any part you want, engines or transmission or anything. Give us a physical description of what the racks are, what they weigh and how they are used.

A. They can be fitted—the cars are equipped with belts along the sides of the cars to which cross bars can be fitted to form compartments, either varying in size of what they are to be used for, whether for motors or transmissions or fenders or whatever it may be.

Q. As a matter of fact, the particular fittings and racks are in many cases especially destined to handle a particular 1960 model Ford rancher station wagon fender.

[R-2362]

A. That is right, and when they change their model, they have to vary the car.

Q. How do they go about that when they come out with a 1961 Ford rancher station wagon with a different fender, what do you do with the car? Do you send it some place to be refitted?

A. It can be adjusted to change the alignment of the cross bars—well, your belts are permanent.

Q. Don't the roads actually have to take a volume of these cars and contract with some outside firm such as Evans to have them refitted to handle the next year's model?

A. I do not know whether our road has done that. It is a motor power department responsibility.

Q. So you do not know if or how that is done on the Pennsylvania?

A. No, I do not.

Q. In some instance these racks which are installed in these cars that are then designated "XAP" do not the racks themselves weigh something like ten tons in some instances?

A. I cannot answer that question.

Q. I will give you a waybill out of your work sheets and ask you whether the particular car that is coming back from one of the assembly plants to one of the parts plants does not have a figure of 21,000 pounds with the designation "free".

[R-2363]

A. Well, that also includes crating and so forth.

Approximately it would average out what you state there.

Q. Could you tell us why it is, what the economics of the situation are that calls for the assignment and special fitting of these cars. I will suggest this to you, Mr. Clark, and you suggest if we are right about it, that in the economical operation of these vehicle assembly plants at Linden or Atlanta or, indeed, in California, it would be a serious additional cost if the manufacturer of the parts had to do sufficient packing of the engines and fenders to ship them in ordinary box cars and that the assembly plant can use the fenders or engines with a substantially lesser transportation cost if they can get racks in these cars especially designed for the engines or fenders and thus eliminate packaging cost in transit, is that the reason for the operation?

A. Yes.

Q. And because of that saving in the intransit packaging the railroads at shipper request do furnish these special rack cars and tailor the fittings to meet the needs of the automobile industry?

A. That is a fair statement.

Q. Now, once a car is shipped, I will take a car that is specially fitted for these Ford fenders of a particular year, when that car

[R-2364]

is shipped from Detroit, to an automobile assembly plant either in New Jersey or Georgia, what is the normal practice of the line terminating the car, is it to return it to the plant to which it is assigned or is it to make it available for general loading?

A. The normal practice would be to return it, itself.

Q. We made a request that the northern lines cooperate with us in developing car-miles loaded and empty for special device cars during three study periods and you address yourself to that statement, do you not?

A. Yes, sir.

Q. I want to be first perfectly clear that you understand what the request was. We asked you to list, did we not, for every train moving during the study days, the box cars by car initial and number?

A. Yes, sir.

Q. And for each such box car to indicate whether it was loaded or empty?

A. Yes, sir.

Q. And to give the miles?

A. Right.

Q. You give me two such—two reasons for opposing such a request and I understand it is your opinion that such a study if made, would not be of any value.

A. For this particular purpose.

Yes.

[R-2365]

Q. What purpose did you have in mind.

A. The purpose as stated in my exhibit here or verified statement for use in offsetting the cars as prepared by the northern carriers.

Q. You are not suggesting then that it would not be useful for the purpose of showing the facts as to the loaded and empty carmiles of box cars other than special device cars?

A. I say that you can not compute empty car-mile ratio to loaded car-miles of this category that is mentioned here of auto parts, for example.

Q. Let us go back.

A. I do not care whether it is related to this particular case or not.

Q. I am trying to relate it to this particular request as to which you are devoting your attention at pages 3 and 4 of your verified statement. Would the request, if complied with, have had value in showing the empty return ratio for box cars other than special device cars?

A. No, it would not have value for this case—

Q. I am not asking but this—I do not mean this case. Would this have value as showing accurately, assuming this sample period, the loaded and empty car-miles of box cars other than special device cars?

A. It would simply indicate the ordinary box cars per-
[R-2366]
centage relationship was so and so, whatever it turned out to be.

Q. And on the other side, it would also permit you to calculate as to the special device cars what the empty return relationship was?

A. Assuming you used the classifications that the Commission says are special device cars, it would give you a figure practically of an empty. As to its practical use, that is something else.

Q. And, as a matter of fact, if you had complied with the request, we could have calculated separate for XAP and XML the empty returns.

A. It could be done.

Q. And it would give you an empty return ratio.

A. Of those classes.

Q. Of those classes. Your criticism is two-fold. First, you say it is error to assume an inevitable relationship between a commodity and a type of equipment, is that your first reason?

A. Yes.

Q. What assumption as to inevitable relationship between commodity class and equipment was reflected in the request that you are discussing?

A. The fact that you are trying to determine the relationship of empty to loaded for, say, auto parts, you are tying up auto

[R-2367]

parts with a class of car in which it is used, whereas in other words, you are trying it up with the special device car whereas, in actual fact, auto parts are moved in general purpose cars.

Q. Where in this request—I am talking about the request that was made upon you in January and I am not talking about the reasons as to why we expect the answers to be different. I am talking about the request as such. Where, in the request is there any assumption or any determination whatever as to what commodity moves in what vehicle?

A. The ultimate objective is what I have stated.

You are bound to get into general-purpose cars auto parts movements.

Q. I am not talking about ultimate movements. I know why it would hurt you. I know the purpose. It is all in the record. We know this issue amounts to two or three million dollars between us—the proper treatment of empty return ratio. We know that. We also have our ideas what causes the difference. I am not asking you about this at all.

I am asking you only about the request. The request asked you to list by car initial and number the loaded or empty miles and I am asking you why, in complying with that request, you had to make any assumption whatever as to any relationship inevitable or otherwise between commodity and class of equipment.

[R-2368]

A. I would say it follows the natural consequences. Your request also gave examples in which you showed a class of cars, XM's and XAP's. The conclusion would be the XAP would be an auto part car and the other three XM's would be general. That is not a fact. The XM cars also handle auto parts.

Q. To that extent this separation would not have made a complete allocation as between the assigned or unassigned cars but I am not asking you about that. Let me pause for a moment.

What are you referring to in these notes?

Are you referring to the notes at the bottom of the example in the request?

A. Yes, on page 4.

Q. I think maybe, if we get into the detail of format, since this request as such, is pretty thoroughly described but not physically in the record, we might as well get it all before us.

You have a copy of it?

A. Yes, sir.

Mr. Clark: I think the request is in the pleadings almost ad nauseam. I have seen it twice. The request speaks for itself.

Mr. Sutherland: You really hate it, don't you?

Mr. Trienens: It is a matter of no moment since the record

[R-2369]

does explain the matters, since the witness has now discussed what the note shows.

A. In answer to your question, yes.

Q. (By Mr. Trienens) Let me describe—our request specifically—here is what we asked you to do.

We asked you to take your wheel report as you do in the 7-day study, and we asked you to list from each report the box cars by initial and number.

A. Yes.

Q. We asked you to indicate whether loaded or empty.

A. Right.

Q. We asked you to indicate mileage?

A. Right.

Q. We suggested in the note under the heading "Equipment Register Shows" that the equipment register does contain definitions of these cars, that is true?

A. Yes.

Q. It is also true that the term generally is a shortcut description of an XM car which is referred to in the equipment register as a house car for general service.

A. It is a general purpose car.

Q. Now, as I gather, you are questioning the cryptic designation of an XAP car as an auto parts automotive loading?

A. No, in answering your question about what this would

[R-2370]

show in the segregation between general-purpose and auto parts cars.

Q. All right. Excuse me if I misunderstand. Let us see what it would show. If you had complied, we would have had the basis for calculating for northern roads and Southern roads the loaded and empty car-miles for cars other than special device cars.

A. You would have that as one item, yes.

Q. And you would have the basis for calculating as a second item the loaded and empty car-miles for all these groups of five or six special-device cars.

A. Right.

Q. You would have the further opportunity of developing a more refined breakdown showing the loaded and empty car-miles for XAP cars.

A. For what?

Q. XAP cars?

A. Yes.

Q. Are you saying that such a series of empty ratios broken down from the average box car and presumably in the north if the 7-day study was representative and if this study was also representative you would have had an aggregate for all box cars of about 40 per cent; you would have gotten separate numbers, separate rates for the special service and the special service cars.

[R-2371]

A. You are asking me whether we would have gotten that.

Q. That would have been the product of this request.

A. We could have gotten it, yes.

Q. In obtaining those separate figures for loaded and empty car-miles, would it have been necessary to make any prior assumptions as to commodity?

A. Certainly.

Q. Why?

A. When this request is made, it is made for a definite purpose. We have to consider the object when we consider whether we want to comply. You have not considered how you are going to allocate the empty miles when you come to how you are going to use those cars.

Q. Let me ask you this as a matter of principle. Let us forget box cars completely for a moment and let us assume that you have a lump figure from the 7-day study as we once had of hopper cars, all hopper cars, one loaded, one empty and one empty return ratio for all hopper cars. We then make a refinement. We take all the hopper cars and we break them into two pieces, open and closed hopper, and we develop separate loaded, separate empty and separate ratio for open tops and we go through the same process for the closed top and we get two empty return ratios; what assumption had to be made in doing that as to any inevitable relationship between any commodity in any car.

[R-2372]

A. The fact that an open top car could not be used for cement.

A. Why did I have to assume that. Tell me why, in going through the wheel reports in getting the separate numbers I had to assume anything as to commodity?

A. Outside of this case you would not but when you make a decision in this case as to whether you are going to do a job, you have to take into consideration the ultimate use we made of the figures.

Q. Let me see if I understand what you mean by the ultimate use. You are starting with an aggregate figure of some 40 per cent as the box car empty return ratio in the north. As a matter of mechanics that can be separated into two or more pieces by the making of a more refined study separating box general and box special device. That might have produced two figures exactly the same both 40 per cent and shown they were both average cars.

It might have produced a figure of 98 per cent for a special device and 92 per cent for the general. You knew enough about the facts as to the Detroit roads and as to the proportion of vehicle parts to total traffic in the north and south to know that the ultimate objective of the Southern lines was to show just that, did you not?

Mr. Kaier: We knew it from your testimony.

Q. (By Mr. Trienens) The request, from the request before—

[R-2373]

Mr. Kaier: We knew it from the testimony.

Mr. Trienens: You knew the request before you had the testimony.

Mr. Clark: There was quite a bit of testimony in your request.

Q. (By Mr. Trienens) So you knew it. The counsel knew it so I guess the witness knew it.

A. I guess I have average intelligence.

Q. I do not doubt that.

Mr. Clark: May I ask a question that will perhaps assist you?

Mr. Trienens: Maybe it will.

Mr. Clark: All these questions directed to the possibility of making computations, do I understand you are directing your attention merely to the computation based on the class of car without any idea of the commodity that is in these cars?

Mr. Trienens: Yes, sir. That is exactly what our request was.

Mr. Clark: Thank you. I think that will clarify it.

Q. (By Mr. Trienens) I distinguished between what our request was and what the other facts were that shed some light on how the result would appear. I want to turn to your second separate reason for rejecting the study which we suggested. As I gather your

[R-2374]

second reason is that we wanted to do it promptly.

A. Wanted to do what?

Q. Wanted to do it promptly.

Mr. Kaier: I do not think he said that.

Mr. Trienens: Meaning that we wanted to make a study proposed in January of 1960 and we wanted it to start almost immediately and to take place in January and February of 1960.

You said that that would have been an unrepresentative period. Is that your second reason?

The Witness: Unrepresentative in this particular year, yes.

Q. (By Mr. Trienens) That is because we would have picked up a period in which the movement of auto parts was heavy.

A. Yes, unusually heavy for that particular section of the year. They should have moved them in the fall of the previous year.

Q. So, if we were trying to determine the empty return ratio of special device equipment and to use that in pricing out traffic in the official Southern traffic study which moved in such special device equipment, this would be an unrepresentative period because a great deal of the traffic we were interested in was moving?

A. Right.

[R-2375]

Mr. Kaier: His testimony says also because of the short span.

The second reason was the matter of the steel strike. Page 4.

Q. (By Mr. Trienens) Did you make any counter proposal as to the other days to be studied?

A. No, sir.

• • •

TESTIMONY OF NORTHERN LINES' WITNESS F. F. COATES

Direct Examination (February 9, 1961):

[R-2456]

Q. (By Mr. Eshelman) Mr. Coates, you are the maker of Verified Statements 76 and 77?

A. Yes, I am.

Q. Is it a fact that the supplemental information furnished by Witness Remington in connection with Verified Statements Numbers 40 or 40-A, contain figures which in order to be reflected in the statement would have to be substituted for certain figures you have used at page one?

A. Yes, sir, that is correct.

Q. Would you state what those figures are as taken from the Remington supplemental statement?

A. On the first page—

Q. I refer to Verified Statement 76.

A. On the first page in the second paragraph, the fifth line, I have a figure of $4,554,454 and from the supplement to Mr. Remington's Verified Statement that figure would become $5,592,936.

In the next line, the first word "increases" would become "reduces." And the figure at the end of the sentence of $4,203 becomes

[R-2457]

$215,266.

Mr. Trienens: It doesn't change the proportion?

The Witness: It does not change the proportion.

Q. (By Mr. Eshelman) In order that those figures may be properly documented should you add something at the end of that paragraph?

A. These substitutions have been made for the same exhibit and page numbers reflected at the end of that paragraph in the supplement to Verified Statements 40 and 40-A.

* * *

[R-2491]

TESTIMONY OF NORTHERN LINES' WITNESS F. F. COATES

(Cross Examination, February 10, 1960):

Q. (By Mr. Trienens) . . . Now, at page 19, again in connection with these miles-per car factors, you state in your only full paragraph on that page that the car miles per serviceable car day are 49.3 for Southern Region and 39.4 for Official Territory.

A. Yes, sir.

Q. You are speaking in that same paragraph of the car miles in North-South traffic, and I want the record to be perfectly clear that these figures, these numbers that you

have used are for the system experience or the Southern region roads and for the system experience for the Official Territory roads as to all traffic in all types of cars and without separation of line haul and terminal.

[R-2492]

A. Yes, sir.

Q. In respect to the north-south traffic, have you made any analysis, either of data available to you as an officer of the Pennsylvania Railroad or on data available to all of us in the operating testimony in this case, as to the car miles per car day of typical movements of official southern traffic on your railroad.

A. I do not know of any—well, the answer is no. I do not know where I might have gotten that information.

Q. Let me ask you specifically: Did you examine Nan Carrow's testimony that official southern cars in what we would regard as a typical train movement would go from Huron to Cincinnati in one day. You did not look at this material?

A. No, sir. I have used these averages as representing just what they say, that they represent the total effort expended in doing business in each of the territories on all traffic, and I think that that is a fairly substantial guide to the situation that exists.

Q. I understand your theory. Immediately following on page 19 you have stated Mr. Heywood's Exhibit F-2 in which he is showing compensation for employees, and you have asked that our attention be called particularly to the maintenance of equipment employes. Are you suggesting there that you have a higher rate of pay for maintenance of equipment employees north than on the Southern

[R-2493]

roads?

A. Yes, particularly with the classes that we can associate most closely with maintenance.

Q. I think we find having had our attention called to that particular exhibit, that there is approximately a 3 per cent difference in the wage rates; is that your understanding of the magnitude of this differential?

A. I have not computed any percentage on it.

Q. That is on the face of the exhibit. It can be computed from the exhibit that you have called attention to.

A. I might say that I would refer you in that list on page 2 specifically to divisions 57, 64, 70 and 71.

Q. What is the per cent difference in the wage rates?

A. I have not computed the percentage of the difference.

Q. What percent of the car costs that are in rail Form A consists of wages for the maintenance of equipment?

A. I do not know.

Q. Depreciation expense would not be affected at all by this, would it?

A. No, sir.

Q. Nor return on investment?

A. No.

Q. As to car repairs themselves, do you know from your analysis of the general committees' work in costs the proper portion of Account 314 what is wages—I should say a portion of Account

[R-2494]

314—associated with repair of cars as contrasted with used cars?

A. No, sir, I do not.

Q. Can you tell us—

A. What committee are you referring to when you say the general committee?

Q. The committee that fixes the per diem rates.

A. Oh.

Q. You know they get out the questionnaires regularly to the roads to supply information for use in fixing per diem rates.

A. I will see if I do have that.

Q. Would you know the proportion of the repair expenses that is attributable to material costs, such as steel, car wheels, such materials as that?

A. No, sir.

Q. Not knowing—excuse me.

A. I would like to say, Mr. Trienens, that this suggestion that has been made by the Southern lines that we use a national average, I feel that among other criticisms, it does, in fact, ignore differences which exist as among the several territories and that is why I have used these illustrations.

Q. Exactly. To contrast that point you recognize that what Mr. Cole and Mr. Remington are trying to do is to take a statistical result which produces 41 per cent higher costs in the north, and know-

[R-2495]

ing from the physical facts of car movement that that cannot be so as to any one, or any hundred, or any thousand box cars in Official Southern traffic, they are trying to explain what those differences are that account for the 41 per cent and whether they have anything in the world to do with the relative cost of that traffic.

Now, my question, since you have called our attention to differences in wage rates and you do not know the extent of the difference and you do not know the proportion of the total car costs that are influenced by such minor differences, I am asking you whether you take—whether you have taken any look whatever at the other costs that would be reflected in Account 314, namely, the prices of steel, car wheels and other materials that appear in that account?

A. I have not made no analysis of Account 314 for any item which may be included in it.

Q. In view of your effort to show that there are, indeed territorial differences of as little as 3 per cent or weighted for the total car costs as little as 1 per cent, that there are truly territorial differences as contrasted with the 41 per cent we are dealing with, why is it you select wages without

any examination of the other factor as to which there may be differences, namely, prices?

A. The reason I select wages is because the figures were

[R-2496]

available to me.

Q. Through Witness Heywood?

A. Yes, sir.

Q. In other words, he is the man who decided we would look at wages instead of prices?

A. I do not know whether that was his decision at all.

Q. It was not yours?

A. Had I been able to develop differences for prices, I would have done so. I was not able to.

Q. Don't you have access to the returns regularly supplied to the AAR that show the different price levels paid for car wheels and steel and other components of the Account 314?

A. I do not know that I do.

Q. But you made no such inquiry?

A. No, sir.

• • •

[R-2509]

Q. And is it conceivable that the use of such a national factor of 16 per cent might wipe out territorial differences in the percentage that user costs are of the total account No. 314?

A. I do not know. The National factor is a percentage that is related to the total repairs.

Q. Is it conceivable that there are territorial differences in the percentage that user costs are to total repairs?

A. When you are speaking of user costs, you are talking about the 16 per cent?

Q. Yes, sir. Whatever is covered by the 16 per cent.

A. That could conceivably be given by territories. I do not know of any studies that show what that figure is by territories, but we have been using that 16 per cent for a long

time in our rail form A and also the Commission uses the same figure in its applications.

I would assume that is because there is nothing better to use.

Q. I would like to ask you whether you are familiar with the Commission's orders in what you will probably recognize as the per diem litigation; are you familiar with the Commission's orders and

[R-2510]

questionnaires calling upon the individual railroads to develop facts, both as to costs and as to operating data, respecting car costs?

A. I would say I know that there are orders on that subject. I am not familiar with them.

Q. You are sufficiently familiar, are you, with them to know whether the Pennsylvania, as an example, has already completed and filed with this Commission a statement for at least one-quarter of the year showing the per cent that user car costs are of Account 314?

A. I do not know. I do not even know whether it has been filed.

Q. I take it that an assembly of data is being handled in some other department of the Pennsylvania Railroad, or is it being handled in your accounting department, if you know?

A. I really do not know. I believe that the forms connected with that study are being sent to the Commission by our department. Who is actually compiling the information, I do not have any idea.

But those forms have not been made available to me.

Q. Let me ask you this, Mr. Coates, since apparently you are not familiar with the detail of these Commission orders.

In analyzing the problem of car costs and in analyzing the proportion of user costs to Account 314 and in analyzing the problems of unfair use or improper connection, so-called

non-reimbursable costs, and in analyzing utilization by type of car, indeed, in analyz-

[R-2511]

ing all of factors covered by your verified statement 76, did you make any inquiry whatever into the data showing the facts as to each of these items currently being developed and filed with this Commission by your railroad?

A. No, I did not because I did not have any way to use it. The information that I have studied has been the Commission Form A applications which have been used in this case by territories and also the work papers that Mr. Remington submitted.

Q. I take it in your search for the facts as to these particular items that, while you did not make such an inquiry at this time, you do welcome the thought that in the near future, both as to your road and as to all roads, we will no longer have to make an assumption like a national figure of 16 per cent on a system figure of car utilization by type of car but rather that we will have the facts as developed by this rather detailed questionnaire.

Mr. Eshelman: Is that a legitimate question? Does he welcome this? Is that related to something he has done?

Mr. Trienens: I am sorry if that welcome affects the sense of the question.

I will ask him whether he has an opinion comparable to Mr. Clark's yesterday, that such an inquiry, such a development of the facts by such a questionnaire would have no useful value.

[R-2512]

The Witness: When all of the facts would become available to me or to any one else and when I could understand those facts and know that I was able to use them properly, they could be of value. But they have not been available to me; they will not be available for a long time—in fact you

said that the figure that was furnished so far was one-quarter of the year or represents one quarter of the year, I forget how it was phrased. But that information still would have only been available to me for one quarter for the Pennsylvania Railroad and not for all railroads.

Q. (By Mr. Trienens) It is because we are in this interim period awaiting the results of that study that we are compelled in this proceeding to deal with such matters as the national factor of 16 per cent that you used in the Form A's?

A. Because we do not have anything better, yes, sir.

Mr. Trienens: That is all the questions that I have.

• • •

TESTIMONY OF NORTHERN LINES' WITNESS J. L. HEYWOOD

Cross-Examination (February 10, 1961):

[R-2629]

Q. (By Mr. Trienens) In your Section F, in which you say you are responding to Mr. Luckett's Exhibit 3, pages 2 and 3, Luckett was showing certain data by territory in terms of index numbers.

Now, you show certain absolute figures for the year 1956. You do not show absolute figures for each of the items covered by Mr. Luckett, do you?

A. No, here we show purely wages and taxes.

Q. So you have not shown any thing as to prices, and you have added the subject of taxes, is that correct?

A. That is correct.

I think it says here that there was nothing stated in the thing absolute in figures in the form of wages and taxes, so that is why I put that in here.

Mr. Kaier: He wasn't just responding to Mr. Luckett.

The Witness: No, I was after two or three other fellows.

Q. (By Mr. Trienens) Would it be in accordance with your understanding of these Form A's that you have applied for the year 1956 that the aggregate costs for the official railroads in dollars would be about three and a half billion dollars?

A. Now, wait a minute until I understand what you are get-

[R-2630]

ting to.

Do you mean when I made application of the unit cost to any particular traffic study?

Q. No, not unit cost at all, just the aggregate dollar cost that entered into your official territory rail Form.

In other words, you got total dollars of expenses, total dollars of return.

A. You mean what I started with or wound up with?

Q. Started with.

A. I don't know what the total was offhand.

Do you mean Eastern territory or official?

Q. Official territory was the one I suggested as three and a half billion.

A. I don't know what—to expedite this, I will agree with your figure on it with the privilege of checking it.

Mr. Kaier: If it is not right, it will have to be written in. If it is important to have it in —

The Witness: If you want me to check it, I—

Q. (By Mr. Trienens) Within a couple of hundred thousand dollars. I will take anything between three and four million dollars.

A. So will we.

You were putting the east and the south together, I assume?

Q. No, official territory.

[R-2631]

A. I can't check that figure. I can give you the east, but I can't give you the official.

Q. Qive me the east.

A. About $276,601,203.

Q. That would be two and three-quarter million dollars?

A. I beg your pardon, $2,723,987,283.

Q. Thank you.

You tell us in Section F—I will shift to eastern district because this is the only figure we have in front of us—you tell us if in the year 1956 these eastern district lines had the same wage levels as did the southern lines, their total wages would have been $52 million less.

Are you saying then that if you had paid your presidents at the same wage rates as the southern roads paid their presidents, and similarly through the professional employees, which is the most important item, and similarly through the other employees, which also enter into this—

Mr. Kaier: That is all employees?

Mr. Trienens: That is right.

Q. (By Mr. Trienens) —that the cost would have been 2 percent lower in the north, is that correct?

A. Well, I didn't work the percent out. That is about what it looks like.

• • •

ORDER

INTERSTATE COMMERCE COMMISSION

No. 29885

OFFICIAL-SOUTHERN DIVISIONS

IN THE MATTER OF DIVISIONS OF JOINT RATES
BETWEEN OFFICIAL AND SOUTHERN TERRITORIES

No. 29799

THE AKRON, CANTON & YOUNGSTOWN RAILROAD COMPANY, ET AL.

v.

ABERDEEN AND ROCKFISH RAILROAD COMPANY, ET AL.

PRESENT: DONALD P. MCPHERSON, Commissioner, to whom the matter which is the subject of this order has been referred for action thereon.

Upon consideration of the record in the above-entitled proceedings, of a petition dated February 15, 1960, filed by the respondent Southern Railroads requesting that certain data lodged with the Bureau of Transport Economics and Statistics, relating to car counts for the year 1956, as set forth in said petition, be made available to the parties, and of a letter dated March 8, 1960, addressed to the Examiners, whereby the Northern Railroads consent to Southern Lines having access to said data:

It is ordered, That the Bureau of Transport Economics and Statistics be, and it is hereby, directed to make available to the parties the data requested in said petition.

Dated at Washington, D. C., this 18th day of March A. D., 1960,

By the Commission, Commissioner McPherson.

HAROLD D. MCCOY,

Secretary.

(SEAL)

BRIEF ON BEHALF OF SOUTHERN TERRITORY RAILROADS

[65]

The Southern lines' proportion of fresh meat refrigerator cars to total refrigerator cars (7.1%) is much less than that of the Official lines (19.1%); only about 2 percent of the total refrigerator cars moving between Official territory and the South are fresh meat refrigerator cars (V.S. 39, pp. 34-35). To the extent the meat traffic moves between Official and Southern territories, the costs of both Official and Southern lines should reflect the high empty return movement experienced thereon. But the Southern lines should not be called upon to share in the costs of the empty return movement of refrigerator cars handling traffic in which the Southern lines do not participate (V.S. 39, p. 35).

The proper cost approach is to apply separately the almost 100 percent empty return on fresh meat traffic* which moves between Official territory and Southern Region, and to develop appropriate empty return ratios for the movement of traffic in general purpose refrigerator cars between Official and Southern territories which are not influenced by the extremely high empty return ratios for refrigerator cars handling specialized commodities.

A further problem raised by the use of the seven-day study of refrigerator car empty return ratios is the unreliability of a seven-day study in measuring the seasonal and variable refrigerator car movement. The 1956-1957 study produced an average figure of 76% for refrigerator cars on Southern lines, this being an average of ratios varying from 96% to 66% on individual days (V.S. 39, p. 38). The 76%

* Similarly, 100% should be applied to bananas originating on the Illinois Central at New Orleans which also move in special assigned cars owned or leased by the Illinois Central experiencing 100 percent empty return movement (V.S. 33, p. 20).

average for seven-days is to be contrasted with the 84% average for Southern lines based on actual records of all refrigerator loaded and empty miles on Southern lines for the full year 1956 (V.S. 39, p. 38 and Appx. H). There is no possible justification for using the results of a study based on 7/365ths of a year when, as in the case of refrigerator cars, records are available showing the loaded and empty miles for the full year.

The problem of obtaining appropriate and reliable empty return ratios for application to Official-Southern traffic moving in refrigerator cars was met in the Southern lines' study by using 100% for such

[66]

cars handling the specialized movement of meat and IC banana traffic as appeared in the traffic study, and applying for the balance of the refrigerator cars the empty return ratios based on the records for the car ownerships that handled the other Official-Southern refrigerator car traffic. The bulk of this traffic moves in Fruit Growers Express cars, as the Northern lines' operating witness conceded (Tr. R 464), because the Southern lines are obligated to load FGE cars to the extent available before using other ownerships (V.S. 28, p. 50 and Ex. M; V.S. 29, p. 30). The loaded and empty car miles of FGE cars on Official lines and Southern lines were made available by the FGE Company (V.S. 39, p. 36 and Appx. F). These data, together with the empty and loaded mileages experienced by the other car ownerships important to the handling of Official-Southern traffic on Southern lines, were weighted together to produce the empty return ratio for the refrigerator cars actually handling Official-Southern traffic (V.S. 39, p. 37). For the Northern lines, FGE empty return ratios were used; data showing the empty return ratios for the less important car ownerships were not available and the Northern lines did not produce such data from their records, presumably be-

cause the empty return ratios for such cars were lower than the empty return ratio for FGE cars.*

In their rebuttal evidence, the Northern lines did not question in any respect the refrigerator car empty return ratios applied in the Southern lines' cost study. The cost principles and the availability of reliable data from the records maintained for refrigerator car owners are thus conceded by the Northern lines, as they must be in light of the use by those lines of the same approach in other cases before the Commission. This is illustrated by Witness Heywood's cost study in Docket 32356, *Fresh Meats—Midwest to East*, described as follows in the Commission's report (313 I.C.C. 345, 366):

> "Line-haul costs computed by respondents [Witness Heywood] were based on through train movements at territorial average weight of through freight trains, with an empty-return ratio of 98 percent for the refrigerator cars. This ratio was obtained from a special study of the car-mile records of 10 large meat packers, owners of the refrigerator cars."

• • •

[70]

a. The Territorial Average Car Costs Which Commingle All the Costs of the Car Fleets Owned by Each Territorial Group Are Improper Because the Consists of the Car Fleets of Each Territory Are Vastly Different from the Cars Carrying Official-Southern Traffic.

One basic reason why an application of Rail Form A by territories produces the higher car unit costs in the North than in the South and why a territorial application of Rail Form A produces results which are inappropriate for use

* Data available for an earlier year indicated that for the second most important car ownership in which Official-Southern refrigerator car traffic moves, Western Fruit Express, the empty return ratio on Offical lines was substantially below the FGE ratio used in the Southern lines' cost study (V.S. 39, p. 39).

in this proceeding is that such an application is not to the cars in which North-South traffic moves but to the conglomerate mixture of all types of cars owned by the carriers assigned to each territory, many of which are not used to any appreciable degree in the handling of North-South traffic (V.S. 39, p. 44).

Over 81 percent of the railroad owned cars, i.e., other than refrigerator or tank cars, carrying the Official-Southern traffic are box cars, whereas only 0.9 percent of the cars are open hopper cars (V.S. 39, pp. 43-44). On the other hand, the total Official territory car fleet is made up of over 40 percent open hopper cars and less than 37 percent

[71]

box cars (V.S. 39, p. 45). Thus, an application of Rail Form A produces average costs for car fleets in both Official territory and Southern territory which have consists vastly different from the consist of the cars used to transport the Official-Southern traffic here involved, moving in the identical car both North and South of the territorial gateways.

If each class of car moved the same number of miles per year, and involved the same total amount of repairs, in each territory, the differences in the car fleets would be of little significance in an application of Rail Form A. However, differences by types of cars do exist. One significant difference as between types of cars is their degree of utilization, as shown in the following table (V.S. 39, p. 46):

Car Type	Car Miles Per Year United States Average
Box	19,635
Gondola	9,503
Hopper, Open	11,827
Hopper, Covered	13,816
Stock	16,953
Flat	18,996

As shown, open top cars rank lowest in utilization of railroad owned cars. The utilization of such cars is especially low in the Eastern District. The Pennsylvania's Chief of Transportation made this plain in his testimony before the

Commission in another proceeding (V.S. 37, Appx. D, Sec. H, p. 25):

> "Here is demonstrated statistically that, notwithstanding the greater proportionate ownership of coal (hopper) cars than any other class of car on the Pennsylvania Railroad, the number of shipments originated per year per coal car owned by and available to the Pennsylvania Railroad is considerably less than the number of shipments originating per year per car of any other class of car."

The reasons for this very low utilization of open hoppers on Eastern District roads were fully explained by the Pennsylvania's witness (V.S. 37, Appx. D, Sec. H, pp. 24-31). Such differences in utilization have an important effect on the unit costs per car and car-mile for the different types of cars, and the system average cost for all types of

[72]

cars reflects the utilization of the average car, not the box cars primarily handling the Official-Southern traffic.*

Whatever differences do exist as between the utilization of different classes of equipment, the record does not indicate that any such differences exist in respect to Official-Southern traffic herein involved.** The Official territory

* The effect of differences in utilization on car costs may be illustrated using the car repair costs furnished by Witness Symes. With a repair cost of about $1 per day for both hopper and box cars (Tr. R 213), the repair cost per car and car-mile for box cars would be approximately half of the cost per car and car-mile for hopper cars if, as has been shown, box cars run about twice as many miles per day as hopper cars.

** The only utilization figures shown by Witness Coates not only commingled all types of cars but also covered both line-haul and terminal services, and thus had no bearing on either the line haul or the terminal service performed in handling Official-Southern traffic (V.S. 76, p. 19; Tr. R-2491-92). Witness Coates' further use of the term "utilization" is in an entirely different and misleading sense that does not measure car-miles per day at all (V.S. 76, p. 20; Tr. R 2496-2504).

carriers handle this traffic over long distances in fast through trains (V.S. 8, Exs. H and M). These trains compare with the fast through trains of the Southern carriers (V.S. 28, pp. 26-28; V.S. 29, pp. 9-13; V.S. 30, p. 8). Thus, whatever differences in utilization are created by fast through trains, such utilization affects the movement of Official-Southern traffic in both territories.

Rail Form A separates car repair costs between mileage and time for all cars on a national 70-30 basis and car return and depreciation between mileage and time for all cars on a national 45-55 basis. In the engineering analysis underlying these factors, the same percentage separations were applied to the comparable portions of each type of car, without regard to any differences in utilization as between the types of cars (Tr. R 2504-07). Having been developed in this manner, the separation factors used in Rail Form A can validly be applied only on a national basis unless adjusted to reflect differences in utilization as between types of cars, as was done in the Southern lines' cost study (V.S. 40, Ex. C, pp. 13-19).

Another significant difference in the car fleets is that the age of Official Territory cars in 1956 was considerably greater than that of the Southern territory cars. This is shown by the following table (V.S. 39, p. 47):

[73]

	Percent Owned Cars in Excess of 25 Years Old	
	Open Hopper Cars	All Freight Cars
Eastern Division	48.60	41.71
Official Territory	40.04	38.52
Southern Region	27.68	29.74

Particularly significant is the fact that 94 percent of the Pennsylvania Railroad's open hopper cars in 1956 were in excess of 25 years old (V.S. 39, p. 47). Unquestionably, the repair costs on the older open hopper cars in Official territory are contributing heavily to the car costs in that terri-

tory.* However, since open hopper cars are of negligible importance in the movement of the Official-Southern traffic herein, the high repair costs on these cars should not be permitted to influence the relative car costs for application to Official-Southern traffic.

Witness Coates states that the average ages of the cars have no meaning because many of the cars have been rebuilt since their original purchase and therefore "the repair costs incurred in connection with these alleged old cars are not as great as Mr. Cole would lead us to believe" (V.S. 76, p. 9). Witness Coates, as has been typical of Official carriers' presentation in this entire proceeding, submitted no statistics concerning the cars which had been rebuilt by the Pennsylvania or by the Official lines as a group. The witness excuses his failure to furnish such evidence by saying that "Unfortunately, statistics are not avail-

[74]

able to show this information" (V.S. 76, p. 10). Certainly information is available showing the number of cars re-

* Witness DeButts testified that it "is a well known fact that the cost of car repairs increases with the age of the cars" and that the average age of the Pennsylvania's open hopper cars is nearly three times the average age of the Southern Railway's open hoppers (V.S. 14, p. 9).

The effect of age of equipment on car repair costs was emphasized by the Commission in its 61st Annual Report (1947), pp. 4-5:

> "We are concerned about the increasing age of railroad freight cars. The average age of such cars, other than cars owned by private car lines, was about 18.95 years at the end of 1939; at the end of 1946 it had reached about 20.72 years. Cars over 25 years of age increased in this period from about 400,000 to about 548,000 and from 24.5 to 31.4 percent of all cars owned. * * * Use of this older equipment results in higher maintenance and operating costs and less efficient adaptation of cars to shippers' needs than would be possible with newer equipment. Shippers are called upon to pay the bill caused by this over-age equipment. We feel that in this respect the railroads are falling below the full measure of their common-carrier responsibility, but that the rate increases they have received may make it possible to correct this situation in large part, provided material for rehabilitation and new construction is made available."

built, and the failure to show even that meager information must be interpreted to mean that the number of cars rebuilt has not materially changed the situation.*

Witness Coates attempts to meet the argument that differences in utilization by type of car justify the use of the national box car figures by showing that the national average proportion of box cars does not approach the proportion of box cars handling the Official-Southern traffic and he concludes therefrom that it would thus be improper to use the national average car costs (V.S. 76, pp. 7-8). The use of U.S. average car costs eliminates the distorting influences of differing car fleets in each territory. However, the Southern lines' study did not, as Witness Coates suggests, apply a U.S. cost averaging all types of cars to Official-Southern traffic without separation by type of car. Instead, the study separated the car costs and thus produced U.S. car costs by type of car consistent with the use of U.S. tare weights by type of car. This resulted in the use, for a box car moving between Southern and Official territories, of a box car unit cost and a box car tare weight that remained the same as the traffic moved from origin to destination in the same car. The use of national car costs by type of car takes into consideration the utilization of each type of car. The fact that the national car fleet is not made of 81 percent box cars does not bear upon the use of national average *box* car costs.

A Rail Form A application to the carriers in the North, which develops the same car costs for all the cars of those

---

* Witness Coates showed that Pocahontas Region car-mile costs are lower than Eastern District in spite of its heavy ownership of open hopper cars (V.S. 76, p. 10), and concluded therefrom that hopper cars do not cause the high Eastern District car costs. This is no answer to the point that the unusually high age and low utilization of Eastern District hopper cars cause the high average expenses, since the average age of Pocahontas hopper cars is substantially less than Eastern District hopper cars and their utilization is greater (V.S. 39, p. 47; V.S. 76, p. 20). The per diem credit position of the Pocahontas Region also explains the relatively low level of car costs on Pocahontas lines as discussed at page 76, footnote, *infra*.

carriers irespective of consist, utilization, or age, reflects to a substantial extent the expenses incurred for the handling of open hopper cars within Official Territory. It is improper to apply such costs to Official-Southern traffic, less than one percent of which moves in open hopper cars (V.S. 39, p. 44). Car costs for application to the Official-Southern

[75]

traffic should reflect the same consist of cars North and South and should further reflect the fact that the Official-Southern traffic moves predominantly in box cars.

• • •

[81]

• • •

For Official Teritory, for example, the dollar figure for car costs is $422,786,401. The line-haul portion of the total cost is $292,806,480, which is related to 9,956,671,001 car-miles run by all cars irrespective of ownership on Official Territory railroads. Of these car-miles entering into the divisor, it is not possible to determine how many were contributed by home cars. However, we do know from the traffic study that, on the Official-Southern traffic, only 12 percent of the car-miles are made by home cars on home line (V.S. 39, p. 55). To develop the car cost per mile for Official Territory cars would require the use as a divisor of the miles made by those cars while on and off home lines and eliminating the use as part of the total miles in the divisor miles made, for example, by a Union Pacific car while on the Pennsylvania Railroad.

Since the costs per car-mile of repair, depreciation and return on a national basis are made up of the miles creating those costs, the numerator and denominator are on the same basis. The use of national average car costs is necessary to avoid the improper influences that territorial averages impute to Official and Southern Territories.

• • • •

d. U. S. Car Costs, Separated by Type of Car, Are Proper for Application to Official-Southern Traffic.

The use of car costs on a national basis eliminates the foregoing distortions resulting from the use of territorial average car costs. In using national car costs, the Southern lines made the further refinement of separating the costs by type of car. This separation is important because different type cars have different utilizations and thus affect the proportion of car repairs and depreciation which are as-

[82]

signed on the basis of mileage and time. (V.S. 40, Ex. C, p. 17).*

In explaining the use of U. S. tare weights,** the Cost Finding Section stated (V.S. 39, p. 56):

> "In the development of costs for the various types of cars the same tare weights were used for all territories. This procedure was followed as cars are not restricted to use in any territory but are used interchangeably for movements in all areas."

Witness Heywood also used national average tare weights by type of car (V.S. 3, p. 12). Quite obviously a car does not change its tare weight upon crossing the territorial boundary and just as obviously the car cost on such a car does not change upon crossing the same territorial boundary. Clearly, the Cost Finding Section's change to a national

---

* This meets the criticism in Ex Parte No. 223 (Sub No. 1), *Minimum Charges per Car*, ... I.C.C. .... (decided April 24, 1961), of the use of "an average cost for the typical car rather than separate costs by car types" (sheet 7). It is the Rail Form A unadjusted average car costs that commingle all types of railroad owned cars and thus fail to "separate costs by car types."

** Prior to 1955, applications of Rail Form A by territories used different tare weights in each territory for each type car. This meant a different tare weight was used on a particular car for each of the several groups of roads (V.S. 39, p. 56).

average tare weight for each type of car was proper, and likewise the use of national average car cost by type of car is proper in this proceeding.

The approach of the Official carriers in their rebuttal of the Southern carrier's use of national average car costs by type of car, instead of a territorial average car cost, is illuminating. The following colloquy typifies their approach (Tr. R 2460):

> "Q. I want to understand the position you take, Mr. Coates, and I gather you would recommend the use of the car-mile costs based on the unadjusted rail form "A" and I refer you to the figures at the middle of page 15 [of V.S. 76]. Those are the costs you would use?
>
> A. [By Mr. Coates] It is the purpose of my statement to say that I certainly would not use the U.S. average car cost.
>
> Q. What would you use?
>
> A. I have not undertaken to say that I would specifically use Eastern District or Official Territory. I tried to confine my comparisons to the bases that were used by Mr. Cole and Mr. Remington."

[83]

Nowhere does Witness Coates offer any reasons why territorial average car costs, that become 46 percent higher where a car crosses the territorial border, may rationally be applied to Official-Southern traffic.*

The only reason given for use of territorial average car costs was summarized by Witness Coates on cross-examination (Tr. R 2490-91):

---

* Witness Coates refers to a difference of 3% in maintenance of equipment wage rates (V.S. 76, pp. 19-20, referring to V.S. 80, Ex. F-2), but does not mention the offsetting prices of maintenance material (Tr. R 2494-96).

"Q. I am asking you why, in developing a figure of miles per car for the cars that incur those costs [depreciation and return], why you would exclude unserviceable cars.

A. Well, they are costs that are incurred by the railroads, and the only way that the railroads can recover these costs is on the basis of the traffic that it handles in the cars that are serviceable for one thing. Well, that is all I can think of now.

Q. This factor of miles—mileage, including unserviceable cars was used by Mr. Remington to separate the U.S. car costs as between the different types of cars, was it not?

A. To separate the car costs between types of cars both as to running and switching costs.

Q. If you are attempting to separate the car costs as between hopper cars and box cars, for example, am I to understand your answer to my question to be that *you want to associate the cost of unserviceable hopper cars with the cost per mile on box cars?*

• • •

The Witness: I think that is a proper way to develop costs when we are trying to price out traffic, whether it be for a division case or a rate case, these are costs that are incurred by these railroads."

This effort to defend territorial average car costs is tantamount to a confession that the car costs used by the Northern lines do not reflect the costs of handling Official-Southern traffic. The use of average costs is not only improper as a matter of principle, but the Northern lines' purported separations of empty return ratios by type of car handling Official-Southern traffic, tare weights by type of car handling Official-Southern traffic and net loads of the

Official-Southern traffic have taken those lines too far down the road toward associating the costs with the traffic here at issue to permit the Northern lines now to defend average

[84]

car costs on the theory that it is proper to average hopper car and box car costs (as discussed at pages 21-22, *supra*).

If railroad cars were restricted to the territory in which the owning railroad was located and all expenses covering repairs, depreciation and return were confined to that territory and were separated as between the types of cars handling particular movements of traffic, justification would exist for using a territorial basis for computing car costs. However, the railroad cars carrying Official-Southern traffic move indiscriminately among the various territories, repairs performed on these cars are charged to the owner on a national basis, the return and depreciation are prorated between time and mileage on a national basis, the tare weight for the car is on a national basis, the car repair costs are prorated between time and mileage on a national basis, the private car line cars are leased on a national mileage basis, and the per diem rate charged or collected by each railroad is on a uniform national basis. The use of national car cost by type of car in the Southern lines' cost study more accurately reflects the costs of repair, depreciation and return of the railroad owned cars carrying Official-Southern traffic, and most certainly is a more accurate reflection of the actual car costs experienced in both Official and Southern territories on Official-Southern traffic than territorial car costs, dominated by types of cars of negligible importance in handling the Official-Southern traffic, and reflecting expenses incurred and repairs performed in other territories, and mileages of cars owned by rail carriers of other territories.

The Commission, in its Per Diem Investigation, I.C.C. Dockets 33145 and 33158, ordered a comprehensive assembly of data for the year 1960 to provide for the accurate

determination of car costs by type of car. In its orders in those proceedings, the Commission has required a separation of car costs by type of car for the year 1960 (the major data are required by orders dated December 18 and 23, 1959). When these data are released by the Commission, further refinement in the separation of car costs by type of car will be possible. The substantial accuracy of the separation used in the Southern lines' cost study is confirmed by the fact that the Northern lines' rebuttal evidence avoided any use of this refined data, separated by type of car in response to the Commission order, showing the facts as to the car costs for box cars on Northern lines. Despite the availability of

[85]

these data, the Northern lines presented a witness in rebuttal who produced no facts of any constructive nature, but criticized any separations of car costs. Witness Coates disclaimed any knowledge of the contents of even the returns to questionnaire prepared by his own department on the Pennsylvania (Tr. R 2509-12). It may safely be assumed that if returns of the Pennsylvania had contained information which would have been favorable to its position in this proceeding such specific data would have been submitted in lieu of general criticism of the entire effort to refine the average car costs for application to Official-Southern traffic.

Accordingly, national car costs, separated by type of car, provide the best evidence of the car costs incurred in handling Official-Southern traffic.

* * *

[108]

The Commission has long recognized that the use of the uncorrected freight commodity statistics for the development of the count of cars for Official Territory is erroneous. The data necessary to accomplish

[109]

this correction are regularly collected by the Bureau of Transport Economics and Statistics in order to reconcile the freight commodity statistics and the waybill statistics (V.S. 40, Ex. C, pp. 9-10). By Petition dated February 15, 1960, the Southern lines requested that this data be made available to the parties for the purpose of correcting the car count in the freight commodity statistics, and the request was granted by the Commission's order dated March 18, 1960. Witness Heywood asserts that Witness Remington's correction of car counts relied upon estimates because the data upon which it is based are allegedly incomplete (V.S. 80, Sec. A, p. 5). There is no basis for this assertion since the data regularly furnished by the railroads to the Bureau of Transport Economics and Statistics, in compliance with the request of the Bureau dated August 23, 1948 (Ex. R-11), provides adequate detail for the adjustment reflected in the Southern lines' cost study (V.S. 40, Ex. C, pp. 10-12), and the Northern lines have not produced a single instance in which the data filed by them has been improperly applied in correcting the count of cars in the Southern lines' cost study. Accordingly, the corrections in the count of cars must be reflected in measuring the relative costs of Official-Southern traffic.

• • •

[117]

The Northern lines' fully distributed cost applications do not include

[118]

pasenger and less-carload deficits or the return on property devoted to such services (V.S. 3, p. 8; Tr. R 769-70), whereas the Cost Finding Section's applications of fully distributed costs include passenger and less-carload deficits, with an

allowance for a 4 percent return on the property devoted to those services (V.S. 40, p. 12).*

[120]

* * *

Accordingly, the Northern lines' study is defective in computing constant costs without consideration of passenger deficits, contrary to the practice of the Cost Finding Section.

* * *

been submitted in lieu of general criticism of the entire effort to refine the average car costs for application to Official-Southern traffic.

[136]

IV.

THE SOUTHERN LINES' COST STUDY SHOULD BE REVISED TO TAKE ACCOUNT OF OVERSTATEMENTS IN THE COSTS OF THE NORTHERN LINES RELATIVE TO THE COSTS OF THE SOUTHERN LINES IN THE HANDLING OF OFFICIAL-SOUTHERN TRAFFIC.

As has been shown, the Southern lines' cost study contains basic adjustments made in accordance with cost principles established by the Cost Finding Section in order that the Rail Form A costs reflect more closely the costs actually incurred in handling the Official-Southern traffic at issue in this proceeding. However, the cost study as such does not reflect other evidence affecting cost of service. The evaluation of these additional factors bearing upon costs establishes that the Southern lines' cost study overstates the costs of the Official lines relative to the cost in the South, for the several reasons to be discussed herein.

---

* Less-carload deficits, a relatively minor factor, are subject to the principles applicable to the intercity passenger deficits, hereinafter discussed, in view of the large proportion of costs common to less-carload and carload freight service.

A. The Southern Lines' Cost Study Overstates the Line Haul Costs on Northern Lines.

Analysis of the data relating to train operations presented by Northern lines' Witness Nancarrow indicates that the average factors used in the Southern lines' cost study overstate the costs of handling Official-Southern traffic on Northern lines.

• • •

[142]

Since the operations have been changed, traffic to and from Cincinnati is blocked to and from Conway, with a separate block for L&N interchange, for example, and without the intermediate service indicated in the obsolete diagrams presented by Witness Nancarrow (Tr. R 452-53).*

To the extent Witness Nancarrow's schematic diagrams cast any light on the cost of through train operations, they indicate that those through trains in Official Territory which handle Official-Southern traffic in important volume are longer and occasion less intermediate handling than is reflected in the averages underlying both the Northern lines and the Southern lines' cost studies, and thus the Southern lines' cost studies overstate the line haul portion of the Northern lines' costs.

B. Costs of Interchanges Between Northern and Southern Carriers.

The Rail Form A system average costs for the year 1956 improperly attribute to the Official carriers an average cost per interchange handling which is 58 per cent higher than the average cost per interchange handling attributed to the

* A further problem, particularly as to the diagrams of trains to and from the Cincinnati gateway, arises from Witness Nancarrow's designation of Official-Southern loaded cars as excluding coal, but the designation of Official-Southern empties as including all empties destined to interchange with Southern carriers, even though they included a large number of empty L&N hopper cars that had obviously carried coal into Official Territory (Tr. R 423-27).

Southern lines at the same gateways ($4.95 v. $3.14) (V.S. 31, pp. 12-13). The uncontroverted testimony of operating witnesses for the Southern lines clearly establishes that, contrary to the cost relationship imputed in the 1956 Rail Form A system averages, the Northern lines actually perform no more onerous or extensive service than do the Southern lines in interchanging Official-Southern traffic, and that there is no factual justification for the use of different costs per interchange in accomplishing the mutual interchange of Official-Southern traffic at the same gateways. In fact, the Southern lines in several instances perform more burdensome and extensive services in accomplishing the interchange of Official-Southern traffic than those performed by the Northern lines.

[146]

* * * *

C. The Northern Lines' Costs are Overstated Relative to Southern Lines' Costs As a Result of Differences in the Timing of the Modernization Program in Each Territory.

Present cost levels which reflect different degrees of modernization in the two territories do not provide a proper measure of future cost relationships. The Commission has emphasized the modernization taking place on the various carriers in its report in *Increased Freight Rates, E., W., and S. Territories, 1956,* 300 I.C.C., 633, 685:

> "The record is replete with examples of the construction of modern 'push button' yards, mechanized maintenance and other technological improvements which in the first few years save substantially all of the cost incurred in providing them. The record shows that, by use of machines, track gangs can be very substantially reduced. We expect the railroads to continue the technological advances that many of them are now making. We appreciate that these improvements require the expenditure of funds which many of them

find it difficult to provide. Nevertheless, with opportunities for savings such as are shown on this record, we are not impressed with contentions that funds are not available at prevailing interest rates."

Obviously, the comparison of the costs incurred by carriers which have only begun to modernize and have yet to realize the savings produced by modernization with the costs of carriers which have already realized the operating economies and efficiencies flowing from modern facilities is not indicative of the cost relationships which will prevail when both groups of carriers are modernized in equal degree.

* * *

[158]

	North	South
1. Costs as Shown in Southern Lines' Cost Study (V.S. 40A, Ex. J, p. 4, item 6)	$152,807,787	$201,915,582
2. Five Percent of Northern Lines' Costs	7,640,389	—
3. Costs Reflecting the Further Evidence of Record (line 1 — line 2)	145,167,398	201,915,582
4. Percent of Total Cost (line 3 as percent of total)	41.82%	58.18%

As reduced by five percent to reflect all the cost evidence of record, the Northern lines' incur 41.82% of the total cost of handling Official-Southern traffic. Of the reduction of $7,640,389 in the Northern lines' costs, the equalization of gateway interchange alone justifies $1,594,086, or 21%, of the reduction (see page 146, *supra*). With respect to the balance, upon which a precise cost figure cannot be placed, the vast potential savings available to the Northern lines' modernization and elimination of duplicate facilities, together with the other factors discussed herein showing the overstatement of Northern lines' costs relative to Southern lines' costs as shown in the cost study, amply justify the reduction in the Northern lines' costs by at least five percent.

These factors affecting costs must be considered by the Commission in prescribing just, reasonable and equitable divisions for future application to the traffic involved in this proceeding. The Commission may not refuse to give effective consideration to these differences in costs established by the evidence simply because it has not been possible to measure them precisely in dollars and cents.

* * *

[183]

(1) Divisions of joint interterritorial rates on coal and coke made from coal were eliminated by common consent of the parties (Tr. R 2022, R 2695-96).

(2) Divisions of joint interterritorial rates on trailer-on-flatcar traffic moving entirely over the lines of the ACL, SAL, FEC, B&O, B&M, NYC, NYNH&H, PRR, Reading, RF&P were excluded from the scope of the reopened proceeding by stipulation of the parties (Tr. R 2700-01).*

(3) Divisions of joint proportional rates on grain and grain products from E. St. Louis, Ill., Louisville, Ky., or Cincinnati, O., to points in Southern territory are not at issue in this proceeding. A separate specific scale of divisions was prescribed on this traffic in the original report to

---

* The divisions on all other traffic originally subject to the prescribed divisions on which the Commission vacated its orders to allow the carriers to establish agreed divisions were placed in issue by the Commission's order of general reopening and have not been excluded by agreement of the parties. The so-called vacated order traffic at issue in this reopened proceeding includes (1) liquid soda and soda ash from Saltville, Va. to Kingsport and Port Rayon, Tenn.; (2) peaches and fresh vegetables moving on per car rates to Piers 22, 27, 28 and 29 in New York City; and (3) all trailer-on-flatcar traffic not covered by stipulation of the parties.

The first two categories of traffic represent only 1,209 cars out of an annual movement of 967,554 cars of Official-Southern traffic (V.S. 11, Ex. 1, Tab. A) and their inclusion works against the Southern lines slightly since under the agreed divisions the Southern lines are presently receiveing $7,760 per year more than they would under the present Docket 29885 divisional basis (V.S. 11, p. 9).

reflect the particular transportation characteristics of that traffic, including the characteristic that the "service performed by the northern lines on this traffic is typically that of an intermediate carrier" (287 ICC at 543). No evidence relating to this traffic has been offered in the reopened case.

(4) In its Fourth Supplemental Report (298 ICC at 84), the Commission specifically held that its orders prescribing divisions in Docket 29885 did not apply to traffic between border points and points in Official territory. This traffic was the subject of a separate proceeding (Docket 32055) in which the Commission rejected unadjusted Rail Form A costs and prescribed the Docket 29885 Column 1 scale as the basis of divisions (*Louisville & Nashville R. Co.* v. *Akron, Canton & Youngstown R. Co.*, 309 ICC 491, 509, 511). The Commission's order of November 23, 1959, denied the Northern lines' petition to consoli-

• • •

[186]

On the basis of Witness Wallace's statement alone, the Western Trunk Lines now ask that the Commission prescribe divisions on the traffic which had been excluded from the Commission's order effective July 15, 1953. There is no basis of record for such prescription. The Commission refused to prescribe divisions on this traffic in 1953 "Because of doubt whether the record would support findings requiring revised divisions on [this] traffic" (291 ICC at 91). The situation is precisely the same on this reopened record.

The situation has not been changed at all by Witness Wallace's Verified Statement 44. All the Commission knows from Verified Statement 44 is that there is a movement of Official-Southern traffic interchanged directly between Western Trunk Lines and Southern lines. Presumably much of the traffic thus shown is not covered by the Commission-prescribed divisions, but the volume is not shown. Even if it were, the Commission would only know that such traffic

exists, which was assumed when the Commission refused to prescribe divisions on such traffic on November 2, 1953 (291 ICC 90, 91).

Most significantly, Verified Statement 44 does not even make a start at furnishing the Commission information essential to any prescription of divisions:

(1) The record does not even show what the divisions are on the traffic on which the Western Trunk Lines ask the Commission to find unlawful.

(2) The record does not give the slightest indication as to the service performed by the Southern lines or by Western Trunk Lines north and south of the gateways, or over any other point, on the traffic on which the Western Trunk Lines seek a prescription.

The record thus does not contain even the beginning of a basis for finding the present divisions unlawful or for prescribing new divisions. Without even a rudimentary beginning showing the present divisions and relative services, the record obviously contains no evidence as to the vital relationship of relative costs to present divisions. The Western Trunk lines have not undertaken to meet, much less satisfy any of the standards of Section 15(6). Until such standards have been satisfied on the basis of evidence of record, the Commission is without power to prescribe new divisions. *United States* v. *Abilene & So. Ry.*, 265 U.S. 274, 290-291; *Brimstone R. Co.* v. *United States*, 276 U.S. 104, 115.

[187]

B. The Southern Lines' Traffic Study is Based on a Scientific Sample Which Provides Current Reliable Data Covering the Precise Traffic at Issue in These Proceedings.

The Southern lines' traffic study accurately measures the transportation characteristics of the precise traffic against which the Docket 29885 equal factor divisions were pre-

scribed to apply, and against which any prescribed change in those divisions would hereafter apply The Southern lines' traffic study, presented by Witness W. W. Wolford, provides the most current data available with respect to the normal annual movement of Official-Southern traffic and supplies all the traffic data required for the Commission's determination of just, reasonable and equitable divisions.

The utilization of modern data processing equipment and techniques has permitted the Southern lines to develop the most complete information pertaining to the movement of Official-Southern traffic ever presented to the Commission. This information shows the services performed and revenue received by each carrier participating in the movement of the precise traffic at issue. It measures the participation of Class I and Class II railroads, individually and as groups, in each territory, and shows the relative importance of Official-Southern revenues and ton-miles to the railroad groups and individual carriers (V.S. 36, Exs. 4 and 5). The distribution of revenue by mileage blocks north and south of the gateways is shown (V.S. 11, Ex. 2). Other information provided by the Southern lines' traffic study includes the volume and consist of Official-Southern traffic, average hauls, distribution by gateways, states of origin and destination, and similar information (V.S. 11 and V.S. 11A).

The Southern lines' traffic study is based on a scientific sample of interline abstracts (the regularly maintained basic records on which interline revenues are divided) for the constructive year July, 1958 through June, 1959 (V.S. 11, p. 2). The use of a full year assures

[188]

that the sample will contain the proper proportion of every commodity regardless of seasonality and, thus, will provide a reliable measure of the annual movement of Official-Southern traffic. A shorter test period (as shown more fully in relation to the Northern lines' traffic study at pages 191-192, *infra*) is certain to be deficient in its coverage of

seasonal commodities which constitute a large movement of Official-Southern traffic. However, as Witness Butler has admitted (Tr. R 649-50), the random selection of abstracts covering an entire year's traffic, such as the Southern lines used in making their traffic study, forecloses any criticism that the study is not representative of an entire year's traffic.

The next question that arises is whether the test period represents the normal movement of Official-Southern traffic under present conditions. The Southern lines' traffic study provides the most current available data covering the normal annual movement of Official-Southern traffic. The constructive year July 1, 1958 through June 30, 1959 was selected as a representative test year in which the normal movement of Official-Southern traffic was not affected by economic recession or strikes. The latter part of the year 1957 and the first half of 1958 were adversely affected by a severe economic recession. On the other hand, the 116-day steel strike during the latter half of 1959 drastically curtailed industrial production and rail traffic, rendering the last half of 1959 unrepresentative of normal conditions (V.S. 36, pp. 1-2; V.S. 52). Thus, the constructive year July 1, 1958 through June 30, 1959 covered by the Southern lines' traffic study represents the most recent period in which Official-Southern traffic moved under normal conditions.

• • •

[190]

C. Deficiencies Impairing the Reliability of the Northern Lines' Traffic Study.

The Northern lines' traffic study cannot be accepted as a reliable measure of the characteristics of Official-Southern traffic because of serious deficiencies in representativeness and coverage. Furthermore, the Northern lines' traffic study does not provide certain data which is necessary to the determination of fair divisions.

1. The Northern Lines' Traffic Study Is Not Representative of the Annual Movement of Official-Southern Traffic.

The Northern lines' traffic study fails to meet the standards of reliability which their own traffic officials established as essential to the acceptability of a study as being representative of the annual movement of Official-Southern traffic. On April 8, 1957, the Traffic Executive Association-Eastern Railroads authorized the preparation of a traffic study for an entire year for presentation in this proceeding (Tr. 629-30), in accordance with the following recommendation of Witness Butler and other representatives of the Northern lines (Tr. R 627-28):

> "It is essential that the Eastern Lines have a reliable traffic study for use in the proposed Official-Southern Territory Divisions case. In previous inter-territorial divisions cases, Eastern Lines have studied all traffic moving in one or more months. This has always raised a question as to whether the selected periods were fairly representative of a year's business. In the pending Transcontinental Divisions case, the Mountain-Pacific Lines used a sampling method based on procedures established by a recognized expert to determine the consist and movement of a year's business. We believe that the sampling method produces a more satisfactory and sustainable result than for a single or several months and that it would be more acceptable to the Commission. In addition, the actual processing of the traffic study by Mr. Butler, after the sample was obtained, would be reduced at least fifty percent, thus, resulting in greater expedition and substantial reduction in expense. Also, valuable experience would be gained for future requirements of this nature."

* * *

[197]

The fatal deficiencies in the representativeness and coverage of the Northern lines' traffic study preclude its accept-

ance as a reliable basis for the development of costs and other evidence relating to Official-Southern traffic. On the other hand, the Southern lines' traffic study provides all of the data required for the Commission's determination of fair divisions. The data were developed in accordance with scientific procedures under strict statistical controls which assured their reliability. No substantial criticisms of the reliability of the Southern lines' traffic study were made by the Northern lines * who themselves accepted its reliability by using it as the basis for Witness Heywood's final cost applications (V.S. 80, Ex. J-3, p. 9).

IX.

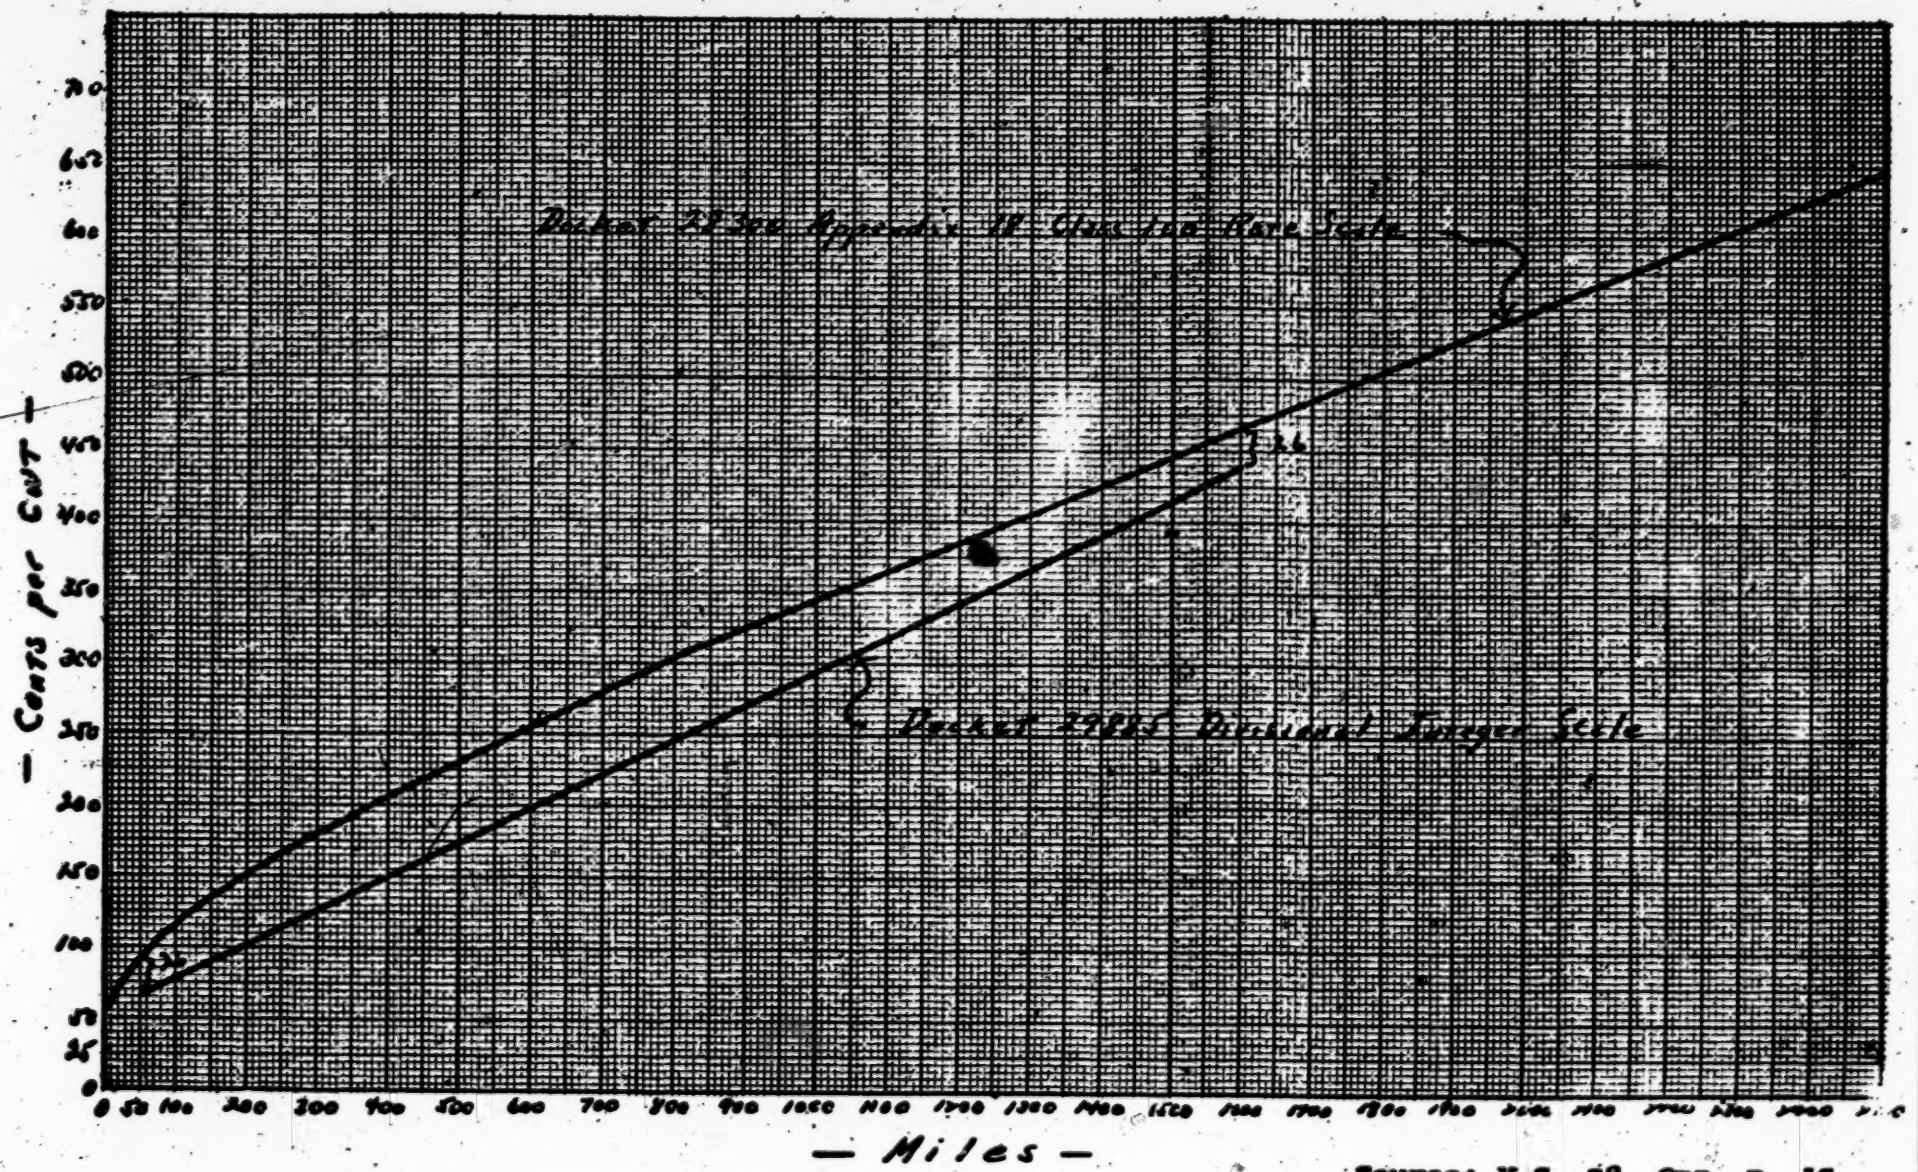
THE CONSTRUCTION AND APPLICATION OF A BASIS OF DIVISIONS TO PRODUCE A FAIR DISTRIBUTION OF THE OFFICIAL-SOUTHERN REVENUES.

Previous sections of this Brief have dealt with the substantive considerations which govern the distribution of the joint revenue from Official-Southern traffic. Upon the resolution of these issues with appropriate findings, the remaining problem is to translate the findings into divisional scales for application to the traffic. This final section of the Brief deals with the mechanics of constructing and applying divisional scales to accomplish a fair distribution of the joint revenue from Official-Southern traffic.

A. The Divisional Scale Must Reflect Cost Relationships in Order To Produce Fair Divisions on Official-Southern Traffic.

The mechanics of scale construction are important in the present proceedings because of the relatively great difference in the average hauls of the two territories. The Southern lines' traffic study shows that the average haul on

* The sole criticism (V.S. 68, pp. 1-2) was withdrawn by the Northern lines (Tr. R 2103-14).



Official-Southern traffic is 511 short-line miles South of the gateways and only 361 short-line miles North of the gateways (V.S. 11, Ex. 1, Tab. A). Whenever such a disparity in lengths of average hauls exists, the magnitude of the integer assigned to the first mileage block determines to a large degree the distribution of the joint revenue between the participating carriers.

For example, the present Docket 29885 divisional scale divides each $100 of joint revenue from a shipment having hauls of 350 miles in the North and 500 miles in the South, the approximate average hauls of Official-Southern traffic, as follows (V.S. 38, p. 2):

Revenue Distribution Resulting from the Application of the Present Docket 29885 Scale (287 I.C.C. at 552, Col. 1)

	Haul	Factors	Percentage Division	Revenue Division
North	350	137	44%	$ 44
South	500	174	56%	$ 56
Total	850	311	100%	$100

Docket 29885 Divisional Integer Scale vs. Docket 28300 Appendix 18 Class 100 Rate Scale

Source: V.S. 38, Opp. p. 15

[255]

2. The Use of Divisional Scales Derived from Rate Scales.

Analysis of the construction of the present Docket 29885 divisional scale shows that it was derived from the Appendix 18 rate scale prescribed in Docket 28300, *Class Rate Investigation, 1939*, 281 I.C.C. 213, 328. The graph on the opposite page shows the mechanics of the construction of the Docket 29885 divisional scale: 26 units representing one terminal handling (half of what the rate would be at zero mileage on the Appendix 18 rate scale for two terminal handlings),* were subtracted from the rates at 50 and 1600 miles, respectively, of the Appendix 18 rate scale. The figures thus derived (65 at 50 miles and 439 at 1,600 miles) became the values for the initial and last mileage blocks, respectively, of the present Docket 29885 divisional scale. The progression of the Docket 29885 scale was determined by drawing a straight line between the value for the initial 50-mile block (65) and the value for the 1,600-mile block (439). Thus, the present Docket 29885 divisional scale strongly reflects the construction of the Appendix 18 rate scale which has a depressed progression, or taper, designed to facilitate the movement of long-haul traffic. This characteristic of a rate scale, which has no bearing whatever upon the relative contribution of the carriers to the joint service, severely and unfairly depresses the divisions of the long-haul carrier group if a rate scale is used as the basis for constructing a divisional scale (V.S. 20, pp. 3-5).

* * *

[271]

Correction of the divisional basis to reflect assumed equality of costs as between Official and Southern carriers would not, however, reflect properly and with precision the costs of handling Official-Southern traffic shown by the specific cost evidence in this record because of the relatively higher

* At 10 miles the Appendix 18 class rate is 64 cents, and at 5 miles 58 cents, indicating by the retrogression that at zero miles the rate would be 52 cents, one-half of which is 26 cents (V.S. 38, p. 15).

costs of the Southern lines' service. Accordingly, in the next section, we describe the mechanics of constructing divisional scales based directly on the evidence of record in these reopened proceedings.

C. Divisional Scales Proposed by Southern Lines.

The objective of a divisional scale is to divide the joint revenue in relation to the amount and cost of service which each side has contributed. In *New England Divisions*, 66 ICC 196, 198, the Commission ruled:

> "The thought dominates the law, as it is now framed, that a paramount consideration in determining the equitable share of joint revenue which any carrier shall receive must be the relative amount and cost of the service which it renders, . . ."

The further decisions reaffirming this rule have been reviewed previously (pages 6-9, *supra*). We now discuss the mechanics by which the decisive cost evidence can be translated into divisional scales to be used in dividing the Official-Southern joint revenues.

[A-1]

PROPOSED FINDINGS*

1. We find that, except as hereinafter provided, the present primary divisions of joint all-rail class and commodity rates (except those on coal and coke made from coal; and certain trailer-on-flat car rates eliminated by stipulation) between official and southern territories, in which northern

* Not applicable to: traffic originating or terminating on the Norfolk Southern, Atlantic and East Carolina or Beaufort and Morehead, as to which a separate brief is being filed by Norfolk Southern; traffic originating or terminating on Atlantic and Danville, as to which a separate presentation has been made by the Atlantic and Danville; nor to traffic originating or terminating on the Georgia and Florida, as to which a separate brief is being filed by the Georgia and Florida.

and southern lines** participate are unjust, unreasonable and inequitable.

2. We find that just, reasonable and equitable primary divisions of the rates referred to in finding 1 (including aggregate or intermediate rates which automatically displace single-factor joint rates) would be determined by use of the prorating factors set forth in Columns 1 and 2 of the Appendix, in computing percentages expressed as integers, the factor for the southern haul being that shown in Column 1 for the short-line distance south of the dividing point, and the factor for the northern haul being that shown in Column 2 for the short-line distance north of the dividing point. The percentages so produced will not be subject to any minimum percentage for either the southern haul or the northern haul.

Provided, that if the joint rate being divided is a factor of a combination rate, and the resulting absence of an origination or termination terminal service is in the southern haul, the prorating factor set forth in Column 1 shall first be reduced by 119 before making percentages; and if the resulting absence of origination or termination terminal service is in the northern haul, the prorating factors set forth in Column 2 shall first be reduced by 104 before making percentages.

3. We find that there is no evidence in the record made in these re-

[A-2]

opened cases directed to the reasonableness of the divisions heretofore prescribed in the original report, as amended by supplemental reports, to apply against the joint propor-

** Northern lines are as defined in footnote (2) to page 498 of original report herein, 287 ICC 497, as amended to include Toledo Peoria & Western Ry. in Second Supplemental Report, 291 ICC 90, and as hereby further amended to exclude Atlantic and Danville Ry.

Southern lines are as defined in same footnote, as amended by Report on Reargument, 289 ICC 4, to include lines of St. Louis-San Francisco Ry. in Southern Territory, and as hereby further amended to include the line of the Atlantic and Danville Ry. west of Suffolk, Va.

tional or reshipping rates on grain and grain products from E. St. Louis, Ill., Louisville, Ky., or Cincinnati, Ohio to points in southern territory, and we affirm the findings made and resulting divisions prescribed in the original report as amended by supplemental reports.

4. We find that the evidence offered in the hearings in these reopened cases is not sufficient to support conclusions directed to the reasonableness of the existing divisions of the joint rates published between points on southern lines, on the one hand, and points on western lines in official territory, on the other hand, where a northern line does not participate in the movement north of the divisional gateways, and we find the existing divisions not shown to be unreasonable.

5. We affirm our prior finding in Report of the Commission on Reargument, 289 ICC 4, that the dividing points to and from which the prescribed primary divisions shall apply are the existing primary dividing points.

6. We affirm our finding in the original report, 287 ICC 497, that before the divisions herein prescribed are applied, differentials or arbitraries which are included in the joint rates so as to cause them to exceed standard rates, for hauls in either official or southern territory, whether for short or weak lines or otherwise, shall be deducted before prorating and added to the share of the carrier or carriers in the territory in which the differentials apply, provided, however, that in respect of rates on citrus fruit from Florida to official territory which include an arbitrary one percentage point shall be deducted from the northern division and added to the southern division in lieu of specific apportionment of the arbitrary.

7. We affirm our prior finding in the original report, 287 ICC 497, that in determining the primary divisions in whole percents, in disposing of fractions of 1 percent the odd 1 percent should be added to the percentage which contains the larger decimal, or if the percentages contain equal decimals, 1 percent should be added to the smaller percentage.

8. Subject to the foregoing findings, we affirm the conclusions and findings in our original report, as amended by supplemental reports.

* * *

d. *Count of Cars.*

Under the heading "Consistent Count of Cars Originated and Terminated," Mr. Remington, in Exhibit C of his Verified Statement No. 40, makes certain adjustments in the count of cars developed from the Freight Commodity Statistics, which are used in computing costs under Rail Form A. These adjustments add a portion of the cars therein reported as interchanged to the number of cars reported as receiving terminal handling. The effect of thus increasing the number of cars counted as terminated and decreasing the number counted as interchanged under Rail Form A, is to assign less switching expense to interchange service, which is a linehaul item, and thereby to reduce linehaul costs. The transfer of switching expense to terminal service, however, does not significantly affect the terminal unit cost per car, because of the accompanying increase in the count of cars given terminal service (V.S. 80, Sec. A, p. 1).

Mr. Remington's Exhibit G, p. 9 shows the effect of this adjustment to be an increase of 0.16% in the Southern lines' share of the total cost of the North-South traffic. His corrected page 9 (which includes the

[119]

missing "A" cars, and to which Eastern lines object) shows the effect of this adjustment to be 0.23% instead of 0.16%. The result of an increase of 0.23% would be to increase Southern lines' share of the cost by almost $1,250,000.

This adjustment relates principally to lake cargo coal, tidewater coal and ex-lake ore. It is based upon the theory that, "For cost purposes a car is originated when lading is placed in a car for outbound movement, and car terminated is a car in which lading is removed and the car is made

empty." (Ex. C, p. 5 to V.S. 40). Thus, his sole test as to whether a shipment is interchanged or is originated or terminated is whether the lading was put into or taken from a car. All other characteristics of the operation would be disregarded. Such a test obviously has no relation to cost. It has no relation to whether a given operation is more like an interchange from the standpoint of the service performed and, hence, of the costs incurred, or whether its transportation characteristics are more nearly those of terminal service.

Mr. Heywood testified (V.S. 80, Section A, p. 2):

> "That the service at tidewater ports on coal, and at the lake ports on coal and ore, is interchange rather than terminal is apparent from the facts with respect to these services. Taking lake cargo coal as an example, the coal trains go to the railroads' lake front yards at the ports. Unlike cars which are to be terminated, the lake cargo coal cars are not then moved to various industries in transfer runs and then switched to effect delivery at the consignee's plant. Rather, they are moved to a dumping machine at the railroads' water front yards and there dumped into the lake vessel. It is obvious that this service is much more akin to a movement to an interchange track than to a transfer and switching movement to effect delivery to a consignee. The fact that the car is not given over to the boat line along with the lading cannot, in itself, mean that the shipment is not interchanged. The interchange of an l.c.l. shipment between railroads is not accompanied by a delivery of the car which carried the shipment; but, nevertheless, it is an interchange. Also, the fact that the interchange is with a boat rather than with a railroad—that the movement is to a dumping machine rather than to an interchange track with another railroad—cannot detract from the essentials of the operation and their significance from a cost standpoint."

[120]

Mr. Heywood also pointed out that in *Lake Cargo Coal Rates, 1925,* 126 I.C.C. 309, 313, the Commission stated, with respect to lake cargo coal rates:

> "The rates thereon apply from the mines to the raised or hump tracks beyond the classification yards at the Lake Erie ports. From these tracks the loaded cars are dropped by gravity to dumping machines at the docks. A separate tariff charge for transferring the coal from cars to vessels is not in issue. The rates on lake-cargo coal are treated as in the nature of proportional rates to the ports for part of a through movement to cross-lake destinations. They include no terminal delivery to consignees at the ports. The local rates on so-called commercial coal to the port cities cover such delivery. For this and other reasons as, for example, concentrated movement at times when commercial coal is not moving heavily, rates on lake-cargo coal always have been lower than the local rates on commercial coal."

Even the rates on lake cargo coal indicate interchange rather than delivery service. They are either (1) proportional rates, differing from the rates to the port cities for local deliveries, the application of which is conditioned upon further movement from the port by water; (2) lower proportionals than those just mentioned, if the shipment is to have a further movement at the termination of the water haul; or (of more recent origin) (3) joint rail-water, or rail-water and rail rates (V.S. 80, Sec. A, p. 3).

The facts with respect to lake cargo coal as set forth above are true also in their essentials as to iron ore (which moves in the reverse direction to lake cargo coal) and tidewater coal (V.S. 80, Section A, p. 3).

Witness Remington stated (V.S. 40, Ex. C, p. 5) that in many instances, cars which are originated or terminated "in every sense of the word so far as rail services are con-

cerned'' are nevertheless counted as cars interchanged in the Freight Commodity Statistics. In this connection, he was referring to lake cargo and tidewater coal and ex-lake iron ore. He did not, however, give any facts to support this statement or show that he had any knowledge whatever regarding the services rendered on this traffic. It is clear, from the foregoing, that his statement is not in accordance with the facts.

[121]

Mr. Remington also stated that export coal through the North Atlantic Ports is treated as terminated in the Freight Commodity Statistics, while coal that is dumped into a vessel bound for New England is treated as interchanged and, here again, he stated that certainly there was no difference in the switching service. It does not appear that Mr. Remington has the slightest knowledge of switching operations on tidewater coal. While export traffic does move over the Pocahontas lines to Hampton Roads, there is no showing that there is any movement, not to mention any substantial movement over Eastern District lines.

Moreover, as is demonstrated above, the operations with respect to coal do not have the characteristics of terminated traffic, but rather of interchange and, therefore, even if there were any inconsistency between the classifications assigned to export coal and that dumped for movement to New England, the result would be that Eastern lines' costs, as developed by Form A, are understated because the export cars should be treated as interchanged rather than terminated.

In reporting the Freight Commodity Statistics, the Commission instructed that shipments delivered to water lines be regarded as terminated on line, and shipments received from water lines be classified as having originated on line; but, in the same order, it required that ''lake cargo coal delivered to Lower Lake and St. Lawrence River ports for transshipment by vessel'' and ''tidewater coal to Atlantic ports'', and ''iron ore received at Lower Lake and St. Law-

rence River ports" all be classified as "interchange traffic" (V.S. 40, Ex. C, p. 6). This careful differentiation of these movements of lake cargo and tidewater coal and iron ore from ordinary movements to and from water lines attest to the fact that they are different in character from those ordinary movements. The differentiation could only mean that the Commission considered the facts with respect to this traffic and recognized it to be interchange traffic.

Southern lines also cite certain statements made by a representative of the Commission's Cost Finding Section in I.C.C. Docket No. 28300 as being in agreement with their contention (V.S. 40, Appendix C, p. 8). In answer to this argument, it should be observed that the Cost Finding Section itself continues to use the figures from the Freight Commodity Statistics in arriving at unit costs (V.S. 80, Sec. A, p. 7), and that the Commission did not adopt the change suggested

[122]

in the statement of the cost witness in 28300. Indeed, in *Class Rates, Mountain-Pacific Territory,* 296 I.C.C. 555, 604, the Commission stated:

> "The effect of counting cars of coal and iron ore having a rail-water or rail-water-rail movement as origination or destination traffic was checked in the prior Docket 28300 cost studies and it was found that 1 percent of the cars in the eastern district and approximately 5 percent in the western district as a whole would be eliminated as interchange cars and included as origin and destination cars. This change had a very small effect on the costs depending upon the weight of the load and distance moved. The range was from 1 to 3 percent in the western district. No adjustment was made in the Cost Finding Section study for the reason that the effect on the costs is very small, and the subject requires further study as to the relative switching service performed for the coal and iron ore traffic as compared with other carload traffic."

As pointed out above, in the present case, Southern lines made no attempt to compare "relative switching service performed for the coal and iron ore traffic as compared with other carload traffic." Indeed, the Commission's conclusions in *Lake Cargo Coal Investigation* and the statements in that case, as quoted above, show that the switching service is not comparable to delivery, but rather to interchange service.

The Remington car-count adjustment is unsound not only in theory but in application. Based on information furnished by the carriers to the Commission at its request to enable it to reconcile its One Percent Waybill statistics with the Freight Commodity Statistics, Witness Remington transferred to an originated or terminated basis certain cars which were reported as interchanged. But the information so requested by the Commission and furnished by the carriers is not sufficiently complete to permit the making of the adjustment even if it were otherwise appropriate, which it is not. Because such information is not complete, Witness Remington's method of re-stating the car-count involves the estimating of a substantial portion of the cars which, according to his theory, should be classified as having been given terminal rather than interchange service. But these esti-

[123]

mates along with other computations made by the witness in developing the adjustment of the car-count used by him in his revised I.C.C. cost applications involve many assumptions which make his resulting conclusions wholly unreliable (V.S. 80, p. 5).

The fact is that, even if it were desired to make the adjustments along the line of the Remington theory, it would be impossible to do so because the information to accomplish the adjustment is not available. In addition to using certain figures reported to the Commission in connection with the One Percent Waybill sample, Mr. Remington re-

sorted to estimates which cannot be accorded any probative value; and moreover while Company material cars are not in the Freight Commodity Statistics, they do appear in the figures that Mr. Remington used in making his adjustment.

As above stated, certain information furnished to the Commission by the railroads, and used by the Commission for the purpose of checking its One Percent Waybill estimates, was used by Mr. Remington (along with his assumptions mentioned above) in making this adjustment. This information was never intended to provide a means of "correcting" the Freight Commodity Statistics. If such statistics as now reported were regarded by the Commission as improperly stated as between cars reported as receiving interchange or terminal service, it could readily revise its requirements for the reporting of such information. But the fact is that although the Commission has from time to time issued orders relating to the reporting of Freight Commodity Statistics, it has never sought to change the car counts along the lines Witness Remington suggests. On the contrary, throughout the period its Cost Section has been issuing annual statements of relative costs for the several carrier groups, the Commission has continued to require the reporting of freight commodity statistics in the same fashion as is currently done.

Further, the lack of value of such an adjustment, even if all necessary information were secured, is indicated by the fact that since the Cost Section of the Commission began its annual issuance of group cost data, beginning with the year 1947, it has never required the carriers to furnish such information and has continued to compute its regularly issued data on group costs with reference to the car counts derived from the Freight Commodity Statistics (V.S. 80, Sec. A, pp. 6, 7).

[124]

The Southern lines also contend that there is an inconsistency between the treatment of the Northern coal and

ore, as interchanged and phosphate rock delivered to water lines in Florida, as terminated. No effort, however, was made by Southern lines to show that the operations are comparable. There was no evidence whatever comparing them. No reason has been shown to support changing the reporting of the phosphate rock cars, as now prescribed by the instructions in the Commodity Statistics, just as no reason was shown for changing the lake cargo and tidewater coal and iron ore reporting as there prescribed, quite deliberately prescribed, and prescribed in harmony with the service as the Commission found it on lake cargo coal in its formal investigation of the rates thereon, those being proportional rates which include no terminal service.

The Commission should find that the adjustment on count of cars, for which the Southern lines contend, should not be made and that the count of cars from the Commodity Statistics should continue to be used, as it always has been. This adjustment should not only be rejected on its own account, but like that relating to switching and terminal companies because of its unwarranted effect upon switching minutes as well, to be discussed hereinafter.

e. *National Car Costs.*

Although generally professing, in justification of most of the adjustments here urged in an effort to alter demonstrated cost relationships, to "refine" the group Form A costs to bring them more close to the handling of the particular traffic involved, Southern lines quite inconsistently depart from this principle when their purpose is better served thereby. To this end they disregard the car costs for the two territories and substitute average car costs for the United States, thereby greatly reducing the costs shown for Eastern lines below the actual expenses incurred in this account while at the same time increasing their own. In fact this one "adjustment" produces their greatest single variation from the cost relationships indicated by the unadjusted Form A costs (V.S. No. 40 A, Ex. G, p. 9). The

several reasons given by Witness Cole in his Verified Statement No. 39 to support this "adjustment" were the subject of Verified Statement

[125]

No. 76 of Witness Coates from which the following analysis of those reasons is drawn.

One of the reasons given by Mr. Cole for employing U.S. car costs both north and south in lieu of territorial costs is that a nationally applicable mileage rate is used in computing car costs for refrigerator and tank cars. This assumes that because the mileage rental rate for each type of car is the same, there is an identical cost for each road or territory. This is a completely incorrect *non sequitur* because, in the case of refrigerator cars, for example, the net debits and credits on account of refrigeration and heater service, car inspection, and general overhead costs are added to this national mileage rate. These costs are not equal as among the several territories.

By using a national car cost Southern lines wipe out the differences in general overhead cost ratios among the several territories. The car costs both for the Eastern District and for the Eastern District plus Pocahontas Region are substantially higher than for the Southern Region. In its annual studies of the "Distribution of the Rail Revenue Contribution by Commodity Groups"—commonly termed "burden studies"—the Cost Finding Section of the Commission prices out Southern intraterritorial movements using Southern territorial car costs, and in pricing Official interterritorial movements uses Official territory costs. In the case of Official-Southern interterritorial traffic the Cost Section uses the car costs for both territories for the assumed hauls in each territory. It does *not* use U.S. car costs for either local or interterritorial movements.

To illustrate his contention that car costs in respect of a particular interterritorial shipment do not change upon passing the boundary between the two territories, Witness

Cole assumed an example of a Union Pacific car being used in a Southern-Official interterritorial movement. But even as to such an instance the items of expense on the railroads north and south would be different since in addition to per diem there would be differences in costs of repairs, whether attributable to owners or users, and for car inspection. Actually the greater part of the interterritorial movement is in cars owned by Official or Southern lines, and their respective car costs involve the whole range of differences in ownership costs, users costs, and per diem debits and credits (V.S. No. 76, pp. 5-6).

[126]

In an effort to show that the differences in car costs as between the territories are attributable to reasons which make it apropriate to here disregard them, Witness Cole suggested that the territorial car costs reflect the composite cost of the car fleet owned by each group of roads, that this is a different car fleet in each territory, and is very different from the consist of the cars handling Official-Southern traffic. To the contrary, however, territorial Form A car costs reflect the composite costs of both the car fleet owned and the car fleet used plus the effect of the per diem net debits and credits. The fact that there is a different car fleet in each territory and that it is not the same as the consist of the cars handling North-South traffic is no justification for the use of national car costs (V.S. No. 76, pp. 6-7).

Mr. Cole further suggests that the territorial car costs are greatly influenced by the types of cars owned by each group, and that over 80 percent of the per diem cars used in the north-south traffic are box cars. But if national car costs are to be used because box car use is here greater than the percent of box car ownership by Official or Southern lines, the same reason would disqualify the use of the national average since national box car ownership is only 43.3 percent (V.S. No. 76, pp. 7-8 and App. A). Even the box car

percentage in the Western District, which is the highest, does not approach the percentage of box car use here.

Witness Cole further suggests that differences in utilization of the different types of per diem cars justify using U.S. average car costs rather than territorial car costs. The constructed statistics used by him in this connection involve inaccuracies, but more importantly they ignore the fact that utilization of cars by types in the several teritories may be much different for various reasons such as the commodities handled, the speed of trains, terminal delays, shopped cars, etc. (V.S. No. 76, pp. 8-9).

Witness Cole also assumes that the difference in territorial costs is in part explained by the difference in the ages of the Official and Southern car fleets, and refers to the percentage of Pennsylvania Railroad open hopper cars over 25 years of age. But these statistics do not and cannot recognize that the repair costs incurred in connection with these alleged old cars, which have been kept modernized through rebuilding, are not necessarily greater by reason of retention of the date of original building (V.S. No. 76, pp. 9-10).

[127]

In concluding his discussion of the effect of the cost of the car fleet owned on average car costs in each territory Witness Cole concludes that Form A as applied to the northern roads develops the same car costs for all per diem cars but reflects to a substantial extent the expenses incurred in connection with open hopper cars within the North which he assumes to be greater. But if this were true the Pocahontas Region car mile costs should be substantially greater than those for the Eastern District which is contrary to fact (V.S. No. 76, pp. 10-11). Further, in here taking the position that hopper car costs are a major factor in making Eastern District car costs higher than those in the Southern Region, Witness Cole is inconsistent with testimony given by him in 1954 in which he expressed the

opinion that the cost of maintaining a box car was considerably higher than the cost of maintaining open top cars (V.S. 76, p. 11). In addition the average cost of acquiring general service box cars in the United States in 1959 was higher than that of open hopper or gondolas (V.S. No. 76, p. 11). Hence both the return element and the depreciation element would also be higher on box than on open cars.

A further reason given by Witness Cole for using U.S. car costs rather than territorial costs was that the latter are strongly affected by per diem debits and credits, and that this has a distorting effect because the basis used in computing Form A costs differs from that used in determining per diem rates. The fact is, however, that car costs are affected by per diem debits and credits and properly so, and that the failure to reflect per diem in the car costs would distort them.

Witness Cole's next reason to justify use of U.S. car costs was that the unit costs for the territories are determined by dividing cost of cars owned by the car miles operated, and that the numerator and the denominator do not represent the same cars in any given territory. This reason is unsound. Territorial average car costs reflect the total net costs and the car miles operated in the territory, and the numerators and denominators are consistent. In answering this reason Witness Coates stated in part as follows (V.S. No. 76, p. 13):

> "Mr. Cole reiterates on more than one occasion that Rail Form A costs include repairs made by the owning road to its own cars or paid by the owning road for repair work performed off line. He seems to gloss over the fact that there is a substantial cost of

[128]

> operating cars other than a railroad's own ownership included in the accounts. As a matter of fact the costs which are included in the accounts of the railroads in each of the territories are costs which must be met

from its own cash, the source of which must be its freight revenues and certainly include its share of revenues from handling interterritorial traffic. The miles included in the accounts represent miles operated by all cars regardless of ownership and these miles must be used as a basis for determining costs and the pricing of traffic which moves over a particular railroad or territory."

Witness Coates then pointed out that the Cole theory as applied produced car costs for Official territorial lines $41 million short of the Form A Group I car-mile costs for running service, interchange switching, and intertrain and intratrain switching which the Commission's own application of Form A produces. For the Eastern District the method produces car costs $62 million short of the actual. This figure represents 25 percent of the total car mile cost of the Eastern District lines. If the same theory were applied to interterritorial traffic of Official lines the intraterritorial traffic of those roads would have to bear not only the car costs incident thereto but a substantial part of the burden of the interterritorial traffic. On the other hand the Cole method of using U. S. car costs would *increase* the costs of Southern lines by nearly $9 million above their own actual car costs.

In addition to the shortages in car costs which the Cole method would produce for Eastern lines, it would additionally exclude some $900,000 from Northern lines' costs and add about $300,000 to Southern lines' costs in respect of the car cost portions of switching costs developed in Rail Form A, Group VI, for switching road train to industry (V.S. No. 76, p. 17).

Another argument offered by Witness Cole to support use of U. S. average car costs was the fact that the Rail Form A procedure makes use of national tare weights. Answering this argument Witness Coates stated (V.S. No. 76, p. 18):

"In my opinion the use of tare weights on a U. S. basis furnishes

[129]

no reason for applying car costs on a U. S. basis. In fact, except as to the development of the percentages for the separation of costs between mileage and time portions for depreciation, tare weights never enter into car cost development in Rail Form A."

Answering Witness Cole's characterization of territorial Form A car costs as measuring "the composite effect of the car fleet owned by the respective groups of roads" (V.S. No. 39, p. 45), Witness Coates pointed out that it erroneously included only ownership costs and ignored users costs and per diem debits and credits. He also noted that Official territory equipment is used to a greater extent in handling the North-South traffic both in Official and Southern territories, and that if Western equipment is disregarded, Northern-owned equipment performed 53.96 percent of the total miles and Southern-owned equipment 46.04 percent of the total miles performed by cars of northern and southern ownership. Yet the participation in the line hauls, as shown by Southern lines, is 40.81% north and 59.19% south. That is to say, the total car miles performed by northern equipment represented 132 percent of the total northern car miles performed by northern and southern equipment while the total car miles performed by southern-owned equipment represented only 78 percent of the total performed by northern and southern cars in the south. This illustrates the importance of including all of Eastern lines' car costs and of dividing them by the car miles performed in their territory. Otherwise northern lines would never recoup the proper proportion of their car costs on the interterritorial traffic, with the result that local traffic would have to bear not only its own car costs but also a portion of such costs attributable to the interterritorial traffic which it is manifestly incapable of doing (V.S. No. 76, pp. 18-19 and App. B).

Mr. Coates also referred to the generally higher wage rates in the Eastern District than in the Southern Region as affecting car costs (V.S. No. 76, pp. 19-20). In 1956, maintenance of equipment and stores employees of Eastern district railroads received compensation amounting to $11,548,082 more than they would have received at Southern Region rates of pay. Including Pocahontas lines, the figure is $12,667,286 (V.S. 80, F2 and F3).

[130]

After pointing out other infirmities in the Cole theory for the substitution of United States car costs for those of the individual territories, and the inconsistent statistics and arbitrary assumptions on which Southern lines' cost figures in this respect were based, Witness Coates concluded (V.S. No. 76, p. 25):

> "In conclusion it is my opinion the unit car costs associated with the costs and transportation service for each of the two territories are more appropriate for use in a North-South Divisions Case than a nationwide average car cost which ignores the differences in territorial costs that do exist."

f. *No Justification Shown for Adjustment of Empty Return Ratios.*

As previously stated, Witness Remington's adjusted costs reflect the application of "empty return ratios appropriate for the Official-Southern traffic" as part of his undertaking to "relate the unit costs to North-South Traffic." (V.S. 40, pp. 18-19). This adjustment accounts in part for the results shown in Table 10 of Verified Statement No. 40.

In support of the empty return ratios employed in Southern lines' cost studies, Witness Remington relies entirely upon the testimony of Witness Cole in Part II of Verified Statement No. 39. (V.S. 40, Appendix C, p. 20). Thus, it is clear that any justification for Southern lines' substitu-

tion of adjusted empty ratios in Rail Form A for territorial average factors must be found in the evidence of Witness Cole. It is submitted no such justification appears. Eastern lines will demonstrate that there is insufficient evidence to substantiate either the necessity for or reliability of the adjusted box car and refrigerator car empty return ratios for Eastern and Southern lines computed by Mr. Cole and furnished to Mr. Remington for incorporation into Southern lines' cost study.

Before turning to the details of the theories and methods employed by Witness Cole in developing these rates however, a brief comment is appropriate with respect to the introductory remarks of the witness

[131]

regarding this subject. At pages 18 and 19 of his statement, the witness undertakes to contrast the cost applications of Witness Heywood with the use of true "average costs" which he asserts was defended by an operating witness for Eastern lines, with obvious reference to Witness Nancarrow. As previously shown, references to average costs in Verified Statement No. 8 of the latter witness, who did not purport to testify as an authority on costs, constituted nothing more than a convenient method of describing the territorial Rail Form A costs presented earlier by Witness Heywood. (R. 552). Nowhere in Eastern lines' direct evidence, to which Mr. Cole was responding, was there any suggestion that the Commission revert to "a conglomerate system average for all type cars" as Mr. Cole implies. (V.S. 39, p. 19).

In purporting to so construe Eastern lines' evidence in order to advance the argument that Eastern lines inconsistently have recognized the need for adjustments in average costs in applying empty return ratios and other traffic characteristics by type of car, Southern lines have attributed a distorted meaning to Eastern lines' presentation in order to produce a straw man which can then be assailed.

Obviously, there is a vast difference between recognizing that box cars and hopper cars, which are suited for different types of commodities, may have separate return characteristics, on the one hand, and Southern lines efforts to distinguish between various classes of box cars, which the record indicates are loaded much more indiscriminately and possess no distinct empty return characteristics, on the other.

The traffic studies herein, both those of Eastern lines and that of Southern lines summarized by Witness Cole at page 24 of his statement, indicate that by far the greatest part of Official-Southern traffic moves in box cars while refrigerator cars are the most significant of the other classes involved. For this reason, apparently, Southern lines have limited the adjustments made in empty return ratios to those two classes of cars. Inasmuch as the individual box car and refrigerator car adjustments incorporated in Southern lines' cost studies rest upon evidence which is dissimilar in many respects, it is proposed herein to treat separately of the contentions advanced by Southern lines in justification of the adjusted empty return ratios employed in costing each of these two classes of equipment.

[132]

(1) Box Cars.

Turning now with more particularity to the box car empty return adjustment urged by Mr. Cole and adopted in Witness Remington's cost applications, it is essential that the underlying theories and assumptions be first clearly understood before proceeding to an analysis of the mechanics and nature of the adjustment made in this element of cost by Southern lines.

At the outset, Witness Cole undertakes to distinguish between general purpose box cars, which may be utilized for "loading all types of commodities", and "box cars which are only suitable for loading those special commodities for which the cars have been specifically designed and con-

structed or box cars which, though they may be physically suited for some type of return load, are in assigned service and thus returned empty to the point of loading." (V.S. 39, pp. 24-25). The witness thereupon refers, at some length, to Vehicle Parts cars as apparently the primary example of the second category of box car equipment.

After demonstrating that Official Territory carriers own a greater proportion of special device box cars (defined as classes XAP, XAR, XML, XMP, XMR and XT) it is asserted that "Commodity Class No. 623, Vehicle Parts N.O.S. requires particular use of special service box cars." (p. 26). The Witness thereupon undertakes to compare Eastern and Southern lines in terms of commodities handled, which would indicate that a greater proportion of the traffic of Official Territory carriers is composed of Vehicle Parts, N.O.S., than is true of Southern lines.

It is significant to note that the foregoing comparisons by Witness Cole are made, first, in terms of classes of equipment, that is, general purpose and special device cars as designated by the Commission in Schedule 417 of the annual report form and, secondly, in terms of commodities moving in all classes of box cars. The tendency of the witnesses for Southern lines to confuse class of equipment with class of traffic and to attribute characteristics to one based upon statistics with respect to the other is one of the fundamental fallacies invalidating Southern lines' adjustment of box car ratios. It is this confusion which, it will be seen, belies the worth of the special study requested by Southern lines which Eastern lines necessarily rejected.

[133]

Assuming the accuracy of Mr. Cole's showing with respect, first to relative ownership of special device box cars and, secondly, relative participation in the transportation of commodity class No. 623, Vehicle Parts, N.O.S., there is, nevertheless, no logical or factual basis for the ensuing assumption that the cars in which the latter commodity

may move incur a 100 percent empty return movement. The witness, at page 27, asserts the proposition that "* * * the Southern carriers should not be saddled with any portion of the costs of handling the empty cars which have moved auto parts traffic solely within Official Territory or between that territory and territories not involved in this proceeding." Yet, there is no evidence whatsoever to substantiate as a *fact* that the cars handling "Auto Parts traffic", uniformly or even normally return empty to origin. Nonetheless, Southern lines have submitted a cost study to the Commission which embodies that uncorroborated assumption.

The Eastern and Southern District average box car empty return ratios, employed in Witness Heywood's cost applications on the involved traffic, were developed from data made available to the Commission by all Class I rail carriers pursuant to the order of July 16, 1956. The carriers' returns to this order embraced a total of seven days at intervals in the periods from October 22, 1956 to August 18, 1957. The results of these studies are stated by Mr. Cole to have produced empty return ratios of 39 in the North and 33 in the South (p. 28). By a series of calculations which will be demonstrated to rest upon insufficient and disassociated data, as well as assumption and judgment, Mr. Cole reached the conclusion that:

> "* * * as far as North-South traffic is concerned, the empty ratio for box cars is no greater in Official Territory than in the south. In my judgment a fair ratio for either territory would be 30 percent." (p. 32).

Thus, it is seen that while Witness Cole has adjusted the empty return ratio for box cars in Southern Territory from 33 percent to 30 percent he has, at the same time, made an adjustment three times as great for Eastern lines in that the Official Territory box car ratio was reduced from 39 percent to the same 30 percent used for the South.

[134]

The adjustment in the box car empty return ratio for Official Territory carriers, with which Eastern lines are naturally most concerned, was accomplished in three stages, each of which requires independent consideration. The first and perhaps the most important step in the Cole adjustment, measured by the degree of its effect upon the empty return ratios, is sought to be justified on the ground of eliminating, as inapplicable to Official-Southern traffic, the allegedly high empty return movement of special device cars. By this first stage in the adjustment, Witness Cole accomplished a reduction in the Official Territory ratio from 38.93 percent to 34.66 percent. Support for this first adjustment is claimed to be found in the same territorial comparisons of box car ownership by classes and the proportions of vehicle parts to other traffic previously referred to and, in addition, the conclusion that inasmuch as the carriers serving Detroit are stated to have a 49 percent empty return ratio (p. 29), there is necessarily a correlation between the two comparisons first mentioned, i.e., equipment ownership and auto parts traffic, from which empty return experience can be statistically computed in a reliable manner.

Even assuming the facts to be as shown by Mr. Cole, however, the logic of his conclusions is open to serious question. System and territorial box car empty return ratios are a reflection of total system or territorial operating and traffic experience. That experience is a composite of many variable factors, some of which exert a favorable influence upon the empty return ratio, others of which may tend to be unfavorable. Southern lines' argument, however, would reject the influence of all variables but one and require the finding that the system average box car empty return experience of the Detroit lines is higher than average simply and solely because they participate in a greater-than-average proportion of vehicle parts traffic, giving no

recognition whatsoever to the other imponderables which influence the empty movement of box cars.

Once having assumed the desired effect for vehicle parts traffic on the system return ratios of the so-called Detroit lines, Mr. Cole then arbitrarily attributes the same effect to Official Territory carriers as a whole based upon nothing more than a comparison of the vehicle parts traffic within the two territories.

[135]

Two very fundamental fallacies in Mr. Cole's logic, however, either one of which of itself is sufficient to invalidate his conclusions, must be immediately apparent from the foregoing recital of the theories underlying the first stage empty return adjustment. First, there is absolutely no evidence to sustain the assumption that any given railroad, having both a higher proportion of auto parts traffic and a higher box car empty return ratio than another compared carrier incurs the latter burden because of the former circumstance. There are undoubtedly any number of influential factors as to which roads with higher-than-average empty return ratios may be similar and the same conclusion could be urged with respect to each of those factors with equal logic as that here suggested by Mr. Cole in assuming the effect attributed to the volume of auto parts traffic. Until the carriers operating experience in transporting that traffic has been more comprehensively analyzed (and Southern lines' suggested study would not accomplish this result), the "* * * very definite correlation between the percentage of vehicle parts to total traffic and the empty return ratios for various carriers" (p. 29), asserted by Mr. Cole, is nothing more than mere surmise.

The second defect in Witness Cole's presentation is the equally uncorroborated and, indeed on this record, rebutted, assumption that auto parts *traffic*, as distinguished from certain auto parts *cars*, may properly be assigned a 100 percent empty return ratio as was done in Southern lines' cost

study. When queried about this assumption, Mr. Cole stated, on cross-examination, that no appreciable quantity of auto parts moves in general purpose box cars and that he had been advised by operating officials that 99 percent of the auto parts moving in box cars utilize special device cars, at least within the South (R. 1692). Again, with no study based upon actual experience to sustain his conclusions, the witness conceded that once a movement of auto parts in a box car was encountered in Southern lines' traffic study, a 100 percent empty return movement was assumed. It is submitted that even if it had been demonstrated that the "definite correlation" between the percentage of vehicle parts traffic and empty return ratios urged by Southern lines in fact exists, there is no evidence to sustain Southern lines' extreme assessment of the *degree* of any such influence in terms of a 100 percent empty return ratio on all vehicle parts box car *traffic.*

[136]

Eastern lines, recognizing the fallacies in sweeping generalizations as to railroad operating experience, such as those here indulged by Southern lines, undertook, in the limited time available to them upon rebuttal, to make a spot check of the accuracy of Witness Cole's assumptions. The results of these checks are fully described in Verified Statement No. 73 of Witness F. H. Clark. Inasmuch as Mr. Cole had singled out the Detroit lines for certain of his comparisons, the New York Central, Wabash, Chesapeake and Ohio and DT&I, joined by the Pennsylvania and Baltimore and Ohio, the remaining large Eastern carriers, made an indiscriminate check of their transportation records to determine if all auto parts transported in box cars in fact require special device box cars, as assumed by Mr. Cole and, secondly, to determine whether such special device cars are limited to particular commodities or special services, again as assumed by Mr. Cole, or are utilized for traffic generally. (V.S. 73, p. 7). As a consequence of those studies, which are

embodied in Exhibits Nos. 1 through 6 to Verified Statement No. 73, Witness Clark concluded as follows:

> "It is my conclusion that any adjustment in the box car empty return ratio for Official Territory which is premised upon the assumptions, first, that vehicle parts traffic, commodity Class 623, moves in special device box cars rather than in general purpose box cars; and secondly, that all special device cars and all assigned box cars incur a 100 percent empty return movement, is clearly unrealistic. It is, of course, true that many shipments of auto parts are transported in special device box cars and that many special device cars and other assigned cars incur substantial empty mileage. It is likewise true, however, that many auto parts shipments are made in general purpose box cars and that special device and other assigned box cars are loaded with a wide variety of miscellaneous commodities. I have not undertaken to assess the degree to which these factors influence the box car empty return ratio within Official Territory. I do not believe that such an evaluation can be made upon any meaningful or accurate basis because of the indiscriminate use of general purpose and special device box cars." (V.S. 73, pp. 14-15).

[137]

As acknowledged by Witness Clark, Eastern lines do not suggest that there are not many occasions when special device box cars and assigned general purpose box cars return empty to the point of origin. The empty return movement under these circumstances is a necessary service to the shipper which is frequently a prerequisite to the enjoyment of the loaded movement by the carrier. But, as Witness Clark pointed out, shippers requiring this service are not only to be found within Official Territory. (V.S. 73, p. 6). Rather, empty return movements of box cars in special and assigned service are a burden of modern competitive rail

transportation to which carriers in all territories are subject. Moreover, neither can it be said that this burden is peculiar to auto parts traffic since similar shipper demands are a characteristic of other commodities as well. Under the circumstances, no justification has been shown for the effort on the part of Southern lines to independently assess the effect upon average box car empty return ratios which can reliably be found to be attributable either to ownership and movement of special device cars or to the transportation of various commodity classes of traffic, such as vehicle parts.

Witness Cole conceded that there are many factors which contribute to producing empty return ratios. (R. 1665). They will vary somewhat with business conditions generally and, hence, the availability of loads for all classes of equipment. The movement of empty cars is influenced by the desire to minimize per diem payments or may be compelled by Association of American Railroads car service orders.

Another influence, and one urged by Mr. Cole as a basis for the second stage in the box car adjustment, is that of directional flow. In this connection, the witness stated that in his experience, even where directional flow of traffic is in perfect balance between two areas, there is an empty return ratio of approximately 25 percent because cars are not made empty at the locations at which traffic is available.

The existence and interaction of these many variables, all of which exert an influence upon the empty return ratios of carriers and territorial groups of carriers, is itself persuasive of the soundness of adhering to average empty return ratios in the absence of very persuasive evidence demonstrating the clear-cut and *measurable* effect of any single influencing factor which may be selected for emphasis. The record here is persuasive that Southern lines' attempt to explain and

[138]

neutralize the difference in the Northern and Southern empty return ratios solely in terms of vehicle parts traffic

is without evidentiary support and rests entirely upon uncorroborated assumption as to both the fact and the degree of the influence claimed for the auto parts traffic. The almost indiscriminate movement of general commodities in special device cars and of vehicle parts and other special commodities in general purpose cars effectively precludes valid acceptance of the adjustment urged by Southern lines on the flimsy foundation of the proportionately heavier movement of vehicle traffic over Eastern railroads.

The second stage in the box car empty return adjustment urged by Witness Cole rests upon an estimate of the influence of traffic moving between Official Territory and Canada upon the ratio for that territory. Thus, he concludes, at page 32, that:

> "* * * the empty ratio for Official Territory should be adjusted to exclude the 1,275,000 miles of empty movement *that can be attributed solely to directional flow* of this Canadian traffic. Such an adjustment would further reduce the Official Territory empty ratio by 2.13 percent points, from 34.66 percent to 32.53 percent." (emphasis supplied)

The foregoing discussion should suffice to demonstrate the impropriety of any undertaking to attribute the net result of the interplay of many variable factors "solely" to any particular circumstance. And in this instance, it is admitted that elimination of the circumstances charged with producing the effect upon empty return ratio, which Mr. Cole so ingeniously computes statistically, directional flow, does not result in corresponding elimination of empty mileage. (R. 1664). As indicated earlier, Mr. Cole concedes that where directional flow is in perfect balance a 25 percent empty return ratio would nonetheless be incurred because of the unavailability of loads at the precise point of unload and because of the existence of the other variable factors which Mr. Cole recognizes. (R. 1665). Under the circumstances, it is impossible to even determine the nature

of the influence, if any, of traffic imbalance in Canadian traffic upon Eastern lines' average box car empty return ratios much less to substantiate the contention that the directional flow of such traffic alone increases that ratio by precisely 2.13 percentage points. Here again Southern lines seek to have the

[139]

Commission adopt a specific measure of the influence of one of numerous variables, each impossible of independent evaluation.

Moreover, if directional flow of traffic exerts the influence attributed to it by Mr. Cole with respect to Canadian traffic, an adjustment in average empty return ratios, with the purported purpose of reflecting the conditions under which Official-Southern traffic is moved, is not complete without a similar assessment of the impact of the directional flow of other blocks of traffic not here involved upon the box car empty return ratios for both territories. The witness, however, elected to limit his computations to a selected example of traffic imbalance, which might be claimed to reduce the box car ratios of Eastern lines. If the effect of directional flow on Canadian traffic can be so readily isolated and so exactly evaluated, as urged, clearly corresponding adjustments should also have been made in the box car ratios for the South as well as Official Territory which would isolate the effect of directional flow of all traffic not here in issue. For example, there is no indication of the influence of directional flow between the South and the West upon the ratio for Southern lines incorporated in Witness Remington's adjusted costs. Yet, if Mr. Cole's theory with respect to directional flow of traffic is correct and if Southern lines were sincere in their oft-professed desire to reflect the particular characteristics of Official-Southern traffic, the further adjustments here suggested could not properly be omitted. Their apparent willingness to go only part way along this path is again demonstrative of the consistent

selectivity in the adjustments of Rail Form A costs here urged upon the Commission.

The third stage in Southern lines' adjustment of the box car empty return ratio for Official Territory whereby that ratio is further reduced from 32.53 percent to the 30 percent employed in Southern lines' cost studies is lacking even a pretense of justification and rests entirely upon the uncorroborated judgment of the witness. As to this third step, Mr. Cole readily conceded that he had made no investigation in either territory nor any calculations whatsoever and that the adjustment rested entirely upon the assumption that there is a greater degree of assigned box car service in the North because of greater industrialization than is true in Southern Region (R. 1694-95). Cer-

[140]

tainly, this last phase in the box car empty return adjustments comes with poor grace from parties who have professed, throughout this proceeding, to provide the Commission with more specific and more accurate cost information through the utilization of modern cost finding techniques. Clearly, it was never contemplated that accepted factors regularly employed in Rail Form A cost applications be discarded in favor of the purely judgment factor of a witness who admittedly has made no investigation to sustain that judgment.

It should be noted, also, that Mr. Cole made no effort whatever to deal with the possibility that the Southern empty mileage ratio on box cars is affected by special device cars to as great an extent, or even greater, than is the ratio in the East. Witness DeButts testified (R. 923, 24):

> "The problem in the South is that we are finding more and more that we have to furnish specially equipped cars, what the shipper wants and what he must get if he is going to keep it on the railroad instead of shipping by truck, which is usually an expensive car sometimes, and we have to meet that demand."

Mr. Cole gave no consideration, in adjusting the box car ratios, to any commodity but vehicle parts. Having in mind movements of such things, for example, as stoves, freezers, refrigerators, washing machines, dryers, and dishwashers in special device cars within the South, as well as other places, it is wholly arbitrary to attempt, as Mr. Cole has, to "refine" empty return ratios on box cars by adjusting only for vehicle parts traffic. There is no evidence whatever that box car traffic moves to a greater extent in special device cars in the East than in the South.

The foregoing discussion now makes appropriate and, it is submitted, more meaningful, a further discussion of the special study sought by Southern lines to which reference has previously been made. In the course of the hearings herein, Southern lines requested that Eastern lines "join in furnishing data which will provide a precise separation of box car empty return ratios as between box cars available for general loading and special device box cars not suitable for return loading." Reference to this request, there incorporated as Appendix B, was made in the Notice served by Southern lines on February 15, 1960, wherein it was further stated that:

[141]

> "In view of the Northern lines' refusal to produce the data requested, the Southern lines hereby serve notice of their purpose to present evidence based upon available statistics from which reliable estimates may be made bearing upon these features of the cost evidence, and to rely upon the well settled rule that, when relevant representations are made which would be either verified or impeached by records in the sole possession of the adverse party, refusal to permit inspection of the records creates a presumption that the representations are true." (pp. 5-6)

It is unnecessary to consider the soundness of the "well-settled rule" upon which Southern lines indicate they will

rely inasmuch as the basic premises urged in justification of the application of that rule are shown to be inaccurate. It has been previously demonstrated that the "reliable estimates" presented by Southern lines resting in one instance upon pure judgment, cannot be sustained. Furthermore, the "relevant representations" cannot, contrary to Southern lines' assertion, be either "verified or impeached" by records in the possession of Official Territory lines.

The records to which Southern lines there referred may be assumed to be the wheel reports of Eastern lines, since they are the indicated source of the information sought by Southern lines' request. It is there stated that the suggested form accompanying that request, based upon the conductor's wheel reports, together with the Equipment Register would "permit the parties to develop box car empty return ratios separately for box cars available for general loading and special device box cars not suitable for return loading." (Notice, Appendix B, p. 1). The data extracted from the wheel reports would make available the car initial and number together with a breakdown as between loaded and empty cars to which miles would thereafter have to be added. The request then contemplated that the Equipment Register would be employed to determine from the car number whether that car was classified as a general purpose box car or one of the six classes of special device box cars.

But the development of a separate empty return ratio for box cars classified as special device, which would be the product of the requested study, would not accomplish the suggested purpose of

[142]

making available a precise box car empty return ratio for cars "not suitable for return loading" nor, indeed, for assigned general purpose box cars. Eastern lines' studies, presented by Witness F. H. Clark in Verified Statement No. 73, demonstrate that special device box cars, particu-

larly Classes XML, XMP, and XMR, are available for and regularly utilized by Eastern lines in the transportation of a wide variety of miscellaneous commodities and are thus, in fact, quite "suitable for return loading." Hence, in actual practice, the "definite correlation" between the class of car and the category of traffic that is urged by and implicit in Southern lines' request, is shown to be lacking.

Any effort, such as that embodied in Southern lines' cost application, to attribute an independent empty return ratio to a class of *traffic,* such as auto parts, when that empty return ratio is developed in terms of the class of *equipment,* as distinguished from traffic, can be of no assistance in the development of costs for application to traffic. It is for this reason, among others, that Eastern lines denied the request to join in the proposed study and stated their opinion, which is here demonstrated by the instant record, that such study would be of no value.

Manifestly, it is highly improper to attribute any transportation characteristics, such as empty return ratio, to a commodity classification of traffic unless it can be demonstrated that those transportation conditions are almost invariably an attribute of the particular commodity or traffic under consideration. Eastern lines' studies here clearly establish, however, that such is not the case with respect to vehicle parts since that commodity moves also in general purpose box cars admittedly suitable for a wide variety of traffic in return movement and, further, and perhaps of greater significance, that special device cars designed and used for particular commodities, such as vehicle parts, are likewise regularly employed for miscellaneous commodities thus invalidating the assumption that they must, by their very nature, return empty to point of origin.

Another important reason for declining Southern lines request was that whereas the Commission's seven-day study embraced days that were spaced through a twelve-month period, the three-day study suggested by the Southern lines would have been for "Monday, Janu-

[143]

ary 25, 1960; Wednesday, February 3, 1960, and Friday, February 12, 1960," or a period covering a span of but 18 days. It is obvious that the period was not representative. Moreover, specially equipped cars were in heavy demand during the period because there was a steel strike during the 1959 Fall period when model changeovers take place and the movements of parts was, therefore, greatly curtailed in that period and, in consequence, was heavy during the period which would have been covered by the proposed three-day study, thus resulting in a heavy demand for the cars and a consequent greater empty return movement to meet this demand than would have applied throughout the year. Of course, a study embracing days throughout a year's period would have resulted in an intolerable delay in the disposition of this proceeding, and such a study would still have been subject to the unwarranted assumption mentioned above (V.S. 73, p. 4).

Any effort to develop a separate box car empty return ratio for application to particular traffic, whether by commodity classification, such as vehicle parts, or by territorial designation, such as the Official-Southern traffic here involved, encounters a further problem in that there is a complete absence of any guiding principle whereby empty miles may be allocated to particular loaded movements. By way of illustration, if a loaded movement of vehicle parts is followed by an empty movement and thereafter by a loaded movement of another commodity and it is desired to develop the empty return experience of the former commodity, empty mileage intervening between the two loaded movements, conceivably, can either be entirely assigned to auto parts traffic or, to miscellaneous traffic, or indeed, be divided between the study traffic and the non-study traffic. In any event, whatever the allocation of this empty mileage, it would rest upon judgment alone.

Southern lines' operating witnesses were unable, upon cross-examination, to suggest any standard which would be

of assistance in allocating the empty miles in the foregoing illustration or in variations of that example (R. 1118-21, 1245). Obviously, the same difficulty inevitably exists when it is sought to develop empty return ratios "appropriate" to territorial movements of traffic. The indiscriminate use, in terms of both commodities and territorial movements, of railroad box car equipment precludes the allocation of

[144]

empty mileage to movements of any particular commodity or territorial classification of traffic on any basis other than mere judgment and makes necessary and appropriate reliance upon system average experience.

Empty mileage is in essence a burden of doing business. It occurs as a consequence of the necessity that equipment be moved to the points at which a demand exists for the transportation of shipments tendered to the railroad. The nature of the operation here involved was very clearly summarized by Witness F. H. Clark in Verified Statement No. 73, at pages 5 and 6, as follows:

> "In general, much of the empty mileage incurred by box cars, particularly those designed for general loading, in unrelated to any particular shipment or placement order. The cars gravitate toward the areas where potential demands exist or are anticipated. Under such circumstances, the empty mileage cannot reasonably be attributed to any specific use or any identifiable shipment, either prior or subsequent to the empty movement, and must be considered as a general burden of doing business. For example, when an empty general purpose box car is received by a Southern carrier from a Northern connection, or vice versa, having previously moved loaded in the opposite direction, the empty return may well be completely disassociated from the preceding trip. The empty movement could well be motivated by a desire to minimize per diem payments or, in compliance with AAR orders, aimed at providing

equipment to territories in need of the same, or the receiving railroad may send the car to car shortage areas of its own road in no way concerned with the origination territory of the previous load. A good illustration of empty haul not assignable to other than system operation is a car moving into storage after a loaded trip. That handling has no connection whatever with the previous load. In my opinion, therefore, it is impossible, in such instances as here under consideration, to associate empty mileage with either the prior or the subsequent loaded movement or to fix the occurrence or point in time at which such mileage may be said to cease to be related to the prior load and thereafter be attributed to the subsequent load."

[145]

The difficulty involved in any effort to allocate empty mileage to particular traffic has previously been recognized by the Commission. In Docket No. 17000, *Rate Structure Investigation, Part 12, Nonferrous Metals,* 204 I. C. C. 319, 351, it stated:

"The amount of empty-car mileage operated to supply car service to a particular traffic cannot be determined with accuracy, because of the labor and difficulties involved in attempting to trace the entire movement of all cars used in handling it, both before and after the transportation is completed, and in attempting properly to allocate such mileage."

Likewise, the Commission has very clearly recognized the essentially systemwide composite character of the relationship between loaded and empty mileage in I&S Docket No. 7008, *Export Soybeans—Southwest and South to Gulf Ports,* 309 I. C. C. 445, 459 (1960), where is stated.

"The furnishing of an empty-car supply is an overhead cost of providing transportation service, and the sys-

tem average of box cars, used by both parties in their cost computations, appears justified."

The box car adjustment urged by Southern lines which, when reduced to essentials is shown to rest on assumption, generalization and uncorroborated judgment, completely fails with any guarantee of assurance to isolate the influence claimed for certain selected factors upon the system and territorial box car empty return ratios, and effectively demonstrates the futility of any effort to precisely dissect the composite result of a number of variables which, by its very nature, is an indivisible overhead burden upon general railroad operations. Eastern lines submit that, under the circumstances, the adjustment urged by Southern lines in this respect has not been substantiated by any credible factual evidence and that no justification has been shown for rejecting the territorial average box car empty return ratios employed in the cost applications of Eastern lines. On the other hand, there is considerable evidence, particularly the studies of Witness Clark and the acknowledged impossibility of allocating

[146]

empty mileage as between various categories of traffic, which fully warrants the use of such territorial averages as appropriate measures of the overhead cost of providing service on Official-Southern traffic as an integral part of the total traffic of Eastern lines.

(2) Refrigerator Cars.

As previously noted, Southern lines' cost study incorporates an adjustment both North and South in the empty return ratios for refrigerator cars as well as that previously discussed with respect to box cars. While the mechanics of this adjustment and the justification therefor are in some respects different from the box car adjustment, it will be seen that here again, just as was true of the box car adjustment, there is a substantial disparity between the avowed

purpose sought to be accomplished by the adjustment and the result which is in fact produced and urged for application to Official-Southern traffic.

Witness Cole criticizes the use of the Commission's average territorial empty return ratios for refrigerator cars developed in the seven-day study on the ground that it "does not reflect the conditions surrounding North-South traffic." The principal basis for this contention is the assertion that fresh meat traffic moves to a greater degree on Official Territory lines than in the South, and that such traffic incurs a 98 percent empty return movement. On these assumptions, Witness Cole expresses the opinion that

> "* * * the proper approach for empty return ratios on refrigerator cars, as in case of box cars, is to apply separately the empty return ratios of 100% for such special movements as fresh meats (215) and bananas originating at New Orleans on the Illinois Central, and to develop an appropriate empty return ratio for the general movement of refrigerator car traffic which is not influence in different degrees in the respective territories by the empty return ratios for specialized commodities."

Up to this point, the theory and method of Witness Cole in dealing with refrigerator cars is essentially the same as that previously discussed with respect to box cars, that is, he compares the relative

[147]

traffic proportions in both territories of a selected commodity, in this case fresh meats, and assumes a 100 percent empty return ratio for that commodity. Thereafter, he undertakes to adjust the refrigerator car empty return ratio on other traffic by eliminating the assumed influence of the movements of fresh meats upon the territorial average factor. Again, as was true of box car traffic, there is no evidence to substantiate the assumption by the witness that

every car handling fresh meats returned empty to point of origin.

Having once determined to eliminate the purported influence of fresh meat traffic, the witness resorts to information as to loaded and empty refrigerator car miles of selected refrigerator car companies on Eastern and Southern lines as affording a "more accurate measure" and a "closer representation" of the ratio of empty to loaded car miles on North-South traffic." (pp. 37, 38). On the basis of information furnished by Fruit Growers Express Company alone, so far as Eastern lines are concerned, and with some additional information from other refrigerator car lines with respect to movements on Southern carriers, the witness concluded that "the empty to loaded ratio which should be used for refrigerator cars (other than bananas and meat) in the North is 75 and in the South is 84." (p. 29). The result of this acknowledged "opinion" expressed by the witness, which is reflected in Witness Remington's cost study is to reduce the ratio for Official Territory from 90 percent as developed by the seven-day study to 75 percent, while at the same time increasing the ratio for Southern Region from 76 percent to 84 percent.

The evidence relied upon in justification of the respective refrigerator empty return adjustments North and South is not comparable, hence it is necessary to examine the adjustment in each territory independently. In each instance, however, it must be reiterated that Southern lines reject the territorial average refrigerator car empty return ratios developed by the Commission and employed by Mr. Heywood and profess to substitute therefor a ratio for each territory which is appropriate to the particular traffic here involved. The ratios actually developed by the witness, however, fall far short of achieving the allegedly desired relationship to Official-Southern traffic.

Referring, first to the Official Territory adjustment, the witness asserts that:

[148]

> "* * * because Fruit Growers Express cars handle a very substantial portion of the North-South refrigerator car miles, the empty to loaded ratio for Fruit Growers Express cars is a closer representation of the empty to loaded ratio for refrigerator cars in the North on North-South traffic than a system average refrigerator car empty ratio based on the Commission's seven-day study." (V.S. 39, p. 38).

Yet, even conceding the substantial participation of Fruit Growers Express cars in North-South business, the basic information furnished by that Company, from which Mr. Cole developed the adjusted empty return ratio, has no particular relationship to that traffic.

At the request of Southern lines and with the concurrence of Eastern lines, Fruit Growers Express Company furnished the total loaded and empty miles made by cars of that ownership on all United States railroads, not including BRE or WFE cars at home in the West but used also for North-South business. This information is shown for the railroads in Official Territory and Southern Region in Appendix F to Verified Statement No. 39. That Appendix did not include the information furnished by Fruit Growers Express for railroads in the West, yet the report of the car company indicated that FGE refrigerator cars move for very substantial mileages on many Western railroads. Witness Cole conceded, for example, that the data furnished by Fruit Growers Express revealed in excess of 17 million miles operated by equipment of that Company on the Great Northern Railroad, miles which are obviously completely unrelated to Official-Southern traffic. (R. 1700).

Inasmuch as the information furnished by Fruit Growers and relied upon by Witness Cole reflected *all* miles in *all* traffic, it is manifest that whatever relationships between loaded and empty miles for *carriers* in the North and South are shown, the resulting ratios cannot, in any sense, be at-

tributed to Official-Southern *traffic* or any other category of business. The FGE miles shown for Eastern lines are just as much a reflection of the experience of those lines on traffic moving between Official Territory and the West and Southwest since the equipment of Fruit Growers Express is shown to be utilized very substantially in other territories during the off season when not

[149]

required for the movement of southern perishables. Obviously, the approximately 17 million miles operated by Fruit Growers Express equipment on the Great Northern and similar operations on other Western District carriers had a corresponding movement in Official Territory completely unrelated to North-South traffic. Thus, while purporting to develop a refrigerator car empty return ratio which, in preference to the Commission's seven-day study, would allegedly reflect the characteristics of North-South traffic, Mr. Cole has actually substituted in lieu of a ratio developed by the Commission from *all traffic* moving in *all refrigerator cars* an empty return ratio developed again for *all traffic* but only in Fruit Growers Express cars.

Moreover, the evidence shown by Mr. Cole, at page 36, based upon Southern lines' traffic study, indicates that Fruit Growers Express cars participated in only 43 percent of the loaded Official-Southern movement in refrigerator cars. Hence, a second defect in the method here urged by Southern lines, which would invalidate even an FGE ratio in fact related to North-South traffic, is the absolute lack of evidence from which the Commission can determine the empty return experience on the remaining 57 percent of the loaded refrigerator car miles made in North-South traffic. Eastern lines submit that clearly there is no justification for substituting for the ratio developed from information based on all refrigerator cars and all traffic one produced by the total United States operations of a selected individual refrigerator car line handling less than half of the North-South

refrigerator car traffic, particularly when the asserted purpose of the adjustment is to produce a ratio which may be found to reflect the particular characteristics claimed for Official-Southern traffic.

In adjusting the empty return ratio for Southern territory, Witness Cole included the loaded and empty miles made on Southern lines by refrigerator car equipment of other ownerships as well as that of Fruit Growers Express Company. This information is stated to have been "obtained from replies to questionnaires directed to the Accounting Departments of the Southern carriers." (p. 27). It is set forth in detail in Appendix G to Verified Statement No. 39 and summarized by the witness at page 37 of his Verified Statement. It was acknowl-

[150]

edged by the witness, however, that the information presented in his Appendix G was similar to that previously discussed with respect to Fruit Growers Express Company cars alone in that the miles shown for cars of other ownerships on Southern lines are likewise those produced by all traffic on those carriers. (R. 1697).

In seeking additional information with respect to the movement of cars other than those of the Fruit Growers Express Company, Southern lines have, by clear implication, recognized the very basic invalidity of undertaking to rely entirely upon the experience of a single car company as affording a measure of the services provided on North-South traffic in which a number of refrigerator car companies participate. As shown, however, while Southern lines attempted to cure this defect as to the Southern Region adjustment, it is alone sufficient to invalidate that made with respect to Official Territory on the basis of Fruit Growers Express information alone. The variance in the underlying data relied upon for the respective adjustments in the two territories likewise detracts from the weight to be given to Southern lines refrigerator car empty return adjustments.

Witness Cole, in using Fruit Growers Express data for his Official Territory adjustment and all refrigerator car companies for his Southern Region adjustment, has violated one of the important precepts in the production of relative costs of service by failing to make comparable studies for both territories.

It must again be emphasized, however, that even had the witness succeeded in producing comparable data North and South, he has by his own admission failed to relate the information relied upon in any manner to Official-Southern traffic. Under these circumstances, any criticism of the Commission's seven-day study because of its more general application applies with equal appropriateness to that here urged by Southern lines. Certainly, an adjustment on a highly selective basis favorable to one of the parties, which is shown upon analysis to constitute not a refinement of information to relate it to particular traffic but merely a distortion to accomplish a desired purpose, provides no justification for departing from the factors normally employed in the Commission's Rail Form A cost formula.

Summarizing, Southern lines' adjustments of box car and refrigerator car empty return ratios, when stripped of the statistical legerdemain whereby they are sought to be justified, are quickly distilled into bold, uncorroborated assumption. By the expedient of attributing

[151]

100 percent empty return ratios to categories of traffic not moving to as great a degree between Official Territory and the South as within Official Territory, adjustments highly favorable to Southern lines are accomplished under the guise of producing ratios which are "appropriate" to the involved traffic. But the empty return characteristics so arbitrarily and inflexibly attributed to vehicle parts and fresh meats moving within Official Territory are simply not borne out by fact. Furthermore, even if the avowed pur-

pose of Southern lines to develop empty return ratios reflecting the particular traffic were to be deemed desirable, it has been seen that the selective ratios here urged by Southern lines rely on nothing more persuasive than judgment and assumption and are, hence, vastly inferior from the standpoint of reliability than the system average factors they are intended to displace. The Commission cannot properly sanction adjustments in Rail Form A which so clearly lack the support of sound evidentiary fact.

g. *Switching Minute Adjustments.*

Beginning at page 62 of V.S. 39, Witness Cole undertakes to identify, on the system average basis, the source of the difference between Official Territory and Southern Region unadjusted Rail Form A box car costs. In terms of the dollar value placed by the witness upon each of the five factors there described, the difference shown for switching costs constitutes the most important single item. Referring to this element of cost, Mr. Cole asserts (p. 63) that "* * * one of the basic problems in railroad cost finding is the inadequacy of information on actual switching services and costs."

Responsive to this statement, and allegedly on the basis of more "adequate" information as to switching services rendered on the involved traffic, Southern lines have incorporated certain adjustments in switching costs into their cost applications. These adjustments are based upon switching studies in the South, more fully described by Witness Seigler in V.S. 42, and upon even more arbitrary modifications in switching costs for Northern lines, more fully described by Witness Remington in V.S. 40-A. It is significant to note at the outset that Southern lines' cost adjustments on account of switching employ markedly different methods for each territory. The adjustments for both territories will be demonstrated to be identical, however, in that

[152].

neither can be found to measure up to even the standards set by Mr. Cole of proceeding upon either adequate or reliable "information on actual switching services and costs."

It will be the purpose of this section to examine the procedures employed by Southern lines in adjusting switching costs, both North and South, and to analyze the various bases for such adjustments. It will be seen that whereas Southern lines' witnesses assailed the switching factors employed in Rail Form A unadjusted and purported to develop adjusted factors more appropriate to the involved traffic, valid evidentiary support for such adjustments is so clearly lacking that departure from Rail Form A cannot properly be justified.

In Appendix L to V.S. 39, Witness Cole compares the engine minutes per car for the years 1948 and 1956 for Eastern District, Pocahontas Region, Official Territory and Southern Region for both boxcars and other cars. That statement shows, for the latter year, 1956, 25.9 minutes in Official Territory and 17.3 minutes in Southern Region for boxcars; and 28.8 minutes and 19.2 minutes, respectively, for other cars. This is apparently the starting point from which Witnesses Seigler and Remington commenced their various studies and adjustments.

So far as Southern Region is concerned, as more fully described by Witness Remington at pages 5 and 6 of his V.S. 40-A, Southern lines, through Witness Seigler, developed an average switching time per car at origin or destination in the South which was substituted for all classes of equipment in lieu of the Form A factors. Thus, instead of the Form A system average switching minutes per car, which Witness Seigler shows as 17.8 minutes for boxcars and 19.8 minutes for other equipment, after having embraced the Remington car count and switching-terminal company adjustments which also affected switching time, there is substituted in both cases the same factor of 26.03

minutes per car developed in Appendix A to V.S. No. 42 of that witness. It might be noted at this point that the average minutes for the 26 box cars shown in Appendix A was slightly greater, 26.55 minutes, than for the 15 other cars, 25.13 minutes, contrary to general experience in both territories which customarily attributes greater minutes to other than boxcar equipment.

For Official Territory, however, no comparable studies were attempted. Rather Witness Remington undertook to adjust the switch-

[153]

ing minutes per car for Official Territory carriers without even the benefit of a study as imperfect as that of Witness Seigler, in several steps, some of which are the consequence of the car count and switching and terminal company adjustments previously discussed. By these various computations, to be more fully described below, Southern lines substituted for the system average switching minutes relied upon in Rail Form A the two factors of 27.65 minutes for boxcars and 30.72 minutes for other cars in Official Territory.

Thus, the net result of the dissimilar adjustments in the switching minutes for the two territories was to neutralize the cost consequences of the very significant differences in the average switching minutes for boxcars and other cars between those territories and to impute to Southern lines a substantially higher than average switching factor not significantly different from that attributed to switching service on Northern lines.

(1) The Seigler Switching Studies.

As previously stated, so far as Southern lines' costs are concerned, the switching adjustment reflected in the cost studies of Witness Remington rests entirely upon the switching studies conducted under the supervision of Witness Seigler and described in his V.S. No. 42. These studies

were limited to a total of 41 cars selected from Southern lines' 1958-1959 traffic study. From such studies a switching minute factor was developed for each study car, as shown in Appendix A to V.S. 42, and the average of these 41 separate factors, 26.03 minutes, was employed to adjust Southern lines' switching costs on all cars in the traffic study whether boxcars or other classes.

Eastern lines do not propose to elaborate upon the deficiencies in the studies at the various study points, most of which had a tendency to overstate the minute factors claimed for that point. Exhibit No. 4 to V.S. No. 72 of Witness Clark contains six examples of errors which alone produced an over-statement of 63.87 minutes out of the 1067.20 minutes claimed for the 41 cars. Eastern lines do most vigorously urge, however, that even assuming absolute accuracy for the switching studies and hence the validity of the average factor of 26.03 minutes for the 41 cars studied, there is no justification whatsoever for attributing this factor, in preference to that developed upon a compre-

[154]

hensive study for use in Rail Form A, to the projected total of 967,554 cars of Official-Southern traffic claimed for Southern lines' traffic and cost studies. Common sense alone, from the mere statement of the proposition, should suffice to demonstrate the absurdity of any claim that an infinitesimal sample of this size, however selected, can be deemed representative of this large body of traffic. Nevertheless, Southern lines' efforts to impart an aura of authenticity to the switching minute adjustment for Southern Region dictates further consideration of the procedures relied upon in substantiation of the Seigler switching factor.

Preliminary to a description of the switching studies made with respect to the 41 car sample of the involved traffic, Witness Seigler undertook to demonstrate the inappropriateness of the Form A average switching minutes for application on such traffic. In essence, he attempted to show,

first, that so-called "volume" commodities handled by Southern lines require less-than-average switching service; and secondly, that these same commodities move to a very large degree within the South and are not here involved. It should be noted that Mr. Seigler did not undertake any similar inquiry with respect to the traffic of Eastern lines.

Assuming, as Mr. Seigler states, that volume commodities tend to move in multiple car shipments, and hence, exert a depressive effect upon system average switching minutes, the same result may be claimed for Eastern lines. Exhibit No. 12 to V.S. No. 71 of Witness Gill, which shows information for Eastern lines corresponding to that for Southern lines appearing at page 5 of Witness Seigler's V.S. 42, indicates that volume commodities particularly iron ore and coal represent in excess of 37 percent of the total traffic of Official Territory lines, again as compared to the small proportion of such commodities involved in this proceeding. Thus, if the movement of such commodities exerts the effect upon system average minutes for Southern Region which Southern lines contend, the presence of volume traffic in the North produces at the very least a corresponding influence upon Eastern lines.

While Witness Seigler urges, as axiomatic, the proposition that multiple origins and terminations reduce average switching time per car, the "illustrative studies" of pulpwood, wet phosphate rock and

[155]

sand and gravel movements shown at page 4 of V.S. 42 in an effort to demonstrate the degree of difference between system average switching minutes and those fairly attributable to volume commodities can hardly be accepted as representative. Mr. Seigler there shows the minutes per car developed for various volume commodities at thirteen Southern study points. These points were admittedly not selected by any sampling procedure but, rather, study areas having a heavy movement of volume commodities were intentionally chosen in order to illustrate the depressive effect

of such commodities on the system average switching minutes (R-1853-1854). Obviously, it is highly improper to condemn the appropriateness of system average minutes in pricing Official-Southern traffic by a process of elimination based upon illustrations of the handling of volume commodities at a mere thirteen points admittedly hand-picked with the express view to corroborating the hypothesis which is sought to be tested. The fact that judgment had to be exercised to find points with heavy movements of volume commodities itself indicates that there are many other points served by Southern lines at which these same commodities do not move in multiple car lots with any degree of regularity. And for the purpose of operating economies it must be remembered that Southern lines operating witnesses consider a multiple car shipment to be a minimum of 5-10 cars. (R-1125, R-1202).

Moreover, if it were Mr. Seigler's intention to contrast the handling given the volume commodities typified in the table at page 4 with that required on the involved traffic, of which the 41 cars in Appendix A are allegedly representative, he fails of this purpose as well. Recognizing that switching minutes are the result of a number of variables and that they will vary with location perhaps to an even greater degree than with commodities, it is significant to compare the switching times shown for the only two points which are common to both the volume commodity study at page 4 and the Appendix A study of the involved traffic. For Panama City, Florida, the table at page 4 shows an average of 11.55 minutes for terminating pulpwood, a "volume" commodity. Item 32, in Appendix A, shows only 11.72 minutes for the outbound pulpboard traffic into which this pulpwood was apparently manufactured. The difference between 11.55 minutes for the volume commodity

[156]

and 11.72 minutes for the involved traffic is acknowledged by Mr. Seigler to be insufficient to justify the conclusions urged by the witness. (R. 1859)

The same conclusion can be drawn from a comparison of switching at the only other point common to the two studies, Georgetown, S. C. There the volume commodity was likewise pulpwood inbound as to which Mr. Seigler shows, at page 4, 13.03 minutes as contrasted in items 3, 25 and 34 of Appendix A, with 17.46, 17.46 and 30.25 minutes, respectively. In the latter instance the first two cars represent pulpboard shipments presumably manufactured from the inbound pulpwood; whereas the car in Line 34 is shown by the underlying data to be a movement of lumber.

While, of course, no sweeping generalizations can properly be drawn from the comparisons at these two common points or, indeed, from any of the very meager studies presented by Mr. Seigler, it seems quite clear that these comparisons do not, in any way, justify the conclusions drawn by Mr. Seigler in his testimony. And, since it is by elimination of the so-called volume commodities assumed to be lower-than-average that Mr. Seigler concludes, as he does at page 5, "that the application of system average Southern Region costs materially understates the costs actually incurred in handling the Official-Southern traffic", this conclusion is necessarily erroneous.

Witness Seigler himself earlier advocated conclusions with respect to pulpwood, the principal volume commodity of Southern lines, which are inconsistent with his testimony in this proceeding. In Docket No. 30958, *Reduced Rates on Pulpwood in Southern Territory*, 291 I.C.C. 155, decided December 3, 1953, in which Witness Seigler testified for protestants Atlantic Coast Line and Louisville & Nashville, the Commission noted, referring to cost adjustments urged by the paper conference, that "The protestants question the accuracy of the data on which the reduced switching time used in the conference study was based, but do not support their criticism with any determinations of their own" (p. 164).

In response to questions upon cross examination with respect to his testimony in this proceeding, Witness Seigler

stated that the "characteristics of the physical operation have undergone an extreme change" in the intervening period because of the program of opening additional wood concentration yards in the South (R-1900). The Commission,

[157]

however, had already taken cognizance of this program, finding that "There were at least 40 such yards in operation at the time of the hearing" and concluding that "the revolutionary results claimed for these yards have not been reflected in statistics" (R-161).

In its report on further hearing in the *Pulpwood case*, 297, ICC. 735, decided February 7, 1956, again referring to the claim of lower unit switching costs resulting from the continued addition of wood concentration yards, the Commission stated, alluding to the testimony of Mr. Seigler:

> "The protestants insist that there has actually been no savings in these costs because on the typical branch line overtime payments to the local train crews, which perform this service, have not and cannot be eliminated on account of the continued use of way stations on the branch lines for pulpwood loading". (p. 741)

Thereafter, in discussing cost of service, the Commission further stated: (pp. 745-746)

> "The principal difference between the protestants and the paper conference relates to estimates of origin and destination switching costs. . . .
>
> "The protestants made time studies of origin, intermediate, and destination switching which embraced 35 trains of the Atlantic Coast Line in a 3-day period in May 1954, 21 trains of the same carrier for 3 days in July 1954, and 79 trains of the Louisville & Nashville for 3 days in the latter month. A total of 582 loaded and 591 empty cars were included, and those originated at way stations as well as at woodyards on representa-

tive segments of the lines of the carriers mentioned. The average time shown for origin switching of these cars was 14.62 minutes per car. It appears proper to adjust this figure to 13.04 minutes to remove an excessive allowance for non-productive time. The protestants' destination switching studies included 4 large mills served by the Atlantic Coast Line and 7 by the Louisville & Nashville. The average time shown in these studies was 17.81 minutes.

[158]

"In our opinion, the results of the protestants' study are more reliable as a basis for estimating switching costs for pulpwood than those of the paper conference since the latter was clearly handicapped by the inability to obtain anything more than fragmentary operating data from the respondents. This comment applies particularly to the study of destination switching time. The observers for the conference were not in a position to record all of the operations which should be included in such a study. In addition, the study of origin switching considers traffic originating at way stations only to a very limited extent."

Turning now with greater particularity to the studies here urged as affording a justification for Southern lines' adjustment of switching minutes for application to the involved traffic, Witness Seigler considered it to be his assignment to "develop the minutes per car applicable to the Official-Southern traffic involved in this case for use in providing the basis for adjusting Rail Form A." (V.S. 42, p. 5) What Mr. Seigler in fact developed, however, again assuming the accuracy of his individual studies, was the minutes per car applicable to but 41 cars of involved Official-Southern traffic. These cars were produced with the assistance of Witness Remington by a sampling process described on cross-examination by Dr. Deming. Although Witness Seigler, at page 6 of his statement, refers to the study cars as "aver-

age" and to the sample as "representative", it is significant that Dr. Deming expressly declined to so characterize the sample which he selected. (R-1580). Certainly the Commission will be at least equally reluctant to accept as representative of Official-Southern traffic a sample containing not a single car to or from Boston, Philadelphia, Detroit, St. Louis, or Buffalo among other large northern cities; one which has cars from Trenton, Mich. and Columbus, Ind., but not such cities as Trenton, N. J. or Columbus, Ohio, and one which shows two movements of rags but none of citrus or vegetables.

The record shows that the 41 cars included in Appendix A resulted from a series of diminishing samples and subsamples. From Southern Lines' traffic study, itself a sample, a "preliminary sample" was selected consisting of 497 cars. As shown in Exhibit R-14, presented during the cross-examination of Dr. Deming, these cars were

[159]

divided 59.4 percent northbound and 40.6 percent southbound, and, most significantly, 59.8 percent were noted as having received yard engine switching and the remaining 40.2 percent, train engine switching. The identification and segregation of the cars in the "preliminary sample" in the terms of the type of switching service provided was deemed desirable by Dr. Deming after he was advised that there might be a difference between yard and train engine switching minutes (R. 1553). Appendix A, when divided as between cars receiving yard engine switching and cars receiving train engine switching, as shown in Exhibit R-19, tends to confirm this substantial difference and shows that the average yard engine minutes developed by the Seigler studies were almost double those developed for the cars which received train engine service (30.75 minutes versus 17.84 minutes).

In recognition of the probable difference in switching minutes occasioned by the type of switching, further sampling

from the "preliminary sample" was designed in a manner which would retain the initial 60-40 proportions of yard and train engine switching (R. 1558 and 1566). There was no effort, however, to retain the proportions in terms or origin or destination service (R. 1559) or any other characteristic. Exhibit R-15 shows that in the next step in the sample design the "preliminary sample" was further reduced to 83 cars, which it was first intended to study before a lesser number of studies was decided upon and a still further reduction made in the sample. (R. 1563).

When the sample of 41 cars actually studied by Witness Seigler was produced, however, Exhibit R-16 shows that while there was no significant difference from the 497 car "preliminary sample" in terms of direction, 63.4 percent of the cars selected had received yard engine switching and only 36.6 percent had incurred admittedly less burdensome train engine service. While Dr. Deming declined to characterize the variations in proportions of yard and train switching between the preliminary 497 car sample and the ultimate 41 car sample as substantial (R-1667), the ensuing comparisons demonstrate the different results that might have obtained had Southern lines in fact retained in their final sample the same 60-40 proportions of yard engine and train engine switching found in the preliminary sample.

[160]

In order to produce average switching minutes for a sample retaining those proportions of the two classes of switching, four yard engine cars must be eliminated from the cars in Appendix A leaving a total of 22 yard engine switched cars (60%) and 15 train engine cars (40%).

If the 60-40 relationship is restored by excluding the yard engine cars showing the greatest number of minutes, readily identifiable from Exhibit R-19, Items Nos. 16(62.72 minutes), 21(51.49 minutes), 26(55.5 minutes) and 33(72.54 minutes), the average switching minutes used in Southern lines' cost study for that territory would be reduced very signifi-

cantly from 26.03 to 22.30 minutes, a decrease of 14.3%. Certainly a possible variation of this magnitude in the most important single item of those selected by Witness Cole as accounting for the boxcar territorial cost differences should not be made to rely upon the propriety of including a mere four additional study cars out of a total estimated at approximately one million cars annually. Viewed in these terms the risk of substantial distortion in relative cost comparisons cannot be sanctioned.

Applying a similar test by assuming the other extreme, exclusion of the four yard engine cars with the lowest minutes, Item Nos. 1, 9, 32 and 38, with a total of 50.58 minutes, the average would be increased to 27.48 minutes, a difference of only 5.6% contrasted to 14.3% variation upon excluding the higher items. Thus it is clear from these two comparisons that Southern lines' failure to retain in the 41 car sample actually studied the 60-40 relationship found in the 497 car "preliminary sample" between those receiving yard engine switching service and those receiving train engine switching service, is much more likely to have resulted in an overstatement of the adjusted switching factor used for Southern Region than the contrary.

Moreover, the range between 22.30 minutes achieved by eliminating the four larger items, and 27.48 minutes, resulting when the four smallest individual factors are those deleted to restore a 60-40 relationship, is so large as to demonstrate conclusively the unreliability of the 26.03 minute factor employed. Certainly, if a difference of over 5 minutes per car can result dependent upon which *four* out of approximately *one million* cars is selected for study, the sample studied is so small as to offend the intelligence.

[161]

And lest it be thought that the foregoing demonstrated variations in switching minutes are of little real consequence, the Commission's attention is directed to Verified Statement No. 77 wherein Witness Coates pointed out that

the switching cost claimed for Southern lines in Witness Remington's study is $12,407,912, representing 6.39% of the total cost South. (p. 1). With each minute therefore representing in excess of $475,000, the range of over 5 minutes suggested by these comparisons would effect a reduction of almost 2½ million dollars out of the total of less than 12½ million in switching costs claimed for Southern lines.

Inasmuch as standard error has been urged by Southern lines as establishing the reliability of the switching study sample among others, it is perhaps appropriate at this point to comment briefly upon the showing in Witness Seigler's Appendix B of switching minutes per car by subsample. It was acknowledged that the subsamples shown there represent the original traffic study subsample in which the study car was found (R. 1574). The 41 study cars themselves were not selected by subsample. Nevertheless, in an effort to demonstrate the validity and reliability of the study, Witness Seigler divided the 41 study cars into 10 subsamples and computed the system average and "actual" switching minutes for each subsample, the difference between those figures, and the standard error. Such a process of arbitrarily assigning cars to subsamples after selection of the sample in one operation is of course a gross distortion of the use of subsamples in sample selection.

The purpose of this maneuver obviously was to produce a standard error from the subsamples which might be claimed to substantiate the reliability of this minuscule sample. Even if it had been done properly in this instance, however, the significance of a standard error must not be misinterpreted. Dr. Deming acknowledged that the standard error is a computation based only upon the data *included* in the sample, hence, the standard error could be desirably low, while at the same time data was erroneously *excluded* from the sample (R. 1595). He also conceded that there could still be a standard error of 2.2 as shown in Appendix B, and probably even less, if through error the sample were completely distorted, as for example by including only cars receiving yard engine service (R. 1597).

[162]

It seems clear, therefore, that a computation which indicates merely that 10 groups of cars having from 2 to 7 cars in each group produce results which are not drastically different *from each other* hardly establishes that those few cars are representative of an estimated annual movement of 967,554 cars, particularly when it is noted that these few cars are themselves shown to vary all the way from a low of 3.39 "actual" switching minutes to a high of 72.54 minutes.

Moreover, the average difference shown for the entire 41 car sample between system average and study minutes in Column 4 of Appendix B is only 7.5 minutes. Dr. Deming did not claim any greater accuracy or reliability for the switching factor of 26.03 minutes derived from the 41 car sample than a range of about 7 minutes (R. 1582). Accordingly, the average switching factor derived from the 41 car sample could just as well be 26.03 minutes minus 7 minutes or roughly 19 minutes since no greater reliability than this was expected by Dr. Deming based upon the sample selected. Witness Seigler shows the Form A factors as 17.8 minutes for boxcars and 19.8 minutes for other cars, or again just about 19 minutes on an average. Thus, even if the Seigler studies were to be taken at face value, there is no justification for the conclusion that the involved traffic, assuming it could be found to be fairly typified by the 41 car sample, an assumption which offends common sense, is significantly different from average traffic in the South in respect of switching service rendered, since the claimed excess over average minutes and the conceded range of reliability of the study are almost exactly the same.

Quite apart from the minimal size of the sample selected for study and the significant variation between that sample and the "preliminary sample" in terms of the type of switching received, there is a further assumption implicit in the method adopted by Witness Seigler which renders unreliable the results obtained. This evidentiary defect arises from the fact that whereas the 41 cars claimed to be

representative of the entire 12 months Official-Southern movement were selected from the traffic sample and, hence, moved during the latter half of 1958 or the first half of 1959, the switching studies were conducted for various one-week periods in 1960. This method necessarily requires the assumption that the service in 1960 at the study

[163]

points which is imputed to the sample cars was substantially similar to the switching actually rendered on those cars in the earlier years. Mr. Seigler's explanation, upon cross-examination, of the procedures followed by his switching committees compels the conclusion that the assumed similarity cannot be substantiated.

The 40 studies conducted in 1960* embraced all cars handled by the selected carrier at the study stations whether Official-Southern or other movements (R. 1834). The resulting minutes were developed for each category of service at all industries in the terminal area and were not, therefore, particularly appropriate to the operation rendered on the study car in the sample (R. 1886, 1887). Obviously, inasmuch as all cars were included in the divisor in each instance, the minutes attributed to each class of service are these for average traffic at that station and do not in way reflect the characteristics of Official-Southern traffic. Hence, the results are clearly at odds with the stated purpose of the studies "to develop the minutes per car applicable to the Official-Southern traffic involved in this case for use in providing the basis for adjusting Rail Form A" (V.S. 42, p. 6).

Having thus obtained a minute factor for each category or service *that by change happened to occur during the one week study period in 1960,* these factors were then *assumed* to measure the services rendered on the particular 1958 or 1959 study cars. Such cars were traced only to the extent

* The study at Memphis, Tenn., on the Frisco imputed to the car in Line 1, Appendix A, was conducted October 7-14, 1957 (R. 1836).

of available yard records (R. 1833) and the corresponding minute factors from the 1960 study were applied on the assumption that the study car moved under conditions similar to those existing during the later study week (R. 1881). No investigation was made, however, to insure that the services rendered in 1960 corresponded to those in 1958 and 1959 when the study cars in fact moved (R. 1839). It was acknowledged that some yards were rebuilt in the interval between the movement of the study cars and the switching study (R. 1938), which would have an obvious effect upon the switching service. Moreover, if the study car had received a category of service that was not encountered in 1960 and for which, therefore, no minute factor was developed, admittedly Witness Seigler simply "took the next best thing." (R. 1945)

[164]

Not only was there no investigation to determine whether operations were conducted in 1960 in a manner similar to that at the time the sample car moved, but no comparison was made of the volume of traffic at the study points in the two periods. (R. 1840). In view of the emphasis by Southern lines' witnesses, including Mr. Seigler, upon the relationship between traffic volume and switching minutes, particularly where the volume is sufficient to permit multiple car handling, it is difficult to reconcile Witness Seigler's failure to insure, before imputing 1960 minutes to earlier movements, that the number of cars handled at the particular industries or by the particular crews involved in 1960 corresponded with that at the time the sample cars moved as part of the total traffic in the terminal area. For example, the underlying data disclosed that the car in line No. 36 of Appendix A was a shipment of freight automobiles from Prairie, Miss. on the G.M.&O. to Culbertson, Pa. This car was selected from an "A" abstract containing 82 similar movements. While, admittedly, the abstract includes shipments for a one-month period, the average daily shipment

would have to be at least 3 or 4 cars. Indeed, it is not unlikely that all 82 cars were handled in a single multiple car block or in several large blocks with corresponding economies since admittedly some study cars did so move (R. 1952). Yet significantly, Witness Seigler made no effort to determine this fact which would have required a reduction in the switching minutes claimed on a single car basis (R. 1880, 1954).

The foregoing example suffices to demonstrate that whereas the Commission has no means of comparing the particular transportation conditions during the 1960 study weeks with those existing at the time the study cars moved in 1958 and 1959, Mr. Seigler might well have made such an inquiry but failed to do so. Instead, Southern lines seek to have the Commission assume that the switching for a week in 1960 at a *few Southern stations* is representative of *all Official-Southern traffic* handled in 1958-59 at *all stations* without even demonstrating that 1960 switching minutes and 1958-59 switching minutes were the same for the few points studied, let alone the entire South.

Furthermore, Witness Seigler made the additional unwarranted assumption that the service at one industry served by a particular

[165]

crew is identical with that at other industries served by that crew inasmuch as he made no effort, for example, to develop a separate factor for each of three industries on a single track (R. 1955). Hence, it is noteworthy that whereas Appendix A includes a boxcar of rags (line 7) originating at South Pittsburg, Tenn., the witness was unable to state that the factors applied to that shipment were developed during a week in which a single car of rags moved from this particular plant (R. 1947). In view of the procedures just described, and even assuming the accuracy of the 1960 factors so far as 1960 traffic handled at the study points during the respective study weeks is concerned, there is

utterly no basis for the conclusion that these 40 studies in 1960 and one 1957 study are representative of the switching service provided by Southern lines on a projected total of 967,554 cars moving in 1958-59.

By way of comparison with Witness Seigler's studies, it is interesting to compute the switching minutes required for handling certain traffic selected by Southern lines' operating witnesses as being typical of the services rendered by their respective railroads. For example, at pages 11-13 of Verified Statement No. 30, Witness L. L. Waters describes the service of the Southern Railway at Chattanooga, Tenn. If, as stated, 24 regular yard engine assignments handled a daily average of 4350 cars within the yard, the average per car is 2.65 minutes. For cars destined to the Alton Park Industrial area, to which Witness Waters referred, the average of 2.65 minutes includes classification into track No. 26. The crew serving Alton Park goes on duty at 7:30 A.M. and is relieved at 3:30 P.M., for a total of 480 minutes. This crew is said to move about 35 cars in each direction on this 23-mile trip, or a total of 70 cars in 480 minutes, which represents an average of 6.86 minutes per car. When the latter factor for industrial switching service is added to the 2.65 minutes for yard work and classification, the total switching time is only 9.51 minutes for delivering a car at this allegedly typical industry as contrasted with 26.03 minutes used in Southern lines' cost study.

One further comment should be made with respect to the Seigler switching studies. It has previously been shown that no effort was made either in drawing the "preliminary sample" of 497 cars or in reducing that sample to the 41 study cars upon which the Remington

[166]

switching adjustment is based, to retain the proportions of traffic in terms of direction shown in Southern lines' traffic study. Tabulation A, Exhibit No. 1 to Verified Statement

No. 11 of Witness Wolford shows 445,820 (46.08%) cars Southbound and 521,734 (53.92%) cars Northbound of the total of 967,554 cars there estimated. Witness Butler's study showed 54.04% of the cars to be Northbound even without inclusion of the Northbound perishable movement separately accumulated. Thus, the ratio Northbound *v.* Southbound is undoubtedly at least 54 percent to 46 percent. Exhibit R-16 demonstrates, however, that of the 41 study cars, 61 percent were northbound and only 39 percent were southbound, indicating that there are more cars in the switching study upon which Southern lines performed origin as contrasted to destination service than is generally true of Official-Southern traffic. This variation, of course, has significance only if there is a difference, so far as Southern lines' service is concerned, between the switching required in originating a car and that provided in terminating a car at a given point.

As previously indicated Southern lines' operating witnesses have almost uniformly taken the position that it is more burdensome to originate a car than to terminate it in the South. The absence of any foundation for this opinion has already been the subject of comment. Nonetheless, if these witnesses were correct in that opinion, then the average switching minutes developed in Appendix A to Witness Seigler's statements are unduly inflated to the extent that the number of originated cars in the 41 car sample exceeds that in the traffic study from which such sample was selected.

And, of even greater significance, if credence were to be given to Witness Seigler's 41 car study as representative of Official-Southern traffic, that study is flatly contradicted by the contentions of Southern lines' operating witnesses with respect to the relative burdens of originating and terminating traffic in the South. This is established by Exhibit No. 3 to Witness Clark's V.S. No. 72 which is a breakdown of the Appendix A study cars in terms of origin or destination service. It will be noted that for the 25 northbound cars originated at the Southern study points, the switching min-

utes developed by Witness Seigler averaged 24.08 minutes per car, whereas for the 16 cars upon which Southern lines performed destination service, the average switching time is 29.07 minutes.

[167]

It seems obvious, therefore, that if Witness Seigler's study could be relied upon as typical, Southern lines' operating witnesses would be shown to be in error in their assumption that origin service in the South is more burdensome than destination service. As a matter of fact, however, neither contention by Southern lines can be supported. As previously demonstrated, there is no substantiation for the opinions expressed by the Southern operating witnesses respecting the relative burdens of origin versus destination terminal service; and it is eminently clear in the light of the preceding analysis of the Seigler switching studies that they cannot be relied upon as representative of Official-Southern traffic for any purpose whatsoever.

The conclusion is inescapable, therefore, that, inasmuch as Witness Remington's adjustment of switching costs for Southern Region relies expressly and exclusively upon the Seigler's switching studies summarized in Appendix A to V.S. 42, that adjustment has not been sustained. While it is recognized that Rail Form A provides for the adjustment of switching minutes in appropriate instances where the particular traffic is found to possess characteristics different from traffic generally, no such showing has been made in this instance. And, even it there had been evidence to this effect, the fact that the particular adjustment here is premised upon a distorted study of an insignificant sample of 41 cars with an admittedly wide range of error hardly commends its acceptance in preference to the Rail Form A average switching factors as a measure of the cost of the entire body of Official-Southern traffic.

(2) The Remington Official Territory Switching Adjustments.

Turning now to the adjustments in switching minutes for Official Territory described by Witness Remington and embodied in the cost studies presented by that witness, it should be emphasized again that a different method was employed in effecting the Official Territory adjustment than that based upon the Sigler studies used in the adjustment of Southern Region switching minutes. Unlike the single factor of 26.03 minutes for all types of equipment used as the basis for adjusting Southern lines' costs, Witness Remington substituted the two factors of 27.65 minutes for boxcars and 30.72 minutes for other cars in developing Official Territory costs (V.S. 40-A, p. 7).

[168]

As previously indicated, the foregoing substituted Official Territory switching factors are the end result of a series of cumulative adjustments made by Mr. Remington to the Form A average figures shown by Mr. Cole in his Exhibit L to V.S. 39 to be 25.9 minutes for boxcars and 28.8 minutes for other equipment. The first two adjustments are the consequences of the switching and terminal company adjustments and the car count adjustment, both of which effected a reduction in switching minutes North (V.S. 40-A, p. 3). The last step, which must stand on its own merits, was "made to eliminate the effect of volume commodities upon the switching minutes per car at origin or destination" (V.S. 40-A, p. 5) and produced a nominal increase for Official Territory. The total net result of all adjustments was to increase the switching minutes for Northern lines by 1.75 minutes on boxcars and 1.92 minutes on other cars. This is to be contrasted with corresponding increases, although on a different basis, in the switching minutes for Southern lines from 17.3 minutes and 19.2 minutes, respectively, to 26.03 minutes for both categories of equipment;

a net change of 8.73 minutes on boxcars and 6.83 minutes on other cars.

The distorting impact of these grossly unequal adjustments upon relative costs in the two territories is readily visualized when it is recognized that the adjustments for Southern lines produced switching minute factors increased over Rail Form A by more than 50 percent on boxcars and 35 percent on other cars while the corresponding increases for Northern lines are but 6.5 percent and 6.6 percent, respectively. Eastern lines submit that when the sum of the several adjustments affecting the switching minutes factors are analyzed in this manner, it becomes eminently clear that Southern lines' declared purpose of reflecting the characteristics of the particular traffic here involved through appropriate adjustments in switching minutes succeeded only in substantially distorting to their advantage the true relationship between the switching services rendered in the two territories.

The vast disparity in the proportionate increases made in the switching minute factors for each teritory would suggest, at least insofar as switching time is concerned, that the involved boxcar traffic handled by Southern lines differs from the average traffic of those carriers to a

[169]

degree almost eight times as great as that which might measure the variation from average on Northern lines. And for other than boxcar traffic the Southern lines' adjustment would assume a degree of difference from average traffic in the South over five times that of the corresponding variation in the North. When it is recalled that Southern Lines' witnesses emphasized the relatively greater proportion of total traffic represented by the Official-Southern traffic here involved for those lines, any claim that this substantial block of traffic varies so drastically from system average operating characteristics is rendered even more unbelievable.

The foregoing comparisons reflect the sum total effect of all adjustments in the switching minute factors, North and South, incorporated in Southern lines' cost studies, including those adjustments made for both territories which result from the car count and switching and terminal company adjustments made by Witness Remington. Assuming, without for a moment conceding, the validity of the car count and switching and terminal company adjustments affecting the switching minute factors hereunder consideration, it is equally appropriate to isolate those special adjustments in switching minutes for both Northern and Southern lines which were made subsequent to the foregoing two adjustments.

For Southern Region, the adjusted Form A average switching minutes reflecting the two prior adjustments just mentioned, as shown in Witness Seigler's Verified Statement No. 42 and Appendix A thereto, are 17.8 minutes for boxcars and 19.8 minutes for all other cars. The adjusted factor South for all classes of equipment incorporating in addition the Seigler studies, is 26.03 minutes, a net increase of 8.23 minutes or 46 percent for boxcars and 6.23 minutes or 31 percent for all other cars, attributable in this instance entirely to the Seigler 41 car studies.

The corresponding partially adjusted Rail Form A factor for Official Territory (embodying the car count and switching and terminal company adjustments), as shown in Exhibit F to V.S. 40-A, are 25.4 and 28.2 minutes, respectively (R. 1998). As stated, these factors were ultimately increased on the volume commodity theory to 27.65 minutes and 30.72 minutes which are the factors applied in Southern lines' cost studies. Thus, the increases made by Mr. Remington in the switching

[170]

minutes factors for Official Territory subsequent to the car count and terminal company adjustments common to both territories amount to 2.25 minutes for boxcars and 2.52

minutes for other cars, in each case an increase of slightly under 9 percent as contrasted to the increases of 46 percent and 31 percent, respectively, urged for Southern lines.

The foregoing very drastically disproportionate increases in the switching minutes employed in costing out the two territories must be examined in the light of the express justification and intent of the adjustments producing those variations which, as noted, was to bring about the elimination of the effect of volume commodities on switching costs in the respective territories. It must logically follow, however, that if volume commodities in fact have the effect on the switching minute factors suggested by the nature and extent of the adjustments made by Mr. Remington, it would appear that the total traffic of Southern lines from which the average Form A figures were developed contains approximately four or five times as much volume commodity traffic as does that of Northern lines inasmuch as the adjustment for Southern lines exceeds that for Northern lines by those proportions.

Moreover, it would have to be assumed that each and every car of the so-called volume commodities moving in the South actually moves in volume, that is as part of a multiple car shipment. Neither of these assumptions can be supported. As a matter of fact Eastern lines, with their trainloads of coal and ore, undoubtedly have a greater amount of multiple car shipments than do the lines of Southern Region, and it is the manner of operation that affects costs rather than a mere comparison of the cars of various commodities, such as pulpwood, which may have been handled, with no knowledge of the degree to which they actually move in volume, that is in multiple cars.

It seems quite apparent, therefore, that the asserted rationale of the switching minute adjustments, both North and South, just considered, that is the alleged necessity of eliminating the effect of volume commodity, does not at all explain the very substantial difference in the degree of the adjustments on that ground made in the cost studies of

Witness Remington. It is only fair to conclude that even if the purpose sought to be accomplished were both proper and necessary, the inconsistency in the procedures employed for the two teritories has

[171]

nullified the efforts of Southern lines to measure the relative effect of eliminating intraterritorial volume traffic. Moreover, even assuming that comparable methods had been followed in furtherance of the sought purpose of the switching adjustments, if it is possible to visualize a method which could completely and accurately measure the influence of a particular category of traffic out of a total traffic entity, the net effect of such an adjustment upon relative costs would have been virtually nil because of the similar and, hence, at the very least offsetting, consist of the general traffic of Northern and Southern lines in terms of the respective proportions of volume commodities handled by each.

Southern lines will doubtless dispute the feasibility of any suggestion that Seigler-type switching studies should also have been made at the Northern stations involved in order to achieve comparability. Any request to make such detailed and costly studies of a sample so insignificant that the results of the studies, even if undertaken, would be meaningless, doubtless would have been denied. In the alternative, however, they could very readily have made the Remington alleged volume commodity elimination adjustment employed for Official Teritory equally as well for Southern Region. The procedure employed in this adjustment is very generally described at page 6 of V.S. 40-A as the Cost Finding Section "Burden Study" method, sometimes referred to as the Pocahontas Adjustment.

One further comment seems appropriate with respect to Mr. Remington's treatment of the switching minute factor for Official Teritory lines. At page 7 of V.S. 40-A and in Exhibit H to that statement, he undertook to corroborate

the switching minute adjustments, both North and South, which it must be emphasized, eliminate the greater part of the difference between those two territories reflected by the Rail Form A switching factors, by means of an analysis in terms of a certain selected origin and destination cities. This correlation, as Mr. Remington points out, was developed by the Cost Finding Section. It establishes as a general principle, with which Eastern lines do not for a moment disagree, that on the average, switching minutes increase directly with the size of the city and, hence, the size and volume of the terminal in which they are performed. Those carriers do, however, dispute the unsubstantiated proposition advanced by Mr. Remington

[172]

that "the size of the cities at which Official-Southern traffic originates and terminates in the North and South does not provide any basis for using the higher factor of minutes per car in the North than in the South." (V.S. 40-A, Ex. H, p. 4).

As both the text of Mr. Remington's statement and Exhibit H indicate, and as he additionally acknowledged on cross-examination (R. 2004), the basis for this very sweeping conclusion with respect to Official-Southern traffic is the same, almost invisible, 41-car sample studied by Mr. Seigler. For that reason alone, Mr. Remington's conclusion in this respect is no more reliable than the assumption previously discussed that the switching on the same 41 cars is representative of that required on the projected annual total of 967,554 cars of Official-Southern traffic.

Even aside from that fundamental flaw, however, Exhibit H contains several errors in the assignment of stations to population groups as a result of which the average minutes North are deflated and those in the South increased. (R. 2005-07). Eastern lines deem it unnecessary to further elaborate upon what already must be common knowledge that contrary to Mr. Remington's assumption, Official Terri-

tory has more large cities than are to be found in the South and, further, that Official-Southern traffic is equally chargeable with the heavier switching burdens incurred by Eastern lines in those cities.

Summarizing, Eastern lines submit, on the basis of the foregoing analysis of the adjustments in switching minutes North and South reflected in Southern lines' cost studies, as well as of the Seigler switching studies upon which the adjustment South is premised, that Southern lines have utterly failed to demonstrate the propriety of substituting the uncorroborated adjustment factors employed in lieu of the system average switching minutes used in Rail Form A unadjusted.

h. *Train tonnage adjustment.*

On the ground that the Commission's Cost Section in its burden studies makes a similar adjustment in the costs of Official territory lines (which recognizes the depressing effect of heavy coal traffic upon the costs of other traffic), Southern lines' adjustments of group Form A costs included an adjustment of train weights for the Official terri-

[173]

tory lines "to eliminate the influence of volume traffic" on the Pocahontas lines (V.S. No. 40-A, p. 8, and Ex. G, p. 9; V.S. No. 80, Sec. E). The nature of this adjustment is explained by Witness Heywood in Verified Statement No 80, Section E. His testimony in this respect, substituting the corrected figures of Witness Remington, is as follows:

> "The use of the revised train loads increases the costs in the North as compared with use of the unadjusted train loads. If, as northern lines contend, the comparison as between the groups is here properly to be made on the basis of using Eastern District costs as against those of the Southern Region, the adjustment is inapplicable. If, however, Pocahontas Region Form A costs are to be included in the Eastern cost base, the adjustment runs in favor of northern lines.

"A comparison of Mr. Remington's Exhibit G, page 7, with his Exhibit D, page 1, indicates that this adjustment increases the cost North from $154,062,358 to $154,929,677 or $867,319, with no change in the cost South thereby increasing the North proportion of the total cost from (44.71% to 44.85%) or 0.14%."

The Cost Section's adjustment to which Witness Remington refers in his Verified Statement No. 40-A and Southern lines' own adjustment in this respect strongly confirm the soundness of Eastern lines' contention that, use of Eastern District costs (without inclusion of Pocahontas Region costs) in comparison with those of the Southern Region for comparing the relative contribution of the two groups of carriers in the handling of the traffic involved is not unfair to Southern lines.

i. *Exclusion of Suburban Service Deficits.*

The eagerness of Southern lines to seek out ways to adjust Eastern lines' costs downward is well illustrated by their exclusion of suburban service deficits (V.S. 40, pp. 21, 22; V.S. 40-A, p. 10). Although both Northern and Southern lines have large passenger deficits, in ascertaining the relative transportation costs of Northern and Southern lines

[174]

under the rates here involved, Southern lines urge the exclusion of only a part of the deficit, the part, of course, that is more weighty in the North than in the South, that incurred in suburban service. By this adjustment, the Southern lines hope to reduce Eastern lines' relative share of the cost on this traffic by over $2½ million annually (Compare Tables 10 and 12 from V.S. 40).

The theory in justification of this adjustment is set forth in Mr. De Butt's Verified Statement No. 14. He says, at pages 12 and 13 of his statement:

"It is essential to an understanding of the passenger problem that it be realized that the deficits associated

with intercity passenger service must be sharply distinguished from the deficits also incurred by some roads in providing suburban service within certain metropolitan areas in the North. They are separate types of operations, both physically and in the problems which they present.

"Intercity passenger service is, in large part, performed over the same tracks, bridges and other facilities as are used in freight service. As a result, an important portion of passenger costs represents the allocation of costs common to freight and passenger service.

"However, elimination of all intercity passenger trains experiencing out-of-pocket losses will not eliminate the reported passenger deficit. The passenger deficit will still reflect the large portion of carrier costs which would continue in any event if all passenger service ended. Under such circumstances, the intercity passenger deficit is treated as a burden to be recovered from the freight service. This becomes largely a matter of terminology, since the freight service is paying for the use of the common facilities that must be maintained for freight service in any event."

It is, of course, admitted that Southern lines have a large passenger deficit. Mr. De Butts admitted also that the railroads in the South have "local and branch line passenger trains which represent a serious drain against the railroad's other revenues" (R. 945). It would seem obvious that, from the standpoint of its relation to North-South traffic and the cost performing it, there is no difference between that part of the

[175]

passenger deficit which results from suburban operations and that part of the passenger deficit which result from the operation of through or local passenger trains. If the Southern lines should not properly be charged with any part

of the deficit incurred in handling commuters from "A" to "B" in the East, it would seem logically to follow that the Northern lines should not be required to bear any part of the Southern lines' deficit from transporting passengers from "X" to "Y" in the South.

But Mr. De Butts's attempted distinction is that the suburban service is largely a separate service, using facilities not common to freight service, while other passenger service generally uses facilities that are also used in freight service. He suggests further that if the latter type of passenger service is discontinued the passenger deficit "will still reflect a large portion of carrier cost which would continue in any event if all passenger service ended", and that "Under such circumstances, the intercity passenger deficit is treated as a burden to be recovered from the freight service. This becomes largely a matter of terminology . . ." (V.S. 14, p. 13).

Southern lines made no effort to prove that the passenger deficit, on other than suburban service, is simply a matter of "terminology" or that it is a fiction. The fact is that putting entirely aside the common expenses that are apportioned between freight and pasenger service, and considering only expenses that are solely related to passenger service, it is found that there is a substantial deficit in the Southern Region. On the other hand in the Eastern District, both including and excluding Pocahontas, the passenger revenues exceed the solely related expenses. These comparisons are shown in Exhibit R-13. Taking 1959, the latest year shown, the results are as follows:

Passenger Revenue	Solely Related Passenger Expenses	Difference
Eastern District Excluding Pocahontas Region		
$571,828,636.	$512,913,020.	$58,915,616.
Eastern District-Including Pocahontas Region		
$602,199,956.	$545,661,252.	$56,538,704.
Southern Region		
$155,314,803.	$159,706,283.	$ 4,391,480. (def.)

[176]

Thus, Mr. De Butts's claim that the passenger deficit—the kind they have in the South—is merely a matter of terminology and would not disappear if the service were discontinued is without foundation.

Northern lines are entitled to a substantial increase in divisions irrespective of whether the costs on the North-South traffic are computed including or excluding passenger deficits. Mr. Heywood's Exhibit B to V.S. 3 showed the unit costs both ways. His own application of Form A costs for the Eastern District lines excluded passenger and l.c.l. deficits and stated return on investment at 6%. At the average haul, and using the year 1956, this showed Eastern lines as incurring 50.5% of the total costs. Using the I.C.C. basis, which includes passenger and l.c.l. deficits and states the return at 4%, Eastern lines incurred 50.7% of the total costs (V.S. 3, Ex. B, p. 15).

Thus, from the standpoint of relative costs, a major criterion, Eastern lines have demonstrated their entitlement to increased divisions whatever the weight to be given the passenger deficits by the Commission. This deficit must be viewed as an entirety however. It would obviously be unfair to pick and choose a part of the passenger deficit to be excluded, selecting in such a manner as to distort the cost relationship to the advantage of Southern lines. Either the passenger deficit should be excluded from the cost figures in its entirety or it should be included in its entirety. On either basis the higher costs in the North are manifest.

j. *There is No Justification for Addition of Pulpwood and Phosphate Rock Constant Costs to Southern Lines' Costs of Handling Involved Traffic.*

It has already been noted that the series of adjustments to the Cost Finding Section's application of Rail Form A for Official Territory and Southern Region, which constitute the cost study of Southern lines, are sought to be justified on the ground that they are necessary to reflect the particular

cost characteristics of North-South traffic (V.S. 40, p. 18). However, included among such adjustments embodied in the testimony of Witness Remington is a very substantial increase in Southern lines' purported costs of handling the involved traffic which represents an asserted deficiency of revenue developed *not for the involved*

[177]

North-South traffic but for other traffic not here in issue. The adjustment in question, which is more fully described at pages 11-14 of Witness Remington's Verified Statement No. 40-A and reflected in Tables 20 and 21 at those pages, is expressly made in reliance upon the testimony of Witness Burroughs in Verified Statement No. 41. It will be the purpose of this section to demonstrate that the addition of so-called constant cost deficits, attributed to intra-South transportation of pulpwood and wet phosphate rock, to the relative service costs of Southern lines claimed on the involved traffic is completely unwarranted.

First, the reason for this adjustment is stated by Southern lines to arise from Northern lines having shown relative costs on a fully distributed basis. Thus, Mr. Burroughs stated on pp. 1 and 2 of V.S. 41, after alluding to the alleged favorable transportation characteristics of wet phosphate rock and pulpwood:

> "There is, however, a further and even more extreme effect of the handling of certain of the volume commodities on the fully distributed costs as applied by the Northern lines. The fully distributed costs allocate the constant costs on a ton and ton-mile basis which assumes that every system ton and ton-mile has an equal ability to contribute to constant costs. This assumption produces extreme distortions in the cost relationships when applied to important segments of Southern-Official traffic."

Again, on page 2, of the same statement, Mr. Burroughs stated:

> "Paper and paper products, the most important category of Southern-Official traffic, provide a prime example of the distortion in cost relationships caused by the Northern lines' application of fully distributed costs. The basic error is that no consideration is given to the volume movement of pulpwood which is an integral part of the transportation service in producing the outbound haul of paper and paper products."

Again, on page 6, the witness stated:

> "The problem this statement primarily addresses, however, is the treatment of fully distributed costs * * *."

[178]

Again, on page 8, he said:

> "The critical fact here is that the ton and ton-mile allocation of constant costs assigns to pulpwood a cost that the Southern lines must recover from their share of the revenue on the essentially transit movement of paper."

A complete answer to this adjustment is that Eastern lines can make just as good a showing—in fact a somewhat better showing—on the basis of out-of-pocket costs, as to which Southern lines' argument admittedly has no application whatever. This may be demonstrated by the following table:

EASTERN PERCENTAGES OF TOTAL COSTS ON GENERAL TRAFFIC AT AVERAGE HAULS

	I.C.C. Basis	
Year	Fully Distributed	Out-of-Pocket
1956	50.7	51.7
1957	50.9	52.0

(Source: V.S. 3, Ex. B, p. 14)

Our first point in reply to this adjustment, therefore, is that even if fully distributed costs should be completely disregarded, Eastern lines' case from a cost standpoint would not suffer in the least but would be, if anything, improved. Yet, the whole basis of the suggested adjustment depends upon Eastern lines' use of fully distributed costs which assign the constant expenses on a ton and ton-mile basis.

Second, Eastern lines' second answer to this adjustment is that they have no participation in the rates on wet phosphate rock and pulpwood, no control whatever over them, no voice as to their level. The suggestion that notwithstanding that fact Eastern lines should bear a part of the constant cost of transporting these commodities wholly within the South is plainly without merit. And that it is palpably unjust is demonstrated additionally by the fact that at least one object—if not the sole one—of the Southern lines in making these rates as low as they are was to induce paper companies to move from other locations—obviously on Eastern lines—to locations on Southern

[179]

lines. Thus, Mr. Marks, of the Southern Railway testified in *Reduced Rates on Pulpwood in Southern Territory,* I.C.C. Docket No. 30958:

> "The pulpwood rates in the South, from the very inception of the production of paper in the South, have been made with the definite object in mind of developing the industry. We realized that with the vast reservoir of pulpwood in the South, there was a golden opportunity to encourage the industry to locate in the South." (V.S. 80, G-12, pp. 17, 18.)

And, on p. 18, of the same statement, Mr. Marks said:

> "That our theory of rate making is correct is evidenced by the enormous growth of the pulp and paper industry in the South, and we feel very keenly that it is an obligation of the railroads to make freight rates

that will foster the continued growth of the pulp and paper industry in the South.

"It is our position that the Interstate Commerce Commission should not fix freight rates that will hamper the railroads in their endeavor to assure the continued growth of this industry, but the railroads should be permitted to exercise their managerial discretion in making rates for the future that will assure the continued growth of this important industry in the South."

The situation, therefore, is that these rates on pulpwood, as to which Eastern lines have no control, were made on a low basis to attract plants from the North, and now the Southern lines want the Commission to require Eastern lines to help make up the deficit under constant costs which they incur. The injustice of sanctioning any such adjustment as that here proposed is manifest.

Third, Even if this proposed adjustment of Southern lines were otherwise valid—and it obviously is not—it could have no application to the traffic of the Southern lines without being applied also to traffic of the Eastern lines. Even if Southern lines had overcome all other objections to the adjustment, before they could succeed with it they would have to make a like adjustment with respect to the movement of raw materials—like iron ore and coal and fluxing stone, for example—which go into the manufacture of things —like iron and steel—

[180]

which move from the North to the South and as to which there could be no movement without the prior movement of the raw material. But Southern lines looked only to improving their own cost situation. Like adjustments on traffic within the North which fail to meet fully distributed costs, but which are essential in the making of things which move from the North to the South, were ignored.

Southern lines' excuse for confining the adjustment to the traffic upon which they made it is that there is a "tacit" transit privilege on such traffic. There is nothing to this point, as will be shown *infra;* even if there were, no such distinction could be allowed to govern. Otherwise, form would be substituted for substance.

While the foregoing is sufficient to dispose of this adjustment for which Southern lines contend, certain aspects will be elaborated in the following paragraphs.

In stating that the fully distributed costs allocate $20,844,431 to traffic that "under the whole premise of the rate structure, cannot make any such contribution to constant costs", Mr. Burroughs drew an unwarranted implication from the use of fully distributed costs which he thereafter proceeded to belabor.

But Eastern lines have never contended that the allocation of constant costs on ton and ton-mile bases constitutes a representation so far as revenues are concerned that each and every commodity in fact makes an identical contribution per service unit to such costs. In thus criticizing Eastern lines' cost evidence, Mr. Burroughs has confused costs with revenues, or the ability of particular commodities to cover full costs as thus computed. If it were his purpose to prove that these commodities cannot make the indicated contribution to constant costs because "under the whole premise of the rate structure," the object is to have extremely low rates so as, to use Mr. Marks' words, "to encourage the industry to locate in the South", that fact is not denied.

Eastern lines' do not agree with the subsequent implication drawn by Mr. Burroughs as typified by his statement that:

> "The critical fact here is that the ton and ton-mile allocation of constant costs assigns to pulpwood a cost that the Southern lines must recover from their share of the revenue on the essentially transit movement of paper." (V.S. 41, p. 8.)

[181]

If pulpwood and wet rock fail to provide their pro rata share of revenues necessary to offset overhead costs, the asserted deficit, if it were properly and necessarily incurred, would be a burden of traffic generally rather than of any particular segment of that traffic whatever its physical relationship to the so-called deficit commodities. Constant cost, created as a burden of all traffic, must be shared by all traffic jointly in proportion only to the revenue-producing abilities of each segment. In placing the entire alleged pulpwood deficit on paper, for example, Mr. Burroughs himself made an allocation of constant cost, in this case to the paper traffic, which he would give precedence over the ton and ton-mile basis he here assailed.

Eastern lines challenge the merits of the allocation urged by the witness which, in effect, represents a pyramiding and, hence, duplication so far as paper and dry phosphate here in issue are concerned, of raw materials deficits added to fully distributed costs for the former already computed on the customary basis. It is submitted that cost is an independent determination capable of computation quite apart from ability to pay or revenues received. The costs incurred in handling pulpwood and wet phosphate rock do not become the costs of handling paper or dry rock or some other commodity, of whatever nature or physical relationship, simply because revenues may be inadequate on the former. A necessity to resort to general funds developed from traffic in the aggregate for general overhead expenses cannot possibly justify the arbitrary assignment of pulpwood costs to the paper traffic, or wet phosphate rock costs to the subsequent movement of the dry commodity.

The foregoing analysis makes it readily apparent, as stated earlier, that Witness Buroughs' criticism of Eastern lines' use of fully distributed costs serves merely as a pretext for the transfer of costs from Southern intraterritorial traffic to that here in issue. The out-of-pocket cost comparisons set forth above in this discussion clearly show that

it is not the use of fully distributed costs which distorts the true relationship between the territories but rather the Burroughs' adjustment which has that effect. Substantial distortions do in fact occur when adjustments are made in an arbitrary manner on only one side of the ledger as in the Burroughs' adjustment which increases the costs shown for the South while undertaking no corresponding adjustment for Eastern lines.

[182]

Mr. Burroughs stated that a characteristic of the "related movement" concept is the necesity to haul the inbound commodity in order to participate in the outbound load. This latter situation was characterized by the witness as a "tacit transit arrangement." He further stated that there must be a direct relationship between the inbound raw material and the outbound finished product and that where there is a transportation operation intermediate between the pulpwood transported locally and the paper ultimately moving in North-South traffic, the former would not be "directly related" (R. 1770-71.)

Yet Witness Remington, in discussing this same adjustment, suggested that it might be equally appropriate to a three-step operation wherein the first movement was one of a raw material, the second of a semi-finished product and the third of a finished article. In the footnote, at pages 12 and 13 of Verified Statement No. 40-A, the latter witness stated that the costs of both the raw material, pulpwood, and the semi-finished product, wood pulp or pulpboard, should be charged against the subsequent haul of the finished paper product. Obviously, the difference in the two situations as to which Southern lines witnesses were not in agreement would not be one of principle but rather of degree.

Southern lines, anticipating this difficulty in rationalizing their theory, have thus chosen to emphasize what Witness Buroughs described as "an essentially transit relationship"

on pulpwood and wet phosphate rock. But a transit relationship is one that is readily identifiable from the tariff and either exists or doesn't exist. If an actual transit relationship exists, then the through rates from the initial origin of the raw material via the transit point to the ultimate desination of the finished product would here be in issue if that movement were between the territories involved. In that situation the through cost would likewise appropriately be considered in fixing divisions. But here no transit is in fact provided by the appropriate tariffs.

The only joint interterritorial rates here before the Commission are those applying on paper and paper products and on dry phosphate rock. The so-called "tacit transit arrangement" is at best an express recognition of the obvious physical fact that the production of finished and semi-finished products necessitates an inbound flow of basic ma-

[183]

terials. Pulpwood, for example, is no more essential to the production of paper than are the myriad raw materials which enter into the production of other commodities moving freely in commerce between the two territories here involved as well as elsewhere throughout the United States. As Mr. Marks stated in the *Pulpwood* case cited above: "Pulpwood is the very heart of the paper industry to the same extent that iron ore is the very heart of the steel industry." (V.S. 80, G-12, p. 18.)

Pulpwood—Paper

In pursuing their one-sided adjustment Southern lines assert:

(1) "The Southern roads do not haul pulpwood in order to obtain the revenues from the pulpwood rates." (V.S. 41, p. 2.)

(2) That is is necessary to haul the pulpwood in order to obtain the outbound routing of the paper

(V.S. 41, p. 2; R. 1769), and, moreover, that under a "practice strictly adhered to", "the outbound routing is assigned to the railroads on the ratio of one ton of outbound paper for each 5.5 tons of pulpwood necessary to produce the ton of paper." (V.S. 41, p. 2.)

These assertions with respect to pulpwood are somewhat surprising inasmuch as most carriers are not inclined to so lightly dismiss as burdensome traffic which, by their own computation, not only covers out-of-pocket costs but contributes almost $5 million annually towards the sum total of constant costs assigned to all traffic as a totality. (V.S. 41, p. 6.) Moreover, the carriers in Southern Region themselves compete vigorously, not only with truck and barge carriers, but with each other for this allegedly burdensome pulpwood traffic. While they may seek to explain this competition as aimed at the resultant paper traffic, such an argument presupposes actual rigid adherence to the claimed pulpwood-paper ratio. Witness Buroughs himself, however, demonstrated very conclusively that the transportation of pulpwood is not in fact a necessary condition precedent to the routing via Southern lines of the paper produced from that pulpwood. (V.S. 41, p. 3.)

The relationship here urged by Southern lines, that between pulpwood and paper, was not previously suggested by those carriers when

[184]

the reasonableness of rates on pulpwood was under consideration by the Commission, even where the compensatory nature of reduced rates on pulpwood was seriously questioned in an internecine battle. *(Reduced Rates on Pulpwood in Southern Territory, supra.)*

As previously noted that proceeding was an investigation into the lawfulness of reduced rates on pulpwood from and to points in Southern Territory, except in Kentucky, Louisiana and Mississippi, on the lines of the Southern Railway, SAL, Central of Ga., Frisco, C&O, N&W, Norfolk

Southern. The rates were protested by the ACL and the L&N. The Paper Conference intervened in support of respondents.

The Commission found that the purpose of the reductions was to recover pulpwood traffic lost to truck and barge carriers. (p. 158). The Paper Conference asserted that consideration should be given to the financial contribution made by pulpwood to the outbound paper. The Commission declined to recognize or comply with a requirement to determine the amount of money which traffic may fairly be required to contribute, stating:

> "The paper conference charges that 'this conclusion was reached without any consideration of the financial contribution *in dollars* actually being made by the pulpwood traffic and, of course, with no consideration of the financial contribution made by the outbound paper traffic derived from the pulpwood.' It is argued that there must be a comparison with the 'contributions *in dollars* made by other traffic.' The cited authority for these arguments is *North Carolina* v. *United States*, 325 U.S. 507, 516, 520. The particular observations of the Supreme Court relied on here were made by way of emphasis of our limited powers with respect to intrastate commerce. Earlier in the opinion, at page 510, the Court had remarked that 'as to interstate regulation, the Commission is granted the broadest powers to prescribe rates and other transportation details.' Consistently with that view, the Court has never undertaken to circumscribe our authority to prescribe minimum interstate rates by a rule such as that which the paper conference considers controlling; namely, that there must be a determination by us of the amount of money which the traffic in question may fairly be required to contribute. We have never recognized the existence of such a requirement, which practically would be very

[185]

difficult, if not impossible, to comply with." (297 I.C.C. 735, 747-748.)

At page 3 of this Verified Statement No. 41, Witness Burroughs showed that Southern roads hauled 23,068,500 tons of pulpwood and originated 8,506,900 tons of paper and products. Thus, notwithstanding the claimed strict adherence to the inbound-outbound ratio, those railroads were required to originate and terminate only 2.71 tons of pulpwood for each ton of paper and products outbound rather than 5.5 tons as alleged. In effect then, the "burden" of handling pulpwood, said to be a prerequisite to securing paper traffic, was only half as great as asserted.

If, as stated, 5.5 tons of pulpwood are required to produce one ton of paper, it can be determined that the pulpwood handled by Southern lines produced only 4,194,272 tons of the total of 8,506,900 tons of paper and products originated by those lines. The remaining 4,312,628 tons, or over half of the total, constituted "free tonnage" secured by Southern lines without the necessity of any "burdensome" pulpwood haul. Using the same ratio of 5.5 to 1, this "free tonnage" obviously required the movement of 23,719,450 tons of pulpwood by carriers, presumably by water and highway, other than Southern railroads. Thus, in supply the raw materials for this "free tonnage", truck and barge lines handled more pulpwood than all Southern railroads and did so without receiving a single pound of outbound paper and products. This comparison makes it apparent, first that pulpwood traffic is desirable, certainly, at least, to competing modes of transportation, for the revenues from that traffic alone and, secondly, and fortunately for Southern railroads, that there is clearly considerably less than strict adherence to the claimed practice of awarding the higher-rated paper traffic to the carrier hauling the inbound pulpwood.

Moreover, by this analysis, Mr. Burroughs' admitted speculation (p. 9) that the pulpwood rates might be increased and the paper rates reduced without injury to Southern lines but with serious impact upon Northern lines, is shown to be utterly removed from reality. Since there are water and motor carriers actively participating in the pulpwood traffic, for the sake of that traffic alone, rates on pulpwood are

[186]

subject to competition; and, moreover, increased rail rates would run counter to Southern lines' policy to attract the paper industry to the South and to encourage its growth there. And so far as rate reductions on paper and paper products are concerned, Southern lines would hardly reduce rates which are already sufficiently competitive to attract more uncommitted "free tonnage" for which truck lines are already competing than tonnage allegedly earned by handling pulpwood under the so-called tacit arrangement.

Wet Phosphate Rock—Dry Phosphate Rock

Inasmuch as it is the position of Southern lines that the principles asserted with respect to pulpwood and paper apply as well to the wet phosphate rock and dry phosphate rock (V.S. 41, p. 9), the foregoing comments are pertinent as well as to the latter. It is appropriate, however, to note three minor differences. First, as Mr. Burrough himself pointed out, the Commission's waybill statistics show only phosphate rock and do not separate wet from dry rock. Hence, the method relied upon by the witness to allocate costs as between the two commodities is subject to careful scrutiny. Second, while reference is made to certain transit tariffs, there is no rate adjustment to the shipper and no claim that the rate here being divided is that on the entire wet rock-dry rock movement (R. 1767). It follows that this is no more a true transit arrangement than was the case with pulpwood. Third, Witness Burroughs' computations

with respect to phosphate rock purport to show a deficiency not only below fully distributed cost, as in the case of pulpwood, but below out-of-pocket cost as well.

But the degree of the deficiency is not material to the inquiry which Eastern lines submit is of prime importance, that is, the propriety of including, as a legitimate cost of handling the traffic, the rates, on which are sought to be divided, the alleged amounts by which some other rates (over which Eastern lines have no control) not here in issue, fall short of returning full cost, with no justification other than the claim that the two movements are "directly related."

Nor is the existence of a tacit transit arrangement a criterion of substance even if it were shown to exist in fact and to be adhered to in practice. Certainly, if this theory had any validity, a carrier actually handling both inbound raw materials at below fully distributed costs

[187]

and the outbound finished products at profitable rates could legitimately claim the same relationship and transfer of cost from the former to the latter whether or not there were any express, or unspoken, arrangement with the shipper as to routing of the finished product. There would be no difference in the physical sense in any case since the outbound product could not come into existence but for transportation of the inbound raw material by whatever means. And to the extent that the inbound transportation movement devolved upon the outbound carrier, and if a common carrier it might well have no choice, then under Southern lines' theory, costs and, hence, rates and divisions, on the outbound product would have to be fixed giving full consideration to any deficiency on the inbound commodity. Eastern lines submit that the complexity and impractical effectuation of the principles of "direct relationship" here expounded by Southern lines, when carried to their logical

conclusion, are another ground upon which it is condemned without more.

There is, then, no possible justification for this effort on the part of Southern lines to transfer the costs of other traffic, not here in issue, to those claimed for such lines on North-South traffic. And even if such transfer were otherwise proper, it would be a gross distortion of territorial cost levels to fail to make corresponding adjustments in the cost of Eastern lines, which Witness Burroughs necessarily conceded would be proper to reflect similar inbound raw material—outbound finished products relationships in the traffic of those carriers (R. 1765, 1806).

k. *In Summary, Each of Southern Lines' Proposed Adjustments to Form A Costs Should be Rejected.*

It is respectfully submitted that the foregoing discussion demonstrates that Southern lines' proposed adjustments to Form A average costs are unsound and should be rejected. They are the work of parties who are motivated by the sure knowledge that they cannot prevail if relative costs are determined by a forthright application of Form A to the immense body of traffic that moves between all stations in the North and all stations in the South, both ways. What the Commission observed when this case was first before it is true now: that adjustments "advanced by litigants in adversary proceedings must neces-

ORDER.

Service Date
January 7, 1963

At a General Session of the INTERSTATE COMMERCE COMMISSION, held at its office in Washington, D. C. on the 27th day of December, A. D. 1962.

No. 29885

OFFICIAL-SOUTHERN DIVISIONS

IN THE MATTER OF DIVISIONS OF JOINT RATES BETWEEN OFFICIAL AND SOUTHERN TERRITORIES

No. 29799

THE AKRON, CANTON & YOUNGSTOWN RAILROAD COMPANY, ET AL.

v.

ABERDEEN AND ROCKFISH RAILROAD COMPANY ET AL.

Upon consideration of the record in the above-entitled proceedings, a petition for further hearing filed November 13, 1962, by the respondent Southern Territory railroads, and a memorandum in support thereof filed November 30, 1962, by the Southern Governors' Conference, et al., interveners, and of replies thereto filed by the respondent Eastern railroads; and

It appearing, That the petition seeks further hearing for the purpose of submitting evidence concerning the effect of proposed combinations and consolidations of rail carriers in official territory upon operating costs and revenue needs of said carriers;

It further appearing, That such combinations and consolidations are involved in pending proceedings before the Commission, in some of which the hearings have not been concluded; and that it cannot properly be assumed at this time that all of the combinations and consolidations will be approved and consummated, as proposed;

It further appearing, That, even if all or some of the combinations and consolidations are approved and consummated, the effect thereof on operating costs and revenue needs of the carriers involved will not be ascertainable within a brief period after consummation;

And it further appearing, That reopening these proceedings for further hearing would result in unjustified delay in the disposition thereof; therefore,

It is ordered, That said petition be, and it is hereby, denied, for the reason that sufficient grounds have not been presented to warrant granting the action sought.

By the Commission.

HAROLD D. MCCOY,
Secretary.

IN THE MATTER OF DIVISIONS OF JOINT RATES BETWEEN OFFICIAL AND SOUTHERN TERRITORIES

Decided

Upon further hearing, present divisions of joint interterritorial rates between official and southern territories found unjust, unreasonable, and inequitable. Just, reasonable, and equitable divisions prescribed. Prior reports, 287 I.C.C. 497, 289 I.C.C. 4, 291 I.C.C. 90, 294 I.C.C. 739 and 298 I.C.C. 83.

Edward A. Kaier, Joseph F. Eshelman, Andrew C. Armstrong, R. G. Bleakney, Jr., Robert D. Brooks, Benson T. Buck, J. Raymond Clark, J. T. Clark, Robert B. Claytor, A. P. Donadio, A. Paul Funkhouser, Thomas P. Hackett, John W. Hanifin, J. E. Hess, Bernard Hulkower, Allen Lesley, Kenneth H. Lundmark, Robert H. Pratt, and *S. W. Scully,* for official-territory respondents.

Douglas F. Smith, Howard J. Trienens, John W. Adams, Phil C. Beverly, C. J. Collins, R. Granville Curry, Arthur J. Dixon, R. Wray Henriott, Moultrie Hitt, Howard

---

1. This report also embraces No. 29799, Akron, Canton & Youngstown Railroad Company, et al. v. Aberdeen & Rockfish Railroad Company, et al.

D. Koontz, John E. McCullough, Prime F. Osborn, Charles P. Reynolds, Edward M. Reidy, Walter C. Scott, Joe A. Sutherland, Donal L. Turkal, E. B. Ussery, Harold B. Wahl, and *Arthur J. Winder* for southern-territory respondents.

Charles H. Clay, R. J. Faletti, James A. Gillen, R. J. Lehman, Don McDevitt, Joseph J. Nagle, and *Edgar Vanneman, Jr.,* for western-territory respondents.

David O. Benson, F. Kent Burns, Reuben G. Crimm, Hammond Fowler, G. P. McCord, Jr., and *Walter R. McDonald* for interveners supporting southern-territory respondents.

[2]

RECOMMENDED REPORT AND ORDER UPON FURTHER HEARING BY OREN G. BARBER AND T. RUSSELL ROPER, HEARING EXAMINERS.

The title case is a proceeding of inquiry and investigation originally instituted on December 4, 1947, upon the Commission's own motion for the purpose of determining whether the then existing divisions of joint rates on classes and all commodities between points in official territory and points in southern territory (as both territories are defined in *Class Rate Investigation,* 1939, 262 I.C.C. 447, 457) were unjust, unreasonable, or otherwise unlawful. All railroad carriers in the two territories were named as respondents.[2] The complaint in No. 29799 was filed July 24, 1947, in which the northern lines assailed as unlawful the divisions of joint rate on citrus fruit from points in Florida to destinations in official territory. As originally instituted therefore the two proceedings brought in issue the division of all joint interterritorial rates between the North and the South except those on coal and coke made from coal which were excluded by mutual consent of the parties.

In the original principal decision dated January 12, 1953, 287 I.C.C. 497, called the 1953 report, embracing all

2. For this note and succeeding ones see Appendix A.

such traffic, the Commission prescribed primary divisions based upon equal mileage factors for the northern and southern lines except as to joint proportional rates on grain and grain products from East St. Louis, Louisville, and Cincinnati to points in southern territory, the northern factors prescribed were 75 percent of the northern general factors. That report also provided that arbitraries which were included in the joint rates should be deducted before prorating and that in lieu of specific apportionment of the arbitrary in respect of the rates on citrus fruit from Florida to official territory one percentage point should be deducted from the northern division and added to the southern division. Also in that report the dividing points for such primary divisions were fixed at the points of actual interchange rather than at the territorial boundaries.

In a report on reargument, 289 I.C.C. 4, decided May 26, 1953, the prior report was modified so as to make the prescribed divisions applicable only to and from the existing primary dividing points. This report also postponed the effectiveness of the prescribed divisions with respect to divisions to and from points on the Norfolk Southern Railway Company and the Beaufort & Morehead Railroad Company pending further hearing. The prescribed divisions became effective on July 15, 1953.

[3]

Upon petition of various parties the findings in the two prior reports were interpreted and certain conclusions were revised in three supplemental reports. In 291 I.C.C. 90, of November 2, 1953, the definition of northern lines was broadened to include the Toledo, Peoria & Western Railroad Company, and the proceeding was reopened for further hearing with respect to divisions of rates between points on certain western trunklines and points in southern territory where no northern (official territory) carrier was a party to such rates, (later vacated, see *infra.*) and with respect to divisions of joint interterritorial rates between

points on the line of the Atlantic and Danville Railway Company west of Suffolk, Va., and points in official territory. The third and fourth supplemental reports, 294 I.C.C. 739 and 298 I.C.C. 83, made certain interpretations of previous findings.

On November 2, 1956, the northern lines petitioned the Commission for general reopening of these proceedings for further hearing and for modification of the order of January 12, 1953, as modified by the order of May 26, 1953. The petition was held in abeyance at the request of the interested parties until April 1, 1959, when the northern lines asked that the petition be processed. After replies had been duly filed, the Commission by order dated July 20, 1959, reopened the proceeding for further hearing. The scope of the divisions now at issue is in some respects more limited than that covered in the 1953 report. The extent to which joint interterritorial rates is now excluded and the reasons therefor are listed in Appendix B.

Traffic Studies

Both the northern and the southern lines made traffic studies for use in these cases. The northern lines introduced two studies developed in accordance with a sampling procedure, embracing carload shipments (except coal and coke made from coal) moving on joint rates (including aggregate-of-intermediate rates which automatically displace single-factor joint rates) between points in southern territory and points on northern (eastern) railroads in official territory. One of such studies covered general traffic for the months of March and September, 1956. The other embraced citrus fruit and fresh or green vegetables, not frozen, for the five months, January to May, 1956. The southern lines introduced a traffic study, developed in accordance with a sampling procedure, which was broader in scope and coverage than that of the northern lines. These lines selected the 12-month period July 1958 to June 1959

as a representative period which excluded any period said by them to be abnormal. Unlike the northern lines' study, this study includes traffic originating or terminating on western or southern lines in official territory when a northern line participated in the hauls.

The southern lines' tabulations include showing of many of the characteristics of the traffic in the same form as that produced

[4]

in the northern lines' study. The southern lines' study, unlike the northern lines' study, does not make separate showings as to citrus fruit and vegetables, such traffic having been included in the over-all general study. Coal and coke made from coal are not included in the final tabulations of the southern lines' study, and there are certain classes of traffic which for reasons shown the southern lines deem the divisions of rates thereon are not here in issue. These segments are: (1) traffic to and from western carriers' stations in official territory, (2) traffic subject to grain proportional and reshipping rates subject to Docket 29885 prescribed divisions, both categories excluded for stated reason that no evidence was introduced by an official territory respondent, (3) border traffic between border points and official territory which was subject of litigation in Docket No. 32055 (the parties have stipulated that this traffic is not in issue), (4) Norfolk Southern general traffic between stations on that line and points in official territory excluded because Docket 29885 divisions were not prescribed thereon and that respondent made a separate presentation thereof (the study does include Norfolk Southern "overhead" traffic), and (5) traffic to and from Morehead City, N.C., on A. & E. C. Ry., excluded for same reason as (4) above.

Northern Lines' Studies

The general traffic study.—The northern lines' general traffic study covering general traffic for the months of

March and September 1956 is expanded to a year's basis by multiplying by six. This study, so expanded, embraced a movement of 983,664 cars, 28,416,839.4 tons, with total revenue of $450,909,348. By directions northbound traffic exceeded the southbound by substantial amounts as shown below:

	Cars	*Tons*	*Through Revenue*
	Percent	*Percent*	*Percent*
Northbound	54.04	59.36	54.87
Southbound	45.96	40.64	45.13

The predominance of higher grade traffic is indicated by the following summary of the separation of the total traffic by primary commodity classifications:

[5]

	Cars	*Tons*	*Through Revenue*
	Percent	*Percent*	*Percent*
Products of agriculture	4.26	3.09	3.28
Animals and products	1.39	0.89	1.25
Products of mines	11.09	18.85	10.81
Products of forests	9.86	8.92	8.31
Manufactures and misc.	70.15	67.23	73.79
Forwarder	3.25	1.02	2.56
Total	100.00	100.00	100.00

About 75 percent of the general traffic moved in box cars and refrigerators as shown by the following tabulation of the movement by types of equipment:

	Percent
Box	72.13
Gondola	11.23
Tank	6.42
Refrigerator	3.15
Hopper, covered	3.04
Flat	2.34
Hopper, open top	1.22
Stock	0.47
Total	100.00

The studies of both groups do not cover less-than-carload traffic as was also the case in the original phase. Gross freight revenue on such traffic has declined substantially since 1947 as follows:

	Eastern district and Pocahontas region	*Southern region*
1947	$243,910,929	$99,608,559
1956	123,550,144	48,067,987
1958	90,667,451	36,532,274

As in the original case, the most important interchange points are Cincinnati, Ohio, Richmond, Va., and Potomac Yard, Va., with

[6]

over half being interchanged at Virginia gateways, the remainder at the Ohio crossings. The relative importance of the principal primary break points on general traffic is shown below:

	Cars
Break point	*Percent*
Cincinnati, Ohio	23.19
Richmond, Va.	19.27
Potomac Yard, Va.	12.37
Louisville, Ky.	8.68
Cairo, Ill.	7.65
East St. Louis, Ill.	4.94
Elkhorn City, Ky.	4.78
Other Virginia cities	16.40
Other Ohio River crossings	2.72
Total	100.00

The average hauls on the general traffic per car-mile and per ton-mile are shown below:

	North	*South*	*Total*
Car-miles	*Miles*	*Miles*	*Miles*
Route of movement	408	519	927
Short line	362	475	837
Ton-miles			
Route of movement	392	508	900
Short line	347	464	811

It was shown that the average hauls of the northbound traffic (not including Florida Vegetables) in the southern lines' general 1947 study (based on average short-line ton-miles) were 370 miles in the North and 500 miles in the South, and of the southbound, 325 miles in the North and 440 miles in the South. On the same basis the present northern lines' general traffic study shows on northbound traffic, 371 miles in the North and 496 miles in the South,

on southbound, 313 miles in the North and 419 miles in the South, and on total traffic 347 miles in the North and 464 miles in the South, compared with the 1947 study figures of 345 miles North and 478 miles South.

The total through revenue, $450,909,348, including the arbitraries, was divided "as settled," between the two groups as follows:

[7]

	Percent
North	45.44
South	54.56

This study shows that the northern lines performed 42.8 percent of the short-line ton-miles of service, and 44 percent of actual route of movement car-miles, the southern lines 57.2 and 56 percent, respectively.

The citrus fruit and vegetables study.—This study, also developed by sampling, covering the movement of these commodities from southern territory to points in official territory on lines of the northern lines for the five months, January through May, 1956, embraced 43,810 cars, 713,618 tons. The total revenue was $19,660,843, which was settled 33.38 percent North and 66.62 percent South. The northern carriers performed 29.4 percent of the short-line ton-miles of service, the southern, 70.6 percent. While the southern lines' study will be discussed fully later, it may be pointed out here that that study covers 14,651 cars of citrus and 21,785 cars of vegetables totalling 36,436 cars moved in the 12 months July 1958 to June 1959, or 7,374 less than the northern lines' study.

The preponderance of citrus and vegetables moved through the Virginia gateways, Richmond and Potomac Yard. Cincinnati was the important Ohio River gateway. The percentage distribution of cars by gateways is tabulated below:

Gateway	*Citrus fruit*	*Vegetables*	*Total*
	Percent	*Percent*	*Percent*
Richmond	69.76	51.20	57.66
Potomac Yard	10.06	13.94	12.59
Elkhorn City	7.56	14.70	12.21
Cincinnati	7.38	11.98	10.38
Evansville	3.26	4.23	3.90
Other	1.98	3.95	3.26
Total	100.00	100.00	100.00

The following table shows the average short-line hauls on this traffic:

[8]

	Short-line Miles		
Car-miles	*North*	*South*	*Total*
Citrus fruit	356	830	1186
Vegetables	360	893	1253
Total	359	871	1230
Ton-miles			
Citrus fruit	355	830	1185
Vegetables	361	890	1251
Total	358	860	1218

As settled, the revenue on the citrus fruit and vegetable traffic divided as follows:

	North	*South*
	Percent	*Percent*
Citrus fruit	34.88	65.12
Vegetables	32.23	67.77
Total	33.38	66.62

Southern Lines' Study

This study for the 12-month period July 1958 to June 1959 produced an estimated total of 967,554 cars containing 28,055,720.7 tons of freight yielding total through freight revenue of $496,088,766, including arbitraries totalling $1,365,705. As stated above this traffic study included traffic originating or terminating on western or southern lines in official territory when a northern line participated in the haul, and as stated above coal and coke made from coal and certain classes of traffic not considered by the southern lines as here in issue, were not included in the final tabulations.

By directional flow, by commodity groups, and by types of equipment, this study follows closely those characteristics as produced in the northern lines' study. The distribution of the traffic by direction is as follows:

	Cars	*Tons*	*Through Revenue*
	Percent	*Percent*	*Percent*
Northbound	53.9	59.5	55.4
Southbound	46.1	40.5	44.6

[9]

The distribution by general primary commodity groups was as indicated below:

Commodity group	*Cars*	*Tons*	*Through Revenue*
Products of agriculture	8.59	6.25	7.18
Animals and products	1.36	0.88	1.17
Products of mines	11.23	19.15	11.21
Products of forests	5.82	5.28	5.15
Manufactures and misc.	68.81	67.13	72.03
Forwarder	4.19	1.31	3.26
Total	100.00	100.00	100.00

Distribution of the traffic (including citrus fruit and vegetables) by types of equipment also shows the predominance of boxcar and refrigerator traffic as follows:

	Percent
Box	68.97
Refrigerator	8.31
Gondola	7.62
Tank	6.65
Hopper, covered	4.25
Flat	3.06
Hopper, open	0.73
Stock	0.41
Total	100.00

As in the northern study, Cincinnati leads as the principal primary break point, with Richmond and Potomac Yard in second and third place. Of the total cars embraced in the study, 55.4 percent passed through the Ohio River-Illinois-Kentucky gateways, 44.6 percent through the Virginia gateways. The detailed distribution of cars by individual gateways does not differ materially from that shown by the northern study.

The average hauls per car and per ton, both route-of-movement and short-line, for the total traffic included in the study are shown below:

	North	*South*	*Total*
Per car	*Miles*	*Miles*	*Miles*
Route of movement	420	567	987
Short line	372	522	894
Per ton			
Route of movement	410	557	967
Short line	361	511	872

[10]

The following table compares the "as settled" division of the total through revenue, in the two groups' studies:

	Combined northern lines' studies—Percent	*Southern lines' study*	
		Percent [1]	*Percent* [2]
North	44.93	44.64	44.75
South	55.07	55.36	55.25

The northern lines point out that the southern study may be subject to criticism for failure to include Norfolk Southern traffic so that the Commission could deal with such traffic separately or together with southern traffic as a whole, according as it shall find proper. As stated, the Norfolk Southern submitted a separate presentation for itself in respect of traffic originating or terminating on its line and passing over its line to or from stations on the Atlantic & East Carolina and the Beaufort & Morehead. The divisional situation as to these lines is the subject of later discussion herein. Inclusion of Norfolk Southern originated or terminated traffic tends to shorten the average hauls in the South as shown in the following tabulation based on average short-line ton-miles:

Traffic study	*North*	*South*	*Total*
Northern general	347	464	811
Southern total	361	511	872
Southern plus Norfolk Southern	361	503	864

It will be observed from a comparison of the various foregoing tabulations that the two groups' studies are basically similar as to the general characteristics of the traffic. The least similar results are the average hauls as

1. Including arbitraries.
2. Excluding arbitraries.

indicated immediately above. These differences may be accounted for principally in the difference in periods studied as well as the inclusion or exclusion of certain traffic in the one and not in the other. We are of the opinion that the southern study more closely corresponds in coverage with the scope of the Commission's order in this reopened phase of the case.

The northern study does not include an estimated annual movement of 46,201 cars which originated or terminated on western district lines on which the northern lines performed only intermediate service. Also excluded was traffic (4,092 cars) to or from southern lines' stations in official territory on which the northern lines performed only intermediate service. A third category not included in the northern lines' study (2,955 cars) which the southern study embraces was traffic between the South and Canadian points moving on combination rates breaking at the international boundary on which the revenue accruing to domestic carriers is divided on the 1953 prescribed basis.

[11]

On the other hand, the northern study includes traffic between points on the Norfolk & Western in southern territory and points in official territory. The extent of this traffic is not revealed in the northern study but its inclusion therein tends to understate the southern lines' average haul since such traffic always has a short haul in the South. The southern study includes so-called vacated order traffic: (1) liquid soda and soda ash from Saltville, Va., to Kingsport and Port Rayon, Tenn., and (2) peaches and fresh vegetables moving on per car rates to piers 22, 27, 28 and 29 at New York City. These two categories represent only 1,209 cars, an inclusion of little significance, but the divisions thereon are again in issue here as are the divisions on trailer-on-flatcar traffic not covered by stipulation of the parties.

The northern study does not reflect the changes in effective divisions which have occurred since 1956, brought about by vacation of the 1953 order as to certain categories of traffic as requested by mutual petitions. Thus, the "as settled" revenue which the northern lines received is understated under present divisional bases. This is particularly true as to vegetables. The rates on this traffic which moved in 1956 contained Florida arbitraries which were deducted before prorating then added back to the southern proportion of the through revenues. Since 1957 vegetable traffic to New York has moved on per-car rates, containing no arbitraries, the divisions thereon providing that the excess of $57 per car in the New York rates, over and above the rates to Jersey City, N. J., shall accrue to the delivering lines before prorating. Thus the northern lines' study shows that during the first five months of 1956 the northern lines received 32.23 percent of the as settled revenue (including arbitraries in effect at that time) on northbound fresh vegetables whereas the southern lines' study of 21,785 cars of fresh vegetables moved in a year subsequent to the establishment of the per-car rates shows the northern lines received 35.28 percent of the as settled revenue (including presently effective arbitraries).

Economic Trends—Revenue Needs

At pp. 501-505 of the 1953 report various statistical comparisons were stated which supported a conclusion "that in the past 20 years the South has bettered its relative economic position in comparison with the North" and that "the southern railroads have benefited from this improvement in the economic situation of the South." The record in this reopened phase indicates a continuation of these trends. There is little evidence comparing these statistics as between the North and the South but figures comparing the South with the entire country are quite abundant. The number of employees in the South in 1958 increased 28 percent over 1947, the number in the North was approximately the same in 1958 as in 1947, while there

was an increase of 12 percent for the entire country. In absolute figures the North in 1958 had almost 10 million employed persons, 5 times as many as the South. The value of manufactures for the

[12]

nation almost doubled between 1947 and 1958, increased about 67 percent in the North, and slightly more than doubled in the South. From 1930 to 1958 the population of the United States increased 41 percent and in the southern States, 44 percent. The percentage population gains during the 20 years 1930 to 1950 were 22.7 percent for the entire country, 24.5 percent in the South, and 18.8 percent in the North, as shown in the 1953 report. An advertisement sponsored by a southern respondent in 1960 shows "that the South's economic development since World War II has outpaced the national rate of growth in practically every category you can name." These data show for the South increases of 40 percent in the number of manufacturing establishments, and 57 percent in the number of industrial and commercial forms, compared with respective national increases of 26 and 25 percent.

The relatively greater increase in freight traffic in the South than in official territory since 1947 warrants the conclusion that the southern lines have benefited from the general improvement in the economic situation in the South. The number of cars and tons handled within the South in 1958 were 100.40 and 120.21 percent, respectively, of that for 1947 while corresponding percentages for official territory were 64.14 and 68.19. Revenue ton-miles for the southern region in 1958 were 99.6 percent of those shown for 1947, and revenue tonnage originated and terminated in 1958 was 105.5 and 113.6 percent, respectively, of that handled in 1950. Corresponding percentages for the eastern district and Pocahontas region were for revenue ton-miles, 85.4 percent, and for tons originated and terminated, 77.3 and 77.5 percent, respectively. Revenue tons origi-

nated and terminated in the entire country in 1958 were 87.9 and 91.3 percent, respectively, of that in 1950.

Freight revenue of the southern lines since 1950 has also increased relatively greater than that of the northern lines as shown below:

Freight revenue for	*Southern region*	*Percent*	*Eastern district and Pocahontas region*	*Percent*
1950	$1,098,229,000	100	$3,374,542,000	100
1958	1,175,318,000	107	3,217,516,000	95.3

The average net ton-miles of revenue and non-revenue freight per annum in the southern region for 1956-1958, 91.8 billions, were 2.1 billions more than those for 1950, and 37.9 billions greater than in 1940. The average for the eastern district and the Pocahontas region in 1956-1958 was 253.2 billions, 6.3 billions less than in 1950, and 53.8 billions greater than in 1940.

At page 503 of the 1953 report the operating ratios of the two groups of carriers are shown for the years 1941-1950, indicating ratios for the southern lines were consistently below the ratios of the northern lines. The present record does not show freight operating ratios separately. The total operating ratios continue to favor the southern lines as shown below:

[13]

Year	*Southern region Percent*	*Eastern District and Pocahontas region Percent*
1951	75.14	79.58
1952	73.26	79.03
1953	72.64	78.79
1954	76.00	81.14
1955	72.79	77.09
1956	74.73	77.62
1957	77.68	79.53
1958	78.61	81.20
1959	76.22	80.52

The 1953 report also showed that the increase in net railway operating income received by the southern lines in the period 1941-51 had been relatively larger than for the northern lines. Continuation of that trend is shown in the table below:

	Southern region		*Eastern district and Pocahontas region*	
Annual average for—	*Millions*	*Percent*	*Millions*	*Percent*
1948-1953	$157.8	100	$395.4	100
1954-1959	162.4	103	361.1	91

The above table reflects operations of the two groups for the six full years prior to and after the present prescribed divisions became effective under which the prior divisions giving the southern lines on general traffic a 25 percent factor advantage was eliminated.

Rates of return on depreciated book investment, set forth at page 503 of the 1953 report, indicate for the years 1941 to 1951 those for the southern lines consistently exceeded those for the northern lines. In this phase of the proceeding the southern lines show the rates of return based on the net investment [3] as follows:

Year	*Southern region percent return*	*Eastern district and Pocahontas region percent return*
1952	5.27	3.86
1953	5.45	4.01
1954	4.48	2.89
1955	5.45	4.19
1956	5.02	4.05
1957	4.14	3.29
1958	3.68	2.00
1959	3.63	2.27

Again comparing these statistics for the 6 full years since the present divisions became effective with the 6 years

prior thereto it is shown that the average rate of return (net investment method) for the southern lines was 4.40 percent in 1954-59 and 4.79 percent in 1948-53, while the northern lines' average was 3.11 and 3.60 percent, respectively.

[14]

The southern lines say that returns for the calendar years 1958 and 1959 should not be used for comparative purposes to determine future divisions in view of the recession in business activity affecting the first half of 1958 and the severe steel strike affecting the last half of 1959, which affected the northern lines to a greater degree than the southern lines. The rates of return of both groups for these years were lower than for any year since 1949. A comparison, omitting 1958 and 1959, shows average annual rates of return for the southern lines, 1954-57, 4.77 percent and 1950-53, 5.19 percent and for the northern lines during the same respective periods, 3.60 and 3.76 percent. Thus the spread between the two groups in the 4 year period before the present divisions became effective, 1.43 percentage points, was reduced to 1.17 in the like period subsequent thereto.

As the Commission stated at page 504 of the 1953 report, relative revenue needs of opposing groups of railroads must be taken into account in prescribing divisions. It was there observed that the southern lines in 1939 put *much* emphasis on the more urgent revenue needs of their railroads when these lines were given an inflation in divisional factors. In the 1953 report in which the inflation was removed, these respondents were less emphatic, merely asserting that the relative revenue needs were if anything greater in the South than in the North, despite their higher rates of return in the decade prior thereto. Here the northern lines say "The Commission, charged with responsibility for maintaining adequate transportation, cannot fail to give substantial weight to the manifestly greater revenue needs of the Eastern lines * * *". The southern lines designate cost of service as the "vital and decisive issue in this divi-

sions case" but recognize that the revenue needs issue may properly be given secondary consideration. They say that a separate claim based upon revenue needs is a claim for a disportionate share of the revenues in excess of the "due proportion" of the financial burden reflected in the cost evidence, and that mere differences in earnings do not constitute the special circumstances necessary to invoke the revenue needs test. They further argue that any transfer of the divisional revenues here at issue would have relatively greater effect in the overall financial condition of their lines and of little practical effect upon the earnings of the northern lines to which this traffic "is of incidental importance only". The southern lines take the position that evidence is lacking here establishing a need in the public interest of a transfer of divisional revenues "to maintain carriers in effective operation". They point out that in both groups there are carriers that have relatively high earnings and others with relatively low rates of return. They also question the propriety of a shift in divisions which would take revenues from certain low-earning roads in the South and increase revenues of lines in the North with higher rates of return. Such a result is inevitable in adjusting divisions on a group basis such as we are compelled to do in this proceeding.

[15]

Our findings and conclusions reflect due consideration of the revenue needs of both groups as well as all the other factors the Commission is directed to consider under section 15(6) of the Interstate Commerce Act.

The southern lines also argue that the northern lines should employ the "principle of self-help" before they may "rely upon others to carry their burdens". They refer particularly to those areas of self-help involving modernization and mergers to eliminate excess capacity; and in addition, failure to adjust their subdivisions to a proper basis. Lack of sufficient cash has caused the northern lines

to forego car and locomotive repairs. In August 1959, 12.1 percent of the northern lines' cars were undergoing or awaiting repairs; the figure for the southern lines was 5.3 percent. In July 1959 6.7 percent of the North's locomotives were in or awaiting shop, for the South, 8.1 percent. In respect of maintenance of properties the northern lines have lagged behind the South. Using the 4-period 1950-53 as a base index of 100 for new rail laid in replacement the northern lines' (including Pocohontas) index declined to 60.6, 60.9, 56.6, 54.4 and 20.5 in the following 5 years, 1954-58, respectively, while the respective indices for the southern region roads were 101.2, 90.9, 76.7, 80.7, and 49.8. Indices for cross-tie and second-hand rail replacements in the two groups follow similar patterns during the comparable years.

The southern lines point to the comprehensive steps taken by the New York Central in a modernization program including construction of modern yards and installation of centralized traffic control, permitting the elimination of duplicate facilities and retirement of excessive track, at the same time reducing its fixed charges, all of this accomplished under present divisions. They contend the Pennsylvania and the B. & O., instead of reducing their long term debt in the past years, should have devoted these funds toward more modernization which would reflect reduced operating costs and higher rates of return. As for the New Haven, they say its financial plight can be cured only by positive steps to reduce its local commuter service deficit; that increased divisions is not the answer. The several electronic yards constructed in official territory have not produced the benefits the northern lines had hoped for. These yards generally have been operating at substantially less than capacity due to lack of sufficient traffic volume.

In respect of their financial condition, the southern lines contrast the "stable or shrinking transportation plant" of the northern lines with their investment of "large

sums to expand their railroad plant and facilities in order to handle the increasing volume of traffic generated by the growing South, but without receiving any additional return to support the additional investment". They fail to recognize that even though their net investment has increased relatively greater than that of the northern lines, their rates of return have been relatively favorable as hereinbefore discussed.

[16]

At page 505 of the 1953 report it was observed that each group then sought to show that it was more adversely affected by motor and water competition. The Commission concluded that the evidence was insufficient to justify a prediction that such competition was likely to be felt more keenly in the future by one group than the other. The two groups again stress these competitive factors, both urging that the impact thereof will be greater in their respective regions. Construction of new highway systems in both territories is under way. In 1958 truck registrations in the official territory numbered nearly 4 million, almost twice that in the South. In that year class I railroads in the eastern district handled 11.25 tons for every ton handled by the class I motor carriers. In the South the 1958 ratio was 1:23.42. On a revenue basis the eastern district rail-truck ratio was 1:3.43, southern region 1:5.68. A comparison of ton-miles of revenue freight handled by Class I intercity highway carriers and by official and southern territory railroads shows that in official territory the motor carriers handled 6.82 percent of the total in 1951 and 8.93 percent in 1958. Respective figures for southern region were 5.22 and 8.85 percent, indicating on this basis a greater relative increase in the South between 1951 and 1958. The waterborne traffic diversion appears to have more seriously affected the northern lines, particularly on the Ohio and Illinois rivers and the Great Lakes. The operation of the recently opened St. Lawrence Seaway has diverted traffic

from the northern lines. Both groups have been forced to lower their rate levels on particular movements to meet competition of other modes of transport.

The following table shows changes in revenue per ton and revenue per ton-mile for the two groups in the 4 years of normal business activity since the present divisions were made effective:

	Eastern district and Pocohontas region		*Southern region*	
	Revenue		*Revenue*	
	Per ton	*Per ton-mile*	*Per ton*	*Per ton-mile*
		cents		*cents*
1954	$2.98	1.55	$2.98	1.46
1955	2.91	1.48	2.89	1.40
1956	2.95	1.49	2.82	1.43
1957	3.14	1.56	2.97	1.48

The southern lines observe that the "location of new industries in the South near abundant sources of raw materials has meant that the long-haul movement of manufactured products into the South has been replaced by the movement of low-rated

[17]

raw materials to nearby plants." Increased population in the South has caused finished products to be consumed locally and they say they are left with less remunerative movement of low-rated raw materials. As an example, it is shown that the Seaboard handled 33.9 percent more tonnage of low-rated commodities in 1959 than it did in 1951. Between the same years its tonnage of high-rated commodities increased only 5.6 percent. Its revenue increases in the same period were 28.7 percent on low-rated, and 2.4 percent on high-rated commodities.

The northern lines show their tonnage and revenues in the eastern district for both groups of commodities decreased in 1959 compared with 1951 as follows:

Eastern district

Tonnage handled

	Tons (millions)	Percent decrease	Revenue (millions)	Percent decrease
Low grade				
1951	453.4		$664.2	
1959	329.1	27.4	559.6	15.8
High grade				
1951	207.4		868.3	
1959	161.0	22.4	736.3	15.2

Efficiency of Operation

In prescribing divisions the Commission is required by section 15(6) of the act to "give due consideration, among other things, to the efficiency with which the carriers concerned are operated." In the 1939 report it was observed that neither group criticized the operating efficiency of any respondent carrier. But in the original phase of this case the relative efficiency of the northern lines was the subject of very substantial evidence directed to support the southern lines' assertion that "performance in the North reflects less efficient operation than in the South." After reviewing the various statistical indicators of efficiency in the prior record, the Commission in the 1953 report, stated at p. 519: "In our opinion the figures disprove the charge that the northern lines are less efficiently operated than the southern lines * * *." In this reopened phase the southern lines do not question the relative operating efficiency of their opponents. Instead they charge that the northern lines have been unwise in choosing to de-

vote available funds to reduction of debt rather than making capital improve-

[18]

ments in their transportation plant. This as well as the charge of "self-help" is directly related to revenue needs and is considered herein under that category.

The southern lines charge that "the primary problem confronting these northern lines must be met through the elimination of duplicate facilities and modernization of railroad plant". They argue that cost savings are available to these lines through the elimination of excess capacity and duplicate facilities. In the 1953 report the Commission stated (p. 525):

> We do not interpret section 15(6) as requiring us to determine whether one group of carriers is more or less efficiently operated than another, but rather to give due consideration to any evidence which might tend to indicate that the showing as to cost of service is affected by wasteful or inefficient management.

These factors will be considered in our appraisal of the showings made as to cost of service. The northern lines assert that the same conclusion as to relative efficiency as made in the 1953 report is warranted upon this record. In fact these lines do not request any finding that the costs of the southern lines should be discounted because of their showing of relative efficiency measured by the common indicators or because of the relatively greater success of the northern lines in dealing with the passenger deficit. They say that they "feel reasonably assured that Southern lines, while they might possibly be criticized in the light of hindsight, exercised their best judgment in dealing with their problems at the time they were encountered". The record establishes that the same observation is warranted with respect to the northern lines.

The northern lines' reference to passenger deficit control relates to data of record showing passenger service revenues and expenses for the two regions. These data show that in 1958 and 1959 total passenger revenue of official territory lines, while substantially under total passenger expenses, have exceeded solely related passenger expenses, while the southern region carriers have yet been unable to reduce their solely related passenger expenses below passenger revenues. The following tabulation reflects this information in millions of dollars for 1959:

1959 Passenger

	Revenues	*Expenses*	
		Total	*Solely related*
Eastern district and Pocahontas region	$602.2	$696.7	$545.7
Southern region	155.3	211.2	159.7

[19]

RELATIVE COST OF SERVICE

The Commission stated in the 1953 report, when prescribing the present divisions, that: ". . . it is to be the safest assumption for the future upon the facts before us that neither contesting group will have an appreciably lower basis of operating costs than the other, . . .". (287 I.C.C. 497, at 526). In order to show that conditions have changed since that time the northern railroads presented evidence as to the relationship of territorial average costs, the trend of those costs over a period of years, and the cost of moving the traffic at issue based on territorial average unit costs applied to traffic samples. The northern railroads contend that their cost evidence shows that costs are higher in the North than in the South for equivalent hauls and loads, that the difference is increasing over a period of years, and that the division of the revenues which they

receive for hauling the traffic at issue is less than their proportion of the costs of hauling it.

The basic formula used by both parties was Rail Form A entitled *Formula for Use in Determining Rail Freight Service Costs*. This formula uses the expenses and statistics for a given year as reported to this Commission by the carriers and supplemental data derived from special studies made by the carriers. The starting point is the freight expenses and statistics which are derived in accordance with the rules prescribed by the Commission for the separation of expenses, rents, and taxes between the freight and passenger services. The freight expenses are inserted in Rail Form A and assigned or apportioned to services such as running service (line-haul), yard and train switching services, station service, special services, and general overheads. The general overheads are later apportioned to the other services. The aggregate expenses for each service are then divided by appropriate service units to derive unit costs. The allowance for return is based upon depreciated original cost, present value of land and rights, and an allowance for working capital. These net figures are also separated between those applicable to freight service and those applicable to passenger service. The allowance for return is increased for a computed Federal income tax based upon the rate of return used for a particular study. The computed Federal income tax gives consideration to the rate of return used in the study and the amount of fixed charges of the carriers under study. The formula as used in this proceeding separated the operating expenses, rents, and taxes other than Federal income taxes as 80 percent out-of-pocket and 20 percent constant. The allowance for return after Federal income taxes was treated as 100 percent out-of-pocket for equipment and 50 percent out-of-pocket for the other property.

The traffic here at issue moves over three statistical and cost territories: the southern region south of the divisional break points and the eastern district and Pocahontas region north of the break points or border.

[20]

The eastern and Pocahontas carriers, as stated above, rely in this proceeding upon eastern district territorial costs as developed by rail Form A. It is their view that such rail Form A costs—unadjusted—should be used to measure the relative costs of service for the two groups of carriers involved.

The southern lines take the view that eastern district territorial costs are only appropriate for the eastern territory, and that Pocahontas region costs should be used for the Pocahontas carriers, or at least official territory cost should be used for official territory (made up of eastern district and Pocahontas region). It is also the view of the southern lines that territory costs should be somewhat narrowed down to the North-South traffic in issue. Endeavoring to adjust rail Form A costs to the interterritorial traffic in issue, there are a number of adjustments presented by the southern lines purportedly improving the accuracy of the wide-open territorial costs for the two groups of carriers.

The northern lines have presented costs which omit carriers assigned for statistical purposes to the Pocahontas region, which is not a geographical area but consists of three class I railroads and several class II railroads. The class I railroads assigned to Pocahontas region are the (1) Richmond, Fredericksburg and Potomac Railroad Company which operates between Richmond and Potomac Yard (Alexandria), Va., serving as a connecting link between many railroads, (2) The Chesapeake & Ohio Railway, which operates between Newport News and Norfolk, Va., Elkhorn City and Louisville, Ky., and Chicago, Ill., Milwaukee, Wis., Petoskey and Detroit, Mich., Toledo and Columbus, Ohio, and Buffalo, N.Y., (3) The Norfolk & Western Railway Company, which operates between Norfolk and Norton, Va., Durham and Winston-Salem, N.C., on the one hand, and Columbus and Cincinnati, Ohio, on the other, and (4) The Virginian Railway, which was merged into the Norfolk

& Western in December 1959 (The division in its report found that the merger would result in savings in operating expenses of more than $12,000,000 a year).

In excluding the Norfolk & Western, Virginian and Chesapeake & Ohio, the only facts referred to having cost significance are the heavy tonnage of coal trains. The northern lines would have the Commission believe that a high proportion of coal means high tonnage trains which means costs that are not representative for merchandise traffic. This view is not borne out by the facts. The R.F.&P. has the lowest group 3 cost (per ton mile) while having the lowest percentage of coal to total traffic. The Norfolk & Western, Virginian has the highest group 3 cost with the highest percentage of coal to total traffic.

The following table shows the relative relationship of the car miles north of the break points of the eastern district carriers and of the Pocahontas region carriers:—

[21]

EASTERN DISTRICT

Carrier	*Car miles north of gateway*
Pennsylvania	87,848,897
New York Central	46,752,616
Baltimore & Ohio	45,620,867
New York, Chicago & St. Louis	14,479,943
Erie	11,678,062
New Haven	9,673,280
Monon	8,379,616
Chicago & Eastern Illinois	6,894,580
Reading	6,791,159
Delaware & Hudson	5,849,618
Boston & Maine	5,769,016
All Others	26,540,454
Total:	276,278,108

POCAHONTAS REGION

Carrier	*Car miles north of gateway*
Chesapeake & Ohio	46,231,033
Norfolk & Western-Virginian	29,878,965
Richmond, Fredericksburg & Potomac	19,452,992
Total:	95,562,990

Total—Eastern district plus Pocahontas region = 371,841,098

Percent Pocahontas of eastern district plus Pocahontas 25.7

The percent of Pocahontas car miles to eastern district car miles including Pocahontas for North-South traffic north of the gateway for the year 1956 was over 7 percentage points higher than the percent of Pocahontas total loaded car miles to Official Territory total loaded car miles. The Pocahontas lines participated in North-South traffic to a relatively greater extent than did the remainder of official territory carriers. The three Pocahontas lines ranked third, fifth and sixth in car miles north

[22]

of the gateway on North-South traffic and participated in practically as many car miles as all the official territory carriers combined other than the Pennsylvania, New York Central and Baltimore & Ohio, yet the northern lines wish to completely disregard the costs of these carriers in pricing out this North-South traffic.

In its statement No. 6-58 dated November 1958, the cost finding section stated at page 23:

> The official territory unit costs were computed by aggregating the Eastern district and Pocahontas region expenses and dividing such aggregates by the combined service units for the operations both in the Eastern district and in the Pocahontas region. The official territory unit costs were used for traffic movement shown as official to official in the outbound statement.

Table I below shows the equated [4] car handlings on various commodities which move in volume on certain carriers. Table II shows the equated car handlings on coal and coke plus commodities which are handled in volume as testified to by the operating witnesses on the railroads listed. Table III shows the equated car handlings for all class I carriers for all commodities and for the volume of commodities for the territories involved in this proceeding.

Table I shows that despite the inclusion of commodities as to which there is no claim of volume movement on the Baltimore & Ohio, New York Central or Pennsylvania, those railroads' equated car handlings do not compare with the equated car handlings of either Pocahontas carriers or more significantly of the southern carriers.

TABLE I

Equated Car Handlings

(Year 1956)

(Adjusted to reflect adjustment in car count)

Carrier	*Volume commodities* [1]	*All commodities*	*Percent volume to all commodities*
Baltimore & Ohio	4,831,826	11,113,342	43.5
New York Central	5,873,348	16,138,595	36.4
Pennsylvania	7,505,777	20,004,684	37.5
Chesapeake & Ohio	6,604,948	10,627,410	62.2
Norfolk & Western	4,212,954	5,712,074	73.8
Richmond, Fredericksburg & Potomac	87,397	672,785	13.0
Virginian	1,447,788	1,599,342	90.5
Clinchfield	697,061	989,408	70.5
Louisville & Nashville	3,461,243	6,186,620	55.9
Seaboard	2,351,062	4,522,971	52.0

1. Coal and coke, iron ore, sand and gravel, crushed stone, phosphate rock and pulpwood.

[23]

TABLE II

Equated Car Handlings

(Year 1956)

(Adjusted to reflect adjustment in car count)

Carrier	Volume commodities	All commodities	Percent volume to all commodities
Chesapeake & Ohio	5,986,800 [1]	10,627,410	56.3
Norfolk & Western	3,958,464 [1]	5,712,074	69.3
Richmond, Fredericksburg & Potomac	68,745 [1]	672,785	10.2
Virginian	1,401,115 [1]	1,599,342	87.6
Clinchfield	615,384 [1]	989,408	62.2
Louisville & Nashville	3,397,372 [2]	6,186,620	54.9
Seaboard	2,308,691 [3]	4,522,971	51.1

1. Coal and coke.
2. Coal and coke, iron ore, sand and gravel, crushed stone and pulpwood.
3. Coal and coke, sand and gravel, crushed stone, pulpwood and phosphate rock.

The following table shows the equated car handlings for all class I carriers for all commodities and for the volume of commodities for the territories involved in this proceeding:

TABLE III

Equated Car Handlings

(Year 1956)

(Adjusted to reflect adjustment in car count)

	Volume commodities [1]	All commodities	Percent volume to all commodities
Eastern District	29,440,281	80,848,567	36.41
Pocahontas Region	10,233,294	15,335,783	66.73
Official Territory	39,673,575	96,184,350	41.24
Southern Territory	15,824,600	37,098,512	42.67

1. Coal and coke, iron ore, sand and gravel, crushed stone, phosphate rock and pulpwood.

[24]

The table below lists the costs shown by the witnesses for the Pocahontas carriers for selected origins and destinations. It is noted that Pocahontas carriers did not rely on eastern district costs in any instance in pricing out the cost of North-South merchandise traffic when moving over Pocahontas lines.

Witness			*Out-of-pocket cost per cwt.*	*Cost utilized*
			cents	
Chesapeake & Ohio	Richmond, Va. (Route C&O direct)	Grand Rapids, Mich.	35.98	Pocahontas [1]
Chesapeake & Ohio	Richmond, Va. (Route C&O direct)	Detroit, Mich.	33.13	Pocahontas [1]
Chesapeake & Ohio	Richmond, Va. (Route C&O Muncie, Ind. —Eastern District)	Indianapolis, Ind.	26.43 12.14	Pocahontas [1] Eastern [1]
		Total:	38.57

		Total: [3]	35.433	

1. Statement 2-58.
2. N & W Form A unit costs adjusted.
3. Does not include loss and damage.

[25]

In *Commodities—Pan Atlantic S.S. Corp.*, 309 I.C.C. 587, decided February 10, 1960, the witness for the water carriers at first used southern region and eastern district cost scales in pricing out the cost of handling merchandise traffic moving between points in the South and North, thus omitting any use of Pocahontas cost scales where traffic moved in connection with a Pocahontas carrier. This omission was called to the witness's attention by the eastern lines' attorney and the witness acknowledged that the use of Pocahontas region costs was proper for movements through that region. In a restated exhibit introduced by the witness the Pocahontas cost scales were used to price out the cost of the movement of merchandise traffic through the Pocahontas region. In appendix B to the aforesaid report, the use of Pocahontas costs on the merchandise traffic moving in connection with Pocahontas carriers was approved. It is stated at page 613 thereof:

> Respondent (Pan Atlantic) acknowledged that the use of Pocahontas region costs were proper for movements through that region and used such costs in its restated exhibit.

Appendix A of that report compares all-rail costs and truck-water-truck costs. The rail costs shown in the comparison include Pocahontas costs on traffic moving over Pocahontas roads. The division based its findings concerning the cost of all-rail service handling of the merchandise traffic therein to the effect that eastern district costs should be used for the portion of service provided by eastern district carriers, and Pocahontas region costs for the portion of service provided by Pocahontas carriers, southern region costs for the portion of service provided by the southern carriers, and western district costs for the portion of service provided by the southwestern carriers. It was not considered proper in that case to price out the cost of moving traffic over Pocahontas lines at the eastern district's cost level. The northern lines in the instant proceeding have

priced out the traffic involved by using only eastern district costs in this proceeding which concerns the proper divisions between territorial groups of service, one of which includes Pocahontas lines.

The cost witness (Chesapeake & Ohio) representing the northern lines took the position that the use of eastern district cost scales overstated the cost of performing the service for the Chesapeake & Ohio portion of the haul. He took the position that it would be entirely proper to use Pocahontas region cost scales in pricing out the traffic moving over the Chesapeake & Ohio from a point in Michigan to Toledo, Ohio.

We conclude that the proper procedure for pricing out the cost of North-South traffic is not to eliminate any carriers or groups of carriers costs but to price out the cost of each carrier to the extent it participates in the movement of traffic between the North and South, reflecting the amount of traffic moving over the lines of each carrier. Under this procedure

[26]

the cost of railroads which participate to the greatest extent in the traffic should receive the greatest weighting where the North-South traffic, herein considered, has cost characteristics differing from the system average, due to differences in train tonnages or switching minutes per car. Under such circumstances appropriate adjustment should be made in the system average cost. It is improper to exclude the cost of important participants in North-South traffic. Our restatement reflects official territory costs.

The northern lines presented evidence to show that the average unit costs for comparable service are higher in the North than in the South. The following summary table illustrates this point. The first six lines are based on the northern lines' application of Rail Form A and the last four lines on I.C.C. Cost Section's application. These costs include a terminal service at one end only, reflect short-line-miles, and are based on a load of 28.9 tons in box cars.

Relation of northern to southern freight service costs

	100 Miles Percent	*300 Miles Percent*	*500 Miles Percent*	*1,000 Miles Percent*
Official territory v. south				
1948	119	113	111	109
1956	131	123	120	117
1957	131	122	120	117
Eastern district v. south				
1948	125	119	117	116
1956	141	131	128	126
1957	141	132	130	126
Eastern district v. south (I.C.C.)				
1948 (1-1-50)	124	116	115	113
1956	143	133	129	127
1957	143	133	131	128
1959	154	143	139	136

[27]

These costs show in a general way that cost levels are somewhat higher in the North than in the South for like services, that official territory costs are not quite as high as eastern district costs, and that the northern lines' application of Rail Form A as compared to the Cost Section's application is one or two percentage points more favorable to the North.

The northern lines' application of Rail Form A differs from that of the Cost Section in the following respects: (a) the use of a 6 percent rate of return without provision for Federal income tax in place of a 4 percent rate of return

with provision for Federal income tax; (b) the base for return is book investment in road and equipment plus cash and material and supplies less recorded depreciation and amortization instead of on the basis of original costs except lands and rights, working capital, including material and supplies, less recorded depreciation and normalized amortization, plus the present value of land and rights; (c) the less-carload and passenger deficits are omitted from the constant costs, and (d) none of the costs of switching and terminal companies is included.

The evidence as to the trends of relative costs over a period of years can best be summarized in tabular form as follows:

Eastern percentage of total Form A costs at average hauls

	Citrus and vegetable traffic		*General traffic*	
Average haul-miles:	*Refrigerator car—16.3 tons*		*Box-car—28.9 tons*	
North	358		347	
South	860		464	
	Official territory	*Eastern district*	*Official territory*	*Eastern district*
	Percent	*Percent*	*Percent*	*Percent*
Northern lines' Form A computation:				
Year 1948	32.3	33.3	46.4	47.8
Year 1950	33.5	34.2	48.8	50.1
Year 1952	33.8	34.7	48.8	50.1
Year 1954	33.1	34.7	49.7	51.0
Year 1956	33.9	35.0	48.8	50.5
Year 1957	34.1	35.5	48.8	50.8

Year 1954 as of 1-1-56	34.7	34.7	50.6	51.8
Year 1955 as of 1-1-57	34.9	34.9	50.5	51.5
Year 1956 as of 1-1-58	35.5	35.7	50.7	51.8

[28]

In the southern lines' traffic study, 69.3 percent of all car-miles were run by box cars and 9.7 percent by refrigerator cars. The table above indicates that there was an increase in the northern lines' proportion of costs in the year 1950 but that the trend since that year is not pronounced. As to box car costs, the northern lines' computation shows no increase for official territory between 1950 and 1957 and only 0.7 percent for eastern district. The out-of-pocket box car costs (Cost Section computation) showed 0.6 percent increase from January 1, 1952 to January 1, 1958.

The northern lines priced out the traffic at issue as measured by their own traffic study both on the basis of Rail Form A unit costs of their own computation and on the basis of Rail Form A unit costs as computed by our Cost

Finding Section. They also applied the I.C.C. unit costs to the Southern lines' traffic study. The I.C.C. costs used were at the fully-distributed level, i.e., they included a ton and ton-mile apportionment of the constant costs. All costs were based on the year 1956 and included an allowance for loss and damage. The table following shows for each traffic study, the percentage of revenues received by the northern lines and the percentage of costs incurred by them:

	General traffic (*Percent*)			*Citrus and fresh vegetables* (*Percent*)		
	Revenue	*Cost*	*Difference*	*Revenue*	*Cost*	*Difference*
Northern lines' traffic study	45.44			33.38		
Northern costs:						
Eastern district v. southern region		49.78	4.34		34.62	1.24
I.C.C. Costs:						
Official territory v. southern region		48.19	2.75		34.00	0.62
Eastern district v. southern region		50.18	4.74		35.26	1.88
Southern lines' traffic study:	44.97			34.63		
I.C.C. costs:						
Official territory v. southern region		47.34	2.37		33.69	(.94)
Eastern district v. southern region		49.31	4.34		34.97	.34

The difference in the results for citrus and fresh vegetable traffic as between the two traffic studies reflects a revision in the divisions and the more recent southern lines' traffic study

[29]

shows that the revenues as settled and the costs on this traffic are roughly equal. The following table will indicate the dollar amounts involved on the general traffic:

	Traffic study of northern lines			*Traffic study of southern lines*		
	Percent		*Percent*	*Percent*		*Percent*
Total revenues	100.00	$450,909,348		100.00	$480,160,317	
Northern lines' share:						
Revenues as settled .	45.44	204,889,448	100.0	44.97	215,915,212	100.0
Revenue if based on costs:						
Northern lines' costs	49.78	224,462,673		—	—	—
Increase		19,573,225	9.6			
C. C. costs:						
Official v. southern	48.19	217,293,215		47.34	227,307,894	
Increase		12,403,767	6.1		11,392,682	5.3
Eastern v. southern .	50.18	226,266,311		49.31	236,767,052	
Increase		21,376,863	10.4		20,851,840	9.7

The southern lines urge that it is settled law that relative service costs are the decisive measure in determining just and reasonable divisions and that the costs of all roads participating in the official-southern traffic should be so applied and adjusted as to reflect the cost characteristics of the traffic here at issue. In order to inform the Commission as to the relative service costs of this traffic they applied Rail Form A adjusted unit costs at the fully-distributed level for the year 1956 to their traffic sample which has been described hereinbefore.

They presented the results of their cost studies in several different forms, but their principal cost evidence can be summa-

[30]

rized as shown in the table below. It starts with the application of the costs as computed by the northern lines applied to the southern lines' traffic study, next the unadjusted Form A costs applied to the same study, and lastly the Form A costs modified to include the effect of 12 adjustments deemed necessary by the southern lines.

	North of gateway (000)	*South of gateway (000)*	*Percent*	
			North	*South*
Total revenues as settled under present divisions	$221,430	$274,656	44.64	55.36
Northern lines' costs applied to southern traffic study:				
Eastern district and southern region	158,427	170,708	48.13	51.87
Official territory and southern region	148,424	170,708	46.51	53.49
Unadjusted Rail Form A costs—Official territory and southern region	169,618	194,306	46.61	53.39
Rail Form A costs including 12 adjustments	152,808	201,916	43.08	56.92

All of these costs are territorial average costs based on the expenses and operations of the year 1956, all are at the

fully-distributed level, and all are applied to the same traffic study.

The unadjusted rail Form A costs above result from the standard computation applied to each territory. The specific adjustments made by the southern lines in the unadjusted official territory and southern region unit costs developed by the cost finding section are discussed below:

a. Way and through train separation:

The Form A procedure provides for costing out traffic at either average train costs or a combination of way train and through train costs. Although the northern lines used average train costs in their study on the theory that it was adequate for over-all territorial cost comparisons they have no objection to the more refined procedure of using way and through train costs. This has the effect of giving slightly lower costs at the longer distances and higher costs at the shorter distances and in this case reduces the proportion of costs of the southern lines by 0.13 percentage points. This adjustment is approved.

[31]

b. Platform costs:

The southern lines excluded platform costs from their study of the costs of originating and terminating official-southern traffic. This brought about an increase of their proportion of the costs by 0.28 percentage points or in revenues about $1,389,000.

The southern lines' reason for the exclusion of platform service, for the traffic at issue, was based upon the conclusion that wherever a separate tariff charge was made for carrier loading or unloading, platform costs should be excluded. They took a sample of 19 cars out of a total of 130,353 base cars (before expansion) in the involved traffic

which had a universe of 967,554 cars and established that, "for all practical purposes none of the involved traffic received lighterage or any other service which would include platform handling as a part of the service under the line-haul rates being divided."

The northern lines took the same 19 car sample and showed that eleven originated on the eastern lines, eight of which were from Manhattan and two from Brooklyn, all of which required either float or lighterage service and platform service. One car originated in New Jersey which was not involved in the issue of platform service. Of the eight cars destined to eastern carriers in the New York area, actually only two were delivered to Manhattan, one to Long Island City, and one to Brooklyn, likewise requiring harbor service, with three cars delivered to New Jersey points but not involved in the particular issue, with one remaining car showing for diversion at Potomac Yard then showing no destination and no possibility of knowing what final service was required.

It is evident from the facts that platform service is incurred by some of the shipments of official-southern traffic, but the southern lines excluded platform costs in each territory, the reason being that for the northern lines "such costs are no longer part of the service covered by the line-haul rates but are covered by a separate charge collected and retained by the northern lines." The southern lines excluded their own platform costs in the interest of relative equality between the territories.

In prior years platform service was considered a part of the line-haul service covered by the through rate and accordingly, platform costs less the incidental revenues were correctly included in computing the cost for the line-haul service. Thereafter, however, the conditions at the unloading facilities changed again. Whereas, prior conditions necessitated that shippers be denied access to the cars for unloading at piers, the new conditions permitted shippers

access to the cars with the result that unloading was no longer a part of the line-haul service provided by the railroad but became the responsibility of the shippers, as it occurs at other destinations in all territories. The Commission took cognizance of these changed

[32]

circumstances in *Increased Freight Rates,* 1958, 304 I.C.C. 289, 375 of which the following quote from item 12 reads:

> The line-haul rates on this traffic are designed to cover only normal delivery and do not include compensation for the loading and unloading services, the line-haul rates on the perishable traffic being generally below out-of-pocket costs.

For the purpose of comparing relative territorial cost levels the inclusion of both the incidental revenue and the costs of platform service are correctly shown in Rail Form A; however, where the purpose is to measure the cost of services performed under the line-haul rates to be divided, it is correct to exclude platform service which is not in the scope of the rates.

c. Switching and terminal companies:

To better understand the switching charges at Chicago and St. Louis, such charges must be considered in the light of rail Form A procedures for switching and terminal companies.

Under rail Form A, as applied by the Cost Finding Section, 75 percent of switching and terminal company costs in the above mentioned cities are divided equally between eastern and western lines. Also rail Form A uses as one of the basic sources of information the Freight Commodity Statistics. The cars originated, terminated and interchanged used in the above formula are derived from the Freight Commodity Statistics. The southern lines contend

that, if a car is terminated on the Illinois Central by the Belt Railway Company of Chicago, the Illinois Central pays the Belt Railway of Chicago a switching charge and this switching charge is debited to account 101 by the class I railroads and this amounts to a deduction from the freight revenue account.

Rail Form A does not include actual switching charges paid by line-haul carriers but substitutes therefor the expenses of the switching and terminal companies for performing this work. Nevertheless, the divisor, the figure that is used to divide into the origin and destination switching costs, includes a count for this car. If this is multiplied by many thousands of cars, an inconsistency in the unit cost would be brought about as a result of having cars in the divisor without having corresponding costs related to these cars. By reason of the method of accounting which the class I railroads employ to cover amounts which they pay as switching absorption, and the like, which they pay to these switching and terminal companies, this does not show up as a cost in class I railroad accounts. In

[33]

separating the costs of such switching and terminal companies as between the different railroad groups, the procedure followed by the Cost Finding Section is as follows:

	Eastern district	*Western district*	*Southern region*	*Total*
Chicago, Illinois	50	50	—	100
St. Louis, Missouri and East St. Louis, Illinois...	50	50	—	100
New Orleans, Louisiana ...	—	50	50	100
Louisville, Kentucky	50	—	50	100

When a switching and terminal company is located on the border between two territories; one half of the amount

for line-haul service is allocated to each territory. Thus, at Chicago and St. Louis areas, a half is allocated to eastern district and the other half to the western district.

The southern lines accepted the Rail Form A in general, but feel that the situation at Chicago and St. Louis areas, which divides between eastern and western districts, however, fails to recognize that carriers assigned to the southern region pay for the services which the switching and terminal companies at those points perform for the origination or termination of cars reported in the statistics of southern region carriers. They maintain that since the reported statistics assign to the southern region carriers the cars switched for their accounts by the switching and terminal companies at those points, the portion of the switching and terminal companies' expenses which are associated with switching such cars must be allocated to the southern region carriers, in order to determine the actual unit costs.

To accomplish this the southern lines determined first, the proportion of the total transportation revenues of each switching and terminal company at the preceding mentioned cities, that was paid by the southern region carriers, and, in turn, assigned the relative proportion of the switching and terminal company cost to the southern region. Although the southern lines' apportionment for the switching and terminal companies on the basis of total transportation revenue is not a recommended method, but due to the lack of a more suitable procedure it will be accepted for this proceeding. This adjustment increased the southern lines' proportion of the costs of official-southern traffic by 0.16 percentage points or in revenues about $794,000.

The northern lines maintain, a different viewpoint toward these switching points at Chicago and St. Louis areas, in that Chicago is not now a primary break point on the North-South traffic and that East St. Louis is such a break point only with

[34]

respect to certain Mississippi Valley traffic and that it is improper to take any portion of the expense of switching and terminal companies in the North and put it into the costs used to price out southern lines' services south of the primary divisional gateways. Regardless where the break point for dividing revenues is located the cost on each side ought to be properly computed and the so-called territorial costs are in reality, groups of carriers operating principally in each territory.

We are of the opinion that the southern lines are justified in making this adjustment of the switching and terminal company costs, at Chicago and St. Louis areas, for the reason that these cars are counted in the southern region and, accordingly, the expenses associated with them also should be included in that region.

d. Count of cars interchanged and originated and terminated:

The southern lines contend that for the purpose of determining relative costs incurred by northern and southern lines, it is necessary that cars receiving comparable service be counted in a consistent manner in both territories.

Rail Form A cost applications are based on the count of cars from the Freight Commodity Statistics, which briefly stated, provide that certain cars carrying shipments which are transferred between rail and water carriers, such as lake cargo coal, tidewater coal, and ex-lake ore, will be classed as cars interchanged and that certain other cars carrying shipments transferred between rail and water carriers will be classed as cars originated or terminated. This creates a situation where a car of coal transferred to a ship at an Atlantic port would be classified as interchanged if the shipment is destined to New England and as terminated if the coal is destined to Europe. Further,

coal in official territory going to Canada and transferred from rail to vessel at a Great Lakes port is interchanged, whereas phosphate transferred from rail to vessel at Tampa, Florida, is terminated. These are examples of cars which receive analogous service but are placed in different categories.

The southern lines urge that all of these cars which receive this port service should be classed as originated or terminated because they all receive similar switching service and that the fact that a larger proportion of these cars in the North than in the South was classified as interchanged inflates the terminal costs more in the North than in the South to their disadvantage. To correct this inflation, they examined the information furnished periodically to the Commission for the purpose of reconciling its One Percent Waybill study of terminations with the Freight Commodity Statistics and found that 1,803,499 cars in the North and 129,019 cars in the South should be changed from "interchanged" to "originated plus terminated." This increased the number of cars originated and terminated by 5.4 percent for

[35]

eastern district, 8.7 percent for Pocahontas region, and 1.1 percent for the southern region. This had the effect of reducing the costs $2,003,871 in the North and $555,541 in the South, and of changing the South's proportion of total costs from 53.44 percent to 53.67 percent, an increase of 0.23 percentage points.

The northern lines show that the switching characteristics of the port service between rail and vessel of this traffic are more akin to interchange than to terminal service, that interchange costs vary greatly, and that the information available is inadequate to correctly compute the adjustment.

The switching characteristics of this traffic are described by a northern lines' witness, as follows:

> That the service at tidewater ports on coal, and at the lake ports on coal and ore, is interchange rather than terminal is apparent from the facts with respect to these services. Taking lake cargo coal as an example, the coal trains go to the railroads' lake front yards at the ports. Unlike cars which are to be terminated, the lake cargo coal cars are not then moved to various industries in transfer runs and then switched to effect delivery at the consignee's plant. Rather, they are moved to a dumping machine at the railroads' water front yards and there dumped into the lake vessel. It is obvious that this service is much more akin to a movement to an interchange track than to a transfer and switching movement to effect delivery to a consignee. The fact that the car is not given over to the boat line along with the lading cannot, in itself, mean that the shipment is not interchanged. The interchange of an l.c.l. shipment between railroads is not accompanied by a delivery of an interchange. Also, the fact that the interchange is with a boat rather than with a railroad—that the movement is to a dumping machine rather than to an interchange track with another railroad—cannot detract from the essentials of the operation and their significance from a cost standpoint.

The northern lines cite the following examples to show that interchange costs vary greatly and that the "lake cargo coal, tidewater coal, and ex-lake ore" are not in a class by themselves:

> Of course, interchange service may involve high, low, or average expense, just as terminal service may involve high, low, or average expense. For example, the interchange of cars between railroads in New York

Harbor necessitates the expense of floating service. So does the interchange of cars between the Pennsylvania and connecting lines at Norfolk. Another illustration of an expensive interchange service of cars is in the

[36]

case of traffic which formerly moved between interior points in the East and interior points in the Southwest over the so-called break bulk water routes. This traffic, even where moving under joint rates (like some of the lake cargo coal traffic) required transfer from car to vessel at the ports.

They also urge that the information furnished to the Commission for purposes of reconciling the Waybill study with the Freight Commodity Statistics is inadequate for the purpose of computing the number of cars to be transferred from interchange service to terminal service and that a substantial portion had to be estimated.

There is a great variation from one point to another in the amount of both terminal switching and interchange switching due to the physical layout of the tracks, volume handled, and other causes. Rail Form A gives an equating factor of 1.0 to origin or destination switching and a factor of 0.5 to interchange switching which reflects the relative amount of switching based on careful studies. The northern lines have referred to the similarity of switching at lake ports to interchange switching. Also, because of the large volume of this traffic it lends itself to multiple-car block switching which is less costly than terminal switching and would justify an equating factor of less than one. The reconciliation between the Waybill Study and the Freight Commodity Statistics has to do only with terminations, and therefore the large blocks of traffic received by boat, transferred to car, terminated on rail, and which were counted as interchanged at the port had to be estimated by respondents. How much was estimated, or how reliable the

estimate, is unknown. It cannot be determined from the evidence whether or not the southern lines' adjustment of the car count would enhance or detract from the accuracy of the costs and for this reason it is not included in our restatement of costs.

e. Car costs:

The traffic study shows that of the official-southern traffic 15 percent of the cars are refrigerator and tank cars (mileage cars) and 85 percent are per diem cars. It is the car costs of the per diem cars which are at issue. The southern respondents say that the territorial differences in car costs are due to factors unrelated to the traffic in this case and that U. S. average car costs should be used in both territories. The amount of the difference in car costs reflected in Form A for a box car with a 28.9 ton load moving 350 miles with one terminal is given as

Official territory	$16.20	131%
Southern region	12.27	100%
Difference	3.93 *	31%

* Assuming equal empty return ratios.

[37]

The relative size of this difference may be judged by comparison with the total out-of-pocket cost of the same service in the southern region of about $85.

The study also shows that 27.43 percent of the box cars are owned by carriers other than official or southern carriers. The same rate of per diem is paid on both sides of the border. The witness gives this as an example of equal car costs in both territories. If it takes more days in one territory than the other to make a trip of equal distance, it would cost more because more days per diem would have to be paid for the same trip. Some showing of equivalent

utilization in each territory such as average box car miles per car day, is necessary to show equal per diem cost.

The southern lines give three reasons why car costs vary among territories and say that none of these reasons has any bearing on the relative costs incurred in handling the official-southern traffic. The first reason given follows:

> The system average car cost reflects the composite cost of the car fleet owned by each group of roads. This is a different car fleet in each territory and is very different from the consist of the cars handling official-southern traffic.

About 82 percent of the car-miles of study traffic (per diem cars) in each territory are handled in box cars.

It is stated that differences in the car costs produced by Rail Form A as between territories do not measure the differences in the cost of repairing box cars but rather the difference in the composition of the car fleet.

Information is furnished as to the percentages of ownership of each type of car in each territory and the percentage of car-miles made by each type of car. The percentages of ownership are more meaningful because the owning road bears the cost of repairs, depreciation, and return. The proportion of box cars in the North is 36.9 percent and in the South it is 37.9 percent. This is a difference of only one percentage point and too small to be significant. The major differences in ownership are that the North has 7.6 percentage points more open hopper cars and the South has 7.0 percentage points more rack cars. Another witness for the southern lines shows that costs per day or per year for repairs, depreciation, and return are insignificant as between types of cars and that utilization is the main factor causing a difference in costs between types of cars.

Thus, the effect of the composition of the car fleet on

[38]

costs developed in Rail Form A can be measured by its effect on car utilization, and this is computed as follows:

Type of car	Miles per year	Percentage of ownership		Miles per year of composite car	
		Official territory	Southern region	Official territory (2) x (3)	Southern region (2) x (4)
(1)	(2)	(3)	(4)	(5)	(6)
		Percent	*Percent*		
Box	19,635	36.9	37.9	7,245	7,442
Flat, including rack	12,456	1.8	9.7	224	1,208
Stock	16,953	.7	.6	119	102
Gondola	9,503	17.5	15.2	1,663	1,444
Open hopper	11,827	40.4	32.8	4,778	3,879
Covered hopper	13,816	2.5	3.8	345	525
Other (average)	15,178	.2	-0-	30	-0-
		100.0	100.0	14,404	14,600

The composition of the car fleet has such a small effect on utilization that some other reason must be found for the difference of 31 percent in the car costs of the two territories.

The second and third reasons given by the southern lines to explain why the higher system average car costs in the North do not apply to the traffic at issue are:

> The system average car cost developed in Rail Form A is strongly affected by per diem debits or credits. This has a distorting effect because the basis used in computing Rail Form A costs differs from that used in determining per diem rates, and;
>
> The unit cost for car costs is determined by dividing cost of cars owned by the car miles operated. The numerator and the denominator do not represent the same cars in any given territory.

These two reasons are related and must be discussed together. The Rail Form A group I car costs of a railroad or territory include principally car repairs, depreciation, and return on all cars owned. Per diem payments for foreign cars serving on this road or territory are added and per diem receipts from owned cars serving on a foreign road or territory are deducted. The inclusion of the per diem settlements adjusts the costs from the basis of cost of cars owned to the basis of cost of cars serving on the road or territory. These latter costs are divided by the service car-miles to give a cost per car-mile. Thus, the numerator and denominator are consistent; both represent cars serving on the railroad.

[39]

The determination and fixing of a rate of per diem which is fair as between all railroads and sections of the country is a difficult and complicated problem into which many considerations enter. However, after the rate is determined it becomes an actual receipt or disbursement settled in dollars and cents and properly a part of the costs for each road and territory in the year incurred.

There are very real differences in the car costs in each territory and the causes are known. Among these causes are: a difference in utilization of 39.4 car-miles per day in the North and 49.5 car-miles per day in the South; differences in taxes and wage rates; and a difference in the relative amount of off-line use of owned cars which is only approximately offset by per diem settlements.

The car costs are especially critical in this case because there is a greater relative use in the traffic here at issue of cars owned by official territory railroads than of cars owned by southern roads. Eliminating cars of other ownership for purposes of comparison, cars owned by official territory railroads made 54 percent of all car-miles although only 41 percent of those car-miles were run in official territory.

The use of a national average car cost conceals territorial differences in cost which are important in the consideration of divisions between territories and therefore separate territorial freight train car costs will be used in our restatement.

f. Freight car empty return ratios:

The southern lines' general viewpoint is that the history of costs is a progressing increase in the degree of refinement away from system average costs. Form A departs from over-all system average costs by separating line-haul and terminal, assigning costs on the basis of load per car, and separating tare weight and empty return ratios by type of car. Territorial empty ratios for all types of cars were separated into empty return ratios for each of six types of cars in the first 7-day study (August 15, 1948 to July 11, 1949) and ten types of cars in the second 7-day study (October 22, 1956 to August 18, 1957). The effect on the empty ratios of dividing "gondola and hopper" into three types and "flat" into two types of cars is discussed. A further refinement of empty return ratios among the kinds of box cars and refrigerator cars is consistent with cost finding development and necessary to more accurately measure the costs of the traffic at issue.

The southern traffic study shows that 69.3 percent of the car-miles are incurred by box cars and 9.7 percent by refrigerator cars. The southern lines changed the empty return ratios

[40]

for general purpose box cars from 39 percent in official territory and 33 percent in southern region to 30 percent in both territories and the empty return ratios for refrigerator cars in official territory from 90 percent to 75 percent and

in southern region from 76 percent to 84 percent. The effect of these adjustments was to increase the proportion of costs in the South by 0.51 percentage points.

Box cars:

The northern lines in applying rail Form A used empty return ratios based on a 7-day study of loaded and empty car miles which produced for each group a single ratio covering all types of box cars and another ratio covering all ownerships of refrigerator cars. In this category of box cars are (1) general purpose cars which can be utilized by and are available to all shippers for loading all types of commodities not requiring special type equipment, and (2) box cars suitable for loading special commodities which, though they may be suited for some type of return load, are in assigned service and thus returned empty (some exceptions) to the point of loading. This includes cars used for transporting auto parts, which utilize cars specifically designed to handle such commodities. This empty return ratio, which is questionable, is contrasted by the southern lines with average ratios of less than 40 percent for all box cars including the assigned cars.

The southern lines present the following items in support of their position:

1. A brief arithmetical computation showing that if special box cars have an empty return ratio of 100 percent and general box cars one of 30 percent, or if special box cars account for 13 percent of loaded box-car-miles in the North and 4 percent in the South, the result will be an over-all empty ratio of 39 percent in the North and 33 percent in the South, which is what the 7-day study produced. . .

2. A showing of the Commission's Transport Statistics of the U.S., 1956 as follows

BOX CARS OWNED

Territory	*Total*	*Special Device*	*Percent Special Device is of Total*
Eastern District	267,266	26,779	10.03
Pocahontas Region	32,834	1,501	4.57
Eastern plus Pocahontas	300,100	28,280	9.42
Southern Region	100,191	4,122	4.11

The southern lines point out that the above indicates that the southern carriers own substantially fewer device cars than do the eastern or official carriers involved in this proceeding.

3. The following showing of the relationship in each territory between the amount of traffic commodity Class No. 623, Vehicle

[41]

Parts, N.O.S., and Total Manufactures and Miscellaneous based on carloads originated and terminated and on freight revenue:

	East. Dist. + Poca.	*South*	*Total (Col. 1 + Col. 2)*	*% Sou. of Total (Col. 2 + Col. 3)*	*% East. Dist. + Poca. of Total (Col. 1 + Col. 3)*
	(1)	*(2)*	*(3)*	*(4)*	*(5)*
CARLOADS ORIGINATED AND TERMINATED

% Vehicle Pts.	6.55%	1.64%			
FREIGHT REVENUE					
Vehicle Pts. NOS	$ 130,212,468	$ 19,329,691	$ 149,542,159	12.93	87.07
Mfrs. & Misc.	$1,827,508,648	$625,523,731	$2,453,032,379	25.50	74.50
% Vehicle Pts.	7.13%	3.09%			

The southern carriers state that this shows they participated to a much more limited extent in vehicle parts, N.O.S. than do the official carriers.

4. The following showing of the empty return ratio of box cars and the proportion of vehicle parts traffic to all traffic in box cars for each of the 3 groups of railroads:

Official Territory	*Box Car Empty Return Ratio*[2]	*Percent Vehicle Parts 623 to Total Box Car Traffic*[3]
Roads Serving Detroit Having Heavy Proportion of Vehicle Parts to Total Box Car Traffic[1]	49%	14.5%
Other Official	34%	4.2%
Total Official	39%	6.8%
Southern Region	33%	2.6%

5. Undertake to establish statistically the effect on the empty return ratio of eliminating vehicle parts traffic. The waybill study does not show for interterritorial traffic the

[42]

number of car-miles in each territory and, therefore, it was necessary to approximate this missing element by combining certain items and proportions in the waybill study with originations and terminations and revenues from the Freight Commodity Statistics. The final result after

1. NYS, Wabash, C&O, DTI, and GTW.

2. ICC Seven-day Study.

3. Percent carloads of Vehicle Parts 623 handled in box cars and percent carloads of all traffic handled in box cars from ICC Statement No. TC-3, 1956, applied to total carloads handled, vehicle parts and total carloads all traffic, respectively from Freight Commodity Statistics, Year 1956.

eliminating vehicle parts traffic shows an empty ratio which is four percentage points higher in official territory than in southern region.

There are undoubtedly many instances where specially equipped or directly assigned box cars have a 100 percent empty return, but no one knows how prevalent this is or whether it approaches 50 percent or 100 percent, for this class of cars. The five items above tend to show that these cars have an effect on the empty ratio, but do not support any conclusion as to the amount of the effect. They will be analyzed below:

1. This is merely a computation showing what the effect would be if certain assumptions are made. By itself it does not prove that those conditions actually exist.

2. This shows the percentage ownership of box cars by railroads in these territorial groups. Cars are interchanged between territories and it is quite probable that cars of eastern ownership travel many car-miles in the western district. It is the car-miles in each territory which affects the empty ratio and the relative ownership may or may not coincide with the relative number of car-miles.

3. The use of the relations is between the numbers or carloads and the revenues of vehicle parts to total manufactures and miscellaneous group of commodities does not measure the relationship of special box cars to total box cars for the reason that many box cars carried commodities other than manufactures and miscellaneous and that vehicle parts do not all move in special box cars.

4. A comparison based on only three observations could easily be a coincidence or caused by some unknown factor.

5. The statistical determination of the effect of special cars on the empty return ratio for all box cars is based on certain assumptions, such as, that Commodity Class 623, Vehicle Parts, N.O.S. moves in special cars only and

that all special cars have a 100 percent empty return. These assumptions have not been proven. In fact, 12 percent of the vehicle parts move in other than box cars. This statistical determination is attempting to show an effect on the empty ratio with an exactness or accuracy of small percentage. This degree of accuracy

[43]

is impossible in this particular computation because the individual steps taken to arrive at the answer contain estimates or approximations, which although valid in a general way, contain a generous margin of error. For example, the percentage distribution of intraterritorial car-miles include different amounts of car-miles made by other than box cars in each territory. The equating factors for revenue are also only a rough approximation.

It is claimed that the unbalanced flow of traffic to and from Canada contributes to the high empty return ratio in official territory. A study based on Canadian commodity statistics shows that, excluding automobiles and parts 468,456 carloads were delivered to Canadian connections and 691,316 were received. If every carload going to Canada could be placed in a car from there unloaded here it would produce the following result:

691,316	southbound loads	
468,456	northbound loads	
222,860	empties	19%
1,159,772	total loads	100%

Thus under perfect conditions, which are never obtained, an empty ratio on Canadian traffic of 19 percent is possible. The figures given as to the unbalance in traffic flow do not appear to indicate that Canadian traffic has a greater empty return ratio than other traffic.

Refrigerator cars:

The 7-day study developed empty return ratios for eastern district of 90, Pocahontas of 86, and southern re-

gion of 76. The southern lines state that these are not representative of north-south traffic because they include meat, of which very little moves between the North and the South, and has a 98 percent empty return. Southern traffic study shows 80,379 refrigerator cars of which only 1,642 or 2 percent are meat. The waybill study shows that based on originations and terminations (not car-miles which are not available) fresh meats constitutes 19.1 percent of refrigerator car traffic in official territory and 7.2 percent in southern region.

The southern lines show that the 7-day study produced varying results for individual days ranging from 96 percent to 66 percent empty return ratio for refrigerator cars in the southern region. The empty and loaded refrigerator car-miles of the principal car owning companies in the southern region obtained from replies to questionnaires sent to the southern roads indicate an empty ratio of 84 percent for all traffic (but not all ownerships) in 1956. This coincides with ratio reported by the A.A.R. Car Service Division on Form CS-57A. This empty ratio of 84 percent is considered more accurate by

[44]

the witness than the results of the 7-day study because it is based on records for the full year and is used in the southern lines' cost study.

The southern lines are unwilling to accept the empty return ratios for refrigerator cars in official territory developed in either the 7-day study or the CS-57A reports, and use instead an empty ratio of 75 percent which is the experience of Fruit Growers Express in official territory. Fruit Growers Express handles only 43.3 percent of the North-South refrigerator traffic but the loaded and empty refrigerator car-miles of the other companies were not available to the southern lines.

These studies of refrigerator car traffic, like the Commission's 7-day study, cover intra-territorial traffic and traffic from and to other territories and is not confined to

North-South traffic. However, unlike the Commission's study, they do not include all traffic and they are not on a comparable basis in both territories.

For the reasons discussed above, we feel that the empty return ratios for both box and refrigerator cars developed by the special studies of the southern lines are not as good an estimate of the empty return incurred by the official-southern traffic as are the territorial empty return ratios developed by the Commission's 7-day study.

g. Short lines (class II railroads):

The southern lines considered it an improper procedure to price out the services of the short lines (class II railroads) on the basis of territorial average class I railroad costs. They measured in their traffic study the amount of service rendered by short-line roads, and in doing so adjusted their Form A territorial average costs, which were based on class I railroads to reflect the level of cost of the short lines and, in turn, applied these adjusted unit costs to the service units of the short lines. This increased the southern lines' proportion of the costs by 0.09 percentage points or in revenues about $446,000. They employed the following procedure in their cost study, in order to reflect the level of short-line costs:

1. The total costs of each short line that participated in the official-southern traffic was determined from the 1956 annual reports of each carrier.

2. The costs which were imputed to the operations of each short line by the rail Form A costs of the class I roads were then aggregated.

[45]

3. The ratio of (1) the actual costs to (2) the cost imputed by the rail Term A costs of class I roads was computed for each short line.

4. And finally, the ratios thus developed were applied to the territorial Form A costs of official-southern traffic on each class II road.

The actual expenses and traffic volume for the year 1956 as reported by the class II carriers in their annual reports were used in computing these costs.

The northern lines objected to the southern lines assuming certain information, such as the compilation of 1956 cars originated and terminated that were on the basis of 1955 operations, and that the traffic consist, operating characteristics and the resulting expenses would be the same for 1956 as for 1955. In the reports for the typical short line the southern lines had the tons, but not the cars originated and cars received, and other categories of tons handled.

The southern lines' traffic study showed the number of cars originated or terminated on short lines for the official territory and southern region to be:

Traffic originated or terminated on other than class I line-haul roads participating in official-southern divisions

	Number of cars	*Percent of cars*
In official territory	16,697	1.73%
In southern territory	55,826	5.77%

The northern lines did not question the count of car data regarding short lines (class II railroads) on the abstracts underlying the southern lines' traffic study, but the northern lines observed that:

> . . . there are many class II railroads in official territory which perform only switching or terminal service, whose charges for such service are paid entirely out of eastern line-haul carriers' revenue, and whose participation is not ordinarily shown on the abstracts.

[46]

The southern lines introduced the following table to illustrate the imputation of class I railroads' costs to the

services of these short lines, based on 15 class II railroads in each territory:

Costs of short lines in year 1956

Imputation of class I roads' costs compared with application of the actual costs of the short lines

Source	*North*	*Percent*	*South*	*Percent*
Territorial average Form A costs	$537,359	100.0	$1,594,486	100.0
Southern lines' study of short line costs	509,943	94.9	1,963,632	123.2
Difference	−27,416	−5.1	+369,146	+23.2
Northern lines' study of short-lines' cost	496,545	92.4	1,878,029	117.8
Difference	−40,814	−7.6	+283,543	+17.8
Difference between northern lines' and southern lines' studies	13,398	2.5	85,603	5.4

The above table shows that the imputation of class I road costs to the service of these short lines overstates the costs in the north by $27,416 (southern lines' method) or $40,814 (northern lines' method) and understates the costs in the South by $369,146 (southern lines' method) or $283,543 (northern lines' method).

The southern lines reflect the cost level of each short line while retaining the separation between line-haul services (car-miles and ton-miles) and terminal services (cars and tons), whereas the northern lines start with the identical actual car-load freight costs for each short line as used by the southern lines, but instead spread the entire costs of each short line over revenue ton-miles, producing an aver-

age "cost per revenue ton-mile" with no separation of line-haul and terminal services.

In our opinion the southern lines' cost study for short lines is the more acceptable procedure, in that it conforms with the principle of separating between line-haul and terminal

[47]

costs as set forth in Rail Form A. The southern lines' traffic study reflects the *actual* level of costs of each participating short line, whereas the northern lines *imputes* to each short line the cost level of class I railroads. Basically, the class II and the class I railroads should reflect their own respective costs. This adjustment is shown in our restatement of the costs.

h. Adjustment of switching costs to eliminate the effect of volume switching at origin and destination:

The territorial average switching minutes per car at origin or destination in 1956 are as follows:

	Official territory		*Southern region*	
	Box cars	*Other cars*	*Box cars*	*Other cars*
Cost section application of Form A ...	25.9	28.8	17.3	19.2
After the effect of respondents' adjustments for "Switching and Terminal Cos." and "Corrected Car Count"	25.4	28.2	17.8	19.8
After adjustment for volume switching .	27.65	30.72	26.03	26.03
Volume switching adjustment	2.25	2.52	8.23	6.23
Total amount added to costs by this volume switching adjustment	$1,310,743		$3,648,130	
Change in percentage of costs	44.71-44.45=—0.26		55.29-55.55=+0.26	

Some volume commodities frequently move in multiple-car blocks at origin and/or destination with a consequently lower switching cost than for commodities usually handled one car at a time. The following table indicates the significance of certain volume commodities:

	Number of cars originated or terminated (Year 1959)		Number of cars official-southern traffic involved in this proceeding (as shown in southern lines' traffic study)
	On official territory roads	On southern region roads	
Pulpwood	162,572	1,102,741	564
Sand and Gravel	340,072	653,972	2,229
Wet phosphate rock	—	287,892	None
Crushed stone and rock	407,630	813,734	8,372
Iron ore	789,188	113,452	661
Coal	6,186,315	1,915,566	None
Coke	558,823	79,984	2,811
Fluxing stone and dolomite	395,811	3,558	51
Total cars of volume commodities	8,840,511	4,970,899	14,758
Total cars	23,771,003	10,840,187	967,554
Percent cars of volume commodities to total cars of all commodities	37.19%	45.86%	1.52%

[48]

The southern lines urge that their territorial average switching costs are depressed by the large proportion of volume commodities in their region to the point that these costs are not representative of the official-southern traffic which includes only a small amount of these commodities.

For this reason they used in their cost study origin or destination switching costs based on a special study in the South and on an adjustment in the territorial costs in the North.

As stated, there were 967,554 cars of official-southern traffic in the year studied. A preliminary sample drawn in accordance with a scientific sampling plan designed and applied by an expert in sampling, produced a sample containing 497 cars in eight batches. From this a subsample of 83 cars was drawn. Finally a subsample of 41 cars was produced. Of these 41 cars, 16 were terminated 25 originated; 26 were handled by yard engines and 15 by train engines.

The southern lines made switching studies according to the principles of Rail Form F of all cars at each of the points in southern region where a car in the sample had originated or terminated. The switch engine minutes per car for origin or destination switching varied from 3.39 at Huber, Ga., to 72.54 at Gadsden, Ala., with an average 26.03 minutes for all 41 cars.

The 41 car sample was divided into ten subsamples and a "standard error" of 2.2 minutes was computed. It is virtually certain that error due to a sampling cannot exceed three standard errors or 6.6 minutes. This means that if all 967,554 cars had been studied the average of all would have been within the range of 26.03 minutes plus or minus 6.6 minutes, or between 19.43 minutes and 32.63 minutes per car.

The terminal switching cost for the southern region in the South's cost study of all 967,554 cars is based on the 26.03 minutes thus developed.

The southern lines show that they adjusted the official territory costs by applying Pocahontas region switching minutes to bituminous coal for the entire official territory and using special minute per car factors for iron ore and anthracite to washers in accordance with the method used by the Cost Finding Section in the burden studies. This

reduced the minutes per car for these commodities with a corresponding increase for all other commodities.

Evidence was introduced to show that volume commodities comprise over 37 percent of the total traffic in official territory and northern lines point out that if volume commodities exert a depressing effect upon system average switching minutes in the southern region, the presence of volume traffic in the North produces at the very least a corresponding influence on the eastern lines.

[49]

The northern lines urge that thirteen study points used by the southern witness to illustrate the difference between system average and volume commodity switching minutes were selected, "hand-picked", for the sole purpose of showing that volume commodities do depress the territorial average. Thus they are extreme instances, not typical or representative. Two of these thirteen points are also among the places studied for the 41 car sample. Having in mind these two points common to both traffics, the northern lines say:

> And, since it is by elimination of the so-called volume commodities assumed to be lower than average that Mr. Seigler concludes, as he does at page 5, 'that the application of system average southern region costs materially understates the costs actually incurred in handling official-southern traffic', this conclusion is necessarily erroneous.

They also point out that respondents' principal witness in a prior case studied 582 loaded and 591 empty cars of pulpwood, a major volume commodity, and found 14.62 minutes for origin switching and 17.81 minutes for destination switching, which is not far from system average.

These three points, that volume commodities exist in both territories, that the 13 points were hand-picked and

that two were common to the points sampled as representative of official-southern traffic, and that pulpwood, a volume commodity, has average switching minutes, are cited by northern lines to show that there is no necessity to make an adjustment for volume commodities. They also urge that a sample of 41 cars is too small to be relied on to be representative of almost a million cars of study traffic. They show further that the sample included no cars from Boston, Philadelphia, Detroit, St. Louis, or Buffalo, among other large northern cities, and not a single car of citrus or fresh vegetable traffic.

Of the 967,554 cars of official-southern traffic, 46 percent were southbound and 54 percent were northbound, whereas the 41-car sample showed 39 percent southbound and 61 percent northbound. Thus the 41-car sample showed 7 percent too many origin studies and 7 percent too few destination studies as compared to the universe. The 25 cars originated had 24.08 minutes per car and the 16 cars terminated had 29.07 minutes per car. The northern lines point out that although southern lines' operating witnesses have almost uniformly taken the position that it is more burdensome to originate a car in the South than to terminate it, the switching studies of the 41 cars show the opposite.

The 26 cars given yard switching averaged 30.75 minutes and the 15 cars given train switching averaged 17.84 minutes. The original sample of 497 cars contained 59.8 percent given yard switching and 40.2 percent given train switching, whereas of the

[50]

41 cars, 63.4 percent were given yard switching and 36.6 percent were given train switching. The northern lines point out that, to restore in the small sample the 60-40 relationship of yard to train switching shown in the more comprehensive sample, it is necessary to drop four cars of yard

switching from the small sample. If the four cars dropped were those with the largest number of switch engine minutes the average per car for the remaining 37 cars would be 22.30 minutes and if the four cars with the lowest number of switching minutes were dropped the average would be 27.48 minutes.

The northern lines show that the 41 cars were not selected by subsample but were later assigned to subsamples and say that this is a distortion of the use of subsamples which throws doubt on the value of the standard error computed therefrom. They point out that the Form A factors are 17.8 minutes for box cars and 19.8 minutes for other cars, which is an average of about 19 minutes and that the principal witness on sampling for respondents did not claim any greater reliability for the switching study factor of 26.03 minutes than a range of about 7 minutes. 26.03 minutes minus 7 minutes is 19 minutes. Thus, they say, "even if the Seigler studies were to be taken at face value, there is no justification for the conclusion that the involved traffic, assuming it could be found to be fairly typified by the 41-car sample, an assumption which offends common sense, is significantly different from average traffic in the South in respect of switching service rendered, since the claimed excess over average minutes and the conceded range of reliability of the study are almost exactly the same."

As to the 41 switching studies, 40 were conducted in 1960 and one in 1957 whereas the 41 cars were handled during the latter half of 1958 or first half of 1959. Switching minutes were developed for each category of service at all industries in the terminal area. Inasmuch as all cars were included in the divisor in each instance, the minutes attributed to each class of service reflect the average traffic at that station and not necessarily the characteristics of official-southern traffic. No investigation was made to determine whether operations were conducted in 1960 in a manner similar to the time the sample car moved, and no comparison was made of the volume of traffic at the study

points between the two periods. The switching studies were made on a single car basis although at least one car in the sample was picked from an "A" abstract containing 82 similar movements. These 82 cars covered a period of a month, and there must have been at least 3 or 4 cars per day, suggesting multiple-car block switching. A witness for the northern lines made a "mere cursory examination" of the switching studies and found six alleged errors amounting to an over-statement of 63.87 minutes out of 1067.20 minutes. Four of the errors were disputed by the southern lines and two amounting to 21.73 minutes were conceded.

[51]

The northern lines point out that the switching minute adjustment was made on an entirely different basis in the North than in the South and that although the increase in switching minutes in the South was 46 percent for box cars and 31 percent for other cars it was only about 9 percent for both kinds of cars in the North. Since the justification for and intent of the adjustments was to offset the effect of volume commodities on the average, the amount of the adjustments would suggest four or five times as much volume commodity traffic in the South, which is not so.

They also take the position that: ". . . assuming that comparable methods had been followed in furtherance of the sought purpose of the switching adjustments . . . . the net effect of such an adjustment upon relative costs would have been virtually nil because of the similar and hence, at the very least offsetting, consist of the general traffic of northern and southern lines in terms of the respective proportions of volume commodities handled by each."

This offsetting effect can be approximated for official territory by the following computations, the first of which assumes that volume switching minutes are the same as in the southern region, and the second that volume switching minutes are greater in the same proportion as the territorial average:

	Proportion of cars originated or terminated	Switching minutes per car	
	Percent		
Southern region:			
All commodities (regional average)	100.00	× 19.2	= 19.2
Other than volume commodities	54.14	× 26.03	= 14.1
Volume commodities (remainder)	45.86		5.1
Volume commodities (5.1 ÷ 45.86%)		11.1	
Official territory:			
All commodities (territorial average)	100.00	× 27.3	= 27.3
Volume commodities	37.19	× 11.1	4.1
Other than volume commodities (remainder)	62.81		23.2
Other than volume commodities (23.2 ÷ 62.81%)		36.9	
Official territory:			
All commodities	100.00	× 27.3	= 27.3
Volume commodities $\frac{27.3}{19.2 \times 11.1 = 15.8}$	37.19	× 15.8	= 5.9
Other than volume commodities	62.81		21.4
Other than volume commodities (21.4 ÷ 62.81%)		34.1	

[52]

Assuming the same difference between box cars and other cars, the switching minutes per car for other than volume commodities in official territory will be:

	All cars	*Box cars*	*Other cars*
First computation	36.9	34.3	38.1
Second computation	34.1	31.7	35.2
Used in southern lines' cost study	xxx	27.65	30.72

The above computations indicate that the adjustment of switching minutes for official territory made by the southern lines is inadequate by from four to seven minutes in comparison with the adjustment they made for their own region.

Territorial average costs are particularly appropriate to the traffic in this case because it is a large and varied body of traffic going to and coming from terminals in all parts of both territories. The depressing effect, if any, of volume switching commodities on the average would affect both territories and, for purposes of comparison, be largely offsetting.

The switching studies in the South have weaknesses, both in the sample and in the studies themselves. The adjustment in the North was not made on a basis comparable to that in the South, and, in this case where the relationship of North and South is of prime importance, this is a major defect.

For these reasons we conclude that Rail Form A territorial average switching costs are a better measure of the relative switching costs on each side of the border of the official-southern traffic than the switching costs computed by the southern lines.

i. Train tonnage adjustment:

The large volume of coal traffic on the Chesapeake and Ohio and Norfolk and Western railroads has a depressing

effect on the costs of other traffic because it moves in heavier than average trains. Based on testimony in the record that merchandise traffic on the Chesapeake and Ohio moves in trains of 3,200 tons and on the Norfolk and Western in trains of 5,128 tons, the southern lines adjusted the through train weights used in their cost computations, as follows:

	Official territory	*Eastern district*	*Pocahontas region*
Territorial average before adjustment (tons)	3,840	3,434	5,426
After adjustment	3,611	3,434	4,121

[53]

This adjustment had the effect of increasing the costs in the North by $867,319 without any change in the costs of the South and resulted in a decrease of the South's proportion of the costs of 0.14 percentage points.

This adjustment was necessitated by the inclusion of Pocahontas region costs in those of the northern lines and would not be applicable if eastern district costs were used.

Adjustment of constant costs:

The southern lines made two adjustments to constant costs: one, the exclusion of passenger suburban service deficits, and the other, the inclusion in southern lines' costs of the fully-distributed cost deficits on pulpwood and wet phosphate rock which they consider to be related (in transit) to the outbound movement of paper products and dry phosphate rock.

j. Suburban passenger service deficits:

The southern lines argue that the basic reason justifying the inclusion of passenger service deficits as a part of the cost of providing freight services is that such passenger deficits are almost entirely attributable to the apportioned costs of common facilities which must be incurred in any event to provide freight service, and they agree that the

passenger deficits from intercity service should be included in the constant costs assigned to freight service, but they would exclude the deficits from suburban passenger service for the reason that the suburban service facilities are separate and not used in common with the freight service.

They excluded from the cost of official-southern traffic north of the gateways the amount of $2,830,575, based on data presented on behalf of Eastern Territory Suburban Railroads before the Senate Committee on Interstate and Foreign Commerce (April 1960) regarding the suburban service of the Boston and Maine; New Haven; New York Central; Delaware, Lackawanna and Western; Central of New Jersey; Erie; Pennsylvania; and Reading railroads. The amount ($377,070) excluded south of the gateways is based on the suburban service deficit of the Illinois Central Railroad.

The northern lines point out that, putting aside entirely the common expenses that are apportioned between freight and passenger service and considering only expenses that are solely related to passenger service, there is a deficit in the southern region, whereas in both the eastern district and in official territory the passenger revenues exceed the solely related expenses. Further, that it is unfair to exclude suburban service deficits but not the solely related deficits, that if the southern lines should not properly be charged with any part of the deficit in handling commuters from "A" to "B" in the East, it would logically follow that the northern lines should not be required to bear any part of the southern lines' deficit from transporting passengers from "X" to "Y" in the South.

[54]

The southern lines state that, "—the suburban service deficits of the northern roads could be eliminated by the discontinuance of commutation service since the separate facilities maintained solely for suburban service are not used for freight or intercity passenger service". They give the following example: "—Reference to Exhibit J exemplifies

the situation which actually exists. It shows track occupancy by various types of trains in the twenty-four hours of a typical week-day of October 1958 on the line of the Pennsylvania Railroad between Overbrook and Bryn Mawr, Pennsylvania, which is a portion of one of that company's principal Philadelphia suburban lines. It will be noted that there are four main tracks in this territory. The outside tracks—No. 1, Eastbound and No. 4, Westbound—are used primarily by suburban trains; while the middle tracks (Nos. 2 and 3) are used primarily for through passenger and freight trains."

It is true that, in the example given, certain track expenses for tracks Nos. 1 and 4 could be saved by abandoning the suburban service and those tracks; however, other costs related to the roadway would continue, such items as land taxes, grading, ditching, culverts, bridges, and signaling systems. Many large passenger terminals are used by both suburban and intercity passengers. In other words, although many individual items of suburban service can be considered solely related, the facilities and service as a whole cannot be considered solely related to suburban service and treated entirely apart from the freight service and intercity passenger service. Because the suburban service deficit includes costs which must be incurred to provide freight service or intercity passenger service, such costs are properly chargeable to those services to the extent they cannot be recovered from suburban operations, and the deficit from suburban operations should not be excluded from the constant costs.

k. Constant cost of transit commodities:

The southern lines included the following amounts in their costs:

Pulpwood	$7,221,986
Wet phosphate rock	615,883
Total	$7,837,869

These amounts represent the constant costs not covered by the revenue and deficits sustained by the southern lines in handling, within the South, these commodities into mills which originate South to North outbound traffic of paper and paper products and dry phosphate rock.

Both groups have included in their traffic and cost studies the service from point of origin to destination of traffic identified on the interline abstracts as transit traffic. The pulpwood

[55]

and wet phosphate rock movements are not so identified and the tariffs for them do not provide for through rates from the points of origin of the raw materials. However, the southern lines claim that an essentially transit situation exists because they maintain rates on the inbound wet phosphate rock and pulpwood which are conditioned upon the outbound movement by rail of the dry phosphate rock and paper products.

The revenue on pulpwood contributes approximately $5 million per year in excess of out-of-pocket costs, whereas the ton and ton-mile method of distribution assigns about $21 million of constant costs to pulpwood. Therefore, say the southern lines, the constant costs in excess of the contribution of pulpwood ($21 million minus $5 million) must be recovered from the high-rated paper and paper products, including southern-official paper traffic. Approximately 54 percent of the paper and paper products originated by the southern lines moves to destinations in official territory, and this traffic produces revenues 36 percent greater than fully-distributed costs.

The southern lines urge that they maintain the low rates on the inbound raw materials in order to hold the outbound high-rated paper and dry phosphate rock traffic to rail movement for the benefit of all carriers participating in the haul, and since the northern lines participate in the movement of this high-rated traffic they cannot deny the

southern lines divisions which reflect the services performed as an integral part of the joint enterprise.

The northern lines made three principal points in rebuttal:

First: The northern lines can make an even better cost showing on the basis of out-of-pocket costs:

Eastern percentages of total costs on general traffic at average hauls

Year 1956	Fully-distributed 50.7%	Out-of-pocket 51.7%
Year 1957	Fully-distributed 50.9%	Out-of-pocket 52.0%

Even if fully-distributed costs should be completely disregarded the northern lines' case would not suffer, yet the whole basis of the suggested adjustment depends on the use of fully-distributed costs which assign the constant expenses on a ton and ton-mile basis.

Second: The wet phosphate rock and pulpwood move wholly within the South and the northern lines have no participation in their rates, no control over them, and no voice as to their level. These rates on pulpwood "were made on a low basis to attract plants from the North, and now the southern lines want the Commission to require eastern lines to help make up the deficit under constant costs which they incur." The northern lines also point out that another reason for the low level of rates on pulpwood and

[56]

wet phosphate rock is competition from other modes of transportation, also that any commodity which earns $5 million above out-of-pocket costs is, in a sense, very worthwhile.

Third: The northern lines urge that this adjustment cannot be made by the southern lines in their territory alone but, to be fair, must also be made in the territory of the northern lines with respect to the movement of raw materials—like iron ore and coal and fluxing stone, for example—which go into the manufacture of things—like iron and steel—which move from North to South and as to which

there could be no movement without the prior movement of the raw material.

The southern lines justify their adjustment on the basis of "an essentially transit relationship" on pulpwood and wet phosphate rock. On this point the northern lines say: "But a transit relationship is one that is readily identifiable from the tariff and either exists or doesn't exist. If an actual transit relationship exists, then the through rates from the initial origin of the raw material via the transit point to the ultimate destination of the finished product would here be in issue if that movement were between the territories involved. In that situation the through cost would likewise appropriately be considered in fixing divisions. But here no transit is in fact provided by the appropriate tariffs."

They further point out that "The only joint interterritorial rates here before the Commission are those applying on paper and paper products and on dry phosphate rock. The so-called 'tacit transit arrangement' is at best an express recognition of the obvious physical fact that the production of finished and semi-finished products necessitates an inbound flow of basic materials. . . ."

The southern lines' position that losses on pulpwood and wet phosphate rock are incurred in behalf of a joint enterprise (paper and dry phosphate rock traffic) in which the northern lines share is largely refuted by the evidence that these rates are profitable to the extent of $5 million a year above out-of-pocket costs.

The transfer to paper products and dry phosphate rock of that portion of the constant costs allocated to pulpwood and wet phosphate rock which the revenue fails to cover is based on a misunderstanding of the nature, significance, and use of constant costs.

Each shipment must pay its out-of-pocket costs, because they are incurred by and because of that shipment. However, the constant costs, because they are incurred on behalf of the operation as a whole, must be shared by all traffic jointly and in proportion only to the revenue-producing

abilities of each segment. In our judgment, the ton and ton-mile apportionment of constant costs made in the same way in each territory on this large and varied body of traffic is fair to both territories, and the transfer to interterritorial traffic of a part

[57]

of the constant costs which had been assigned to intraterritorial traffic is not well-founded.

Restatement

The cost evidence introduced by both parties was voluminous, appropriate to the issues, and true in the sense that it was represented to be. The differences between the parties were not so much as to the verity of the figures presented as to, first: the degree to which territorial average costs could and should be modified to fit the specific traffic at issue, and second, the meaning and significance of various data and statistics.

Both parties computed the cost of service based on the southern lines' traffic study and the territorial average costs (1956) in Statement No. 2-58, Rail Carload Cost Scales by Territories, prepared by the cost finding section. The southern lines computed costs for all traffic for official territory and southern region and the northern lines computed costs for general traffic (all traffic except citrus fruits and fresh or green vegetables, not frozen-northbound) and citrus and vegetable traffic separately for official territory, eastern district and southern region. The cost computation of each party furnished substantial verification of that of the other party. Further, and positive verification was made by applying the unit costs in Statement No. 2-58, to the service units by type of car.

The charge made by the northern lines that the southern lines omitted 70 percent of the cars in the traffic sample from their cost studies might have been true at some stage of these proceedings but is not true of their final cost presentation.

Our restatement is based on official territory (eastern district plus Pocahontas region) costs north of the break points, for reasons previously discussed, and are at the fully distributed level, as advocated by both groups, on all traffic and incorporates six of the adjustments advocated by the southern lines, as shown in the table below. The figures shown were determined by applying the cost section's unit costs to the southern lines' traffic study.

[58]

Restated costs

All Traffic	*Official Territory*	*Southern Region*
Revenue as settled	$221,431,708	$274,657,572
Percent	44.64	55.36
Fully-distributed costs-unadjusted	169,617,543	194,306,309
Percent	46.61	53.39
Adjustments:		
Exclude platform cost	—2,254,075	— 453,673
Way and thru train separation	—2,283,259	—3,595,230
Switching and terminal companies	— 163,473	+1,039,610
Include short line cost	— 37,725	+ 529,347
Switching minutes—Pocahontas region	+1,310,743	—0—
Train tonnage—Pocahontas region	+ 867,319	—0—
Total adjustment (net)	—2,560,470	—2,479,946
Fully-distributed costs—adjusted	$167,057,073	$191,826,363
Percent	46.55	53.45

As shown above, we have fully reviewed and restated the cost studies as presented by the parties. In addition to these comprehensive studies the southern lines urge that the evaluation of certain additional factors bearing upon costs establishes that their cost study overstates the costs of the northern lines relative to the costs in the South, all to the effect that their showing of the northern lines' costs should be reduced by at least 5 percent. The additional factors which they say should be considered include: (1) overstatement of line haul costs, (2) costs of interchanges between northern and southern carriers, (3) differences in the timing of modernization programs in each territory, and (4) savings which would result from "necessary" elimination of alleged excess capacity and duplicate facilities. The only item to which they attach a cost figure relates to the equalization of gateway interchanges amounting to $1.6 million. As to the balance they agree a precise cost figure cannot be ascertained. We have fully considered these points, and are of the opinion that the service unit costs as determined by the application of rail Form A reflect for the most part the costs which are referred to here, and that as the northern lines contend these factors are partially offset in the South. Our overall appraisal of this evidence is adequately reflected in our conclusions and findings.

[59]

Importance to the public

Section 15(6) of the act also specifies that the Commission in prescribing divisions should give due consideration to "the importance to the public of the transportation services of such carriers". No real issue exists between the contending groups in this respect. Each group is considered to be of equal importance to the public and it is indisputable that this interterritorial traffic could not be handled in one region without the facilities and services of the carriers in the other. In prior territorial-wide divi-

sions cases the public generally has not concerned itself with such issues which primarily are viewed only as a struggle between the railroads.

In this reopened phase, however, certain interests representing the public and certain regulatory bodies were permitted to intervene. The New England Conference of Public Utility Commissioners and the Great Lakes Conference of Railroad and Utility Commissioners intervened purportedly to lend support to the northern lines. These parties did not offer evidence. The Southern Governors' Conference [6] and the Southeastern Association of Railroads & Utilities Commissioners [7] intervened in support of the southern lines, and presented 17 witnesses who introduced evidence designed to show why the divisions of the northern lines should not be increased. Unlike the contentions of the southern lines as a group, their requested finding is that "equal factor divisions should be maintained".

Among the witnesses presented by these interveners were shippers or receivers located at Atlanta, Savannah, and Milledgeville, Ga., Birmingham, Ala., Clewiston, Fla., Winston Salem, N.C., Jacksonville and other Florida points; and Catawba, S.C. Also testifying were representatives of a brick manufacturers association, a textile industry association, the port interests of Georgia and South Carolina, and the agricultural departments of various southern States. In summary they contend that a shift of divisions from the southern lines would result in (1) higher rates on southern inter- and intraterritorial traffic (2) diminution of services, facilities and equipment, both of which in turn would (3) impair the ability of southern shippers to compete in distant markets with consequent less traffic generated, and (4) cause diversion to other modes of transportation, thus impeding the economic growth of the South.

Much of the argument to support these contentions is the same as that made by the southern lines in their brief and discussed elsewhere in this report. There is nothing

concrete of record to support the various assumptions of these interveners. The dire predictions posed by them appear to result from fear rather than fact. The Commission has in the past, particularly in the last two decades, caused a shift of revenues from one group of carriers to another in various divisions cases. Information as to the effect of such shift upon the losing group should be available but the interveners do not substantiate their assumptions with such facts, indeed if any there be.

[60]

Divisions of the Norfolk Southern, et al.

At page 544 of the 1953 report, the Commission quoted portions of the 1939 report, explaining briefly why in that earlier proceeding the divisions of the Norfolk Southern Railway Company, except on peaches, were not made subject to the prescribed basis in 1939, referring principally to the loss occasioned by such basis thus adding to the adverse burden of this railroad.

This line's condition was found considerably improved in the 1953 phase of this case. It then asked for "some small relief" through increased divisions, in which request it was joined by the Atlantic and East Carolina Railway Company. After consideration of the evidence concerning these carriers the Commission was unable to find that a special basis of divisions for them would be justified. One of the considerations which apparently led to this conclusion was the improved financial condition of the Norfolk Southern particularly when compared with rates of return of the northern lines generally and those of the Pennsylvania in particular, with which line it was presumed that the greater portion of traffic through Norfolk was interchanged.

Thereupon these three respondents filed separate petitions seeking reconsideration. It was observed upon reconsideration (289 I.C.C. 4, 8) that the basis prescribed in the original 1953 report would cause these carriers to

incur a proportionately greater reduction in revenue than the southern lines as a whole. The Commission there stated:

> Upon further consideration we are in doubt whether the present record contains all the facts which should be currently considered in establishing a proper basis of divisions of joint rates between official territory and points on these lines.

Accordingly the case was reopened for further hearing, and the order as to these respondents was postponed pending the further hearing which was had in this reopened phase.

Of the three carriers only the Norfolk Southern introduced evidence. Considering first the situations of the Atlantic & East Carolina and the Beaufort & Morehead, the former is now part of the Southern Railway System, which owns all of its capital stock. This acquisition was approved by report decided February 12, 1957, *Camp Lejeune R. Co., Securities and Operation,* 295 I.C.C. 511. This line extends approximately 96 miles from Goldsboro, N.C. to Morehead City, N.C., which is the only interchange point of the Beaufort & Morehead, a line extending 3 miles to Beaufort, N.C. One of the conditions imposed upon the Southern in the cited acquisition proceeding reads (p. 517) as follows:

> That the present divisions of revenues as between the Beaufort and the East Carolina be continued as at present, or as hereafter mutually agreed.

[61]

Inasmuch as the Atlantic & East Carolina now is part of a southern standard line and in view of the above-quoted divisional condition as to the Beaufort & Morehead, it appears that these carriers should not be given special consideration in this phase of the case. Their divisions will be subject to the general basis prescribed.

The situation with respect to the Norfolk Southern, however, does require separate detailed consideration. This line has traditionally been classed as a "weak" line, having been awarded arbitraries in various instances. See *Southern Class Rate Investigation*, 100 I.C.C. 513, 128 I.C.C. 567. As noted in the 1953 report its condition has improved in recent years. Its main line extends from Norfolk, Va., in a southwesterly direction, to Charlotte, N.C., 379 miles, with 210 miles of branch lines; ninety-five percent of its local mileage is in North Carolina, the remainder in Virginia. Its annual system freight revenues approximate $10 million, 34 percent of which is said to be involved here. For purpose of this case, the respondent has divided its traffic into three categories:

(1) Traffic in which the Norfolk Southern participates as an intermediate carrier moving between points in the South and points in official territory. The divisions on this "overhead" traffic is subject to the 1953 prescribed scales. During the constructive year, later described, revenue accruing to the Norfolk Southern in this category amounted to $879,069. No special basis of divisions on this traffic is requested, except that if a change is made in favor of the northern lines, the Commission is asked to see that this line's revenues as a whole will not be diminished.

(2) Traffic originating or terminating on the Atlantic & East Carolina and the Beaufort & Morehead railroads to and from points in official territory moving over the Norfolk Southern as an overhead or intermediate carrier. During the constructive year this category embraced the movement of 1,655 cars, interchanged at Norfolk, 60 cars of which were handled by the Beaufort & Morehead. It is estimated that Norfolk Southern's portion of the revenues would have been about $32,000 less annually if the 1953 prescribed basis had been applicable. All of the traffic in this category must be handled between New Bern, N.C. and Morehead City, or to and from points between Goldsboro and New Bern by

the Southern Railway, a standard southern territory carrier. We are not aware of circumstances which differentiates this traffic from that which originates or terminates on the Atlantic & East Carolina portion of the Southern and is not interchanged with the Norfolk Southern. Revenue accruing to the latter in this category is a matter of subdivisions and should not be made subject to a special basis.

(3) The third category, characterized as "the most important", embraces that traffic which originates and terminates on the line of the Norfolk Southern and moves to or from points on lines of the northern railroads in official territory.

[62]

At page 545 of the 1953 report the Commission stated:

> The divisions of rates to and from the Norfolk Southern are in an unsatisfactory state. To a large extent they are based on rate prorates running back for many years, as to which there is disagreement. The settlements of revenue apparently are determined by the line which collects the charges. It does not appear that the interested carriers have made any effort to adjust their differences, as we suggested in our 1939 report.

In this reopened phase the record fails to indicate that the divisional situation has changed materially since the 1953 report. Substantial evidence was adduced by the Norfolk Southern designed to support a finding that a definite "modernized" basis of divisions be prescribed, all to the end that it "is not requesting an increase in its involved divisions, but requests only that the level of its revenue from this interterritorial traffic be preserved".

For the purpose of showing the characteristics of this traffic the respondent submitted a traffic test covering all shipments of general traffic originated or terminated by it in the two months of November 1958 and March 1959, ex-

panded to an annual basis by multiplying by six, and included separately all shipments of northbound fruits and vegetables for the year 1959. The general study as expanded covers what is referred to herein as the constructive year. The interterritorial traffic originated and terminated on the Norfolk Southern accounted for 15.1 percent of its total carloads, 12.6 percent of its total tonnage, and 23.4 percent of its total revenues, thus indicating that traffic in this category is relatively important to it.

The general traffic test covers 17,292 cars, 638,394 tons, with total revenue of $5,588,844, of which the Norfolk Southern received $2,271,984 (including $10,284 in arbitraries) or almost 40 percent. The northern lines received about $3 million, almost 54 percent. There were 432 cars, 8,501 tons of fruit and vegetables moved in 1959, all of which moved via Norfolk. Of the total revenue, $130,427, the Norfolk Southern also received about 40 percent. About 54.7 percent of the total cars were northbound, accounting for 50.8 percent of the total revenue. Southbound traffic generally consists of higher rated commodities. By far the most important gateway was Norfolk through which moved 13,488 cars, 76.1 percent of the total. Second was Richmond, 1,590 cars, and in third place was Lynchburg, Va., 1,422 cars. The test shows 372 cars interchanged at Roanoke.

The study indicates that if the traffic during the constructive year (including fruits and vegetables) had been subject to the 1953 prescribed basis, the revenue accruing to the Norfolk Southern would have been $450,362 less than that "as settled". The line's net railway operating income in 1958 amounted to $267,700, in 1959, $434,000. It can readily be seen deficits in this respect would have occurred.

[63]

The line is in pressing need of sufficient revenues to improve its physical plant and provide additional rolling equipment. It has paid no dividends since 1957 when it paid 60 cents per share.

Based on average short-line ton-miles distances, the average haul on all originated or terminated traffic during the constructive year was 162 miles south and 365 miles north via all gateways. On traffic moved only through Norfolk (13,488 cars) the averages were 136.6 miles south and 431.3 miles north. On the movement of the 432 cars of fruits and vegetables the averages were 55.2 miles south and 704.2 miles north which tended to reduce Norfolk Southern's average haul down in the over-all figures.

As stated, 76.1 percent of the cars in the traffic test were interchanged at Norfolk. This accounted for 85.9 percent of its total standard line revenue. At that point it interchanges with the Chesapake & Ohio, Norfolk & Western,[8] and the Pennsylvania. Following are various statistics designed to show that the Pocahontas lines (C. & O. and N. & W.) participate in the traffic to a greater extent than the Pennsylvania. During the constructive year the 13,488 cars were interchanged at Norfolk as follows:

	Cars	*Percent*
C. & O.[1]	3,412	25.30
N. & W.[1]	6,503	48.21
Total Pocahontas lines	9,915	73.51
P.R.R.[1]	3,573	26.49
Total	13,488	100.00

The following table shows the number of cars of the numbers shown above which originated or terminated locally on the lines shown:

C. & O.	1,975
N. & W.	3,306
P.R.R.	1,409

On a revenue basis the Pocahontas lines received 52.71 percent of the total (C. & O. 17.70 percent, N. & W. 34.39

1. And/or connections beyond.

percent, R.F. & P. 0.62 percent), the Pennsylvania 24.75 percent and all other northern lines, 22.54 percent. The traffic moved by the Pennsylvania involves a marine service transfer across Chesapeake Bay at an expense of $35 per car.

Rates of return for the southern region and the eastern district plus the Pocahontas region 1952 to 1959 are shown earlier in this report. A comparison of average returns 1946-50 of the latter with the Norfolk Southern and the Pennsylvania are shown at page 546 of the 1953 report. Rates of return 1952 to 1959 of the eastern district (excluding the Pocahontas region), the Norfolk Southern and the three

[64]

connecting lines at Norfolk based on net investment are shown below:

Year	*Percent return Eastern District excluding Pocahontas region*	*N. S.*	*C. & O.*	*N. & W.*	*P.R.R.*
1952	3.43	2.33	6.65	5.43	2.98
1953	3.68	3.39	6.90	5.11	2.98
1954	2.48	1.88	6.16	4.76	1.96
1955	3.64	2.81	7.93	6.94	2.87
1956	3.33	2.81	8.20	7.19	2.76
1957	2.43	2.47	7.88	7.12	1.80
1958	1.13	1.01	6.68	6.63	0.49
1959	1.43	1.50	5.82	7.56	1.26

The northern lines say that the foregoing comparisons of the eastern district, the Norfolk Southern, and the Pennsylvania "are persuasive of the propriety, so far as primary divisions are concerned, of treating the Norfolk Southern in the same manner as other Southern lines, leaving it to

the respective groups to make any neeessary special provisions for the Norfolk Southern through the medium of sub-divisional arrangements."

The Norfolk Southern urges that it would be absurd to diminish its revenue when the major beneficiaries would be the Pocahontas lines whose rates of return are relatively high.

Under a permissive order of the Commission granted in *Pooling of Refrigeration Earnings*, 258 I.C.C. 24, effective as of January 1, 1942, the proprietary lines of the Fruit Growers Express Company were allowed to enter into an arrangement whereby the net loss or gain realized in furnishing protective service could be pooled and at the close of the year such net loss or gain be distributed between the participating proprietary lines on the basis of loaded car miles handled by such lines. Members of the pooling arrangement were the major carriers in the South and "quite a few" eastern carriers that terminated perishable traffic. Norfolk Southern joined about May 1, 1945. However, on and since April 1, 1959, several of the principal official territory lines, including the Pennsylvania, C. & O., N. & W. and B. & O., have withdrawn, so that now only the R.F. & P. is still a member. As a result Norfolk Southern estimates it is losing an average of $49 on each car of originated fruits and vegetables given protective service. It requests that the prorating factor prescribed for it on its originated and terminated

[65]

traffic interchanged at Norfolk be an additional four percentage points higher as a temporary measure until the pooling situation is adjusted.

Norfolk Southern proposes that on traffic originated or terminated by it, interchanged at Norfolk, its prorating factors be made 149 percent of the factors presently prescribed for the northern lines, and on traffic flowing through other gateways, 125 percent. The factors herein prescribed

for application by the Norfolk Southern are deemed to be just, reasonable, and equitable and will apply to all originated and terminated traffic regardless of gateway. In our opinion this will afford the carrier adequate revenues in view of its peculiar situation.

In connection with the second supplemental report, 291 I.C.C. 90, an order was entered making the Atlantic and Danville Railway Company a respondent herein and assigning the proceeding for further hearing with respect to divisions of joint interterritorial rates between points on the lines of this carrier west of Suffolk, Va., and points in official territory. It is understood by the parties that a further hearing in this respect has been afforded in this reopened phase. While there is certain evidence of record of the financial condition of this line, now in receivership, there is nothing specific with regard to the extent of its traffic here involved. It filed no brief and hence has not made any requested finding for special consideration. Its principal connections with lines in official territory are at Norfolk or Suffolk. It is presumed that the remaining traffic is not of considerable consequence. Accordingly, the divisions prescribed herein will apply to the Atlantic & Danville the same as to the southern lines in general.

The Georgia & Florida Railroad (Alfred W. Jones Receiver) also made a presentation in its own behalf, tendered evidence by four witnesses, and filed a brief, although its traffic is included in the southern lines' study and its case was covered by these lines' arguments. This line runs north and south extending from Greenwood, S.C., to South Valdosta, Ga., 284 miles, with branch lines totalling 36 miles. It has never been financially strong, having been in receivership much of its existence, and under its present sole receiver since June 1, 1949. It has never paid dividends and no bond interest has been paid since October 19, 1929. Its annual average net railway operating income 1955-59 was $71,235, rate of return 0.33 percent, with a deficit each year since 1930 in net income after fixed charges.

This respondent submitted a separate traffic study showing the extent of this interterritorial traffic for a constructive year based on actual movements for October 1958 and April 1959. This shows of a total of 3,570 cars, 75 percent were northbound, 25 percent southbound. Revenue thereon "as settled" 45.48 percent north and 54.52 percent south. Further comments on the study are deemed unnecessary.

[66]

So far as shown this is the first time Georgia & Florida has requested special consideration in divisional matters. It now urges that its proportion of through revenues should be not less than the proportion it enjoyed prior to the institution of this proceeding. It suggests that this could "be accomplished by dividing the total revenue on present divisions * * * then reduce official lines' revenue an arbitrary proportion of 10.4 percent" and adding same to its revenue.

This respondent in 1959 was granted loan guarantees for purposes of purchasing new cars and rehabilitation of its line. Because of the use to which the borrowed monies would be put, the receiver submitted figures in *Georgia & F. R. Loan Guaranty,* 307 I.C.C. 707, 307 I.C.C. 453, intimating that its net railway operating income would increase from a deficit of $7,600 in 1950 to $840,000 in 1963. In addition total funds available to meet fixed obligations would increase from $281,952 in 1960 to $514,839 in 1963, the latter exceeding total fixed obligations by $142,977. None of the receiver's optimism was apparently based upon a condition that he receive higher interterritorial divisions.

The Georgia & Florida is the only respondent in either group without direct interchange with a railroad of the other group that is here seeking to be singled out and given preferential treatment. There is no doubt that there are several lines in both groups not differing materially from this respondent. We see no justification upon this record, to give recognition to respondent's requested finding. In

support of the position taken by the southern lines generally in rebuttal of the northern lines showing of the financial condition of certain northern lines, including the New Haven, the southern lines on brief say "If any transfer of the official-southern divisions could be justified on revenue needs grounds, it would not be a change in the primary divisions, but in the subdivisions of the Northern revenue * * *". It is not clear why such argument should not apply with equal force to the Georgia & Florida, a member of the southern lines group. We conclude that the Georgia & Florida is not entitled to a basis of divisions differing from that herein prescribed for the southern lines generally.

Dividing points—In this reopened phase the northern lines again urge that the construction of divisions over fictional break points rather than over actual points of interior interchange results in unjust inflation of southern revenues. They request a finding that the "dividing points to and from which primary divisions shall apply are the points at which the traffic is interchanged between a Northern and Southern line."

This problem has been a vexatious one ever since these general north-south divisions were first considered in Docket No. 24160, the northern lines always contending that actual interchange points should govern, while the southern lines strenuously urged that the primary divide points should be at the territorial border. In the original 1939 report

[67]

(docket No. 24160) the Commission sided with the northern lines, only to reverse its position in its report on reconsideration, 238 I.C.C. 149. Subsequent thereto the interested lines in 1944 entered into what is known as the "Roanoke Agreement" as a compromise on traffic moving through the Ohio River gateways to points in central and Illinois territories. Details of this agreement are stated at page 528 of the 1953 report, and need not be repeated here.

In the 1953 report the Commission again agreed with the northern lines' contentions but upon reconsideration (289 I.C.C. 4) modified its finding, saying: "Upon all the facts before us it would not be desirable to require the use of points in Illinois and Indiana north of the Ohio River as primary dividing points". The northern carriers are dissatisfied with the Roanoke agreement. The southern lines' present traffic test, as stated, embraced a total of 967,554 cars. Of these 86,843 or 9 percent were interchanged at interior Illinois-Indiana junctions, the most important of which were East St. Louis, 28,738 cars, Chicago 19,441 cars, and Indianapolis 12,599 cars.

The following tabulation shows the number of cars so handled by individual lines:

Railroad	*Cars*		
	Northbound	*Southbound*	*Total*
Illinois Central	30,838	15,463	46,301
Gulf, M. & O.	14,476	3,680	18,156
St. Louis-San Fran.	8,832	3,129	11,961
Southern	2,880	2,219	5,099
Louisville & Nashville	2,471	2,798	5,269
Missouri Pacific	—	57	57
Totals	59,497	27,346	86,843

A comparison of the total number of cars moving through primary divide points with those moving through these points but not interchanged follows:

Divide points	*Total Cars*	*Cars not interchanged*	
		Number	*Percent*
Cairo, Metropolis Thebes-Gale	74,504	65,470	87.9
East St. Louis	55,767	11,005	19.7

[68]

The total revenue on the 86,843 carloads was $49,642,442, which was settled 63.9 percent south and 36.1 percent north. If the primary break were made over the actual points of interchange the southern lines would have received 58.4 percent, the northern lines 41.6 percent, a result of which the southern lines would receive $2,743,675 less than at present, an average of $32 per car.

If the Roanoke agreement had not been applied the southern lines would have received an additional $1,981,763, or $15 per car on cars subject to the agreement.

We are not aware of any changed conditions since 1953 favoring the northern lines as to the dividing point issue. We are not persuaded that the Commission should again reverse its position thereon. The prior conclusion (289 I.C.C. 4, 8) that the dividing points to and from which the primary divisions shall apply are the present dividing points is affirmed. This is in harmony with the conclusion reached in *Official-Southwestern Divisions*, 289 I.C.C. 11, 16 (1953).

Divisions of rates to and from points on western lines—The western trunklines [10] named in the footnote on page 91 of the second supplemental report, 291 I.C.C. 90, sought interpretation of the findings in the two prior reports whether such findings embraced divisions of rates from and to points on their lines in official territory to and from points on southern lines. In that report dated November 2, 1953, the Commission concluded that such prescribed basis should be applied to traffic in which a northern line participated. This interpretation was affirmed and elaborated on in the third supplemental report, 294 I.C.C. 739. At page 91 of the second supplemental report, however, the Commission stated:

> Because of doubt whether the record would support findings requiring revised divisions on traffic which they interchange directly with southern lines; as

to which the northern lines were not involved, we do not believe the modification sought by the western trunklines should be made. We deem it proper, however, to afford them an opportunity now to introduce evidence which might well have been presented when this proceeding was being heard if they believe that they are prejudiced by the situation which has resulted from our decision. The proceeding will therefore be reopened for that purpose.

Accordingly, the third ordering paragraph of the order which accompanied the November 2, 1953, report reopened the proceeding for further hearing on this issue. A prehearing conference was held on December 2, 1953, after which counsel for these western trunklines advised the Commission by letter dated January 26, 1954, that the interested carriers had reached an agreement and that further hearing was not needed. Thereupon the Commission by order dated February 1, 1954, vacated the aforesaid third ordering paragraph. This record shows that these agreed divisions are published as divisional

[69]

basis 469, with which the western trunklines since 1954 apparently have been well satisfied.

The order herein of July 20, 1959, issued upon petition of the northern lines for general reopening of these proceedings for further hearing should be construed to include issues as to divisions of rates on traffic which the respondent western trunklines interchange directly with the southern lines. There appears to be no question that the general divisions prescribed effective July 15, 1953, and those to be prescribed in this reopened phase apply and will apply to the joint rates on traffic interchanged with southern lines in which there is participation by a northern line. The southern lines' traffic study includes the latter traffic (46,201 cars) but does not include that which is interchanged directly by a western trunkline and a southern line for the

reason that when the northern lines concluded their direct presentation no evidence had been offered by the western lines who should occupy the same position in these proceedings as the northern lines. The northern lines' general traffic study does not embrace either category.

It was not until the third session of hearings in August 1960 [11] that the western trunklines made their presentation which consisted principally of a traffic study [12] covering the months of March and September 1956, showing separately the number of cars interchanged directly with the southern lines and the number so interchanged in which a northern line participated, segregated by direction and commodity groupings. The study shows 9,814 cars interchanged directly with southern lines, 55.5 percent of which were northbound. The study also shows a movement of 7,195 cars interchanged with the southern lines via a northern line connection, 3,813 cars northbound. The latter category is now subject to the general prescribed basis while the former is subject to the aforesaid agreed basis 469.

The western-line respondents request a finding that the divisions on both categories of traffic should now be the same as are prescribed for the northern lines. In their brief they appear to be under the impression that when the Commission reopened the case in 1953 for further hearing (later vacated) with respect to traffic interchanged directly with the southern lines, all the additional evidence the Commission required was a traffic study and this is all they have supplied in this reopened phase. We are unable to gain such an impression from the prior supplemental reports. The findings in this report will embrace divisions of rates on traffic interchanged between the western trunklines and the southern lines in which there is participation by a northern line or lines. However, the record is inadequate to support findings with respect to traffic interchanged without northern lines' participation, because the record does not show present divisions on such traffic nor the relative service performed by each group. These respondents

have not satisfied the requirements under section 15(6) as to traffic interchanged directly with the southern lines.

[70]

Canadian—Northern Maine traffic—The southern lines' traffic study shows 2,955 cars (3 percent of the total) moved to or from Canadian points on combination rates made over an international boundary point, 2,227 of which were northbound, 728 southbound. A slight controversy exists as to the divisional basis applicable to this traffic, since two southern-territory lines settled divisions on 245 southbound cars on the old 24160 basis. The southern lines are now, in this reopened case, for the first time asking the Commission to avoid any similar controversy for the future by prescribing divisions on this traffic "that reflect its demonstrated characteristic, i.e., 'overhead' traffic for the official territory part of the haul." They urge that since the northern lines perform no terminal service thereon the northern factor should be adjusted to reflect the situation.

The northern lines oppose any special basis on Canadian traffic. They point out that these joint rates are the same as the domestic rates to and from the border points and as such contemplate two terminal services of which southern lines perform but one. They show that of the 2,955 cars involved, 1,324 cars moved through the Detroit, Mich., gateway, 609 of them in connection with the Chesapeake & Ohio, indicating that the latter has to bear heavy expense in addition to that entailed by normal interchange in the Detroit-Windsor area, largely because of the international character of this traffic.

A similar situation exists with respect to traffic moving between the South and destinations in northern Maine on combination rates made over Brunswick or Lewiston, Maine. The joint revenue accruing south of these points is divided on the presently prescribed general basis. Thus the southern lines contend that the northern lines receive compensation for a terminal service which they do not

perform. The southern study embraced 3,158 cars in this category, about 90 percent of which consisted of clay from Georgia origins to paper mills in northern Maine, 80 percent thereof going to Maine Central points on combinations over Brunswick. On March 16, 1960, these clay rates were superseded by single-factor joint through rates over protest of the Maine Central. Clay traffic to Bangor and Aroostook points remained on the combination basis.

The northern lines advance several reasons why this Maine traffic should not be excepted from the general basis of divisions. These include characteristics peculiar in part to New England territory, such as lower traffic density, higher level of costs, multi-line hauls north of the gateways and lower rates of return. These lines urge that the general basis of divisions is required to compensate them fully for the services they perform.

The Commission is required under section 15(6) of the act to consider "whether any particular participating carrier is an originating, intermediate or delivering line." It has frequently recognized the fact that intermediate carriers having no terminal service to

[71]

perform in originating or delivering shipments are entitled to a less proportion of joint rates for that reason. See *Through Routes and Joint Rates,* 174 I.C.C. 477, 485; *Official-Southwestern Divisions,* 287 I.C.C. 553, 580; *Divisions of Rates, Official and Southern Territories,* 278 I.C.C. 89, 94. In the latter two decisions a special basis of division on grain and grain products moving on joint proportional and reshipping rates was prescribed.

The southern lines take the position that the divisions of joint proportional rates on grain and grain products from East St. Louis, Ill., Louisville, Ky., and Cincinnati, Ohio, to points in southern territory are not at issue in this reopened phase for the reason that no evidence relating specifically to this traffic was offered. As stated earlier,

in the 1953 report a separate specific scale of divisions was prescribed to reflect the characteristics of this traffic. The northern factors were made 75 percent of the northern general factors to reflect the intermediate service performed by the southern lines. While no new evidence pertaining to such traffic was tendered here, the divisions thereon are still before us, and in accord with prior practice we are of the opinion that the northern factors should remain at 75 percent of the northern general factors here prescribed. We also conclude that the divisions of the joint combination rates on Canadian and northern Maine traffic, hereinbefore referred to, should likewise be prescribed and subject to the same basis. Our findings herein will reflect these conclusions.

Proposals. The northern lines favor simple modification rather than complete revision of the present divisional scales and ask that we make "such modifications therein as shall serve to redistribute the total revenue between the two groups with primary regard for their relative general levels of costs and relative revenue needs." As reflected in our findings, we agree in principle that this course is most practical.

These respondents contend on brief that "because of their greater revenue need, the Commission should add 10 percentage points to the 25 percent increase that would be justified on the basis of relative costs alone, and thus prescribe, on general traffic, the present divisional factors for southern lines and the present factors increased by 35 percent for eastern lines." On citrus and vegetable traffic their proposition is the same except that their present factors be increased by only 15 percent. They estimate that the divisions thus proposed would increase their total revenue about $35 million annually, making the adjusted rates of return for 1959 for official territory lines 2.42 percent, for southern region lines 3.19 percent.

As stated earlier, the northern lines ask that the divisions of the per car rates on vegetables to New York, N.Y.,

be excluded herein from the general basis and a special provision be applied thereto so that the excess of $57 per car in the New York rates, over and above the rates to Jersey City, N.J., shall continue to accrue to the delivering lines before prorating. They also ask that our findings exclude the divisions of rates on liquid

[72]

caustic soda and soda ash from Saltville, Va., to Kingsport and Port Rayon, Tenn., as to which the present order was vacated by orders entered January 29 and September 18, 1959, in response to joint petitions filed by the interested railroads. In addition these lines request that the divisions of joint rates on all trailer-on-flat car traffic be excluded from our findings so that the parties may be free to negotiate divisions on such traffic as it is inaugurated. Since the divisions on the traffic here sought to be excluded were not specifically dealt with in the original phase of this proceeding and no specific evidence thereon was offered in this reopened phase, we are able to exclude only that traffic listed in appendix B. It would appear that the parties could again accomplish this objective by filing meritorious mutual petitions for vacation of the order in those instances upon which they should be able to agree.

The southern lines would abandon the present scales of prorating factors entirely and substitute therefor scales of prorating factors constructed directly from the costs developed in their cost study. They oppose the use of divisional scales derived from rate scales because of the rate of progression, being partly curvilinear and in part straight line, thus they say favoring the short-haul in the North. The mechanics of the construction of the proposed scales are difficult of brief explanation; a detailed description thereof would serve no useful purpose. In addition, we have not accepted at its face value the cost study upon which the scales are based. The initial factors for the 50-

mile block are 155 South and 137 North. Omitting other 50-mile block factors the proposed scales are as shown in columns 1 and 2 below:

Distance	*Column 1 (South)*	*Column 2 (North)*	*Column 3*
100 miles	214	194	204
200 miles	330	307	323
300 miles	447	421	443
400 miles	563	535	563
500 miles	680	648	682
600 miles	797	762	802
700 miles	913	875	921
800 miles	1030	989	1041
900 miles	1146	1102	1160
1,000 miles	1263	1216	1280
1,100 miles	1380	1330	1400
1,200 miles	1496	1443	1519
1,300 miles	1613	1557	1639
1,400 miles	1730	1670	1758
1,500 miles	1846	1784	1878
1,600 miles	1963	1897	1997

The scale in column 3 above are the northern factors based solely upon the southern-cost study. The column 2 scale is column 3 reduced by 5 percent which these lines say is required

[73]

to correct the relative overstatement of the cost for the northern hauls. The 5 percent increment has been discussed hereinbefore. We give little support to the arguments there presented. It will be noted above that the factors in columns 1 and 3 become equal at 400 miles. The only way the southern lines could reduce the northern factors below those for the South on hauls over 400 miles and thus give the southern lines the larger share of the joint revenue was to

utilize the 5 percent reduction tool. This is clearly to their advantage since the longer average hauls are in the South. These proposed scales would be appropriately modified to cover traffic on which one group performs no terminal service. Upon this record it is manifestly impossible to accept the scales proposed which would transfer an undisclosed amount of revenue to the southern lines over those presently in effect.

The progression of the divisional factors was thoroughly considered at pages 526-27 of the 1953 report. We adhere to the views there expressed. The southern lines also oppose the imposition of the 15 percent minimum. Their opposition rests on the assumption that the integer scales would be constructed directly on cost scales derived from their cost study. Such scales if used, would reflect an allowance for terminal service and hence the prescription of a minimum would be unwarranted. Since we are simply modifying the present scales, which are subject to the minimum, similar action is required in this reopened phase to protect the very short haul carriers which for the most part perform principally orginating or terminating service.

General Discussion and Conclusions

Section 15(6) of the act provides in part as follows:

> Whenever, after full hearing upon complaint or upon its own initiative, the Commission is of the opinion that the divisions of joint rates . . . applicable to the transportation of . . . property, are or will be unjust, unreasonable, inequitable or unduly preferential or prejudicial as between carriers parties thereto . . . the Commission shall by order prescribe the just, reasonable, and equitable divisions thereof to be received by the several carriers . . .

In exercising the function placed upon the Commission in the determination of lawful divisions, the second sentence of section 15(6) provides as follows:

In so prescribing and determining the divisions of joint rates, fares, and charges, the Commission shall give due consideration, among other things, to

[74]

the efficiency with which the carriers concerned are operated, the amount of revenue required to pay their respective operating expenses, taxes, and a fair return on their railway property held for and used in the service of transportation services of such carriers; and also whether any particular participating carrier is an originating, intermediate, or delivering line, and any other fact or circumstance which would ordinarily, without regard to the mileage haul, entitle one carrier to a greater or less proportion than another carrier of the joint rate, fare or charge.

It will be noted that we must give "due consideration" to a number of factors. In one of the first decisions involving these provisions, *New England Divisions*, 66 I.C.C. 196, the Commission said at page 199 "that the relative amount and cost under economical and efficient management of the service rendered is a prime factor in determining the fair and equitable share of joint revenue which each carrier shall receive."

In the 1939 report the cost element was given weight upon a showing that from 1932 to 1936 the cost per revenue ton-mile in the South was about 16 percent higher than that in the North. At page 525 of the 1953 report, as previously referred to, the Commission stated that the record then showed that "for more than a decade the southern railroads have not labored under a disadvantage of operating costs generally higher then those of the northern lines."

As stated earlier, both groups rely heavily upon relative costs of service as a determining factor in this reopened phase. The northern lines say:

It is beyond dispute that the power of the Commission to prescribe divisions of joint rates rests upon Section 15(6) of the Act as that provision has been construed by the Commission itself and by the Courts. Those interpretations make it abundantly clear that relative service costs are a primary consideration and that the Commission must, in addition, weigh the relative financial needs of the carriers involved in the light of the public interest. It is the position of Eastern lines that the Commission should, first, undertake to fairly assess the relative service cost levels of the two groups of carriers, parties to the

[75]

involved rates, and should thereafter adjust its determination made upon the basis of such relative costs to reflect any greater financial need on the part of one of the groups.

The southern lines would have these divisions determined almost solely on a cost of service basis, for, as we have earlier shown, their proposed integer scales are directly related to the showing of their cost study. They agree with the northern lines, however, in saying that the rulings of the Commission establish that "cost of service is of paramount importance in this . . . proceeding."

In commenting upon the importance to be given the various factors set forth in the second sentence of section 15(6) of the act, the district court (Massachusetts) in *Boston and Maine Railroad v. United States*, 208 F. Supp. 661, affirmed 371 U.S. 26 (October 15, 1962) said:

> "Due consideration" is not the equivalent of "primary consideration." The importance to be given any of the factors enumerated in the statute must necessarily depend upon the case under consideration. The evaluation of the importance of the various factors in any given case is peculiarly the function of the Commission.

As shown in our review of the cost evidence there was an increase in the northern lines' proportion of costs in 1950 over that shown in the 1953 report for 1947 but that since 1950 there has been no appreciable increase in the trend favoring the South, that is the spread has not increased to any extent. It is shown, however, that the cost level in 1956, the year both groups used, is somewhat higher in the North than in the South for like services. The northern revenue as settled under the southern traffic study, 1958-59, on all traffic was 2 percentage points less than the fully distributed cost of handling the traffic.

Our review of the economic trends and revenue needs leads us to agree with the southern respondent that the South's economic development since World War II has outpaced the national rate of growth in practically every category, while the North has not been so fortunate. The increase in southern growth is reflected in the freight traffic trends earlier set forth, all to the benefit of the southern lines, as shown in freight revenues, net railway operating income, and rates of return. The divisions prescribed in 1953 did not increase the fortunes of the northern lines to the extent warranted upon this reopened

[76]

record, considering the services performed by each group in the joint effort of handling the traffic at issue. We, therefore, deem it wholly proper upon the record before us in this reopened phase that the proportion of the divisions of these joint rates accruing to the northern lines should be increased by a modest amount. Our findings and our prescribed scales of prorating factors hereinafter set forth are designed to implement and carry out this and other conclusions reached concerning all of the factors which must be evaluated under section 15(6) of the act, and in so doing we officially notice the decision of the Commission of March 21, 1963, in docket no. 31503, *Akron, Canton & Y.R. Co: v. Atchison, T. & S.F. Ry. Co.,* I.C.C.

[77]

FINDINGS AND ORDER.

1. We find that the present primary divisions of joint all-rail class and commodity rates (except those on traffic listed in appendix B) between official and southern territories are unjust, unreasonable, and inequitable.

2. We find that except as hereinafter provided, just, reasonable and equitable primary divisions of the rates referred to in finding 1 (including aggregate of intermediate rates which automatically displace single-factor joint rates) would be determined by use of the prorating factors set forth in appendix D in computing percentages expressed as integers, the factor for the northern line or lines being that shown in column 1 for the short-line distance north of the dividing point and the factor for the southern line or lines being that shown in column 2 for the short-line distance south of the dividing point.

3. We find that just, reasonable, and equitable divisions of the joint proportional or reshipping rates on grain and grain products from East St. Louis, Louisville, and Cincinnati to points in southern territory and of the joint combination rates on Canadian and northern Maine traffic from points in southern territory would be determined in the same manner as specified in finding 2 except that the factor for the northern line or lines would be that shown in column 3 of appendix D for the short-line distance north of the dividing point and the factor for the southern line or lines would be that shown in column 2 of appendix D for the short-line distance south of the dividing point.

4. We find that just, reasonable and equitable primary divisions of the rates on traffic originating or terminating on the line of the Norfolk Southern would be determined by the use of the prorating factors set forth in appendix D in computing percentages expressed as integers, the factors

for the northern line or lines being that shown in column 2 for the short-line distance north of the dividing point and the factor for the southern line or lines being that shown in column 2 for the short-line distance south of the dividing point.

The dividing points to or from which the primary divisions shall apply are the points at which the traffic is interchanged between a northern line and a southern line. In no case shall a primary division be less than 15 percent, and in disposing of fractions of 1 percent the odd 1 percent should be added to the percentage which contains the larger decimal, or if the percentages contain equal decimals 1 percent should be added to the smaller percentage.

[78]

Before the divisions herein prescribed are applied, differentials or arbitraries which are included in the joint rates so as to cause them to exceed standard rates, for hauls in either official or southern territories, whether for short or weak lines or otherwise, shall be deducted before prorating and added to the share of the carrier or carriers in the territory in which the differentials apply, provided, however, that in respect of rates on citrus fruit from Florida to official territory which include an arbitrary one percentage point shall be deducted from the northern division and added to the southern division in lieu of specific apportionment of the arbitrary.

It is the order of the hearing examiners that in the absence of a stay or postponement by the Commission or the timely filing of exceptions, the effective date of this order shall be 30 days from the date of service thereof.

It is further ordered, That the respondents, according as they participate in the transportation, be, and they are hereby, notified and required to establish, within 90 days of the date this order becomes effective, and thereafter to apply, divisions of joint all-rail interstate rates for the

transportation of property between points in official territory, on the one hand, and on the other, points in southern territory, determined as provided in this report.

It is further ordered, That the said respondents be, and they are hereby, notified and required to cease and desist, within 90 days of the date this order becomes effective, and thereafter to abstain from asking, demanding, collecting, or receiving divisions of said joint rates upon bases other than those hereby prescribed.

It is further ordered, That the order entered herein on January 12, 1953, as amended by order dated May 26, 1953, and the subsequent orders entered herein vacating said order of January 12, 1953, as amended, be, and they are hereby, vacated and set aside as of the date the divisions prescribed hereby become effective.

And it is further ordered, That this order shall continue in force until the further order of the Commission.

Dated at Washington, D. C., this 2nd day of July, A. D. 1963.

By the Commission, Oren G. Barber and T. Russell Roper, Hearing Examiners.

HAROLD D. McCOY,
Secretary.

(SEAL)

[1]

APPENDIX A

Footnotes

2. Railroads assigned to the eastern district or Pocahontas region, and the Toledo, Peoria & Western Railroad Company, (291 I.C.C. at 91), are referred as northern or eastern lines, and railroads assigned to the southern region and the lines of the St. Louis-San Francisco Railway Company in southern territory (289 I.C.C. at 9) are referred to as southern lines. Individual carriers will sometimes be referred to by their initials or other short titles.

3. Net investment method is the carriers' investment in road and equipment, material and supplies, and cash; less accrued depreciation and amortization at the end of the year under consideration.

4. Equated car handlings refer to the number of cars originated and terminated and interchanged and weighted by the switching minutes required for such services.

5. The I.C and G.M. & O. reach Chicago, while the I.C., G.M. & O., L. & N., and Southern reach East St. Louis.

6. Insofar as their interest in this proceeding is concerned, composed of the Governors of Alabama, Florida, Georgia, Kentucky, Louisiana, Mississippi, North Carolina, South Carolina, and Tennessee.

7. Composed of the members and member Commissions charged with the regulation of common carriers and other public utilities in the States named in footnote 6.

8. Data herein with reference to the Norfolk & Western where applicable, include the Virginian Railway. These railroads merged December 1, 1959.

9. On June 22, 1960, the Atlantic & Danville filed a petition asking that it be dismissed as a party defendant, or, in the alternative, be dismissed as a party against which any relief should be granted. By order dated July 21, 1960, the petition was denied for the reason that "it is desirable that lawful divisions applicable to all respondent railroads participating in the joint interterritorial rates in issue be determined upon completion of the record and procedure in this proceeding." Attached to this petition were two verified statements and eight exhibits directed principally to the financial and operating statistics of this respondent. These statements and exhibits were never formally made part of the record although the petition states that the

"exhibits and verified statements attached to this petition constitutes its case." Briefs of both principal

[2]

contending groups indicate that such material is probative evidence herein. Accordingly, in fairness to the Atlantic & Danville the aforementioned documents will be considered in evidence unless objection is taken to such ruling in the parties' exceptions to this report. However, on November 1, 1962, after this record was closed, this line was acquired by the Norfolk & Western and is operated under the name of Norfolk, Franklin and Danville Railway Company, thus in practical effect removing the Atlantic & Danville from this proceeding as a southern respondent.

10. The Minneapolis & St. Louis Railway Company has since been acquired by the Chicago and Northwestern Railway Company.

11. There were five sessions of hearings: November 16 to 19, 1959, January 12 and 13, 1960, August 2 to 5, 1960, September 27 to 29, 1960, and February 7 to 10 and 13, 1961.

12. The study excluded carload movements of coal, coke made from coal, grain and grain products, and transit shipments.

APPENDIX B

Traffic excluded

1. Coal and coke made from coal by common consent of the parties.

2. Trailer-on-flatcar traffic moving entirely over the lines of the A.C.L., B. & O., B. & M., F.E.C., N.Y.C., N.Y.N.H. & H., P.R.R., Reading, R.F. & P., and S.A.L., by stipulation at hearing.

3. Trailer-on-flatcar traffic via Potomac Yard, Va., from and to points on the Southern Railway (including its system lines as specified in the stipulation) and points on B. & O., B. & M., C.R.R.N.J., D. & H., L.I.R.R., N.Y.C., N.Y.N.H. & H., P.R.R. and Reading, by stipulation dated November 13, 1961.

4. So-called border point traffic embraced in Docket No. 32055 (309 I.C.C. 491) by stipulation.

[1]

APPENDIX C

Rulings on Evidence

On brief the parties press certain objections made during the course of the hearings to rulings of the examiners with respect to the receipt or rejection of certain exhibits, documents, or oral testimony offered in evidence by the opposing group. Each of the contentions will be considered separately.

Evidence offered by the northern lines.—

Exhibit J-3 to V.S. No. 80 (except pages 1 and 9). During the last session of hearings, assigned for the purpose of receiving the northern lines' rebuttal and to afford these lines their right of closing, the above-numbered exhibit was offered in evidence. This consisted of applications of the form A unit costs for the several territorial regions or districts for 1957, 1958, and 1959 to the traffic embraced in the studies of both groups already of record. Upon objection this material was rejected as not being proper closing rebuttal. The evidence was offered in purported rebuttal of any claim by the southern lines that the group cost relationships as shown by the northern lines would not necessarily be the same for later years. The southern lines' cost evidence did not deal with trends of cost relationships as between the carrier groups. Of necessity the proferred evidence was not available to the northern lines when they presented their case in chief. Receipt of such evidence at the closing hearing would have necessitated further rebuttal by the southern lines and undue delay in closing the hearings. The northern lines did not wish to offer the evidence on this condition. The evidence was properly rejected.

V.S. No. 68, pages 2-6, and exhibits A and B. This evidence, sought to be introduced as rebuttal at the closing hearing, consists of a traffic study for the full year 1956. It was offered in purported rebuttal of the southern lines' assertion that the northern lines' study for a portion of the year expanded to a full year, fully described in this report, was not representative and hence would not reflect the true overall transportation characteristics of the total traffic covered. A portion of exhibit J-3 to V.S. No. 80, rejected as noted above, contained cost applications to this new traffic study. Upon objection, the study was rejected on the ground that it was improper closing rebuttal, absent an opportunity for the southern lines to examine and fully cross-examine thereon at a later hearing. As the northern lines say, "litigation must one day come to an end." They were not willing to afford their opponents opportunity to present rebuttal

[2]

thereto. The traffic study had been completed at the time the northern lines completed their direct case but they chose not to offer it at that time. The offer of same at the rebuttal stage was too late.

Evidence offered by the southern lines.—

Errata sheets to Verified Statements 40 and 40-A. The southern lines offered these errata sheets at the closing hearing after their attention had been directed to the fact that some 86,000 "A" cars were not applied unit costs in the southern lines' cost studies. The examiners felt that since both groups recognized such error existed, an accurate record warranted receipt of the material. The northern lines stressed that a check of such data would be required with further cross-examination of southern lines' witness but they elected not to prolong the hearings for these purposes. The examiners concluded that a special case was presented under which the southern lines should be per-

mitted to correct known errors even though they had rested their case in chief. We adhere to that view, and conclude that the northern lines' position has not been unduly prejudiced by this action.

Other southern exhibits offered after these lines had completed their case. Revised appendices A and B of Verified Statement 42, said to reflect a degree of refinement in the original appendices A and B were offered as newly acquired evidence not available at the time the southern lines had completed their affirmative case. We declined to mark these exhibits for identification nor did we permit an offer of proof.

An exhibit containing correspondence bearing upon the need for developing separate empty return ratios for general service and special service box cars was offered as a counsel's exhibit at the conclusion of the cross-examination of rebuttal presented by one of the northern lines' witnesses as an admission against interest. Similarly an exhibit, extracts from the record in Docket No. 32055, was offered for the purpose of impeaching a witness who had testified concerning empty return ratios on certain northern lines.

The southern lines also offered two other counsel's exhibits, one purporting to show the disposition of terminal allowances received by Maine carriers and the other being a certified copy of testimony presented by the northern lines in Docket No. 31964 to show that the testimony of a northern lines witness to the effect that "intrastate operations of the southern lines are more expenseive than their interstate

[3]

operations was not a proper conclusion. These exhibits were offered "to explain rebuttal testimony".

The southern lines submit that Rule 1.84(e) of the Commission's General Rules of Practice requires that upon request by the offering party rejected exhibits be numbered, identified, and incorporated in the record, and that so construed the rule provides a simple, proper method for preserving for the Commission without prejudice to any party, the question as to the propriety of the examiner's ruling excluding the exhibit. In view of the fact that the southern lines had rested their case, and the time fixed for the filing of their evidence had expired, we deemed such circumstances a bar to the receipt of additional evidence by them, however admissible, in this stage of the proceeding. It was for this reason that the evidence was not marked for identification and that offers of proof in connection therewith were not permitted to be made or received. This and other rulings not specifically discussed herein are affirmed.

APPENDIX D

SCALES OF PRORATING FACTORS PRESCRIBED.

Distance	*Column 1*	*Column 2*	*Column 3*

EXCEPTIONS OF SOUTHERN RAILROADS TO RECOMMENDED REPORT AND ORDER

[8]

A. The Unlawful Refusal of the Examiners to Hold that the Burden is on the Northern Lines to Produce the Evidence Necessary to Prove Their Own Costs of Handling the Involved Traffic.

In the case of each adjustment which the Examiners rejected, the Examiners' restatement of costs used territorial averages for the

[9]

cost element in question. As will be shown in discussing a number of the most important individual adjustments, the decisive consideration in the Recommended Report was not the propriety of adjusting the costs to reflect the handling of Official-Southern traffic as contrasted with the average traffic, but whether the data supporting the adjustment was adequate or comparable.

The issue may be illustrated by one example of the several that will be discussed in connection with the various individual adjustments. The unadjusted Rail Form A average costs use territorial average empty return ratios for all refrigerator cars. The Southern lines assembled records for the full year showing the empty return ratios for the refrigerator car ownerships handling Official-Southern traffic on the Southern lines. The Southern lines also obtained all the data that was available to them to show the empty return ratios actually experienced by the Northern lines for the same car ownerships. The purpose was to confine the empty return data to the refrigerator cars handling the traffic at issue so that the average would not be inflated by the higher empty return ratios of other refrigerator cars used in carrying traffic not significantly involved in this case (as more fully discussed at pp. 54-58, *infra*).

The Northern lines, who benefited by the use of the high average empty return ratio in the North for all refrigerator cars, have in their possession the records showing the actual facts as to the kinds of refrigerator cars used in handling Official-Southern traffic. Instead of presenting that data to provide a comparable showing, the Northern lines found it in their interest insistently to remain silent. When this sort of situation arises, as it did repeatedly in this proceeding, the Commission may not lawfully permit the Northern lines to obtain an increase in their divisions by simply resting upon an inapplicable territorial average cost factor that favors their position where they have it within their power to bring forward more reliable data in their possession.

The present divisions are in the form of a uniform divisional scale equally applicable both North and South of the break points. The great bulk of the cost elements underlying Official territory and Southern Region averages, including train costs, maintainance of way costs, station costs, overhead costs and the like, are no greater in the North than in the South, as shown by the fact that the entire difference in

[10]

the average costs is accounted for by only four or five specific elements of cost.* Since Official-Southern traffic constitutes only 6.0 percent of the total traffic of the Northern lines and 21.4 percent of the total traffic of the Southern lines,** there is no reasonable basis for assuming, particu-

* In the case of box cars, the entire difference in average costs is attributable to five elements: switching costs, car costs, empty return ratios, platform costs and switching and terminal company costs (V.S. 39, pp. 62-63). The car cost element does not affect traffic moving in refrigerator cars (sheet 36).

** The percentages shown are ton-miles of Official-Southern traffic related to total ton-miles for each group (V.S. 36, Ex. 5). The percentages of cars of Official-Southern traffic to total cars originated and terminated are only 4.07 percent for the North and 8.93 percent South (p. 60, *infra*).

larly in the North, that the territorial average costs in fact measure the costs of the particular traffic here at issue. The Northern lines have the burden of showing that the present equality of divisions on Official-Southern traffic should be changed in their favor, and their mere showing that several elements of cost are higher for average traffic in the North does not meet that burden in the absence of a showing that the average is, in fact, applicable to the traffic in issue and in the face of the showing by the Southern lines that the average is not applicable in the South. Where, as here, the Southern lines undertake to prove through the best evidence available to them that the average is not applicable to the Official-Southern traffic, the Northern lines cannot fairly be permitted to thwart that proof by withholding data in their possession and, at the same time, criticize the Southern lines' adjustment because the lack of data affected the comparability of the adjusted costs.

Because the Northern lines are proponents of changing the present divisions in their favor and, in addition, are in possession of data which the Examiners find necessary to an adequate adjustment in a number of important areas of the cost controversy in this proceeding, the Examiners err in recommending increased divisions for the Northern lines on the basis of territorial average cost factors. Instead of using such averages in their "Restated Costs," the Examiners should have recommended one of the following lawful alternatives: (1) dismissing the Northern lines' claim; (2) accepting the Southern lines' adjustments where any deficiencies would have been cured by data in the possession of the Northern lines and the Northern lines failed to produce such data; or, (3) initiation of an investigation by the Commis-

[11]

sion to obtain from the Northern lines the facts considered necessary for an adequate adjustment on a comparable basis in both territories. Each of these three lawful alternatives is next discussed.

(1) Dismiss the Northern Lines' Claim for Increased Divisions.

The Administrative Procedure Act specifically provides that "the proponent of a rule or order shall have the burden of proof" (5 U.S.C. § 1006(c)). This statutory provision codifies the rule that has long been enforced in proceedings for divisions of joint rates. The Courts have held that an order of the Commission changing existing divisions must be based upon evidence justifying and requiring the change. *Brimstone R. Co. v. United States,* 276 U.S. 104, 116-117 (1928); *Beaumont, S.L. & W. Ry. Co. v. United States,* 282 U.S. 74, 82 (1930). And the Courts have specifically held that the proponent of a change in divisions has the burden of proof in all respects, including specifically the proof of the vital issue of cost of service. In *Gardner v. Akron, C. & Y. R. Co.,* 276 I.C.C. 655, 658, 661-662 (1949), the Commission, upon finding that the cost evidence was deficient, dismissed the complaint for increased divisions. This action was sustained on judicial review. *Central R. Co. of New Jersey v. United States,* 99 F. Supp. 564 (D.N.J. 1951), affirmed, 342 U.S. 935 (1952).

The Northern lines, relying exclusively upon unadjusted territorial average costs, have not met their burden of proof on the vital cost issue. Specific evidence applicable to the traffic at issue is essential because, as the Supreme Court has stated "averages are apt to be misleading." *United States v. Abilene & So. Ry. Co.,* 265 U.S. 274, 290-291, (1924). In *Advance Transportation Co. v. Allard,* 305 I.C.C. 751 (1959), the Commission dismissed a complaint where the proponent of the change in divisions relied entirely upon average cost data, stating (305 I.C.C. at 758):

> ". . . the regional cost evidence submitted by the complainants is not shown to be typical or representative of the expenses of the complainants and the defendants in performing the interline transportation under consideration."

(2) Accept the Southern Lines' Adjustments Where the Northern Lines Do Not Produce Comparable Data in Their Possession.

A second lawful alternative would be to accept the adjustments advocated by the Southern lines in the absence of contrary proof based upon

[12]

data in the possession of the Northern lines. It is a well-established principle that, where relevant representations are made which would either be verified or impeached by records or other data in the exclusive possession of the adverse party, refusal to produce such records or data creates a presumption that the representations are true.

The rule is stated at 31 C.J.S., Evidence, § 156 as follows:

> "In the absence of explanation, the failure or refusal of a party to produce evidence may create an adverse inference where such evidence is within his knowledge, and within his power to produce is not equally accessible to his opponent, and is such as he would naturally produce if it were favorable to him . . . . It has also been held that, where a party fails to present a fact necessary to his case when it is within his power to do so, it will be presumed that such fact does not exist, and the same is true where evidence as to certain matter is introduced, and the adverse party, having it within his power to refute such evidence if it is untrue, fails to introduce any refuting evidence."

In *Interstate Circuit, Inc. v. United States,* 306 U.S. 208, 226 (1939), the Supreme Court applied this rule:

> "The production of weak evidence when strong is available can lead only to the conclusion that the strong would have been adverse. *Clifton v. United States,* 4

How., 242, 247. Silence then becomes evidence of the most convincing character." *

In *Eastern Bituminous Coal Ass'n v. Baltimore & Ohio R. Co.*, 299 I.C.C. 691 (1957), the Commission applied this principle in a rate proceeding in which costs were less decisive. In sustaining adjustments to Rail Form A costs resisted by the Pennsylvania and other Northern lines, the Commission stated (299 I.C.C. 722):

> "Rail Form A permits a large amount of flexibility so adjustments may be made to reflect the operating practices of a single railroad or group of railroads when handling particular commodities. Insofar as they had access to data, the Clearfield complainants developed factors applicable to the coal traffic. The defendants were in possession of the complete data, but they produced no

[13]

> specific performance data for the service required in handling coal from the various districts."

The same principle was invoked in *Chesapeake & O. Ry. Co. v. United States*, 11 F. Supp. 588 (S.D.W. Va., 1935), affirmed, 296 U.S. 187 (1935), where the courts upheld a Commission order based upon evidence of transportation conditions presented by a shipper on the express ground that, "if the operating conditions were not equal, the evidence necessary to establish that fact lay peculiarly within the knowledge of the railroad. Had the operating conditions not been similar, it would have been a simple and easy matter for the railroad to have shown the difference. This it did not do" (11 F. Supp. at 593).

---

* See also *Mammoth Oil Co. v. United States*, 275 U.S. 13, 51-52 (1927); *Cliett v. Scott*, 102 F. 2d 725 (5th Cir., 1939); *Hann v. Venetian Blind Corporation*, 111 F. 2d 455, 458-459 (9th Cir., 1940); *Sternberg Dredging Co. v. Moran Towing & Transp. Co.*, 196 F. 2d 1002, 1006 (2d Cir., 1952); *Tendler v. Jaffe*, 203 F. 2d 14, 19 (D.C. Cir., 1953).

The obvious duty of the carrier in possession of relevant cost data to produce that data was recently confirmed by the Supreme Court in *Interstate Commerce Commission v. N.Y., N.H. & H.R. Co.*, 372 U.S. 744, 760 (1963): "Of course, when such an issue is raised, each carrier should bring forward the data relating to its own costs that are required for the resolution of the issue."

This rule has special force here. The whole issue in this divisions case is the proper division of revenues earned by two groups of railroads rendering a joint service. A vital test of the share to which each is entitled is the relative cost contribution of each participant, and each maintains records establishing facts necessary to that determination. The withholding by the Northern lines of their records permits no doubt that their records substantially confirm the adjustments made in the Southern lines' cost study.

This principle provides the strongest support for the reliability of the adjustments in the Southern lines' cost study concerning operating factors on the Northern lines. The Northern lines cannot have it both ways; they cannot withhold data and then assert deficiencies in the study arising from their own failure to come forward with evidence in their possession. The only inference that can sensibly and lawfully be drawn from their failure to produce more refined data in their possession is that such production would either provide further confirmation of the Southern lines' cost study or prove that the study overstated the cost of handling Official-Southern traffic in the North.

The treatment of costs in the Examiners' Recommended Report, using territorial averages instead of the adjustments presented by the

[14]

Southern lines in order to achieve comparability, is in startling contrast to the Commissioner's approach to this same question of comparability of cost data in the *Border Point*

Divisions case, *Louisville & N. R. Co. v. Akron, C. & Y. R. Co.*, 309 I.C.C. 491 (1960). In that case, complainants presented studies of the costs of handling the traffic in issue on their own lines, and defendants (Northern lines here) relied upon unadjusted Rail Form A averages for both groups of roads (309 I.C.C. at 506-509). The Commission recognized the lack of comparability between the costs thus presented, stating that "the only comparable cost data as between northern [Eastern] and southern carriers were on the basis of the territorial or systemwide averages submitted by defendants" (309 I.C.C. at 509). In its conclusion, the Commission rejected use of the Northern lines' unadjusted Rail Form A costs, stating: "However, the only comparable cost data for complainants and the defendants are on the basis of territorial or systemwide averages, which are not determinative of the costs of these particular movements." (309 I.C.C. at 509).

This finding of the Commission, rejecting use of territorial average costs despite their being the only "comparable" cost data of record, was specifically sustained on judicial review. *Boston and Maine R. Co. v. United States*, 208 F. Supp. 661, 676 (D. Mass. 1962), affirmed 371 U.S. 26 (1962). The Court discussed the argument of the New York Central on the question of comparability of the cost comparisons as follows (208 F. Supp. at 675):

> "In the supplemental exceptions, dated March 9, 1959, filed by N.Y.C. to the proposed report of the examiner, it is stated (at page 24) that L & N's restatement of the northern railroads' cost study 'destroyed any possible comparison by adjusting the L & N costs without making similar adjustments in the N.Y.C. costs.' N.Y.C. went on to say that 'it would be unrealistic to expect the New York Central to study the movements at the 130 points involved' on its railroad. N.Y.C. argues that since the burden of proving the unreasonableness of existing divisions was upon the complainant L & N, it was incumbent upon the latter

carrier to produce evidence of the relative costs of handling the traffic in question. L & N,

[15]

however, did introduce in evidence its own actual costs in place of average costs. The costs put in evidence by N.Y.C. were unadjusted average costs for the northern railroads which did not reflect the actual costs. The Commission found that this evidence was not helpful in determining the costs of the particular traffic involved in this case. N.Y.C. now takes the position that the burden of adjusting the average costs presented in evidence by the *plaintiffs* [Northern lines] was on the L & N, even though the data necessary to make these adjustments were not available to the L & N and could only be produced by the plaintiffs themselves. We think this position is untenable."

As the Court held, the New York Central could not properly be permitted to invoke territorial average costs, even where such averages were the only comparable costs, where the Northern lines themselves had in their possession the data which would show the actual costs. This fair rule for dealing with the question of comparability, adopted by the Commission and affirmed by the courts in 1962, has been violated in the Examiners' Recommended Report in this proceeding. Here, there is even more reason for applying the rule in the *Border Point Divisions* case because the Northern lines, who have in their possession the camparable data which did "reflect the actual costs," are also the proponents of a change in the present divisions and thus, as a matter of law, have the burden of proof.

(3) Require the Production of Actual Data on a Comparable Basis.

If the Commission considers the data of record inadequate it may not simply adopt a territorial average cost by default. If the Commission chooses not to dismiss the com-

plaint and not to accept the adjustments offered in the absence of complete data, it has ample power to develop a record that contains adequate and comparable data.

The Commission's duty to obtain adequate cost evidence was emphasized by the Court in setting aside a Commission order in *Pacific Inland Tariff Bureau v. United States*, 129 F. Supp. 472, 486 (D. Ore. 1955):

> "The Commission's criticism of the inadequate evidence offered
>
> [16]
>
> by barge and truck operators as well as by the railroads is well-founded. The Commission is not a passive arbitrator of disputes between carriers. It is the instrument chosen by Congress to regulate interstate commerce in the public interest. When carriers fail to produce satisfactory evidence, the Commission may require them to produce additional and more satisfactory evidence. It may make its own investigation. It may consult with 'other interested and presumably better informed agencies of the Government as to particular questions.' Cantlay and Tanzola, Inc., v. United States, supra, 115 F. Supp. 81. However the record does not disclose that any of those courses was followed in this case. The fate of our national transportation system should not depend upon evidence either offered or withheld by competing carriers."

In the *Freight Car Per Diem* case, the Court set aside an order of the Commission for failing to resolve cost issues when the Commission possessed ample power to "turn the matter over to its accounting staff for investigation." *Boston & Maine R.R. v. United States*, 162 F. Supp. 289, 298 (D. Mass. 1958). On appeal to the Supreme Court, the Commission declined to defend its action and expressed readiness to "proceed in accordance with the terms of the remand." 358 U.S. 68, 71 (1958). The Commission there-

upon directed its Cost Finding Section to conduct an investigation, including the preparation of forms for the gathering of detailed, adequate and comparable data from the railroads (orders in I.C.C. Docket Nos. 31358 and 33145, *Railroad Freight Car Per Diem Charges*).

The Examiners' passive reliance upon territorial averages in the absence of comparable data from all the carriers participating in this important *Official-Southern Divisions* case is to be contrasted with the action of the Commission in the *Florida East Coast Divisions* case, Docket Nos. 26459 and 26462. After an initial decision in the case (235 I.C.C. 211 (1939)), the proceedings were reopened (order dated April 8, 1940), and the Commission directed its Cost Section to participate in the case. The Cost section prepared Rail Form C, which refined the costs to a far greater degree than Rail Form A, and submitted forms

[17]

and questionnaires to each of the participating carriers. After assembling the cost data, the Cost Section submitted its report dated April 1944, to the Commission and the parties. The report of the Cost Section effectively disposed of the controversy, as the case was thereafter dismissed (order dated November 13, 1944). Thus, in a division proceeding of far less importance than this *Official-Southern Divisions* case, the Commission did not rely upon Rail Form A territorial averages but took the initiative in assembling actual and comparable cost data from the carriers.

Where, as here, the Commission has the necessary power, it can prevent the Northern lines from blocking the development of actual and comparable cost evidence by requiring the Northern lines to produce the necessary data.

Any of these three alternatives—dismissing the Northern lines' claim, using the adjustments offered by the Southern lines in the absence of data produced by the

Northern lines, or compelling production of comparable data—would have avoided the Examiners' error of transferring the burden of proof to the Southern lines instead of leaving that burden upon the Northern lines who are in possession of the data. The Recommended Report does not discuss, much less give reasons for rejecting, these alternatives. Instead, the Examiners recommend use of territorial average costs in their restatement of costs, thus unlawfully imposing on the Southern lines the burden of proving the contrary and enabling the Northern lines to profit by withholding data in their possession.

G, p. 2) ($166,708,524 + $2,254,075 = $168,962,599; and $193,489,819 + $453,673 = $193,943,492).

• • •

[25]

Not one of the "real differences" whose "causes are known," referred to by the Examiners, provides any basis whatever for finding that car costs of the Northern lines are any higher, much less 32 percent higher, than those of the Southern lines in the handling of Official-Southern traffic.

The first factor referred to is "a difference in utilization of 39.4 car-miles per day in the North and 49.5 car-miles per day in the South." This "difference in utilization" has no rational bearing upon the relative costs of handling Official-Southern traffic. The figures are system average figures. The Northern lines' witness who introduced these figures conceded that they represented "all traffic in all types of cars and without separation of line-haul and terminal" (Tr. R. 2491-92).

The "real differences" in "utilization" relied upon by the Examiners provide no justification for applying territorial average car costs to Official-Southern traffic because the figures relied upon reflect the "utilization," in terms of car-miles per car day, of all traffic in the territory in all types of cars (including hopper cars, serviceable and unserviceable, that carry practically none of the Official-Southern traffic). Low utilization of the average car in the North could explain the 32 percent higher territorial average car costs in the North, but the system average utilization of all cars in the North does not cast any light on the utilization actually experienced with respect to the box cars carrying Official-Southern traffic.

But even if the "utilization" figures cited by the Examiners could be attributed to the Official-Southern traffic, the 25 percent difference in "utilization," in the sense used in the figures 49.5 car-miles per day and 39.4 car-miles per day, would not explain any difference in unit costs which are separated as between line-haul and terminal. The figures cited in the Recommended Report are, literally, car-

miles per day. When a car is being loaded or unloaded, it is accumulating days which add to the denominator without accumulating any miles for the numerator. The effect of terminal service on a computation of car-miles per car days is illustrated in the following table. This computation assumes 4 days to originate (or terminate) a car, and also assumes that the car averages 100 miles per day when in line-haul service. If the car moves

[26]

300 miles in territory A and 450 miles in territory B for each terminal handling, the following relationship of car-miles per day results:

	Territory A	*Territory B*
1. Miles per terminal handling	300	450
2. Days for a terminal service	4	4
3. Days for line-haul service	3	4.5
4. Total Days (line 2 + line 3)	7	8.5
5. Car-miles per day (line 1 ÷ line 4)	42.9	52.9
6. Index, car-miles per day (Territory A = 100)	100	123

As shown, a 23 percent difference in "utilization," as measured in terms of car-miles per car day, is produced by a separation between line-haul and terminal even if there is no difference at all in the cost per car-mile, or in the cost per terminal service, between the two territories. Since Rail Form A does separate line-haul and terminal costs, and since the Northern lines have the short-haul on Official-Southern traffic (sheet 9), the use of equal car costs per terminal handling and equal car costs per car-mile gives the Northern lines full credit for a difference in "utilization" in terms of car-miles per day by assigning greater costs (terminal plus line-haul) per car-mile. But this provides no justification for granting the Northern lines any higher unit costs per terminal handling, or per car-mile, as is the result of using Rail Form A territorial average costs.

Thus, the figures cited by the Examiners as representing "a difference in utilization" cannot be shown to establish any actual difference in utilization at all, either in line-haul or in terminal service, and these figures do not therefore provide any justification whatever for any higher car costs in the North for each car-mile and for each terminal handling of Official-Southern traffic.

The second category of known "causes" of higher car costs in the North than in the South cited by the Examiners are "differences in taxes and wage rates."

There is no evidence in the record to support a claim on behalf of the Northern lines of any difference in taxes which might affect car costs, and, indeed, the Northern lines made no such claim, The argument in

[27]

their Brief (pp. 124-130), based upon a comparison of taxes *per mile of road*, plainly has nothing whatever to do with car costs. Thus, the Examiners' assertion that differences in taxes are one of the known causes for differences in car costs is wholly gratuitous. Moreover, the evidence of record shows just the contrary—that is, that the taxes per dollar of investment, which of course includes investment in cars, are significantly greater in the South than in the North:

	Official Territory	*Southern Region*
1. Taxes (V.S. 80, Sec. M, Ex. F-4)	$ 170,469,035	$ 59,607,746
2. Net investment (V.S. 3, Ex. A, p. 15)	11,632,453,674	3,704,767,995
3. Taxes per $1 of net investment (line 1 ÷ line 2)	.1465	.1609
4. Index (Official Territory = 100)	100	109

• • •

[28]

The fact of greater use of Northern-owned cars in the handling of Official-Southern traffic does not explain 32 percent higher costs for the Northern lines in handling the same box car as it crosses the Ohio River. This factor does not even work in the direction ascribed to it by the Examiners, but has just the opposite effect. As will be shown, there is an inconsistency between the base used in computing per diem costs under Rail Form A and in determining the level of per diem rates under the formula approved by the Commission.* The nature of the inconsistency is such as to increase the relative costs of the railroads who use cars owned by other roads and to reduce the costs of the owning roads. If this is so, and we shall show that it is, the fact relied upon by the Examiners that Southern lines use cars of Northern ownership to a greater degree in handling Official-Southern traffic means that the costs of Northern lines in furnishing those cars would be reduced and the costs of the Southern lines increased as a result of the inconsistency inherent in Rail Form A costs and the per diem formula. As a result, the fact of greater use of Northern-owned cars in the handling of Official-Southern traffic does not support 32 percent higher, or any higher costs in the North, but indicates higher costs in the South for the cars actually carrying this traffic.

More important even than this irrationality in the reliance of the Examiners upon the predominant use of

* Southern Railway System lines do not agree that there is any inconsistency between using original costs in Rail Form A and the use of actual per diem debits and credits. Furthermore, the Southern Railway maintains that, in computing the costs of car ownership, it is proper to credit the excess of per diem credits over cost of ownership to the cost of ownership of the cars involved.

Southern Railway joins in the controlling argument in this Official-Southern divisions case that, however the car costs are computed for the particular cars in issue, it is wholly improper to take territorial average car costs influenced by the per diem debits and credits on hopper cars, for example, and apply such average car costs to the box car traffic at issue in the present case.

Northern cars in Official-Southern movements to explain the higher Rail Form A car costs shown for the Northern lines, however, is that this reliance apparently led the Examiners to ignore the really crucial significance of the relative car ownership positions of the two groups of lines. The record shows that *overall,* the Southern lines are heavy per diem credit lines,

[29]

whereas the Northern lines just about break even with virtually offsetting debits and credits (V.S. 39, p. 54):

		Per Diem Net Debits and Credits (Year 1956)
Eastern District	Net Debit	$24,568,808
Pocahontas Region	Net Credit	27,974,634
Eastern District plus Pocahontas Region	Net Credit	3,405,826
Southern Region	Net Credit	23,987,115

The overall relative car ownership positions of the Southern and Northern lines, therefore, are precisely opposite to their relative positions on Official-Southern traffic as found and relied upon by the Examiners. In evaluating relative car costs on a territorial average basis as shown by Rail Form A, it is these territorial average figures which control the result, not the wholly uncomparable figures relating to relative car ownership positions on Official-Southern traffic cited by the Examiners. And these territorial average car ownership figures establish beyond any doubt that the Form A car costs relied upon by the Northern lines are the product, not of higher actual car costs in the North, but of an inconsistency between Rail Form A costs and the per diem formula which artificially reduces the car costs of carriers such as the Southern lines which have heavy per diem credit positions.

The inconsistency between car costs as computed under Rail Form A and under the formula used in determining per diem rates results from the great difference between the original cost and the reproduction cost of railroad cars. Rail Form A car costs include depreciation computed in relation to original cost. Return is computed at 4 percent (after allowance for federal income taxes) on net original cost. However, the per diem rate is determined on a very different base under the formula established by the Commission in *Chicago, B. & Q. R. Co. v. New York, S. & W. R. C.*, 297 I.C.C. 291 (1955). Under the per diem formula, depreciation is computed in relation to reproduction cost new, and return is computed at 6 percent of reproduction cost new less depreciation (V.S. 39, p. 48; Tr. R 2472). With the great inflation experienced in the last two decades, the per diem formula, using the reproduction cost base, produces costs of car ownership for depreciation and return which are much higher than Rail Form A costs using the original cost base (V.S. 39, p. 48).

[30]

Where carriers use each other's freight cars to approximately the same extent, these differences in the formulas have no material effect upon unit costs as developed under Rail Form A. Where one carrier or group of carriers uses cars of other carriers or groups to a greater extent than its cars are used by the other carriers or groups, however, Rail Form A costs are seriously distorted. The mechanics of this distortion were set forth in the record in tables showing that, assuming equality of car costs in all other respects, the inconsistency in the original cost and reproduction cost bases alone produce differences in Rail Form A average costs which equal or exceed the entire 32 percent difference between the territorial average costs for Southern Region and Official territory (V.S. 39, pp. 49-53). As these illustrative tables show, where one group of lines experiences a per diem credit balance and the other group

has a per diem debit balance (or a lesser per diem credit balance), the latter will show higher car costs under Rail Form A solely because of the inconsistency between the original cost and reproduction cost bases used in Rail Form A and in the per diem formula respectively. This effect of the inconsistency between Rail Form A car costs and the per diem formula causes the Rail Form A territorial average costs of Southern lines to be less than the costs of the Northern lines, because, as shown above, the Southern lines' car costs are seriously distorted by their heavy per diem credit position.

The foregoing example is not as extreme as some of the results actually produced by Rail Form A and underlying the Examiners' "Restated Costs." Consider, for example, the effect on the car costs of the Clinchfield. This particular Southern Region railroad participates in Official-Southern traffic moving primarily in box cars. The Clinchfield also originates coal not at issue in this case, and owns a fleet of hopper cars, many of which are interchanged with other railroads, including Northern lines. A box car moving over the Clinchfield obviously occasions some cost, including return on the investment in the box car. However, because per diem credits, computed at the reproduction cost level, are generated by Clinchfield hopper cars while off line and because Rail Form A computes the cost of the same hopper cars on an original cost base and then averages box car and hopper car costs, the absurd result of a *negative* return on both hopper cars and box cars is produced on the Clinchfield (V.S. 39, p. 53). The Northern lines' witness conceded that Rail Form A produces this extraordinary result of negative car costs (Tr. R 2478):

[31]

"[Q.] Let us assume the reproduction cost is twice as high so that the price level was double when the car was built. The return on the reproduction cost was $2.00 under our example, correct?

A. [By the Northern lines' witness] Yes.

Q. If Rail Form A develops the cost of $1.00, and that car goes off line on their to the Pennsylvania and the per diem is calculated at the rate of $2.00, what happens in calculating Rail Form A?

The Rail Form A develops the cost of $1.00, that goes off line onto the Pennsylvania, the per diem rate is calculated at $2. Does Rail Form A then take the $2 and credit it to Clinchfield Form A?

A. The per diem is credited to the Clinchfield.

Q. So, under our example, . . . under Rail Form A, you include a dollar and you credit $2 and you end up with a minus $1 as the return cost on this car, that is the way Rail Form A works, does it not?

A. With respect to the return, yes."

The Northern lines also conceded that such a negative return would be applied to a foreign line box car moving over the Clinchfield (Tr. R 2479):

"[Q.] Given this negative figure for the return as a result of this Form A calculation as applied to this hopper car that went off line, how would you price out a foreign line box car moving from somewhere in the south over the Clinchfield to somewhere in the north?

A. [By the Northern lines' witness] How would I price out a box car—

Q. That is right, moving from the south to the north over the Clinchfield. This is a foreign car.

[Counsel for Northern lines] Your question is, was it priced out in the Eastern [Rail Form A unadjusted] study?

[Counsel for Southern lines]: They used minus a dollar a day.

That was under the eastern lines method. That was done, was it not?

The Witness: For Clinchfield, itself?

Q. [By counsel for Southern lines]: Yes, sir.

A. I guess that is what it would amount to."

[32]

The Northern lines' only effort to avoid this absurd result produced by Rail Form A was to argue that the low or even negative car costs shown for the Clinchfield could be ignored because "if group costs are employed . . . the results for individual road Form A applications are not significant" (V.S. 76, pp. 21-22). The low and negative car costs of individual Southern Region roads cannot be dismissed so casually. The negative return costs of individual roads strongly depress the level of the group average car costs of the Southern Region roads. As a result, the Southern Region average car costs are depressed for a reason that the Northern lines do not even attempt to defend when the cause is shown in the individual road applications.

The Examiners do not discuss directly the effect of the inconsistent bases in computing car costs under Rail Form A and under the per diem formula. The Examiners' only defense of the relationship between Rail Form A costs and per diem cost in their Restated Costs is as follows (sheet 39):

> "The determination and fixing of a rate of per diem which is fair as between all railroads and sections of the country is a difficult and complicated problem into which many considerations enter. However, after the rate is determined it becomes an actual receipt or disbursement settled in dollars and cents and properly a part of the costs for each road and territory in the year incurred."

This theory may be sound if the property base used in the per diem formula is consistent with the property base used in Rail Form A, but the theory stated by the Examiners is simply not responsive to the issue in this case when such inconsistency has been shown.

The theory stated by the Examiners may have been entirely sound at the time Rail Form A was created. At that time (1940), per diem credits did not present the prob-

lem they do today because the reproduction cost level of cars was not significantly different from the original cost level. However, with inflation in the war and post-war period, the costs of replacing cars are far in excess of the original costs for the cars they replace (V.S. 39, p. 53). This substantial difference in the original cost and reproduction cost bases produces an artificial "profit" when per diem credits reflecting the reproduction cost level are applied against Rail Form A costs for the same cars calculated using the original cost base. Actually, there is no real profit since the per diem formula, using the reproduction cost base, was ordered by the Commis-

[33]

sion as the proper measure of "reasonable compensation" to the car owner. *Chicago, B.&Q.R. Co. v. New York, S.S.W.R. Co.*, 297 I.C.C. 291, 301-304, 307 (1955). It would be entirely inconsistent with the Commission's purpose in using the reproduction cost base in determining per diem rates, in the interest of an adequate car supply (297 I.C.C. at 304), to turn around in a divisions case and penalize the car owning roads through the use of inconsistent bases in computing the costs used in fixing divisions.

Where, as here, the per diem formula and the Rail Form A costs use inconsistent bases, some adjustment should be made to place the costs on a comparable basis. In *Louisville & Nashville R. Co. v. Southern Ry. Co.*, 319 I.C.C. 639 (1963), a divisions case decided by Division 2 after the Examiners' report in this Official-Southern case was served, comparable costs were obtained by using reproduction costs instead of original costs in the Rail Form A computation (319 I.C.C. at 654):

> "As the L. & N. furnishes all the coal cars used in the Knoxville movement, the per diem charges paid by the Southern for these cars is the only actual cost of these cars to the Southern, and must be used in determination of the Southern's costs. The per diem charges

paid by the Southern were determined upon a reproduction cost basis. The use of reproduction cost for L. & N. cars, which is readily ascertainable here, makes comparable these costs as between the complainant and the defendant placing them on an equal footing. It is, therefore, appropriate in these circumstances to deviate from Rail Form A."

Whether or not the approach approved by Division 2 in the *L&N* case is correct where the cars that produce the net per diem debits and credits are the cars hauling the traffic at issue, it is perfectly plain that the depressing effect of per diem debits on Rail Form A car costs resulting from the use of Clinchfield, L&N and other hopper cars by Northern roads has nothing whatever to do with the relative costs of hauling the Official-Southern box car traffic at issue in this case, and credits and debits resulting from traffic not in issue should not be used to strike an average cost to be applied to this traffic. In this *Official-Southern Divisions* case, the traffic is handled predominantly in box cars and less than one percent of this traffic is carried in open-hopper cars (V.S. 39, pp. 43-44). The artificial profit reflected in the per diem credits depressing the Southern Region average car costs are generated by use of Clinchfield, L&N and other Southern line hopper cars on Eastern

[34]

District roads (V.S. 39, p. 54). Since hopper cars account for the effect on the territorial averages of the inconsistent bases used in the per diem formula and in Rail Form A, such a distortion must not be permitted to influence the relative car costs to be applied to Official-Southern traffic which does not move in hopper cars.

Because per diem debits and credits, computed on different bases, markedly affect system average costs for a reason that has nothing whatever to do with the relative costs

of handling Official-Southern traffic, the traffic involved in this proceeding should be priced out using car costs not distorted by per diem debits and credits. Since per diem debits and credits are substantially offsetting on a national basis, the use of a national basis of car costs, separated by type of car, avoids the distorting effect of the very different bases used in the development of the per diem rate and in the calculation of Rail Form A costs. It was because the territorial average cost for all cars had no reliable relationship to the traffic at issue that the Southern lines used car costs that did not assume that either group of roads experienced higher costs per mile in hauling the Official-Southern traffic.

The Southern lines' cost study did not use a "national average car cost" as the report states (sheet 39), but a national average cost separated by type of car. Thus, a national *box car* cost was applied to Official-Southern traffic carried in box cars. This is entirely accurate in view of the facts that the railroad cars carrying Official-Southern traffic move indiscriminately among the various territories, repairs performed on these cars are charged to the owner on a national basis, the return and depreciation are prorated between time and mileage under Rail Form A using national averages, the tare weight for the car is on a national basis, the car repair costs are prorated between time and mileage on a national basis, private line cars are leased on a national mileage basis, and the per diem rate charged or collected by each railroad is on a uniform national basis (V.S. 39, pp. 40-57; V.S. 40, Ex. C, pp. 13-19).

The use of national car costs by type of car in the Southern lines' cost study reflects the costs of repairs, depreciation and return of the railroad-owned cars carrying Official-Southern traffic, and certainly is a more accurate reflection of the actual car cost experienced in both Official and Southern territories on Official-Southern traffic than the territorial average car costs, dominated by types of cars of negligible

[35]

importance in handling the Official-Southern traffic, and reflecting expenses incurred and repairs billed back to the owner from other territories, and mileages of cars owned by rail carriers of other territories.

The equal-factor car costs used in the Southern lines' cost studies are consistent with the present equal-factor divisions. The Northern lines having failed to prove any facts relating to the carriage of Official-Southern traffic that would justify any higher costs for handling the same car north of the Ohio River or Virginia Gateways, use of 32 percent higher car costs, as in the Examiners' "Restated Costs," or any higher car costs, would be unlawful as lacking support in substantial evidence related to the traffic at issue and failing to enforce the burden of proof which is lawfully upon the Northern lines.

The requirement that the Northern lines prove with specific evidence that their costs of cars carrying Official-Southern traffic are higher than the costs of the Southern lines for the same cars is particularly appropriate in this case where the Northern lines had in their possession at least at the time of the rebuttal hearing specific facts which would have confirmed or disproved the application of territorial average car costs to the Official-Southern traffic handled in box cars.

The rebuttal hearings in this case were held on February 7-13, 1961. At that time, the carriers had completed but had not released the results of a special study of car costs for the year 1960 which the Commission had ordered in its general investigation, *Railroad Freight Car Per Diem Charges,* Docket Nos. 31358 and 33145. This special study of car costs provided, for the first time, a separation of car costs by type of car (V.S. 40, Ex. C, p. 13).* Despite the

* The Commission's orders, dated December 18 and 23, 1959, required that the individual carriers furnish data in great detail, including information showing car repair costs, investment, utilization and per diem payments and receipts, separately by type of car (home and foreign).

availability of these data, the Northern lines' rebuttal witness on the subject of car costs presented no facts at all as to the actual costs for box cars as contrasted with the average cost for all cars on Northern lines (V.S. 76). Their witness disclaimed any knowledge of the results of the special study of car costs ordered in the *Per Diem* investigation, even of the study made by his own Pennsylvania Railroad Accounting Department (Tr. R 2509-12). It may fairly be concluded that, if the facts as to box cars supported the use of territorial average car costs, such data would have been forthcoming.

* * *

[44]

(ii) *Empty Return Ratios for General Purpose Box Cars.*

The box car empty return ratios used in the Examiners' restated costs are in the form of a single ratio for each territory averaging together all types of box cars, including (1) box cars available for general loading and, (2) box cars such as those assigned to automobile parts manufacturing plants which are not available for return loading, as the Examiners acknowledge (sheet 40).

As has been shown, the box cars in assigned service have, for all practical purposes, an empty return ratio of 100 percent. Since the average box car empty return ratio in each territory includes the experience of those box cars having a very high empty return ratio, it arithmetically follows that the correct ratio for the general-purpose box cars is *less* than the average for all box cars in both the North and the South. The extent to which the empty return ratio for the general purpose box cars in each territory is *less* than the average for all box cars, after deducting the experience of the specially assigned box cars, obviously depends upon the relative importance of the specially as-

signed box cars to the total box car movement in each territory.

The arithmetic of the situation is illustrated in the following table (V.S. 39, p. 25):

North	Box (General)	Box (Special)	*Average* Box
Loaded Miles	5,000	750	5,750
Empty Miles	1,500	750	2,250
Empty Return Ratios ...	30%	100%	39%
South			
Loaded Miles	5,000	200	5,200
Empty Miles	1,500	200	1,700
Empty Return Ratios ...	30%	100%	33%

The significance of this illustration is that a seemingly small difference in the proportions of special box cars to all box cars (750 out of 5,750 or 13% in the North and 200 out of 5,200 or 4% in the South) has an important effect on the average box car empty return ratio. Thus, assuming that the empty return ratio for each category of box cars is the *same* in each territory, the territorial average empty return ratio

[45]

for all box cars is 18 percent higher in the North (39 percent instead of 33 percent) solely because of the different and higher proportion of special box car to total box car movements in the North."

The Examiners refer to this illustration (sheet 40) and dismiss it with the statement that it "is merely a computation showing what the effect would be if certain assumptions are made. By itself it does not prove that those conditions actually exist" (sheet 42). Having acknowledged the arithmetic relationship inherent in box car average

empty return ratios, the Examiners again reveal a basic error in their concept of the burden of proof.

The present divisions are based on a uniform divisional scale applying equally in the North and in the South. The Northern lines are the moving parties seeking higher divisions in the North because of allegedly higher costs. The Northern lines do not begin to meet the burden of proof which is theirs by using average box car empty return ratios which are 18 percent higher in the North without proving that the empty return ratios properly applicable to Official-Southern traffic are, in fact, 18 percent higher. The illustration shows that an 18 percent higher average box car empty return ratio is arithmetically consistent with empty return ratios for special cars and, separately, for general purpose cars, which are the *same* in both the North and the South. Having shown this to be the undeniable arithmetic of the problem, the burden is on the Northern lines to prove that the empty return ratios applicable to the movement of Official-Southern traffic in specially assigned box cars, and in general purpose box cars are, in fact, 18 percent higher before the empty return ratios used in the Examiner's restatement of costs can lawfully be supported.

The Examiners do not recite any evidence showing that the average box car empty return ratio is, in fact, applicable to any category of Official-Southern traffic, and the Northern lines presented no such evidence in support of their claim.*

* * *

---

* The only specific evidence which the Northern lines presented showing the empty return ratio for any particular group of cars dealt with a group of 160 unassigned general purpose cars owned by the Pennsylvania and used to carry general traffic, including Official-Southern box car traffic. The records maintained for these cars showed an empty return ratio of 16 percent on the Pennsylvania Railroad (Tr. R 2419-22), which is substantially less than the 30 percent applied in the Southern lines' cost study for general purpose box cars.

[59]

3. Adjustment of Switching Costs.

An important factor determining the costs of particular traffic is the amount of switching service required in originating or terminating that traffic.

The Examiners do not question, as a matter of cost principle, the propriety of adjusting Rail Form A costs where the switching services per car required in originating or terminating particular traffic differ from the territorial average. Indeed, the Cost Finding Section, in its annual publication, expressly provides for just such an adjustment (Statement No. 5-63, p. 1):

> "The territorial figures reflect the out-of-pocket costs for car-load freight service under a wide range of operating conditions within each territory, including the type of car (tare weight and percent of empty-return movement); the net weight of load, the length of the haul, and the type of train, whether way or through. Aside from the factors listed the costs represent average operating conditions within each territory.
>
> "Methods are provided for adjustments in the costs . . . to show . . . A(3) the effect of greater than average, or less than average, engine-minutes per car in origin and destination switching."

The Commission's decisions fully accept the adjustment of average switching minutes per car to reflect the actual studies of particular traffic in issue. E.g., *Linoleum and Floor Covering from Trenton, N. J. to San Antonio, Tex.*, 311 I.C.C. 505, 508-509 (1960); *Petroleum Products, Portland, Maine, to New Hampshire*, 311 I.C.C. 280, 281 (1960). In fact, the Commission has criticized the use of territorial average switching minutes, stating that "respondent should have made detailed switching studies to determine the switching minutes per car" *Commodities-Pan Atlantic Steamship Corp.*, 313 I.C.C. 23, 57 (1960).

[60]

The real question in this case is not whether an adjustment of territorial average switching minutes per car is proper as a question of cost principle. The question here is whether the Northern lines have sustained their burden of proving that the territorial average switching minutes per car measure the costs of handling the Official-Southern traffic here at issue. This is of particular importance in this case where the traffic at issue constitutes such a small proportion of the total cars originated and terminated reflected in the territorial average, as shown in the following table:

	Official Territory	*Southern Region*
1. Total Number of Cars Originated plus Terminated	23,771,003	10,840,187
2. Number of Official-Southern Cars Originated plus Terminated	967,554	967,554
3. Percent Official-Southern Cars Originated plus Terminated to Total Cars Originated plus Terminated	4.07%	8.93%

Source: Lines 1 and 2, Table at sheet 47 of Recommended Report (for record references see So. Lines' Brief, p. 87.
Line 3, line 1 ÷ line 2.

The Northern lines did not undertake to sustain their burden of showing that territorial average switching costs measured the costs of originating and terminating Official-Southern traffic which is only 4.07 percent of the total cars originated or terminated in the North and 8.93 percent of the total for the South, and the Commission should so find. And, as we shall show, this record establishes: that the territorial average switching minutes per car substantially understate the Southern lines' costs of originating and terminating the traffic here at issue; that the switching minutes

per car used in the Southern lines' cost study for cars originated or terminated in the South are based upon scientifically selected and accurately conducted switching studies; and, that there is no basis for finding that the switching minutes per car used for cars originating or terminating in the North were understated. First, however, we shall show that, even under the Examiners' own conclusions, the Examiners' restatement of costs overstates the costs of the Northern lines by $1,310,743.

[61]

(a) The Recommended Report is Internally Inconsistent in Making an Upward Adjustment in the Average Switching Costs of the Northern Lines.

The closing paragraph of the Examiners' discussion of the switching cost adjustment states as follows (sheet 52):

> "For these reasons we conclude that Rail Form A territorial average switching costs are a better measure of the relative switching costs on each side of the border of the official-southern traffic than the switching costs computed by the southern lines."

The many errors underlying this conclusion will be discussed separately. The point which we are making here is that the Examiners' ultimate "Restated Costs" are not consistent with their adoption of "Rail Form A territorial average switching costs." To be consistent, the "Restated Costs" would necessarily make *no* adjustment in the territorial averages on account of switching. Yet the Examiners' "Restated Costs" include, as one of the "Adjustments," an increase of $1,310,743 in the Northern lines' costs of handling Official-Southern traffic (under the heading "Switching minutes-Pocahontas Region") with no increase at all in the Southern lines' costs (sheet 58). The Recommended Report contains no explanation whatever reconciling the making of this adjustment in the territorial aver-

age costs with the prior finding adopting the "Rail Form A territorial average switching costs."

The Description of the adjustment which was made ("Switching Minutes-Pocahontas Region") is misleading. It is described more fully earlier in the report as an adjustment of "the official territory costs by applying Pocahontas region switching minutes to bituminous coal for the entire official territory and using special minutes per car factors for iron ore and anthracite to washers" (sheet 48). This adjustment in the North was part of the simultaneous adjustment made in the Southern lines' study for both North and South to eliminate from the territorial average costs the effect of below-average switching minutes per car experienced by volume traffic not involved in this case (as the Examiners recognize, sheets 47, 48). The Examiners had previously found that the proportion of volume commodities to total traffic was greater in the South (45.86%) than in the North (37.19%) (sheet 47), but the Examiners' conclusion as to switching is that the difference is not sufficiently great to warrant an adjustment in switching for *either* territory (sheet 52):

[62]

> "Territorial average costs are particularly appropriate to the traffic in this case because it is a large and varied body of traffic going to and coming from terminals in all parts of both territories. *The depressing effect, if any, of volume switching commodities on the average would affect both territories and, for purposes of comparison, be largely offsetting.*

Thus the Examiners' stated conclusion is that no adjustment should be made for switching in *either* territory, North or South, and the average switching costs should be used for "both territories."

Accordingly, the "Restated Costs," which include a switching adjustment increasing the costs of the Northern lines alone, are completely inconsistent with the Examin-

ers' conclusions and discussion of switching costs. Even if the Examiners were entirely correct in their conclusions and discussion of the subject of switching costs, the Examiners "Restated Costs" must be changed to delete the inconsistent $1,310,743 increase in the costs of the Northern lines.

(b) The Proper Adjustment of Switching Costs.

Turning next to the Examiners' conclusions based upon acceptance of the "Rail Form A" territorial average switching costs, we shall show that average costs cannot fairly be applied to the traffic here at issue because the use of such averages understates the relative costs of the Southern lines in hauling Official-Southern traffic. The Examiners' discussion of switching costs is difficult to follow because it mixes together four separate features of the switching cost problem. To provide a separate analysis of each feature we shall discuss: (i) the showing that average costs in the South are depressed by volume commodities; (ii) the studies of switching Official-Southern traffic in the South; (iii) the extent to which average switching costs in the North are affected by volume commodities; and (iv) the switching of Official-Southern traffic in the North.

i. The Effect of Volume Commodities on Southern Region Average Switching Costs.

The Rail Form A switching costs reflect the services required in switching all cars originated or terminated on Southern Region lines.

[63]

These territorial average switching unit costs are the same for all switching handlings without regard to type of switching (road or yard), type of car or any other characteristic which affects the amount of switching work required. As

the Examiners recognize elsewhere in their Report (sheet 36):

> "There is a great variation from one point to another in the amount of both terminal switching and interchange switching due to the physical layout of the tracks, volume handled, and other causes."

It is because there is such "a great variation" in the amount of switching that it is important to examine the characteristics of the traffic at issue, as contrasted with average traffic, as those characteristics affect the amount of switching services required.

In recognition of the fact that there are great variations in switching costs and that "volume handled" is an important factor affecting the switching services required per car, the Southern lines presented an analysis of the traffic that underlies the Southern Region average. Operating witnesses identified the commodities that are regularly switched in multiple-car blocks in the South (V.S. 28, pp. 17-25; V.S. 29, pp. 26-29; V.S. 30, pp. 8-11; V.S. 31, pp. 5-6; V.S. 34, pp. 12-13). A table in the Examiners' report shows that these volume commodities account for 45.86 percent of the total carloads originated or terminated by Southern Region carriers, but for only 1.52 percent of the cars of Official-Southern traffic which are at issue in these proceedings (sheet 47).

It is apparent from the operating testimony alone that the presence of such a high proportion of volume commodities in the Southern Region average operates to depress that average for a reason that has substantially nothing to do with the handling of the Official-Southern traffic at issue in this case. The Southern lines did not rest upon the operating testimony showing the volume handling of these commodities, but instead, presented a series of thirteen studies of the switching performed to originate or terminate volume commodities. The results of these studies were as follows (V.S. 42, p. 4):

SWITCHING STUDIES ON INTRA-SOUTH VOLUME COMMODITIES

Commodity	Railroad	Study Points	Minutes Per Car To Originate or Terminate a Car
Pulpwood	SAL	Georgetown, S. C.	13.03
Sand	So. Ry.	Gaillard, Georgia	3.74
Stone and Rock	L&N	Boyles-Varnons, Ala	7.15
Wet phosphate rock	ACL	Achan, Florida	2.75
Pulpwood	So. Ry.	Canton, N. C.	5.98
Stumps & Pulpwood	ACL	Brunswick, Georgia	7.24
Sand and Gravel	SAL	Lilesville, N. C.	7.65
Pulpwood	A&StA.B.	Panama City, Florida	11.55
Wet phosphate rock	SAL	IMC Turn, Florida	7.87
Sand and Gravel	GM&O	Bogue-Chitto Br., La.	3.29
Pulpwood	SAL	Vidalia-Abbeville, Ga.	11.73
Stumps & Pulpwood	ACL	Waycross, Ga.-High-springs, Fla	7.24
Sand and Gravel	L&N	Radnor-Mt. Pleasant, Tenn.	4.89

All the studies which were made show that these important commodities are handled in such manner as to experience switching minutes per car substantially below the Southern Region average (19.8 minutes per car) (V.S. 42, p. 2).

The Examiners appear to have rejected these studies on the ground that they were "hand-picked" (sheet 49). There is no substance to the charge. The witness made these "on-the-ground switching studies" of commodities which the operating witness had testified were handled on a multiple-car basis (V.S. 42, p. 4), and the resulting switching minutes per car confirmed the operating testimony.

The Northern lines' criticisms related particularly to the volume commodity pulpwood. The Examiners first refer to an argument that, because two of the illustrative studies of volume commodities "were common to the points sampled as representative of Official-Southern traffic," the conclusion that the presence of volume traffic in the Southern Region depresses the territorial average switching costs

"is necessarily erroneous" (sheet 49). This criticism makes no sense. The two points referred to are Georgetown, S.C. and Panama City, Florida (two of the three highest minutes per car of the thirteen studies, shown in table above). The study at Georgetown, S.C. showed that the switching minutes for originating a car of Official-Southern paper amounted to 17.46 minutes per car (V.S. 42, Appx. A, line 3), which is 34 percent higher than the 13.03 minutes per car required to terminate a car or pulpwood at the same point. The study at Panama City showed

[65]

switching minutes for originating a car of Official-Southern paper was 11.72 minutes per car (V.S. 42, Appx. A, line 32), which is slightly higher than the 11.55 minutes per car required to terminate a car of pulpwood at the same point. These comparisons of the termination of a volume commodity and origination of Official-Southern traffic at the same points provides no rational criticism of the conclusion that the origination and termination of volume commodities, as a whole, substantially depress the Southern Region average switching minutes per car.

The Examiners also appear to accept the Northern lines' argument "that pulpwood, a volume commodity, has average switching minutes" (sheet 49). The sole basis for this argument is the testimony in "a prior case" of a study on one Southern railroad showing 14.62 minutes to originate and 17.81 minutes to terminate a car of pulpwood (sheet 49). Both of these figures are below the territorial average and, these earlier studies did not fully reflect the "revolutionary change in railroad operations in handling pulpwood" which have materially reduced the switching required to originate and terminate pulpwood on that road, as shown on this record (V.S. 28, pp. 18-22).

The most glaring defect in the Examiners' discussion is the rejection of illustrative studies of originating and terminating pulpwood as "hand-picked" and the citation of obsolete testimony of a witness in a prior case, without

so much as mentioning the later and more comprehensive switching studies of pulpwood that had been made at a later stage of the same case, Docket 30958, *Reduced Rates on Pulpwood in Southern Territory*. The results of those studies, presented in this record by the witness who made them, showed that the minutes per car required to originate pulpwood ranged from 4.95 to 8.80 minutes per car and from 10.90 to 13.23 minutes to terminate a car, which is only from one-fourth to two-thirds of the 19.8 minutes per car Southern Region average (V.S. 41, p. 6). After this comprehensive study had been introduced in Docket 30958, the Commission entered its order dismissing that proceeding in light of the "cost data as to the cost of handling this pulpwood traffic in representative periods." (see V.S. 41, p. 6).

The Examiners completely disregard the testimony as to the pulpwood switching studies contained in this record and disregard the action of the Commission based on current and comprehensive studies in Docket 30958, but the Examiners rely upon earlier incomplete studies

[66]

not accepted by the Commission in Docket 30958 when they accept the Northern lines' argument that pulpwood "has average switching minutes" (sheet 49).

Curiously, the Examiners' treatment of another cost adjustment (constant cost of transit commodities) relies upon the same studies in Docket 30958 which showed that, because of the low costs of pulpwood traffic, such traffic is "profitable to the extent of $5 million a year above out-of-pocket costs" (sheet 56). If territorial average costs are used for pulpwood, that commodity would show an out-of-pocket loss of nearly $10 million (V.S. 41, pp. 5-6). The Examiners thus rely upon facts developed in the studies in Docket 30958 which showed that the actual costs of handling pulpwood were substantially less than the Rail Form A average in connection with their rejection of one of the Southern lines' cost adjustments (constant cost of

transit commodities), but the Examiners find just the opposite—that pulpwood is average cost traffic—in rejecting the Southern lines' adjustment of switching minutes per car.

In rejecting the Southern lines' illustrative studies as "hand-picked," the Examiners also disregard the evidence in this record of a study of the origination and termination of wet phosphate rock at *all* stations handling that traffic in the South. That study showed that the average time to originate these cars was 3.22 minutes per car and the average time to terminate these cars was 3.20 minutes per car (V.S. 41, pp. 11-12), which is only about one-sixth of the Southern Region territorial average of 19.8 minutes per car (V.S. 42, p. 2). Such a study, covering the entire Southern Region movement of this important volume commodity, cannot possibly be dismissed as "hand-picked," and yet the Examiners disregard this evidence entirely.

On the basis of all the evidence, it is entirely clear that volume commodities, comprising 45.86 percent of the total Southern Region cars (sheet 47), receive substantially less switching service than the average switching service for all cars reflected in Rail Form A. It follows that the remaining traffic in the South, as a whole, experiences higher than average switching service per car.

Considering these facts—(1) that volume commodities constitute 45.86 percent of the total cars handled, (2) that such commodities require less than territorial average switching minutes per car, (3)

[67]

that there is a great variation in required switching time from one place to another and, (4) that Official-Southern traffic constitutes less than 10 percent of the total cars handled by the Southern lines—it is wholly unrealistic to assume that territorial average switching minutes are applicable to the origination and destination switching of Official-Southern traffic. This, however, is the assumption which the Examiners make (sheet 52):

"Territorial average costs are particularly appropriate to the traffic in this case because it is a large and varied body of traffic going to and coming from terminals in all parts of both territories."

Even if it were possible that the less than 10 percent of the cars originated or terminated by the Southern lines require no more switching effort than would be required for the territorial average car, there is no reason to leave this important question to assumption one way or the other. It was to avoid the necessity for any such assumption that the Southern lines studied the switching services actually required to originate or terminate the traffic at issue in this case.

ii. *The Switching Services Per Car Performed by the Southern lines in Originating and Terminating Official-Southern Traffic.*

Having shown that the territorial average switching costs are strongly affected and depressed by the presence of volume commodities which are not a significant factor in the movement of Official-Southern traffic, the Southern lines undertook to determine by actual switching studies the switching services performed in originating or terminating the average car of Official-Southern traffic, as contrasted with the average car of the entire Southern Region traffic.

Since the Examiners' discussion of the Southern lines' switching studies is entirely negative, one cannot tell from reading their Report how the Examiners would recommend that the Southern lines go about studying the facts as to the switching performed in handling Official-Southern traffic. One might infer from the Examiners' references to the cities, commodities, directional flow and proportion of yard and train switching (sheets 49-50) that the Examiners believe that the Southern lines should have examined these and other characteristics and selected a sample of cars to be studied that reflected each of these characteristics. Under such a procedure, the sample would have had to

[68]

include a judgment selection of cars of citrus and vegetables, and cars destined to St. Louis and Buffalo, because the entire movement of Official-Southern traffic includes such cars (see sheet 49). Any sample that did not include any such cars would, as a matter of "common sense" be too small (see sheet 50).

If the Southern lines had selected a series of switching studies in the manner implicitly suggested by the Examiners in their criticisms, the resulting studies would have been subject to the charge that they were "hand-picked," a charge which the Examiners make against the studies of volume commodities (sheet 49). More important, the selection of a judgment sample would have violated the ruling in *Increased Parcel Post Rates, 1957,* 309 I.C.C. 59, 72 (1959), in which the Commission stated that the Post Office Department's cost ascertainment system "can and should be improved in the future * * * Scientific or random sampling should be substituted for a series of samplings selected on the basis of the judgment of the Department's employees, no matter how capable the latter may be."

Accordingly, the Southern lines retained a sampling expert, Dr. W. Edwards Deming, to select the switching studies to be made, and the sample was drawn from the Southern lines' traffic study in accordance with a scientific samplying plan designed and applied by Dr. Deming (V.S. 42, p. 6).*

As soon as the particular movements of Official-Southern traffic were selected in Dr. Deming's sample, switching studies were made to determine the switching minutes per car for the services performed in handling each such movement. The switching studies for the cars of Official-Southern traffic selected in the sample were prepared in accordance with the principles of Rail Terminal

* Dr. Deming is described as one of the "outstanding authorities on sampling techniques" in the publication of the Bureau of Transport Economics and Statistics entitled "Waybill Statistics—Their History and Uses" (Statement No. 543, February, 1954, p. 9).

Form F (Statement No. 6-54) developed by the Commission's Cost Finding Section (V.S. 43, p. 1). The entire terminal operations of each railroad at the points where a sample car was originated or terminated were studied in order to develop the switching minutes applicable to the various services performed by the carriers at that terminal (Tr. R 1886). The minutes per car for each element of service (e.g., classification, transfer, place-

[69]

ment, weighing) at each study point, developed by the on-the-ground switching studies, were applied to the services actually received by the study car at that point (Tr. R 1837-39). Thus, when the sampling plan selected a car of paper originating at Georgetown, S.C., a switching study of the minutes per car required for each element of switching services performed in originating a car of paper at the particular mill at which the sample shipment originated became relevant.

The switching study sample covered 41 cars selected by Dr. Deming, and the switching studies for each such car produced an average switching minutes per car for the origination or termination of Official-Southern traffic of 26.0 minutes per car, as compared with the 18.5 minutes per car that the Rail Form A territorial average would assume for such cars (V.S. 42, Appx. B).

The Examiners conclude that "The switching studies in the South have weaknesses both in the sample and in the studies themselves" (sheet 52). This conclusion is wrong in both respects.

First, as to the asserted weakness "in the studies themselves," the Examiners' criticisms are collected in a paragraph at sheet 50 which commingles a number of charges, each of which lacks substance:

The Examiners state (sheet 50):

"Switching minutes were developed for each category of service at all industries in the terminal areas. Inas-

"*The limits of sampling error.* The maximum uncertainty in any estimate that is made from a sample used in place of an equal complete coverage of the same frame may be placed at 3 times the standard error of the estimate.

"a. The actual difference between (a) the estimate produced by the sample and (b) the result of a complete coverage carried out under the same conditions, is usually much less, and may be in either direction. Only about 1 estimate in 40 will fall below 2 standard errors from the result of a complete coverage, and only about 1 in 40 will fall above 2 standard errors."

[76]

Thus, the chances are only one out of forty that the switching minutes per car for originating or terminating all Official-Southern traffic in the South is below the range of 26.0 plus or minus 2 times 2.2, which is a range from 21.6 to 30.4 minutes per car.

Considering the nature of the standard error as explained by the sampling experts of both Southern and Northern lines, the Examiners' acceptance of the calculation of the Northern lines' counsel ("26.03 minutes minus 7 minutes is 19 minutes") is unsound (sheet 50). Moreover, the comparison of the 19 minutes so computed and the use of 19 minutes as the Rail Form A average is misleading. An average of 17.8 minutes for box cars and 19.8 minutes for other cars does not produce "about 19 minutes" but substantially less than that figure where the traffic at issue moves predominantly in box cars (68.97% in the Southern lines' traffic study, as shown at sheet 9 of the Recommended Report).

A proper interpretation of the results of the Southern lines' study, in light of modern sampling techniques, is that the switching minutes per car for originating or ter-

much as all cars were included in the divisor in each instance, the minutes attributed to each class of service reflect the average traffic at that station and not necessarily the characteristics of Official-Southern traffic."

This is not true. Switching minutes were developed separately for the classification services (which properly reflect all cars classified at the particular yard), for transfer services (which properly reflect all cars covered in the particular transfer runs) and, *separately,* for each industry track or group of industry tracks separately switched. This is plainly shown in the illustrative map attached to the switching study instructions (Exhibit R-18, following p. 5), and in the "sample log" attached to the switching study instructions (see separate provision for switch engine time at "Smith & Co." (Exhibit R-18, following p. 9, Supp. 2)). The fact that the Southern lines' switching studies did not average together "all industries in the terminal area" is further demonstrated by the different switching minutes per car developed for two different sample

[70]

cars handled by the same railroad in the same terminal area. The switching factor for one car was 32.83 minutes and for the other was 55.51 minutes (V.S. 42, Appx. A, line 24 and line 26), a difference which could not have resulted if the Southern lines' studies had averaged all industries in the terminal area, as erroneously stated by the Examiners.

The Examiners further state (sheet 50):

"The switching studies were made on a single car basis although at least one car in the sample was picked from an "A" abstract containing 82 similar movements. These 82 cars covered a period of a month, and there must have been at least 3 or 4 cars per day, suggesting multiple-car block switching."

The switching studies were not made on "a single car basis" in the sense the Examiners use the phrase. The sampling

plan selected a car to be studied, but the switching studies did not assume that such a car would be handled "on a single car basis" or on any other assumed basis. The switching studies reflected the switching services that such a movement actually received, as discussed above. The unusual example referred to by the Examiners is entirely consistent with such treatment. This particular car of traffic did come from an industry that originated over 80 cars a month and there must have been at least 3 or 4 cars a day at that industry. The Examiners suggest, in reciting such facts, that the switching actually performed on a car originating at such an industry should be relatively low. What the Examiners do not show in their report is that the 'Southern lines' switching study of the movement in question (a car originated at Prairie, Mississippi, Tr. R 1880; R 1954) did produce relatively low minutes per car (7.39 minutes, V.S. 42, Appx. A, line 36). This shows that the Southern lines' switching studies did reflect the switching services performed in originating or terminating each of the Official-Southern movements, including movements lower, as well as higher, than the 26.0 minute average for the average car of Official-Southern traffic.

The Examiners state (sheet 50):

> "No investigation was made to determine whether operations were conducted in 1960 in a manner similar to the time the sample car moved, and no comparison was made of the volume of traffic at the study points between the two periods."

[71]

A comparison of operations between the time of the switching study and the time the car moved would be irrelevant. The sole issue in this case is the determination of fair divisions for the future, not the historical fact of how a car moved in 1958 or 1959. The traffic study for that period is important evidence not as an historical fact but as the best evidence of the characteristics and distribution of Official-Southern traffic as it moves today and will move in the

future. The switching studies are relevant in showing the services that are and will be performed in handling Official-Southern traffic now and in the future when the divisions resulting from this proceeding will be in effect. As a result, a change in operations or volume of traffic, if any occurred between the movement of the car in the sample and the making of the switching study, should be reflected in the switching study.

The criticisms as to changes in operations is not realistic in any event since operations in yards are influenced by the physical layout of the yard, rebuilding of the yards is not a common occurrence, and any such rebuilding would naturally operate to increase the efficiency of the yard and thus reduce the minutes per car shown in the switching studies as compared to the date on which the car in the sample happened to move.

The volume of cars handled at a terminal during a particular period affects the switching minutes per car, but the important comparison is not between the switching study week and the day on which the car in the sample happened to move. The relevant test of volume is whether the volume of cars handled during the periods in which the switching studies were conducted was higher or lower than the average volume of cars handled at the same points. The Southern lines did make this relevant test of the reliability of the periods in which the switching studies were made and this test showed that the volume of cars handled in the study weeks was, on the average, somewhat higher than the average weekly volume at the points at which studies were made (Tr. R 1940).* The fact that a somewhat higher volume was experienced in the study weeks than in the periods in which the study cars moved resulted in some *understatement* of the switching minutes per car actually experienced by the Official-Southern traffic.

---

* This test of the representativeness of the study periods conformed to the principle accepted by the Commission in sustaining the switching studies made by Southern lines in *Increased Switching Charges at Memphis, Tenn.*, 308 I.C.C. 5, 10 (1959).

[72]

The Examiners' last comment directed to the switching studies themselves is the following (sheet 50):

> "A witness for the northern lines made a 'mere cursory examination' of the switching studies and found six alleged errors amounting to an overstatement of 63.87 minutes out of 1067.20 minutes. Four of the errors were disputed by the southern lines and two amounting to 21.73 minutes were conceded."

So far as the "cursory" character of the examination of the switching studies, the Northern lines had ample opportunity to review all details of the studies and undoubtedly brought forward every criticism they could contrive. The total effect of the "six alleged errors," if correct, would be to reduce the results shown in the Southern lines' studies from 26.0 minutes per car to 24.5 minutes per car (1067.20—63.87 = 1003.33 ÷ 41). Four of the alleged errors are not errors at all (as shown in detail in the Southern lines' Brief, pp. 97-99), and the Examiners do not find otherwise. The two errors which were conceded only reduced the final result from 26.0 minutes per car to 25.5 minutes per car (1067.20 — 21.73 = 1045.47 ÷ 41), a relatively insignificant reduction.

As shown, there is nothing in the Examiners' discussion to support any conclusion that there are substantial weaknesses in the Southern lines' switching studies themselves. We next turn to the Examiners' separate conclusion that there were weaknesses in the sample.

With respect to the size of the sample, the Examiners apparently accept the notion, advanced by the Northern lines, that a sample size of 41 observations cannot be fairly typical because this is "an assumption which offends common sense" (sheet 50). The Southern lines made no such "assumption." Nothing was assumed. The sample was scientifically selected by Dr. Deming, not on the basis of judgment or assumption, but on the basis of mathematical

principles. The reliability of the sample result in measuring the average of the whole body of traffic is measured by mathematical principles in terms of the "standard error," as Dr. Deming testified (V.S. 12, p. 10):

> "The ability of a sampling plan to indicate its own margin of error is one of the main features of modern practice. This calculation is possible because the selection and the method of estimation follow a definite theory, the use of which is well understood. The margin of error for a stated probability is not a matter of judg-

[73]

> ment, as it is derived from the sample itself by the laws of probability. It has a standard interpretation the world over. No result derived from this sample is of unknown quality."

In appraising the Examiners' acceptance of the Northern lines' criticisms of the sample size of the Southern lines' switching studies, it is most significant that all of these criticisms were generated by counsel, in cross-examination and on brief, although the Northern lines had retained an expert in modern sampling techniques (see V.S. 2). This expert, Dr. R. W. Van Voorhis, relied upon the very same mathematical principles of sampling as did Dr. Deming. Thus, Dr. Van Voorhis testified at the opening hearing as follows (V.S. 2, pp. 5, 8):

> "The reliability of an estimate made from a sample is measured by its standard error, and is obtained from the sample itself from the laws of probability.

* * *

"The standard error of an estimate makes it possible to make statements in the language of probability about the reliability of an estimate obtained."

Having themselves advocated scientific sampling methods at the opening hearing, the Northern lines did not and could not present a sampling expert at the rebuttal hearing to criticize in any way the sampling plan prepared by Dr. Deming and used by the Southern lines as the basis of their switching studies.

Accordingly, the Northern lines' criticisms of a 41 car sample as being so small as to offend "common sense" is an appeal not to common sense at all but to a rejection of the very scientific sampling techniques which the Commission has called for in *Increased Parcel Post Rates, 1957*, 309 I.C.C. 59, 72 (1959), and which expert witnesses for both Southern and Northern lines have supported in this case.

Under modern sampling "The number of sampling units in the frame is of little consequence to the precision of a sample . . . Thus, the size of sample required to reach a prescribed precision for the valuation of a small lot of material will be about the same as for a big lot." (V.S. 12, Appx. B, p. 10).

As to the "common sense" of the situation, a 41 car sample is not small considering the very substantial effort involved in conducting each separate switching study required to develop the switching min-

[74]

utes per car actually required in originating or terminating a movement of the kind drawn into the sample. A one week study of all switch engine movements in the terminal area, separating the time of each engine as between the various services performed during each tour of duty, is a most extensive undertaking, as is apparent from the instructions and sample forms set forth in the switching study instruc-

tions (Exhibit R-18). To characterize a 41 car sample as small is to ignore the effort involved in each switching study and, in effect, to preclude a party from developing the switching minutes per car properly associated with the traffic at issue as contrasted with average traffic. It is precisely because the Northern lines benefit from the territorial average relationship that they adopt such a negative approach to the whole switching study effort. The Commission should not countenance the Northern lines' negative approach and their entirely destructive criticisms, but should encourage the development of facts relating to the particular traffic at issue in preference to territorial averages. This is particularly true where, as here, it is the Northern lines that have the burden of proving that the average is applicable to the traffic at issue before they can lawfully obtain increased divisions.

The Examiners do not mention at all a most persuasive confirmation of the results produced by the 41 car sample. When it became apparent that counsel for the Northern lines were making an attack on the size of the sample, the Southern lines completed a study of the switching services performed on additional movements comprising a related sample which was twice as large (83 cars) (Ex. R-15). The switching minutes per car for this larger sample were found to be 25.0 minutes with a standard error of 1.7 minutes (Tr. R 1569). The standard error for the enlarged sample was lower than the standard error for the 41 car sample (2.2 minutes), as would be expected (Tr. R 1589-90), and the result of the larger sample was relatively close to the result produced by the 41 car sample (26.0 minutes per car). As Dr. Deming testified, the result produced by the enlarged sample vindicated the integrity of the smaller sample (Tr. R 1602). This vindication of the reliability of the 41 car sample after it had been attacked on cross-examination by counsel for the Northern lines is most significant in considering the "common sense" of the situation, and yet this significant

[75]

evidence is totally disregarded by the Examiners in their discussion accepting the criticisms advanced by Northern lines' counsel.*

The Examiners also accept the argument of Northern lines' counsel which misuses the standard error. The Southern lines' switching study produced an average minutes per car of 26.0 with a standard error of 2.2 (V.S. 42, Appx. B). The Examiners then state (sheet 50): "26.03 minutes minus 7 minutes is 19 minutes." This is a misuse of the standard error.

Dr. Deming stated that "the extreme variation of an estimate made from a probability sample is usefully placed at 3 standard errors above and below the result of the equal complete coverage" (V.S. 12, p. 8). This means that the "extreme variation" of the 26.0 minutes per car result of the switching sample is 26.0 plus or minus 3 times 2.2, which is a range of from 19.4 to 32.2 minutes per car. But why rely on the "extreme?" As Dr. Van Voorhis testified, "the chances are about 95 out of 100" that the result lies within 2.3 standard errors. Thus, the changes are 95 out of 100 that the minutes per car for all Official-Southern traffic are within the range of 26.0 plus or minus 2.3 times 2.2, which is a range from 20.94 to 31.06 minutes per car. And, as Dr. Deming further pointed out (V.S. 12, Appx. B, p. 6):

---

* The evidence cited in the foregoing paragraph is all in the record, having been elicited from the Southern lines' witness on cross-examination. When the Southern lines offered into evidence the detail underlying the 83-car switching study sample so that the Commission might have access to the complete facts (Tr. R 1820-21), the exhibit was rejected (Tr. R 1821-22), and the Examiners refused to permit the rejected exhibit to be identified as required by Rule 1.84(e) of the Commission's General Rules of Practice (Tr. R 1823). This rejection of detail underlying facts already of record was erroneous, as was the refusal to identify the exhibit (as discussed at pp. 121-126, *infra.*)

minating Official-Southern traffic in the South are substantially higher than the territorial averages imputed to the traffic under Rail Form A, and that the sample result produces the best estimate of the actual switching minutes per car for the origination or termination of all Official-Southern traffic in the South.

The one finding of the Examiners that would, if true, undermine the integrity of the sampling underlying the Southern lines' switching study is the following (sheet 50):

> "The northern lines show that the 41 cars were not selected by subsample but were later assigned to subsamples and say that this is a distortion of the use of subsamples which throws doubt on the value of the standard error computed therefrom."

It may well be that the Examiners' belief that the Southern lines' switching study was not based upon cars selected by subsample underlies their acceptance of other criticisms of the sample, because failure to select the 41 cars without the assignment of subsample at that time would, if true, cast doubt on the value of the standard error. But it is not true. Dr. Deming selected the 41 cars, and Dr. Deming's sampling plan provided for the designation of the subsample *before* the movement was studied by the Southern lines. When asked how the cars were assigned to subsamples, Dr. Deming testified (Tr. R 1574, R 1575, R 1577):

> "A. That was done in the original sample, an abstract, and the cars thereon, that falls into subsample 2 remains there. It was there and was also there and is still there."
>
> * * *
>
> "Q. And what about "A" cars, where do they belong?
>
> "A. Those I selected, of those I selected ten subsamples."

The important fact in appraising the integrity of the standard error is that the sample consist of 10 independent subsamples, as testified by both Dr. Deming (V.S. 12, p. 10) and Dr. Van Voorhis (V.S. 2, pp. 5-6). The 41 car switching sample were so selected, as Dr. Deming testified and, therefore, there is no basis for any "doubt on the value of the standard error computed therefrom," as erroneously found by the Examiners.

In view of the incontrovertible mathematical significance of the "standard error" in measuring the reliability of results produced by the Southern lines' switching study sample, the Examiners' recitation of variations between the 41 car sample and the entire traffic in terms of directional flow and proportion of yard and train switching (sheets 49-50) is irrevelant. The standard error of a sample conveys all the information that there is in regard to the precision of the sample result, as Dr. Deming testified (V.S. 12, p. 8):

> "That is to say, details concerning the sampling procedure, such as the modes of stratification, the size of the sample, and the statistician's reasons for his choices of plan and for the description of the sampling units, convey no further information about the precision of an estimate, once the numerical value of its margin of error has been calculated."

The same principle is set forth in the Recommended Practice adopted by the American Society For Testing Materials (V.S. 12, Appx. A, p. 3):

> "Details concerning the sample procedure, such as the modes of stratification, the size of the sample, and the statistician's reasons for his choices of plan and for the description of the sampling units, convey no further information about the precision of an estimate, once the numerical value of its margin of error has been calculated."

[78]
The same principle was also adopted in the Standards of Probability Sampling for Legal Evidence published by the Society of Business Advisory Professions, Inc. (V.S. 12, Appx. B, p. 6):

> "*Information provided by the standard error.* Once a sampling survey is completed, and an estimate is obtained therefrom, the standard error of this estimate, or the margin of error and its associated probability, calculated (a) by the proper statistical theory from the results of the sample, and (b) under the necessary conditions for validity (use of random numbers, adherence to the prescribed sampling procedure) conveys all the information that there is in regard to the precision of the estimate in question."

The Examiners' approach, rejecting the scientific sampling plan because the random selections are not deemed "typical," was expressly condemned in the text by Professors Hansen, Hurwitz and Madow, "Sample Survey Methods and Theory" (Vol. I, p. 80):

> "Rejection of atypical or 'unrepresentative' observations. Another procedure which may lead to more or less serious biases is to examine the observations drawn by a random process and then to discard those that, in the judgment of the investigator, are unrepresentative or atypical. In an extreme case, when most of the observations must pass the test of being representative in the eyes of the investigator or else be rejected, the whole selection operation is reduced to one of a judgment or purposive selection."

Besides being irrelevant, the Examiners' analysis of the effects of directional flow, proportions of yard and train switching and other characteristics of the traffic are misleading.

The Examiners' reference to the showing "that the sample included no cars from Boston, Philadelphia, Detroit, St. Louis, or Buffalo, among other large northern cities, and not a single car of citrus or fresh vegetable traffic" (sheet 49) is entirely beside the point. It is not necessary for a random sample to include every city and every commodity to provide a reliable estimate of the average of all traffic covered by the sample. Citrus and fresh vegetables from the South constitute only 3.8 percent of the entire Official-Southern movement.* In any event, the operating testimony indicates that substantial switching services are required in originating these perishable commodities (V.S. 34, pp. 18-

[79]

19), so that the lack of such traffic in the sample in no way prejudiced the Northern lines.

The absence in the sample of cars from five particular Northern cities** has nothing whatever to do with the integrity of the sample as a basis for studies of origin and destination switching services performed in the South. And it is also true that no cars in the sample originated or terminated in the large Southern cities of Miami and Tampa. The reference to the Northern cities further presumes that a representative sample of Official-Southern traffic will necessarily include a high proportion of originations or terminations in the large cities of the North. There is absolutely no basis for this assumption. There is no basis in this record or otherwise for assuming that the sample does not include a fair distribution of large city and small town originations and terminations in both the North and the South.

---

* 35,951 cars of citrus and vegetables out of 967,554 cars constituting the annual movement of all traffic at issue (V.S. 11, Ex. 1, Tab. G, commodity classes 59, 61, 77-89).

** Why any cars from St. Louis would be expected in a sample of Official-Southern traffic in which Northern lines participate is far from clear under any circumstances since St. Louis is serviced directly by five Southern Lines (L&N, Southern, IC, GM&O and Frisco).

As to directional flow, the Examiners remark upon the fact that the sample cars showed greater minutes per car for terminating Official-Southern traffic in the South than for originating Official-Southern traffic in the South. The Examiners then find an inconsistency in the operating testimony that "it is more burdensome to originate a car in the South than to terminate it" (sheet 49). There is no inconsistency because the comparisons are different. The operating witnesses were comparing the services required in originating a car as compared with the services required in terminating the same car, other conditions being equal (e.g., V.S. 28, pp. 7-16). The Southern lines' switching studies covered the origination and termination of Official-Southern traffic and, by definition, the Southern lines do not originate as well as terminate any single car of this interterritorial traffic. No operating witness testified that the switching minutes per car required to originate Northbound paper and other Official-Southern traffic were greater or less than the switching minutes required to terminate the different Southbound commodities, which is the comparison produced by the separation of the Southern lines' switching studies as between origination and destination services cited by the Examiners (sheet 49).

The Examiners' reference to the proportion of yard and train move-

[80]

ments is both irrelevant and inconsequential if relevant. Even if it were proper to tinker with the results of a random sample "to restore in the small sample the 60-40 relationship of yard to train switching shown in the more comprehensive sample," the proper way to go about making the adjustment would not be "to drop four cars of yard switching from the small sample" (sheet 50). Why drop the four cars with the largest switching minutes or the four cars with the lowest switching minutes? The Examiners

state that cars given yard switching averaged 30.15 minutes and cars given train switching averaged 17.84 minutes (sheet 49). To create a 60-40 relationship, the direct approach would be to give 30.75 minutes a weighting of 60 and 17.84 minutes a weighting of 40. This produces an average of 25.59 minutes per car (.60 x 30.15 plus .40 x 17.84), which is less than one-half minute per car different from the 26.0 minutes per car result of the 41 car switching sample without such an adjustment.

The Commission should reject the Examiners' analysis of the Southern lines' switching studies and adopt the switching minute factor for Official-Southern traffic in Southern territory as developed in the Southern lines' switching studies in preference to the territorial average which understates the services performed by the Southern lines in handling the traffic at issue. The integrity of the switching study sample has been established and the Northern lines have not shown any substantial error in the individual switching studies.

iii. *The Absence of Any Showing of a Need for an Upward Adjustment in the Average Switching Minutes per Car for the Northern Lines*

The Northern lines relied upon territorial average costs and they presented no proof that would justify any upward adjustment in their territorial average switching minutes per car for application to the origination or termination of Official-Southern traffic in the North.

Nevertheless, the Examiners accept the assertion of the Northern lines that (sheet 48):

> ". . . if volume commodities exert a depressing effect upon system average switching minutes in the southern region, the presence of volume traffic in the North produces at the very least a corresponding influence on the eastern lines."

[81]

The Examiners undertake to calculate the allegedly offsetting effect of volume traffic in depressing the territorial average switching minutes per car through a computation of their own devising (sheet 51) (no such computations having been presented by the Northern lines in their evidence or argument). Solely on the basis of these computations, the Examiners indicate that the switching minutes per car for other than "volume commodities" in Official territory used in the Southern lines' cost study "is inadequate by from four to seven minutes in comparison with the adjustment they made for their own region" (sheet 52).

These computations made by the Examiners make a series of unsupported assumptions and misconceive entirely the basis of the Southern lines' adjustments in territorial average switching minutes per car.

The Examiners' computations start with the territorial switching minutes per car for Southern Region and then assume that the 26.0 switching minutes per car developed in the Southern lines' switching study is applicable to "other than volume commodities" representing 54.14 percent of the total cars originated or terminated in the South (sheet 51). The 26.0 switching minutes per car represents the average for originating and terminating all of the Official-Southern traffic involved in this case. This traffic does not necessarily have the same switching characteristics as 54.14 percent of the Southern lines' total traffic, and the Southern lines never claimed or assumed that it did. The Official-Southern traffic represents only 8.93 percent of the total cars originated and terminated by Southern Region carriers (see p. 60, *supra*), and the 26.0 minutes per car represents the services performed as to that 8.93 percent of the Southern lines' total traffic. The 26.0 minutes per car does not purport to measure the switching minutes per car required to originate or terminate intra-South traffic other than commodities identified as volume com-

modities, termination of western grain traffic in the South or any other interterritorial traffic. The Examiners' calculation of 11.1 minutes per car as the switching performed for volume commodities in the South is thus without foundation.

The Examiners' next computation makes the assumption that the 11.1 minutes per car calculated for volume commodities in the South also measures the services performed in handling the same commodities in the North, or can be used to estimate the services performed in

[82]

handling such commodities in the North. There is absolutely no support in the record for any such assumption.

The term "volume commodities" as used in the Examiner's computations are commodity classes (pulpwood, coal and six other commodities (see sheet 47)), which the Southern lines' operating witnesses identified as moving primarily in multiple-car blocks *in the South* (p. 63, *supra*). No witness for the Northern lines testified that these commodities are handled in multiple-car blocks in the North. No witness for the Northern lines testified, for example, that pulpwood is handled in the North through the new techniques of concentration yards which permit multiple-car handling (see p. 65, *supra,* as to this development in the South). As to coal, the most important commodity in the North, no Northern line presented any evidence showing that coal receives any less switching service than the average car in the North. Indeed, the record in this case shows that Northern lines have testified in other proceedings as to the extensive switching services required in the handling of bituminous coal, including individual weighing of the cars (V.S. 37, Appx. D; Sec. B, p. 2; Sec. D, pp. 2-5; Sec. H, pp. 14, 15, 22; Sec. I, pp. 5-6).

In the absence of any evidence as to the physical handling of these commodities primarily in multiple-car blocks in the North, there is no substantial evidence to support the basic assumption underlying the Examiners' computations

of the effect of "volume commodities" on the switching minutes per car required for the handling of "other than volume commodities" in the North.

Accordingly, there is no basis on this record for any finding that the territorial average switching minutes per car in the North understate the switching minutes per car required to originate or terminate Official-Southern traffic in the North. The Northern lines have the burden of proving that the average costs apply to the traffic here at issue, and they certainly have the burden of proving that their switching costs are higher than average because their average is depressed by cars having lower than average switching costs. Yet, in the absence of any such evidence, the Examiners base their conclusions on calculations which assume for the Northern lines facts which they never even attempted to prove.

Despite the absence of any evidence, the Southern lines' cost study increased the average switching minutes in the North to reflect an

[83]

adjustment made by the Cost Finding Section, imputing Pocahontas Region switching minutes per car to bituminous coal traffic for the entire Official territory, and using special minute per car factors for iron ore and anthracite to washers (V.S. 40A, p. 6). (This is the adjustment referred to as "Switching Minutes-Pocahontas Region" which the Examiners reflected in their "Restated Costs," contrary to their own conclusions on the subject, as discussed at pp. 61-62, *supra*). The record does not support any such adjustment, and it was made by the Southern lines in their cost study solely to avoid conflict with the Cost Finding Section. Strict adherence to requirements of substantial evidence thus calls for the elimination of the upward adjustment in the average switching costs of the Northern lines calculated by the Cost Finding Section and used by the Southern lines' cost study. Indeed, the facts in the record as to the relationship of coal on Pocahontas lines to coal

on other Northern lines shows that the switching experience of the Pocahontas lines is *not* fairly representative of the costs of switching the same commodity on other Northern lines. This was developed in the record, after the Southern lines had presented their cost study, in the form of a comparison of the number of cars of coal originated per active mine on important Pocahontas and Eastern District coal originating roads (comparable data of Southern lines are also shown) (V.S. 80, Sec. M, p. 2; Tr. R 2682):

Pocahontas Lines	*Cars per Active Mine (Year 1956)*
Norfolk and Western	4104
Chesapeake & Ohio	2907
Eastern District Lines	
New York Central	1725
Baltimore & Ohio	1717
Pennsylvania	1392
Southern Lines	
Illinois Central	9265
Clinchfield	3624
Louisville & Nashville	3050

The Northern lines' principal cost witness conceded that "The greater number of cars originated per active mine has, of course, a very marked influence on the cost of origin service on this traffic" (V.S. 80, Sec. M,

[84]

p. 2). Thus, the foregoing table shows that the Cost Finding Section's method of imputing the switching costs of Pocahontas lines to the origination of coal on Eastern District roads assumes a relationship contrary to the facts shown in this record.

Thus, unlike the situation proved for Southern Region carriers, there is no basis for assuming that the switching

costs of originating or terminating other than volume commodities is any higher than the territorial average in the North, and there is certainly no basis for assuming that the upward adjustment of switching costs in the North, made in the Southern lines' cost study, understates the Northern lines' costs of switching Official-Southern traffic. The Examiners' conclusion that the Northern lines experience switching costs "four to seven minutes" higher for "other than volume commodities" is based upon a computation not supported by substantial evidence, and should be rejected by the Commission.

(iv) *The Northern Lines' Failure to Develop Any Facts as to the Switching Services Which They Perform in Handling Official-Southern Traffic.*

As shown above, there is no basis for inferring from any facts in the record, as to the handling of other traffic in multiple car blocks or otherwise, that the Southern lines' cost study understates the switching costs in the North.

Even for the South, where the evidence proved the depressing effect upon the Southern Region average of the switching of volume commodities, the Southern lines did not make any assumptions as to the effect on Official-Southern traffic but made actual studies of a scientifically selected sample of the 8.93 percent of the actual traffic at issue here. The results of these switching studies formed the basis for the adjustment of average costs in the South.

No such switching studies were made by the Northern lines to measure the switching services which they performed in originating or terminating the 4.07 percent of their total cars which constitute Official-Southern traffic. The Northern lines' sampling expert could have selected a sample, and the Northern lines could have conducted switching studies to develop the facts. Instead, the Northern lines chose to rely upon the territorial average costs, not by supporting the

[85]

averages with evidence as to the facts relating to Official-Southern traffic, but by resisting all efforts to develop the facts.*

The Examiners sanction the Northern lines' negative approach in the following conclusion (sheet 52):

> "The adjustment in the North was not made on a basis comparable to that in the South, and, in this case where the relationship of North and South is of prime importance, this is a major defect."

The "adjustment . . . in the South" was based upon actual studies of switching services performed in handling Official-Southern traffic in the South. Under the Examiners' approach, all the Northern lines have to do to defeat the Southern lines' study is to refuse to develop any facts as to their actual handling of the traffic in issue. This refusal to study the facts precludes the making of an adjustment in the North "on a basis comparable to that in the South" and this alone, under the Examiners' analysis, "is a major defect."

This is a grossly unfair approach. It violates all precepts of burden of proof, particularly where the Northern lines alone are in possession of the facts as to the switching services which they perform in handling Official-Southern traffic in the North.

---

* The only data presented by a Northern lines' witness that permits any calculation of the minutes per car performed in handling Official-Southern traffic in the North shows services substantially below average. This operating evidence shows that a typical block of 17 cars of Southern perishables arriving at the Pennsylvania's Harsimus Cove yard would be spotted on team tracks at Ball Ground, which is 3 to 4 miles away, within 1½ to 2 hours (Tr. 468-469), or an average of only 5.3 to 7.1 switching minutes per car. Even assuming a 100% empty return, it would require only 10.6 to 14.2 minutes for the round trip as compared with the system average of 28.2 minutes per car for refrigerator car traffic (V.S. 40A, Ex. F). Another witness for the Pennsylvania testified that practically all fresh vegetable traffic destined to the New York area receives team track termination (Tr. R 465, 2643).

Since the Southern lines proved that the territorial average switching costs were inapplicable and studied the switching services actually performed in the South, the results of such studies should be reflected in the costs. The Northern lines' failure to develop comparable data as to the handling of the traffic in their own territory should not be rewarded by having the Southern lines' studies rejected. If the Northern lines' claim that the Rail Form A average costs, as adjusted upward by the Cost Finding Section, understates the costs of originating or terminating Official-Southern traffic in the North, they certainly failed to

[86]

prove it. Indeed, the Northern lines failed to present any substantial evidence supporting the application of even their territorial average costs, much less any higher costs, to the traffic at issue in this case.

For these reasons, the Commission should reject the Examiners' Recommended Report and "Restated Costs" on the subject of Switching Costs and should include in the "Restated Costs" the adjustment of switching costs made in the Southern lines' cost study.

4. Inconsistent Counting of Cars as Interchanged and as Originated or Terminated in Computing Rail Form A Unit Costs.

In their treatment of "Count of cars interchanged and originated and terminated" (sheets 34-36), the Examiners begin with the following statement of the position of the Southern lines (sheet 34):

> "The southern lines contend that for the purpose of determining relative costs incurred by northern and southern lines, it is necessary that cars receiving comparable service be counted in a consistent manner in both territories."

The Examiners never dispute this obviously correct statement of principle, yet they sanction the use of Rail Form A costs in which "comparable service" is counted in an inconsistent manner.

The inconsistency arises from the fact that Rail Form A costs used in the Examiners' restatement of costs are based on the Freight Commodity Statistics in which the Northern lines count as cars interchanged shipments which move by rail to a port for loading onto a boat for water movement to another point in the United States (Tr. R 869-70), whereas the Southern lines report as cars terminated shipments receiving comparable services when carried to a port for loading onto a boat for water movement to a foreign destination (V.S. 21, p. 25; V.S. 22, p. 50). Thus the Northern lines report a large volume of coal, terminated at port dumping facilities for loading onto boats, as cars interchanged, while the Southern lines report the large volume of phosphate rock hauled to ports for loading onto boats as cars terminated. The Examiners describe these facts and correctly state: "These are examples of cars which receive analogous services but are placed in different categories" (sheet 34).

[87]

The Examiners then recite the steps taken by the Southern lines to correct this statistical inconsistency and thus eliminate a situation which "inflates the terminal costs more in the North than in the South" (sheet 34). The Examiners should have found that the inconsistency inflates *both* the terminal costs *and* the interchange costs more in the North than in the South.

The improper counting of a car as interchanged instead of terminated affects the weighting accorded to that car in computing switching costs. A car which is counted as a car terminated is weighted by a factor of 1.0 in computing Rail Form A costs whereas a car counted as a car interchanged is weighted by a factor of only 0.5 in allocat-

ing the total switching costs among the various kinds of switching services (V.S. 40, Ex. C, p. 7). The following tables illustrate the effect which inconsistent counting of cars as between cars interchanged and cars originated or terminated has upon the cost per car. The first table illustrates the allocation of switching costs between terminal and interchange services on the basis of a correct count of cars in each category:

	Origin or Destination	*Interchange*	*Total*
Total Switching Costs ..	—	—	$500
Cars	100	100	—
Weighting Factor	1.0	0.5	—
Weighted Cars	100	50	150
Distribution of Weighted Cars	67%	33%	100%
Distribution of Costs ...	$335	$165	$500
Costs per Car	$3.35	$1.65	—

Thus, in this illustration, Rail Form A would impute a cost of $3.35 per car for origin or destination switching and $1.65 per car for interchange switching on the basis of the correct car count. The next table shows the Rail Form A cost allocations for the same cars, but counting 10 percent of the cars as interchanged cars although the cars actually received origin or destination switching:

	Origin or Destination	*Interchange*	*Total*
Total Switching Costs	—	—	$500
Cars	90	110	—
Weighting Factors	1.0	0.5	—
Weighted Cars	90	55	145
Distribution of Weighted Cars ..	62%	38%	100%
Distribution of Costs	$310	$190	$500
Cost per Car	$3.44	$1.73	—

[88]

A comparison of the two tables shows that the inconsistent counting of 10 percent of the cars which actually received origin and destination switching has the effect of inflating *both* the unit cost for origin and destination switching ($3.35 to $3.44) *and* the unit cost for interchange switching ($1.65 to $1.73). Thus, even if the Northern and Southern lines each terminated the *same* number of cars and interchanged the *same* number of cars for precisely the *same* total switching expense, the inconsistent counting of cars originated or terminated as cars interchanged in the North would produce *higher* unit costs both for origin and destination switching and for interchange switching in the North than in the South.

The arithmetic of the issue of consistency in the count of cars is not disputed by the Examiners. Instead, the Recommended Report adopts irrelevant and incorrect assumptions of the Northern lines which obscured the issue and led the Examiners to conclude: (Sheet 36)

> "It cannot be determined from the evidence whether or not the southern lines' adjustment of the car count would enhance or detract from the accuracy of the costs and for this reason it is not included in our restatement of costs."

Before showing the errors in the Recommended Report which led to the Examiners' conclusions, it is most significant to show that the Commission's Chief Cost Analyst and the Commission itself have recognized the need for, and have made, the very corrections in the car count statistics urged in this proceeding by the Southern lines.

In Docket 28300, *Class Rate Investigation, 1939,* Rail Form A costs were presented in evidence by the Commission's Chief Cost Analyst. The costs in that case were originally computed using the car counts from the Freight Commodity Statistics which contain the inconsistent classification of cars for cost purposes of which the Southern lines

complain here. When this situation was called to his attention by Western *and Eastern* lines, the Commission's Chief Cost Analyst agreed that the criticism was correct, as follows (V.S. 40, Appx. C, p. 8):

> "*Statement of the Effect of a Change in the Count of Carloads Originated and Terminated:*
>
> "The point has been raised by the Western and Eastern carriers that the use of the count of carload traffic appearing in Schedule 541 of the rail carriers' Annual Report Form A resulted in an

[89]

> understatement of the number of carloads originated and terminated. (See transcript pages 88 and 120). The reason given was that the traffic interchanged with water carriers may in some cases be counted as traffic delivered to connecting carriers or received from connecting carriers rather than as traffic originated or terminated.
>
> "For example, ore traffic delivered by rail carriers to the water lines at the head of the lakes, or received by rail carriers from the water lines at the lower lake ports, is counted as traffic delivered to or received from connecting carriers when identified as receiving previous or subsequent rail transportation, or as moving on joint through bills of lading. This treatment is correct for statistical purposes in determining the national production, as it eliminates duplications. *However, from the standpoint of cost, such a count is incorrect as the rail terminal service at point of interchange with water lines is a complete origin or destination operation and should be counted as such.*"

The Cost Section cured this error by preparing a questionnaire under which the railroads concerned reported data for use in correcting the car counts shown in the Freight Commodity Statistics (V.S. 40, Appx. C, p. 9), and the Chief

Cost Analyst corrected the costs. *Class Rate Investigation, 1939*, 262 I.C.C. 447, 576 (1945).*

[100]

* * *

Having shown the dollar effect of this item, the Examiners nevertheless refuse to reflect it in their "Restated Costs." The only explanation given is the following blanket statement (sheet 58):

> "We have fully considered these points, and are of the opinion that the service unit costs as determined by the application of Rail Form A reflect for the most part the costs which are referred to here, and that as the northern lines contend these factors are partially offset in the South."

---

* In *Class Rates, Mountain-Pacific Territory*, 296 I.C.C. 555, 604 (1955), the Cost Finding Section did not attempt to correct the recognized error in the "counting of cars of coal and iron ore having a rail-water or rail-water-rail movement as cars originated or terminated in lieu of cars interchanged" because (1) the effect on costs was very small in that proceeding and (2) the relative switching service performed for the coal and iron ore traffic as compared with other carload traffic required further study. Neither of these reasons applies in this Official-Southern divisions proceeding:

(1) In this proceeding, the data obtained from carrier reports on file with the Bureau of Transport Economics and Statistics shows that 5.4 percent of the cars in the Eastern District, 8.7 percent of the cars in the Pocahontas Region, and 5.9 percent of the cars in Official Territory (Eastern District plus Pocahontas Region) were incorrectly counted as cars interchanged rather than cars originated or terminated in 1956 as compared with only 1.1 percent of the cars in the Southern Region (V.S. 40, Ex. C, p. 11). If the car counts are not corrected to show that the 1,803,499 cars incorrectly counted as cars interchanged in Official Territory were actually cars originated or terminated (V.S. 40, Ex. C, p. 11), the Northern lines' costs relative to the Southern lines' costs will be overstated by 0.23 percentage points and this affects the distribution of Official-Southern revenue by over $1 million annually (V.S. 40A, Ex. G, p. 9). The significant effect on cost relationships in this division's case has thus been established, as the Examiners note in their Report (sheets 34-35).

(2) As to the need for documentation of the relative switching services performed on coal and iron ore traffic as compared with other carload traffic, the

This statement provides no rational basis for refusing to adjust the restated costs so as to equalize the interchange costs at the gateways.

The problem of equalizing gateway interchange costs arises from the fact that the Rail Form A unadjusted costs include an average cost of $4.95 per interchange handling in the North as compared with $3.14 per interchange handling in the South (V.S. 31, pp. 12-13). The Northern lines did not prove, nor does the record support, use of costs per interchange handling that are 58 percent higher in the North than in the South for any of the interchange services performed in handling the Official-Southern traffic. But whatever the validity of such an average relationship as applied to interchange services performed elsewhere within the respective territories, the record is conclusive that the costs of interchange services performed at the territorial gateways are not 58 percent higher for the Northern lines than for the Southern lines. The record establishes that the cost per interchange handling in accomplishing the interchange of Official-Southern traffic at the territorial gateways is no higher for the Northern lines than for the Southern lines, and the "Restated Costs" should reflect this fact.

As a matter of common sense, it is apparent that territorial average cost differences, even if applicable to Official-Southern traffic handled within the North and within the South, are not applicable when both groups of lines are interchanging traffic with each other at the territorial gateways. Whatever circumstances affect the costs of performing interchange service at such common points obviously affect both Northern and Southern roads performing services at such points. Any differences in the costs of Northern and Southern lines operating in the same terminal areas would be random differences not inherent in the average conditions within the separate territories.

* * *

[104]

* * *

The use of territorial average costs for interchange services results in the application of $4.95 per interchange handling for the Northern lines and $3.14 per interchange handling for the Southern lines (V.S. 31, pp. 12-13). These costs should be equalized for the interchange of Official-Southern traffic at the territorial gateways, as follows:

1. Number of cars interchanged at gateways (total cars shown in V.S. 11, less cars shown in V.S. 26, p. 47)	880,711
2. Average cost per interchange handling ($4.95 + $3.14 ÷ 2; V.S. 31, pp. 12-13) ..	$4.04
3. Overstatement of Official territory Costs (880,711 × [$4.95—$4.04])	$797,043
4. Understatement of Southern Region Costs (880,711 × [$4.04—$3.14])	$797,043

[105]

This overstatement in Official territory costs and understatement in Southern Region costs totals $1,594,086 (referred to by the Examiners as "$1.6 million" (sheet 58)). A proper restatement of the costs of handling Official-Southern traffic should reflect such equalization of the interchange costs at the territorial gateways.

* * *

[114]

* * *

8. Exclusion of Suburban Service Deficits.

The Cost of Service issue in this case is the determination of the cost of handling the Official-Southern traffic at issue. Although acknowledging elsewhere that this is the cost issue (see p. 8, *supra*), the Examiners nevertheless include in their "Restated Costs" a statistically apportioned share of deficits from suburban service (commuter) operations. Since the Northern lines have substantially greater commuter deficits than the Southern Region lines, inclusion

of such deficits as a part of the cost of handling Official-Southern traffic increased the relative costs of the Northern lines as found by the Examiners.

The Examiners include suburban service deficits in their restated costs on the same basis as intercity passenger deficits. They refuse to recognize any difference in the two types of passenger services. The record shows, however, that suburban service and intercity passenger operations are distinctly different, both physically and in the problems which they present.

[115]

The basic reason justifying the inclusion of intercity passenger deficits as a part of the cost of providing freight services is that such passenger deficits are almost entirely attributable to the apportioned costs of common facilities which must be incurred in any event to provide freight service. As the Commission observed in *Railroad Passenger Train Deficit,* 306 I.C.C. 417, 420 (1959):

> "The criticism of our separation rules is based on the fact that only about 75 percent of the passenger operating expenses as reported can be directly separated from those for freight service. These are known as solely related expenses. Obvious examples are wages of trainmen and enginemen in passenger operation. The other 25 percent, which are not solely related, present a typical problem in the ascertainment of the components of common costs. For the most part, the costs which must be apportioned are in the group of accounts for maintenance of way and structures."

Because the statistical passenger deficit includes maintenance of way and structure costs which must be incurred to provide freight service, such costs are properly charged to freight service to the extent they cannot be recovered from passenger operations (V.S. 14, p. 13):

"Intercity passenger service is, in large part, performed over the same tracks, bridges and other facilities as are used in freight service. As a result, an important portion of passenger costs represents the allocation of costs common to freight and passenger service.

"However, elimination of all intercity passenger trains experiencing out-of-pocket losses will not eliminate the reported passenger deficit. The passenger deficit will still reflect the large portion of carrier costs which would continue in any event if all passenger service ended. Under such circumstances, the intercity passenger deficit is treated as a burden to be recovered from the freight service. This becomes largely a matter of terminology, since the freight service is paying for the use of the common facilities that must be maintained for freight service in any event."

The fact that common facilities must be maintained for freight service was emphasized by the Supreme Court in upholding the Commission's consideration of passenger deficits in freight rate proceedings. In *King v. United States,* 344 U.S. 254, 265 (1952), the Court stated:

"In Florida, moreover, the discontinuance of railroad passenger service would not permit the discontinuance of high-speed tracks

[116]

and equipment because of the need for fast freight schedules to transport perishable fruits and vegetables from Florida."

The Examiners invoke the same principle in support of the inclusion of suburban service benefits. They find that "the suburban service deficit includes costs which must

be incurred to provide freight service or intercity passenger service" (sheet 54). So far as appears from the Recommended Report, it would seem that the Southern lines are the authors of the contrary concept that suburban service deficits are incurred in operations entirely separate from the freight and intercity passenger service (sheet 54).

Actually, it is the Northern lines themselves who have stated and shown the magnitude and distinctive nature of the suburban service deficits. Because the passenger service data reported to the Commission by roads which perform both suburban service and intercity passenger service do not show separately the costs, revenues, and deficits for suburban service, the magnitude of the suburban service deficits was not known until the recent presentation of the "Eastern Territory Suburban Railroads" to the special study group of the Senate Committee on Interstate and Foreign Commerce in April, 1960. This separation shows that suburban service deficits account for very substantial portions of the passenger deficits of each of the Northern roads providing suburban service. Thus, suburban service produced only 15 percent of the passenger revenue but was responsible for 23 percent of the passenger deficit experienced by the Pennsylvania. On the New Haven, suburban service accounted for 30 percent of the passenger revenue and 50 percent of the passenger deficits (V.S. 14, Ex. D).

The separate and extraordinary character of the suburban service causing these substantial deficits, as distinguished from freight and intercity passenger service, was also shown by the Northern lines in their presentation to the Senate Committee (V.S. 14, pp. 15-16):

> "Another vitally important feature of railroad suburban service is the subject of wide misunderstanding by the public. This is the extent of railroad investment and railroad costs represented by fixed facilities, such as track. It is a widely held but entirely false belief that railroads use, for their suburban and com-

mutation services, primarily those roadway facilities which they must nec-

[117]

essarily have and maintain for their other operations. The disastrous corollary to this false belief is that little, if any, in the way of operating expenses on the roadway need be assigned or attributed to this service, and that the railroads do not have any substantial investment in these facilities on which, as private businesses, they should earn a fair and adequate return over costs.

"These notions are completely false as applied to railroads handling a substantial volume of suburban passengers. Reference to Exhibit J exemplifies the situation which actually exists. It shows track occupancy by various types of trains in the twenty-four hours of a typical week-day of October 1958 on the line of the Pennsylvania Railroad between Overbrook and Bryn Mawr, Pennsylvania, which is a portion of one of that company's principal Philadelphia suburban lines. It will be noted that there are four main tracks in this territory. The outside tracks—No. 1 Eastbound and No. 4 Westbound—are used primarily by suburban trains; while the middle tracks (Nos. 2 and 3) are used primarily for through passenger and freight trains.

"The symbols appearing on the Exhibit for each of the three types of trains demonstrate immediately that all of the through passenger and freight trains could readily have been handled exclusively on two tracks only—in this case Nos. 2 and 3. It thus follows inevitably that one-half of the track facilities in this territory are maintained solely because of the company's suburban service operations. A far larger proportion of other roadway facilities, such as stations, terminals, coach yards and repair shops, are maintained solely in connection with suburban service."

The Examiners quote a portion of the above-quoted example (sheet 54), but they do not refer to the Northern lines' own characterization as an "entirely false belief that the railroads use, for their suburban and commutation service, primarily those roadway facilities which they necessarily have and maintain for other operations."

The Examiners' conclusions on suburban service deficits are thus contrary to the record made by the Northern lines themselves before the Congress. Moreover, the Examiners' theory of suburban service operations finds no support in any evidence presented by the Northern lines. Indeed, in their brief, the Northern lines did not even argue the theory as to suburban service adopted by the Examiners (see No. lines' Brief, dated June 19, 1961, pp. 173-176). Considering that the Northern lines have the burden of proof, it is not lawful for the

[118]

Examiners to include suburban service deficits which the Northern lines did not prove included costs incurred to provide freight service and, indeed, did not even object to the exclusion of suburban service deficits on any such theory.

The theory which the Northern lines did advocate, and which apparently was also accepted by the Examiners, is that it is no more inappropriate to assign suburban service deficits as a part of the cost of Official-Southern traffic than it is to assign deficits representing a deficiency in all passenger revenues as compared to "solely related passenger expenses" (sheet 53).

This whole line of argument assumes that the expenses denominated as "solely related" to passenger service in the Commission's prescribed accounts include only expenses which the railroads can avoid by eliminating passenger service. The Commission itself has refused to permit some of the "solely related" expenses to be considered as a part of the direct and avoidable cost of pas-

senger service in train discontinuance cases.* As a result, the argument about a "solely related" deficit is based upon an improper assumption, and this is of particular importance where the so-called "solely related" passenger deficit reported for the Southern lines as shown in the Recommended Report is only some 2½% percent of passenger revenues ($4.4 million deficit in relation to $155.3 million annual revenues (sheet 18)).

But even if a "solely related" passenger deficit of this magnitude does represent a deficit assignable solely to passenger operations in the South, this constitutes no justification for including suburban service deficits as a part of the cost of handling the Official-Southern traffic. The argument, if correct, leads not to the conclusion that both types of deficits should be considered costs of handling the freight traffic at issue here but to the conclusion that *both* deficits should be excluded. In order to avoid any argument based on the "solely related" passenger deficit theory, the restated costs which the Southern lines have set forth in these Exceptions (p. 18, *supra*) exclude both suburban

[119]

service deficits and the so-called "solely related" passenger deficits of the Southern lines for the year of the cost study.**

---

* *Louisville & N.R. Co. Discontinuance of Service, Ocean Springs, Miss.-New Orleans, La.*, 307 I.C.C. 173, 180-182 (1959); *Chicago & N.W. Ry. Co. Discontinuance of Service Between Chicago, Ill. and Duluth, Minn. and Mankato, Minn.*, 307 I.C.C. 585, 607 (1959); *Texas & N.O.R. Co. Discontinuance of Service between Houston, Texas and New Orleans, La.*, 307 I.C.C. 725, 731-32 (1960).

** The portion of the so-called "solely related" passenger deficit for the year 1956 included in the costs assigned to Official-Southern traffic, and excluded in the Southern lines' restatement of costs in these Exceptions, is computed from the record as follows:

1. Solely Related Passenger Deficit, Southern Region, Year 1956 (Exhibit R-13) $11,302,132

For the foregoing reasons, each of the adjustments discussed herein should be made in a further restatement of the "Restated Costs" set forth in the Recommended Report. Upon such further restatement, the proportion of the total costs of Official-Southern traffic borne by the Southern lines is 56.98 percent (see table at p. 18, *supra*) as compared with the Southern lines' share of the present revenues of 55.36 percent.

2.	Portion of Solely Related Passenger Deficit related to distance (.70† time line 1)	$ 7,911,492
3.	Portion of Solely Related Passenger Deficit unrelated to distance (.30 † times line 1) ..	$ 3,390,640
4.	Ton-miles, Southern Region, Year 1956 (V.S. 3, Ex. A, p. 15)	93,914,726,000
5.	Tons originated plus terminated, Southern Region, Year 1956 (V.S. 3, Ex. A, p. 22)	509,992,564
6.	Solely related passenger deficit per ton-mile (line 2 ÷ line 4)	.00842¢
7.	Solely related passenger deficit per ton (line 3 ÷ line 5)	.66484¢
8.	Ton-miles of Official-Southern traffic south of break points (V.S. 40A, Ex. K)	15,625,356,000
9.	Tons of Official-Southern traffic originated or terminated in South (V.S. 40A, Ex. K)	28,055,721
10.	Portion of solely related passenger deficit related to distance allocated to Official-Southern traffic (line 6 x line 8)	$1,315,655
11.	Portion of solely related passenger deficit unrelated to distance allocated to Official-Southern traffic (line 7 x line 9)	$ 186,526
12.	Total portion of solely related passenger deficit allocated to Official-Southern traffic (line 10 + line 11)	$1,502,181

† 70-30 is the approximate allocation of passenger deficits as between distance and unrelated to distance under Rail Form A. Changing this factor would have no appreciable effect on the result of this calculation since such a change would not change the total amount of the solely related passenger deficit allocated to Official-Southern traffic, but would have only a minor effect on the relationship between terminal and line-haul costs.

[185]

C. Use of Cost Scales Provides the Proper Basis for Determining Fair Divisions.

The basis of divisions prescribed in this proceeding must relate the various components of the scale (i.e., terminal service, way train and

[186]

through train haul, including interchange) to each other in a manner which preserves the essential cost relationships in compliance with Section 15(6), which provides that in prescribing "just, reasonable, and equitable" divisions, the Commission must give consideration to "whether any particular participating carrier is an originating, intermediate, or delivering line."

Prior to the development of Rail Form A by its Cost Finding Section, the Commission refused to construct divisional scales on the basis of cost scales reflecting a single uniform progression of all line-haul costs on the ground that, under such cost scales:

> ". . . it is assumed that the line-haul unit transportation cost does not vary with distance. This assumption is commonly made by statisticians who undertake to make studies of average transportation costs in the form of distance scales. Whether this assumption is true is a question which remains to be answered." *Southwestern-Official Divisions,* 234 I.C.C. 135, 138 (1939).

In the 1939 report in *Official-Southern Divisions,* 234 I.C.C. 175 (1939), the Commission specifically commented on the absence of adequate cost evidence, stating (234 I.C.C. at 188):

> "Some of the speculation and controversy necessarily arising in considering averages of this kind could

be avoided if it were possible to separate terminal and line-haul elements of expense by some satisfactory method."

Since the development of Rail Form A, however, a method has been provided for separating terminal and line-haul elements, and the straight-line progression of line-haul costs has become an established cost principle which can no longer be characterized as an unproven statistical assumption. The Rail Form A formula separates rail costs into terminal and line-haul elements and provides for the further breakdown of line-haul into way train and through train costs. With the separation of way train costs, the straight-line progression of through train costs reflected in Rail Form A cost scales has been fully established in numerous studies made and reviewed by the Commission's Cost Finding Section. These studies have been fully documented and the nature of through train line-haul costs shown in this record (V.S. 38, Appx. G).

In the prior proceedings in this docket, there was no evidence in the

[187]

record to support the progression of costs reflected in Rail Form A. This explains why the Commission stated in its 1953 Report that Rail Form A costs "*assumed* that the line-haul element increases uniformly mile for mile" (287 I.C.C. at 526-527). Uncontroverted evidence in the present record, however, establishes that uniform progression of through train line-haul progression in Rail Form A cost scales is no longer an assumption but is a proven fact which cannot be ignored. Moreover, the cost scales introduced by the Northern lines are themselves based on a straight-line progression of cost (V.S. 3, Ex. B), and the Northern lines thus concede that such progression is proper.

In Docket 31503, the *Transcontinental Divisions* case, Witness Butler, the principal witness for the Northern lines

in the present proceeding, advocated the use of costs as providing the fairest standard for determining divisions (V.S. 38, p. 18):

> "Based upon many years of experience in divisions matters I am of the opinion that relative costs of service here afford the fairest common standard by which to weight the relative contribution of the participating groups of carriers in the performance of the joint transportation."

In Docket 28277, *Official Western Trunk Line Divisions*, the Northern lines criticized the use of a rate scale progression in constructing a divisional integer scale and advocated the prescription of divisional integer scales based on relative costs in their exceptions to the Examiner's first report (V.S. 38, p. 19):

> "Since the proportionate contribution of the two groups of carriers to the performance of the transportation should furnish the primary consideration in the determination of a reasonable divisional basis, and since that contribution of effort or expense can ordinarily be best measured by relative costs of service, it is of major importance that there be taken into account the progressions which relative costs of service would produce in a scale of divisional factors predicted thereon."

The Official-Southern divisional scale prescribed by the Commission in 1953, and now recommended by the Examiners for future applications, violates these principles of proper scale construction which have been advocated by both the Southern lines and the Northern lines. At no time in these proceedings have the Northern lines presented any defense of the construction of the divisional scale which, because of its

relationship to the construction of the Docket 28300 class rates, unduly favors the short-haul Northern lines.

On the basis of the plain command of Section 15(6) of the Act as applied to the record in this case, the divisional scales should be constructed from the evidence of record showing the relationship of terminal and line-haul services, thereby eliminating the unlawful and prejudicial effect of the rate scale progression in depressing the divisional revenues of the long-haul Southern lines.

D. The Southern Lines' Proposal That Divisional Scales Be Constructed Directly From the Evidence of Record.

The Examiners describe the construction of divisional scales proposed by the Southern lines as follows (sheet 72):

> "The southern lines would abandon the present scales of prorating factors entirely and substitute therefor scales of prorating factors constructed directly from the costs developed in their cost study. They oppose the use of divisional scales derived from rate scales because of the rate of progression, being partly curvilinear and in part straight line, thus they say favoring the short-haul in the North. The mechanics of the construction of the proposed scales are difficult of brief explanation; a detailed description thereof would serve no useful purpose. In addition, we have not accepted at its face value the cost study upon which the scales are based."

After setting forth the proposed scales, the Examiners conclude (sheet 73):

> "Upon this record it is manifestly impossible to accept the scales proposed which would transfer an undis-

closed amount of revenue to the southern lines over those presently in effect.*

To the extent the Examiners reject the Southern lines' proposed scales on the ground of the Examiners' contrary view of the evidence, particularly the cost evidence, this does not bear upon the question of scale construction as such. To the extent, if at all, the Examiners are found to be correct in their rejection of specific aspects of the Southern lines' cost evidence (discussed in Exceptions Nos. 1 and 2, *supra*),

[189]

the cost evidence, as thus modified, would provide the basis for constructing the divisional scales.

The Examiners' statement that "the mechanics of the construction" of the Southern lines' proposed scales are "difficult of brief explanation" is misleading since the principles underlying the construction of the proposed scales are simple and direct.

The first step is to determine from the cost evidence for each territory the factors for the initial 50-mile block, which include one terminal handling, the actual miles of the line-haul service in way trains and the actual miles of line-haul service in through trains performed for the average haul of the initial block.

The second step is to calculate the cost of the actual miles of through train service (and additional way train service, if any) for each additional 50 short-line miles. Assembly of the costs in this manner, and rounding to whole numbers, produces divisional scales directly from the evi-

* The Examiners' reference to an "undisclosed amount of revenue" is not correct. The precise revenue effect of the Southern lines' proposed scales was calculated from the record (So. Lines' Brief, p. 275).

dence of record relating to the handling of Official-Southern traffic.*

If any additional allowance were justified for either group on the ground of revenue needs (as it is not on this record), such specific allowance could then be superimposed on the divisional scales, thus recognizing a revenue needs allowance as the special allowance disproportionate to costs that it inherently would be.

There is nothing difficult or complex about the process of constructing divisional scales once the cost evidence has been analyzed and appraised. Indeed, the construction of divisional scales from the cost evidence proposed by the Southern lines in this case is precisely the method recently adopted by Division 2 in *Louisville & Nashville R. Co. v. Southern Ry. Co.*, 319 I.C.C. 639 (1963). Whatever the merits of Division 2's analysis of the particular cost and revenue needs evidence in that proceeding, the approach used in constructing the divisional integer scales was direct and straight-forward. Upon resolving the cost issues, Division 2 stated (319 I.C.C. at 660-661):

> "Utilizing the unit costs for line-haul and terminal services as shown in appendix A, a mileage scale of divisional factors has been devised reflecting the relative fully distributed costs of the carriers and is set forth in appendix B. The scale gives due weight to all

[190]

> material factors, including distance, for any prospective hauls on either line."

The scales set forth in Appendix B to that report are in 20 mile blocks, with the factor for each mileage block measured by the cost at the midpoint mileage of each block.**

---

* As discussed in specific detail in the So. Lines' Brief, pp. 271-276.

** As can be calculated by applying the costs set forth in Appendix A, lines 22 and 23 (319 I.C.C. at 664), to the mid-point of each of the mileage blocks set forth in Appendix B (319 I.C.C. at 666).

The "mechanics of the construction of the proposed scales" of the Southern lines in this Official-Southern case present no difficulty of explanation, and are simple and direct compared with the present Docket 29885 divisional scale constructed from the Docket 28300 Class Rate scale in a manner which has never been explained or rationalized by anyone.

E. The Erroneous Refusal to Eliminate the 15 Percent Minimum Provision From the Present Divisions.

If a divisional scale is correctly constructed to reflect terminal and line-haul services, there is no need for any minimum percentage. Separately prescribed minimum divisions are appropriate protection for short-haul carriers only where the division is otherwise based upon a mileage prorate which contains no allowance for terminal service. *Divisions of Freight Rates,* 148 I.C.C. 457, 463 (1928). If a proper divisional scale is used reflecting the services performed in handling the traffic at issue, full credit for terminal service, way-train service and through train service (including interchange services) are reflected in the scale itself and there is no need for a minimum division. Accordingly, the Southern lines propose that the 15 percent minimum for Official-Southern traffic now in effect be eliminated.

In response to this feature of the Southern lines' proposal, the Examiners state (sheet 73):

> "The southern lines also oppose the imposition of the 15 percent minimum. Their opposition rests on the assumption that the integer scales would be constructed directly on cost scales derived from their cost study. Such scales if used, would reflect an allowance for terminal service and hence the prescription of a minimum would be unwarranted. Since we are simply modifying the present scales, which are subject to the minimum, similar action is

[191]

required in this reopened phase to protect the very short haul carriers which for the most part perform principally originating or terminating service."

The Examiners are incorrect in stating that the Southern lines' "opposition rests on the assumption that the integer scales would be constructed directly on cost scales derived from their cost study." The Southern lines opposed the present 15 percent minimum as inconsistent with *any* divisional scale that included an allowance for terminal service. If the allowance for terminal service is adequate, the scale itself protects "the very short-haul carriers which for the most part perform principally originating or terminating service." Use of a 15 percent minimum to apply a different division than the scale would produce is necessarily unfair to the extent of the difference.

This principle is not at all confined to divisional scales constructed from cost scales. Where, as in the case of the present Docket 29885 divisional scale, the terminal allowance (equivalent to 221 miles) is excessive, there is excessive protection for "the very short haul carriers." As a result there is even *less* reason for the use of a 15 percent minimum in connection with the Docket 29885 scale than in the case of a scale which adequately protects the terminal service of the very short haul carriers by providing a terminal allowance reasonably related to the cost of line-haul service.

[192]

Exception No. 6—To the Prescription of Increased Divisions for the Northern Lines on Grain Traffic Moving on Proportional Rates Despite a Total Absence of Evidence With Respect to This Traffic.

A most unusual aspect of the Report and Recommended Order in these proceedings is the fact that the Examiners recommend the prescription of new divisions on a category of traffic while conceding "no new evidence pertaining to such traffic was tendered here." The traffic referred to is the movement of grain and grain products on joint proportional rates from East St. Louis, Illinois, Louisville, Kentucky and Cincinnati, Ohio to points in Southern territory. The grounds stated for this unprecedented action are briefly set out in the Report. The discussion is brief, and for convenience that entire discussion is reproduced in full (sheet 71):

> "The southern lines take the position that the divisions of joint proportional rates on grain and grain products from East St. Louis, Ill., Louisville, Ky., and Cincinnati, Ohio, to points in southern territory are not in issue in this reopened phase for the reason that no evidence relating specifically to this traffic was offered. As stated earlier, in the 1953 report a separate specific scale of divisions was prescribed to reflect the characteristics of this traffic. The northern factors were made 75 percent of the northern general factors to reflect the intermediate service performed by the southern lines. While no new evidence pertaining to such traffic was tendered here, the divisions thereon are still before us, and in accord with prior practice we are of the opinion that the northern factors should remain at 75 percent of the northern general factors here prescribed. . . . Our findings herein will reflect these conclusions."

This recommendation urges the Commission to take action which it has no power to take under Section 15(6). This was settled by the Supreme Court in its decision in *United States v. Abilene & Southern R. Co.*, 265 U.S. 274 (1924), one of the early landmark cases decided after the passage of the Transportation Act of 1920 in which Section 15(6) originated. In that case, Mr. Justice Brandeis, speaking for the Court, made it plain that specific evidence with respect to typical individual shipments is an absolute prerequisite to any lawful order changing divisions (265 U.S. at 290-291):

> "A further objection of the carriers should be considered. They point out that the record does not contain any tariffs showing the
>
> [193]
>
> individual joint rates, or any division sheets showing how these individual joint rates are divided, nor any information concerning the amount of service performed by the Orient and its several connections under such individual joint rates. As justification for this omission, it is argued that there are in the record exhibits, furnished by the several carriers, containing data from which the Commission could reach a conclusion as to whether or not the divisions, taken as a whole, were equitable as between the Orient and its several connections; that in a general rate case, evidence 'deemed typical of the whole rate structure' will support a finding as to each rate in the structure by raising a rebuttable presumption concerning each rate; that typical 'evidence' in this sense means, not evidence directly representative of every individual rate, but evidence tending to show the general situation; that a like presumption arises in a division case; that the data dealing with the traffic in the aggregate, which was furnished by the exhibits, constituted such typical evidence; that, in this proceeding, information concerning

individual rates and divisions was not essential; and that the course pursued by the examiner is, in substance, that upheld in the *New England Divisions Case,* 261 U.S. 184, 196-199.

"The argument is not sound. The power conferred by Congress on the Commission is that of determining, in respect to each joint rate, what divisions will be just. Evidence of individual rates or divisions, said to be typical of all, affords a basis for finding as to any one. But averages are apt to be misleading. It cannot be inferred that every existing division of every joint rate is unjust as between particular carriers, because the aggregate result of the movement of the traffic on joint rates appears to be unjust. These aggregate results should properly be taken into consideration by the Commission; but it was not proper to accept them as a substitute for typical evidence as to the individual joint rates and divisions. In the *New England Divisions Case,* tariffs and division sheets were introduced which, in the opinion of the Commission were typical in character, and ample in quantity, to justify the findings made in respect to each division of each rate of every carrier. A like course should have been pursued in the proceeding under review."

No evidence at all having been presented with respect to this grain traffic, it is plain that the typical evidence rule has not been satisfied.

The application of the typical evidence rule is not affected by the fact that the change recommended here maintains the same percentage relation that now exists between these grain rate divisions and the general

[194]

basis of divisions. The typical evidence rule is general in its application and precludes any change in divisions, whatever the theory, except upon a record that meets its requirements.

Moreover, the fact that the Examiners are recommending the maintenance of a prior relationship is irrelevant. It is impossible to determine whether a particular percentage relation produces a reasonable result or otherwise meets the standards of the Act without evidence. Consequently, the Commission should not, and may not lawfully, enter an order on this record changing these divisions on grain traffic.

* * *

EXCEPTIONS ON BEHALF OF SOUTHERN INTERVENERS TO RECOMMENDED REPORT

[2]

INTRODUCTORY STATEMENT

In their Report, the Examiners have recommended that the uniform scales presently being used to divide the revenues produced by freight traffic moving between Southern and Official territories be abandoned and that a new basis of divisions be prescribed which would inflate the divisional scale for the Northern railroads and thus result in a drastic decrease in the revenues of the Southern railroads.* In the view of these interveners, this recommendation constitutes a clear and direct threat to the economy of the South. Consequently, as representatives of the public in that part of the country, we feel compelled to take vigorous exception to the Examiners' Report and Recommended Order.

For 15 years, these interveners and others in the South were engaged in a long and bitter struggle to obtain for our section of the country a fair and equal chance to compete with other sections, particularly the North, through uniformity of rail freight rates.

* * *

---

* Throughout these Exceptions, we shall treat the so-called 29886 uniform scales presently being used to divide Official-Southern revenues as though they provide equal treatment for the railroads in both territories. In view of the substantial factor in these scales for terminal service, it is doubtful that they actually do provide equal treatment to the long-haul carriers, which, in this case, are the Southern railroads. (For a full discussion of the mechanics of scale construction, see the Brief of the Southern Railroads, pp. 249-286.) To the extent that there is such an error in the construction of the uniform scales, it should be corrected, for a discrimination against long-haul carriers would amount to an inadvertent discrimination against the Southern public. Far more important to these interveners, however, is the fight against open and deliberate discrimination to which these Exceptions are primarily directed.

[4]

These interveners vehemently protest such treatment of the economic hopes and aspiration of the people of the South. We expect, and by virtue of the controlling provisions of the Interstate Commerce Act

[5]

and the Administrative Procedure Act, we have a right to demand, a rational explanation of any action taken by the Commission adverse to the interest of the people of the South, including an explanation of any disposition that is made of the substantial arguments which we have tendered in defense of those interests. No such explanation can be found in the Examiners' Report, and the duty is upon the Commission itself to meet this responsibility. In order to facilitate the Commission's task in this regard, the following specific exceptions are directed to the Examiners' Report and Recommended Order.

SPECIFIC EXCEPTIONS

EXCEPTION NO. 1—*To the Refusal of the Examiners to Recognize the Interest of These Interveners, as Representatives of the Southern Public, in the Divisions to be Prescribed in These Proceedings.*

A most fundamental error in the Examiners' Report from the standpoint of these interveners lies in their flat refusal to recognize the existence of a legitimate interest on the part of the people of the South in the divisions to be prescribed in these proceedings. Since this error goes to the very right of these interveners to participate in these proceedings, it obviously must be dealt with at the outset of these Exceptions. Despite its fundamental nature, however, we think this error can be disposed of briefly, for the Examiners' position reflects a refusal to recognize the nature of the public's interest in interterritorial

[6]

divisions, a factually erroneous understanding of the established practice of public representatives in such cases, and a failure to comprehend the inevitable impact of a reduction in the Southern railroads' division upon the rates and services available in the South.

1. The Refusal to Recognize the Nature of the Public's Interest in Interterritorial Divisions.

As was carefully pointed out in our Brief dated June, 1961 (p. 4), neither the Southern Governors' Conference nor the Southeastern Association of Railroad & Utilities Commissioners is interested in the financial well-being as such of the stockholders of any railroad or group of railroads. These interveners are interested, however, and vitally so, in the maintenance of a system of rail transportation adequate to meet the needs of the people of the States they represent. To meet these needs, these interveners must, from geographical necessity, rely upon the Southern railroads. For although the railroads in other territories aid in the transportation of freight moving interterritorially to and from the South, only the Southern railroads can provide Southern industries with many necessary services and facilities at rates which will permit them to compete on equal terms with industries located in other parts of the country.

The needs of the Southern people with respect to their rail transportation system were shown in great detail in these proceedings. Witness after witness was presented by these interveners to testify on this subject. The unvarying testimony of each one of these witnesses was that

[7]

the Southern economy in general, and the business with which they were directly concerned in particular, could not stand either an increase in the freight rates on interterritorial and intraterritorial traffic or a diminution of the

services, facilities and equipment available to handle such traffic. Indeed, these witnesses declared, the crying need in the South is for lower freight rates rather than higher, and for more services, facilities and equipment than less.*

This testimony not only stands completely uncontroverted in the record, but the Examiners themselves seem to have accepted it by implicitly conceding the utter dependence of the Southern economy upon maintenance of at least the present level with respect both to rates and to services and facilities. Notwithstanding this concession, however, the Examiners avoided the normal implication of the evidence produced by these interveners by simply denying that a decrease in the divisions of the Southern railroads would have any effect whatever upon either the rates or the services and facilities available in the South.

The sole basis for this conclusion—a conclusion which, if true, would undercut the whole reason for the participation of these interveners in these proceedings—is set forth in a single paragraph in the Report (sheet 59):

[8]

> "Much of the argument to support these contentions is the same as that made by the southern lines in their brief and discussed elsewhere in this report. There is nothing concrete of record to support the various assumptions of these interveners. The dire predictions posed by them appear to result from fear rather than fact. The Commission has in the past, particularly in the last two decades, caused a shift of revenues from one group of carriers to another in various divisions cases. Information as to the effect of such shift upon the losing group should be available but the interveners do not substantiate their assumptions with such facts, indeed if any there be."

---

* The testimony of the witnesses presented on behalf of the Southern public by these interveners was summarized at length in our Brief (pp. 16-27). That testimony appears in the record as Verified Statements, Nos. 45-63.

This paragraph rests upon the assumption that divisions proceedings are mere private disputes between the railroads involved with which the public should not concern itself. Such an assumption is demonstrably invalid.

Proceedings under Section 15(6) are not and were never intended to be mere partitions of property between private parties. Quite the contrary, as was expressly pointed out by Mr. Justice Brandeis in the *New England Divisions* case, the Section makes it "clear that, in fixing divisions as well as rates, the public interest should be considered." 261 U.S. 184, 195 note 16. Section 15(6) thus recognizes an inevitable connection between interterritorial divisions and the public interest. The Examiners' refusal to acknowledge this connection and accord proper recognition to the interest of the public in these interterritorial proceedings is therefore in direct conflict with the nature of such proceedings as established by the Supreme Court.

* * *

[16]

EXCEPTION NO. 2—*To the Failure of the Examiners to Give Effect to the Overriding Demands of the Public Interest which Require the Maintenance of Uniformity in the Interterritorial Divisions of the Northern and Southern Railroads.*

For the foregoing reasons, the interest of these interveners as representatives of the public is a substantial one, and the Examiners' failure to recognize that interest constitutes a serious error which must be corrected by the Commission. When it does so, the Commission will then find it necessary to pass upon the public interest considerations which these interveners have urged but which the Examiners have not evaluated. The first and most important of these is the public interest in maintaining the existing uniformity in interterritorial divisions between the Northern

and Southern railroads. Despite our repeated and pointed insistence upon the importance of this uniformity to the public, the Examiners have not recognized any public interest in uniformity at all. These interveners believe that this omission must be remedied by the Commission in furtherance of a sound and lawful administration of Section 15(6) of the Interstate Commerce Act.

Insofar as any reasoning at all is given for the preferential divisions accorded the North in their Report, the Examiners seem to have taken the position that the existing equality between that territory and the South should be destroyed because the Southern railroads, on the average, have slightly more favorable "freight traffic trends"—that is, with respect to freight revenues, net railway operating income and rates of

[17]

return—than the Northern railroads, and because the Northern railroads have slightly higher costs, on the average, than the Southern railroads. The assumption of the Report from which this reasoning proceeds is that, with minor adjustments, these average figures accurately reflect the relative costs and relative revenue needs of the two groups of railroads with respect to the interterritorial traffic at issue in this case. As we shall later show this assumption is itself based upon and affected by serious defects both in the proceedings before the Examiners, and in the Examiners' view of the Commission's proper function under Section 15(6) of the Interstate Commerce Act. For present purposes, however, we will ignore these defects and treat the recommendation of the Report as though it actually had the foundation in fact it purports to have. Even under that generous assumption, the recommendation of an inflation for the Northern railroads is contrary both to sound transportation policy and to the legal duty of the Commission under Section 15(6).

1. The Absence of any Finding of Natural Disadvantages to Justify the Preferential Treatment Accorded the North.

The mere showing of differences in the costs of two groups of railroads in the handling of interterritorial traffic would not, even if properly made, justify the establishment of a system of rates or divisions which prefers one territory over the other. Quite the contrary, in order to justify such a result, it would be necessary not only to show the

[18]

existence of cost differences but also to establish that such differences are the product of the inherent advantages and disadvantages that go to make up the respective overall transportation conditions of the two territories. Differences in cost that cannot be related to such inherent advantages and disadvantages might well be the product of nothing more than inefficieney or overcapacity on the part of the railroads in one territory. And where this is so, to permit such differences to control interterritorial relationships with respect to rates or divisions would only tend to perpetuate an already undesirable situation.

This is precisely the situation here. The traffic involved in this case moves between points in Official territory and points in Southern territory over routes which, for all that appears in this record, are substantially identical on both sides of the territorial border. It is not shown that the Northern railroads must contend with mountains or rivers more difficult to cross, than those found in the South. Nor does the record indicate the existence of any other operating condition which makes the task of the Northern railroads inherently more onerous than that of those in the South. What the record does show is that Official-Southern traffic moves between the territories in the same freight cars, powered by the same kind of locomotives, operated by identical crews. In short, the record shows that the inherent costs of transportation in the North are the same as those in the South.

[19]

In the Docket No. 28300 proceeding, the Commission itself found that there are no inherent differences between the transportation conditions prevailing in the North and those prevailing in the South. Indeed, it was precisely upon the basis of that finding that the Commission found the discriminatory class rates then prevailing in the South to be unlawful. And it was upon the basis of that same finding that the Supreme Court upheld the Commission's action in its landmark decision in *New York v. United States,* 331 U. S. 284 (1947). Thus, the Court said (at 315):

> "* * * the record makes out a strong case for the inference that natural disadvantages alone are not responsible for the retarded development of the South and the West, that the discriminatory rate structure has also played a part. How much a part cannot be determined, for every effect is the result of many factors. But the inference of prejudice from the discriminatory rate structure is irresistible. If this discriminatory rate structure is not justified by territorial conditions, then its continued maintenance preserves not the natural advantages of one region but manmade trade barriers which have been imposed upon the country. Such a result cannot be reconciled with the great purposes of § 3(1) as amended in 1940, 49 USCA § 3(1)."

The Examiners have not even attempted to demonstrate that the Supreme Court was wrong when this holding was made, nor have they set forth anything which demonstrates that the balance of "natural advantages" between the two territories has radically changed in the relatively few years since that decision, even assuming that the term "natural advantages" is to be read broadly enough to encompass ad-

[20]

vantages of so transitory a nature that changes within so short a period of time could even be contemplated. Certainly the improvement since 1947 in the economic conditions prevailing in the South does not support any such conclusion. In the first place, as already pointed out, this improvement was the natural result of the removal of discrimination and cannot properly be used to justify reimposing discrimination in another form. Moreover, even taking into account this improvement, the level of economic activity in the South is still far below the level prevailing in the North.

The seriousness of the situation in the South in this regard is apparent when the critical economic data are examined on a per capita rather than a percentage increase basis, as they were in the testimony of Mr. W. Thomas Rice, President of the Atlantic Coast Line Railroad Company (V.S. No. 15, pp. 4-5):

> "Despite the rapidity of the development of the South in recent years, I would like to emphasize again that the area is still below national levels in a number of respects. For example (see Exhibit No. 11), in 1956 manufacturers' expenditures for new plants and equipment per capita in the South were $48 as compared with $67 in the nation, or only 71 per cent of the national level. In the same year value added by manufacturer per capita in the South was $500 as compared with $835 in the nation, or 60 per cent of the national level. In 1955, total bank assets per capita in the South were $670, or 48 per cent of the national level of $1,398. The total value of farm products sold per capita in the South in 1954 was $131 as compared with $153 in the nation, while retail sales per capita in the South were $815 as compared with $1,054 in the nation in 1954."

[21]

These figures show beyond any real controversy that the post-war improvement in economic conditions in the South, far from amounting to a "natural advantage" in favor of that section of the country, still leaves the South at a substantial disadvantage as compared to the rest of the country, including the North.

2. The Failure to Recognize Inefficiency and Overcapacity as the Real Causes for Whatever Problems the Northern Railroads Might Have.

The still-existing disparity between the economic conditions in the North and the South also graphically demonstrates, we think, the insufficiency of any claimed changes in relative costs and relative revenue needs as a justification for finding substantial changes in the relative transportation conditions prevailing in the two territories since 1947. For, in view of the presence of the huge concentrations of industry and wealth in the North, the higher costs and lower rates of return claimed by the Northern railroads not only cannot possibly be related to natural disadvantages of the North, but, instead, must be attributed to their failure, as a group, fully to utilize the unusual opportunities for savings and efficiency which they quite obviously have.

In this connection, it seems well to point out that, despite a substantial decline experienced since the Supreme Court's 1947 decision upholding uniform class rates, the Northern railroads still have a far greater traffic density on their lines than the railroads operating in

[22]

the South. The data establishing this greater traffic density are uncontroverted in the record (V.S. No. 36, Ex. 1, p. 21):

REVENUE TON MILES PER MILE OF ROAD

	Southern Region	*Northern Region*
1947	2,311	4,774
1948	2,299	4,597
1949	1,948	3,573
1950	2,225	4,049
1951	2,409	4,472
1952	2,379	4,101
1953	2,339	4,045
1954	2,217	3,526
1955	2,432	4,231
1956	2,512	4,569
1957	2,391	4,422
1958	2,231	3,637
1959	2,373	3,723

As the Commission has observed, "This greater density affords the . . . [Northern railroads] greater opportunities for handling heavier trains," and thus should make possible for them savings and efficiencies not available to the Southern railroads. *Louisville & Nashville R. Co. v. Akron, Canton & Youngstown R. Co.*, 309 I.C.C. 491, 501.

The failure of the Northern railroads, as a group, to realize the advantages of their unusual opportunities for savings and efficiency can only be explained in terms of the overcapacity and inefficiency with which those railroads are suffering as a result of the termination of the period of artifically high economic activity in the North. Consequently, the extent of this failure is not uniform among the Northern

[23]

railroads. Indeed, several of the Northern railroads, notably the Chesapeake & Ohio, the Nickel Plate and the Norfolk & Western, apparently are taking full advantage of these opportunities, for these railroads have rates of

return much higher than those of any of the Southern railroads. This proves, we think, that the balance of economic advantages is still very much with the North. Where problems of overcapacity and inefficiency are not operative, the Northern railroads are by far the better earners.

It may be true that economic activity in the North is declining, both in absolute terms and in relation to the South, and that fewer and fewer Northern railroads will have an opportunity to utilize their full capacity. Here again, however, such a decline would be nothing more than the natural result of the removal of the trade barriers that prevented the growth of the South prior to the decision in the Docket No. 28300 proceedings. Having long been the beneficiaries of discrimination against the South, the North should not now be heard to complain of a slight decline in its artificially high level of economic activity brought about by the removal of that discrimination. And the Northern railroads should not be heard to complain of the slightly higher costs and slightly lower rates of return which result from the overcapacity built to serve that artificially high level of economic activity.

The Northern railroads have in effect admitted that the real root of their problem lies in this very overcapacity. In a series of im-

[24]

portant control and merger applications, they have repeatedly urged the Commission to allow them to effect major consolidations which would permit elimination of many duplicate facilities and produce vast savings. These applications, aimed to bring about a complete realignment of the Northern railroads into three systems, are expressly predicated upon the view that maintenance of the existing rail system in the North would be wasteful in view of permanent changes that have rendered large parts of that system virtually useless. The true nature of the Northern railroad problem was spelled out in detail by Mr. Alfred E. Perlman, President of The New York Central Railroad

Company, in his testimony in support of the Penn-Central merger (Statement of A. E. Perlman in F. D. 21990, pp. 6-7):

"* * * The East can or will no longer support the present and increasing capacity of its transportation system. Eastern railroads no longer share in periods of economic prosperity. They are partners only in times of economic downturn. For example, taking the years 1928 through 1930 for a base, the originated freight tonnage for all Class I railroads in 1960 was 98.52% of the base period. The carriers in Eastern District, however, originated only 69.9% of the 1928-1930 freight tonnage originations. Rail carriers in other parts of the country ranged from about 99% for the Northwest to almost 150% in the South.

"Why is this so? Obviously the decline in position of the Eastern railroads is a result of many causes, some of which, such as discriminatory and over-burdensome regulations, are shared with railroads in other parts of the country. But Eastern railroads are particularly plagued with problems of inter-modal competition and of the economic character of their territory that, if not peculiar to the East, are so magnified as to deserve special mention.

[25]

"During my school days at M.I.T., Lynn, Massachusetts was the center of the nation's shoe manufacturing. Worcester was the leather capital. General Electric centered its heavy electrical machinery production in New England. The textile industry employed thousands of New Englanders. All of this has gone in less than forty years. Moving West, the great steel producing areas of the country lay in official territory. Pittsburgh, Youngstown, Chicago and Buffalo furnaces almost exclusively served the steel consumers and were almost exclusively fed millions of tons of coal

and ore scrap by Eastern railroads. At the end of World War II, there was but one integrated steel mill west of the Mississippi—now there are three. The South has its own. Examples can be found in almost every industry.

"What this means is that industry has moved with its markets. Industry has decentralized away from the once-called industrial East. The West and the South have become largely self-contained insofar as industrial production is concerned, and the plants which remain in the East serve relatively compact market areas. There is no sign of any turn away from this trend."

This candid and straightforward approach to the problems of inefficiency and overcapacity in the railroad system of the North is quite obviously the only fair way to deal with those problems, for any other approach would reimpose upon the South, in the form of a permanently inferior rail transportation system, the very discrimination which was removed when uniform class rates were prescribed. Why should the North, as a railroad rate territory, be entitled to maintain, partly at the expense of the South, a rail transportation system far more extensive than that which the South can afford to build for

[26]

itself? Why should the South be forced to subsidize the uneconomic consequences of attempting to maintain facilities that are partly unneeded in the North? And why should the people of the entire country be deprived of the benefits that flow from a unified national economy unhampered by artificial barriers that prevent the most efficient allocation of transportation resources?

Transitory differences in costs and rates of return not related to natural territorial advantages cannot be allowed to create barriers to the operation of normal economic forces without destroying any truly nation-wide market and imposing onerous and discriminatory burdens upon those

territories whose growth is dependent upon the free play of the market. In this respect the situation here is entirely analogous to that presented in Docket No. 28300. For there, too, differences were found in the average costs prevailing in the territories involved. Because these differences could not be related to natural advantages and disadvantages of the respective territories, however, they were not allowed to affect the finding of uniform transportation conditions throughout all of that part of the United States east of the Rocky Mountains. On the basis of that finding, class rate differentials which were sought to be justified by such cost differences were condemned as "man-made trade barriers" (331 U.S. at 315), and uniform class rates were prescribed for application within and between all of the territories involved. The same sort of approach must be taken in this divisions case if the integrity of the Commission's historic order in that case removing discrimination from the South is to be preserved.

[27]

3. The Unfairness Inherent in the Destruction of Uniformity in the Divisional Structure in the Absence of Natural Territorial Advantages.

The real causes for whatever higher costs and lower rates of return might face the Northern railroads are thus shown to be the inefficiency and overcapacity of those railroads and not any natural territorial advantages of the South. In view of this fact, the fairness of an increase in the divisions of the Northern railroads to meet the Eastern railroads' costs or increase their rates of return, even if necessary to offset transitory differences, must be considered.

As shown above, the inevitable effect of any divisional structure that accords higher divisions to the Northern railroads would be to improve the rail transportation system of the North at the expense of the Southern public,

for any transfer of divisional revenues to meet the needs of the Northern railroads could not fail to have an adverse impact upon rail transportation in the South, either through increased freight rates or through a diminution in the availability of rail services, facilities and equipment, or both. Consequently, a transfer of divisional revenues to the Northern railroads would bear heavily upon the Southern public regardless of the reasons that might be offered to support it. Of course, if it could be shown that the South, as a freight territory, possessed natural advantages over other parts of the country, the transfer would be justified under established principles of law and sound

[28]

transportation policy. Were such a transfer to be ordered in absence of natural territorial advantages as recommended by the Examiners, however, the impact upon the South would be unlawful, unsound and grossly unfair to the Southern people.

The absence of natural territorial advantages necessarily means that the preferential divisions recommended by the Examiners for the Northern railroads will put those railroads in a position inherently superior to that of the railroads serving the South. Consequently, they will be able to provide better services, facilities and equipment to the Northern public at lower rates than can be made available in the South. The significance of this superiority becomes apparent when it is realized that *the Northern railroads' primary duty is to serve the competitors of Southern industry.*

It is common knowledge that most of the buying power of the country is concentrated in the North and that, notwithstanding the substantial geographical disadvantage which must be overcome, industries located in other parts of the country must seek to reach that market. The Commission itself recognized this situation in its report in the Docket No. 28300 proceeding (262 I.C.C. at 695):

"Official territory is the largest consuming territory in the country, and is the market that nearly all manufacturers desire to reach, particularly where they have a surplus of their products to sell. In shipping to official territory, manufacturers in the other territories not only have the disadvantage of location, but are subjected to an additional burden in those instances where they must pay class rates on a much higher level than their competitors in official terri-

[29]

tory. This situation reacts to the disadvantage of manufacturers in the other territories, and to the advantage of those in official territory, tends to restrict the growth and expansion of the manufacturers in the other territories, and, to some extent, to prevent the establishment of new manufacturing plants in those territories."

The divisional structure recommended by the Examiners is therefore doubly damaging to the South; first, in bringing about a deterioration in the transportation system which is vitally necessary to move the products of the South; and, secondly, in forcing the Southern people to subsidize a superior transportation system for their competitors in the North who already have the advantage of being located closer to the principal markets in which they compete.

No justification can be found for such flagrant discrimination in the mere fact, relied upon so heavily by the Examiners, "that this interterritorial traffic could not be handled in one region without the facilities and services of the carriers in the other." The overriding factor that dominates consideration of any transportation problem is that of competitive relations. Any improvements in the transportation services available to handle that part of a Southern-Official haul that lies in the North would be more than offset by improved services accorded to competitors

in the North on all of their transportation needs. And the deterioration of services available for the Southern part of the Official-Southern haul and the general transportation needs associated with

[30]

that traffic would leave the Southern shipper at a serious disadvantage vis-a-vis his Northern competitor. Thus, the unfair impact of a divisional structure preferential to the North is in no way ameliorated by the participation of Northern railroads in Official-Southern traffic.

The plain fact is that the only possible justification for an unequal divisional structure is a finding based upon substantial evidence that one of the two territories involved has natural advantages over the other. There being neither finding nor evidence to that effect in this proceeding, the Commission must retain the existing equal-factor basis of divisions.

EXCEPTION NO. 3—*To the Examiners' Superficial Treatment of the Issues Raised in This Proceeding Concerning Relative Costs and Relative Revenue Needs.*

Considerations of the public interest, when properly recognized and given effect, show clearly that the Examiners should not have recommended disruption of the existing equal-factor basis for dividing the revenues from Official-Southern traffic, even if they were correct in their assumption that the costs and revenue needs of the Northern railroads had been accurately shown to be higher with respect to this traffic than those of the Southern railroads. In fact, however, this critical assumption of the Examiners is also not well founded. Instead, their findings as to the relative costs and relative revenue needs of the two groups of railroads with respect to this traffic are also erroneous.

* * *

[44]

EXCEPTION NO. 4—*To the Examiners' Imposition of a Part of the Northern Transportation Burden Upon the Southern Public Without Any Finding that the North Is Incapable of Supporting Its Own Transportation System.*

As we have shown above there is no justification, either in law, in policy or in fact, for the Examiners' recommendation that the existing equality between Northern and Southern freight territories be abandoned in favor of a system of divisions highly preferential to the North. Over and above all of this, however, there is yet another defect in their Report which demands correction by the Commission. For even if the Examiners were correct in concluding that the showing in the record with respect to the costs and revenue needs of the Northern railroads requires an increase in their revenues, the burden of that increase could not properly be imposed upon the Southern public, as it was here, without an effort first to determine whether the North is capable of

[45]

supporting its own transportation system through rate increases. Instead, the Examiners should have given serious consideration to this alternative in the light of the uncontroverted evidence of record showing the clear superiority in economic strength still held by the North over the South. It seems plain that, if they had done so, the only possible conclusion they could have reached would have been that the South is in no position to support the Northern transportation system.

1. The Refusal to Give Any Effect at All to the Principal of Primary Local Responsibility.

The Examiners erroneously refused to give any effect at all to the principle that the primary responsibility for

meeting the revenue needs of the railroads of any territory must be met locally by the people of that territory. Yet, this principle has always been applied in dividing the revenues from Official-Southern traffic.

In *Division of Rates, Official and Southern Territories*, 234 I.C.C. 167 (1939), for example, the first case involving the prescription of a general basis for North-South divisions to come before the Commission, the Southern railroads were denied a generally higher basis of divisions on Official-Southern traffic despite explicit recognition by the Commission "that transportation costs on the traffic here considered may properly be considered to be higher in the South, and that, although the exact degree of difference is indeterminable, it is not negligible, as the northern lines argue." 234 I.C.C. at 189. Instead, the Commission pre-

[46]

scribed a higher basis of divisions for the Southern railroads only on those interterritorial rates containing an "increment or excess" due to the higher rate levels then prevailing in the South. 234 I.C.C. at 191. "Where no such increment is to be found in the rates, as those on denatured alcohol and cast-iron pipe prescribed in the decisions before cited, fair application of the principle demands that the divisions of each group of carriers be on the same basis." 234 I.C.C. at 192-193.

The principle applied in the first *Official-Southern Divisions* case was thus that even substantial differences in relative territorial cost would not justify the prescription of a preferential scale for divisions where to do so would necessarily force one territory to support the transportation system of another. An inflation in the divisions of the Southern railroads was necessary on certain traffic, of course, because the excess revenues collected by the Southern railroads were paid by the Southern public, and, as the Commission itself recognized, where unequal rate structures are maintained in two territories, as was the situation

at the time of the first Official-Southern Divisions case, the only proper way to minimize the discrimination being suffered by the territory paying higher rates would be to make sure that the excess revenues thus generated remained with the railroads serving that territory (234 I.C.C. at 190):

> ". . . In view of the factors which have been responsible for the measure of these rates, therefore, there is logic in the argument of the southern lines that 'the rates which contain something above the official level, because of the southern lines' participation, should be divided so as to give the increment in the rate to the southern carriers'."

[47]

But where no such "increment in the rate" existed, a uniform divisional structure was necessary in order to avoid imposition of the Southern transportation burden upon the Northern people.

Since the decision of the Commission prescribing uniform class rates in the Docket No. 28300 proceeding, the differences that originally existed between the interterritorial rate level and the rate level within the North on the same traffic have partially disappeared by reason of the former rates having been superseded by a uniform level. Certainly there was no evidence introduced by the Northern lines to show an increment in the northern portion of the rates to be divided in this case. The interterritorial rates now reflect, directly or indirectly, the mandate of equality handed down by this Commission in the Docket No. 28300 proceeding. And it was precisely for this reason that the Commission, in its 1953 report in Docket No. 29885, removed the selective inflation previously enjoyed by the Southern lines by virtue of the "increment" theory, when the issue of lawful divisions was brought back before it shortly after the termination of that proceeding. In the words of the Commission (*Official-Southern Divisions*, 287 I.C.C. 497, 523):

"Recognition of the increment theory in our 1939 report made it logically necessary to prescribe a special basis of divisions for those rates which contained no increment. The question as to which of the alternative bases should apply to rates established in the future was necessarily left to determination by the two groups of carriers, who have found it a difficult and controversial problem. They agree as to the desirability of a single basis of divisions on general traffic for the future.

[48]

"The differences in general level between the interterritorial rates and those in official territory have been substantially reduced since 1939 partly because of our action in prescribing a common level of class rates and in authorizing larger cumulative general increases in the eastern district than in the southern region and between the two sections. Apparently there are still a considerable number of interterritorial rates which are higher than the official-territory level just as there are many which are on that level or lower. No trustworthy estimate of the average percentage relation as of the present time is possible.

"The fact that at one time the South was considered a higher-rated territory than the North gave some support for the increment theory. From evidence based on our waybill studies, however, it appears that in 1947 the average intraterritorial rate levels in the South and in the North were substantially equal and that subsequent general increases have raised the northern level to a greater extent than the southern."

There can be no doubt that the decisions of the Commission in its previous reports dealing with Official-Southern divisions preclude any inflation in Northern divisions to meet allegedly higher costs in this case. As pointed out above, the Northern railroads could not and, indeed,

did not even try to establish any increment in the rates involved here that can be related to services they perform or costs borne by the Northern public. Moreover, the uniform class rates prescribed in the Docket No. 28300 proceeding are still in effect. This latter fact is particularly significant. Class rate levels are designed to reflect basic differences in transportation conditions from territory to terri-

[49]

tory, and, directly or indirectly, these rates govern the entire rate structure. Where the class rate levels of two territories are the same, the railroads in each territory should ordinarily be treated the same for purposes of divisions. The Commission gave explicit recognition to this fact in its decision in *Official-Southwestern Divisions*, 287 I.C.C. 533, 576-577, 578:

> "In considering divisions in the past, we have observed that if the general rate structure is well adjusted, a very significant and valuable test of divisions may be made by comparing them with the local rates for the same haul. . . . In comparing rates with divisions the pertinent fact is that under our class-rate decision a local class rate for a given distance in southwestern territory is the same as one for the same distance in eastern territory, while for an interterritorial haul including equal distances in each territory the division for the southwestern service is 35 percent higher than the eastern."

> "The issue here with respect to divisions is essentially the same [as the issue in Docket No. 28300 with respect to class rates]. The facts which support a homogeneous class-rate structure are strongly persuasive that there should be no weighting of divisions in favor of either contending group."

And the same approach has consistently been taken in other divisions cases. In the recent *Official-Western Trunk Lines*

Divisions case, for example, the Commission was explicit in its condemnation of a basis of divisions that distributed revenue in a manner inconsistent with the uniform level of class rates between the two territories (*Akron, Canton & Youngstown R. Co. v. Atchison, Topeka & Sante Fe Ry. Co.*, 318 I.C.C. 351, 365 (1962):

[50]

> "The transportation history of the past decade, as shown by the evidence in the present record, confirms the soundness of the decision not to prescribe higher class rates for western trunkline territory than for official territory, and the 500-A basis of divisions with its average 20-percent western inflation is inconsistent with the class-rate decision. As indicated by the traffic studies before referred to, this interritorial traffic consists of commodities of the kind for which class rates or commodity rates related thereto are designed. The common level of class rates in the two territories argues strongly for a single scale of divisional factors, contrary to the position of the complainants."

The overriding principle in all these cases, of course, is that of primary local responsibility—that is, that no consideration should be given to imposing a part of the transportation burden of one territory unless and until it is first determined that the territory seeking preferential treatment is so impoverished that it cannot support a rate level sufficient to carry its own burden. This principle has its roots as far back as the *New England Divisions* case, in which the Commission issued this significant warning (126 I.C.C. 579, 599):

> "The dangers in [the] . . . assumption that deficiencies in local earnings must inevitably be made upon interchange business at the expense of connecting lines are obvious. Communities and the roads which serve them might too readily arrive at the conclusion

that they are 'unable' to increase local rates and, in disregard of the principle of self-help, unduly rely upon others to carry their burdens. However, it is clear that the financial needs of weaker lines are an important factor in our consideration of divisions."

[51]

In line with this long-established principle, these interveners do not contend that the Commission is wholly lacking in power, under any circumstances, to impose a part of the transportation burden of one community upon another. We do contend, however, that such an order represents an extraordinary step which cannot be taken except where circumstances are found to be compelling. The decisions discussed above recognize this principle and establish, beyond question, the proposition that each community should carry its own burdens insofar as that is possible.

* * *

[55]

The record thus shows that the Southern people are fighting a long and uphill struggle in their efforts to raise their standard of living to that already enjoyed in other parts of the country. In such a situation, the South cannot properly be expected to contribute to the luxury of maintaining the elaborately overbuilt rail system of the North. The South has many needs of its own which must be met, and we are striving mightily to meet them despite the handicap of a still woefully inadequate industrial base. There is simply no justification whatever for further shackling the efforts of our people by imposing upon them a permanently inferior rail transportation system.

We think the Commission should not, under any circumstances, impose a part of the Northern transportation burden upon the Southern people. For it to do so without even finding that the North is incapabale of carrying that burden without help would be unthinkable.

EASTERN [NORTHERN] LINES' REPLY TO EXCEPTIONS OF SOUTHERN RAILROADS

[5]

Reply to Exception No. 1, A, Southern Lines' Contention Concerning Burden of Proof.

On pages 8 to 17 of their Exceptions, Southern lines argue that Northern lines had the burden of proving the cost of performing the service on North-South traffic, and that if Southern lines'

[6]

proof was faulty with respect to any adjustment made in Form A costs, Northern lines had the burden of proving the correct facts with respect to the suggested adjustment, failing which the Commission should either dismiss Northern lines' claim for increased divisions, accept Southern lines' adjustments where the Northern lines had not produced comparable data in their possession, or require the production of actual data on a comparable basis.

This argument concerning burden of proof is carried by Southern lines into the discussion of their contentions with respect to many of the cost adjustments which they urge the Commission to make.

As a background to the discussion of the burden of proof point, it is important to bring certain facts to the attention of the Commission:

1. The cost evidence used by the Commission in prescribing the divisions in which Northern lines now seek a change was based upon unadjusted Form A territorial costs for Northern and Southern lines.
2. The Commission has held that Form A territorial average costs are appropriate in considering large blocks of traffic, such as here involved.

3. Southern lines' evidence in this case is based upon Form A territorial averages. All of the costs in their presentation are these Form A averages except those which they elected, for their own partisan purposes, to adjust.

4. Northern lines presented evidence to show that Form A territorial average costs properly measure the cost for performing the service with respect to the North-South traffic here in issue.

Each of these points will now be briefly discussed.

[7]

1. THE COST EVIDENCE USED IN PRESCRIBING THE PRESENT DIVISIONS CONSISTED OF UNADJUSTED RAIL FORM A TERRITORIAL COSTS.

In the original decision in this case, *Official-Southern Divisions*, 287 I.C.C. 497 (1953), the Commission noted, at p. 507 that the Northern lines "applied Form A to the expenses and statistics for the eastern district (including as well as excluding the Pocahontas region) and the southern region . . ." The result was a showing of higher costs for the Eastern District and for the Eastern District including Pocahontas than for the South (p. 508). At p. 508 the Southern lines' views as to the Form A costs were set forth:

> "Although the southern respondents request a formal finding that 'such Form A average costs do not purport to reflect the cost of transporting any particular commodity or traffic, let alone the interterritorial traffic here in question,' in their exceptions they argue that 'Form A costs . . . require a differential in the South,' and that 'comparative costs under Form A, properly adjusted, fully support the present differential in southern divisions.' This argument appears to involve the premise that such costs may properly be used to determine the relative expense

actually incurred by the respective groups of carriers in transporting the interterritorial traffic."

Then the Commission stated that (p. 508):

"The average interterritorial shipment as shown by the southern lines' traffic test (excluding Florida vegetables) received a haul of 823 miles, of which 478 miles were on southern railroads and 345 miles on northern. For this average service the former received 58.45 percent of the revenue and the latter 41.55 percent."

Continuing, the Commission said (p. 509):

"Using the Form A unit cost of 1948 for boxcar traffic previously shown, the southern lines multiply the average-haul figures for each group by its average line-haul cost and add thereto the appro-

[8]

priate average cost of one terminal service, arriving at a total cost of 24.7 cents for the southern lines and 20.4 cents for the northern, which represent percentages of 54.77 and 45.23 respectively."

Hence the Rail Form A cost comparison presented by Southern lines showed that those carriers were incurring only 54.77 percent of the costs while receiving 58.45 percent of the revenue.

The Commission further stated that the "southern lines say, however, that a number of adjustments must be made in Form A before it can properly be used in this manner."

After setting forth the adjustments for which the Southern lines contended, the Commission stated:

"The adjustments proposed by the southern lines would serve to raise their average line-haul factor 7 percent above that of the northern lines. Under Form A the southern line-haul factor is 5 percent lower.

Accordingly, the adjustments would serve to show higher costs for the southern longer haul on interterritorial traffic than Form A, . . ."

The adjustments were rejected by the Commission, which concluded after thorough consideration that "We find them unconvincing." Then it said, at p. 510:

"This view is not unduly influenced by the fact that Form A is principally the work of our cost section, which is expressly charged with the duty of developing improved methods of determining transportation costs. As we have heretofore had occasion to observe, cost finding as applied to common carriers has been and still is a progressive science to which many students of the subject have contributed. We welcome the results of all research which aids in formulating principles not susceptible of exact proof, but suggestions for improvement advanced by litigants in adversary proceedings must necessarily be received with some degree of skepticism."

[9]

The Commission's conclusions regarding costs were stated at p. 526:

"If we were to give controlling weight to the cost studies of the northern lines for 1946 and 1948 in this record, the differentially higher basis of divisional factors sought by those lines would be justified. We do not accept that showing at face value because, admittedly, there were certain important items of expense in those years which may reasonably be regarded as transient, particularly in the northern lines accounts for maintenance of way and structures and equipment. This was particularly true of the Pennsylvania, which in 1948 and the two following years had high freight-car repair costs apparently cyclic in

nature. We consider it to be the safest assumption for the future upon the facts before us that neither contesting group will have an appreciably lower basis of operating costs than the other, and that there are no other relevant circumstances which are of sufficient importance to justify higher divisional factors for one group than the other."

It will thus be noted that the costs upon which the Commission acted in prescribing the present divisions were those developed by the application of Rail Form A, that adjustments suggested by the Southern lines were found "unconvincing", and that the Northern lines' higher costs were discounted for the future, not because of any deficiency in the formula or misgivings as to its appropriateness as a measure of North-South traffic, but rather because of what were thought to be nonrecurring expenses in the North during the years for which the evidence was developed. It is clear, therefore, that having adopted and relied upon Rail Form A unadjusted costs in fixing the present divisions, the Commission may and should now employ the same standard in determining whether those same divisions should be modified in the light of ensuing developments affecting territorial cost levels. This is especially true in view of the record's disclosure, as we shall later point out, that Official-Southern traffic is handled under the same conditions as other traffic, and that the average costs are therefore fully representative of the cost of handling the traffic here involved.

[10]

2. The Commission Has Held That Form A Territorial Average Costs Are Proper for Use in Cases Involving Large Blocks of Traffic, as Here Involved.

The demonstrated reliance of the Commission upon unadjusted territorial Rail Form A costs in the prior pro-

ceeding herein is completely in accord with its undisputed recognition of the purpose and probative value of Rail Form A in proceedings of this nature. The Rail Form A formula developed by the Commission's Cost Section was first employed in Docket No. 28300, *Class Rate Investigation, 1939*, 262 I.C.C. 447 (1945), in which the Commission had under consideration the lawfulness of interstate class rates in that part of the United States which lies east of Mountain Pacific Territory (p. 454). To assist in this inquiry, the Commission received in evidence studies, prepared by its then Chief Cost Analyst, of the relative cost of rendering transportation service in the various territories. After thoroughly describing the formula at pages 571-591 of the report therein, the Commission, with respect to the reliability of the studies stated (p. 693):

> "There are different degrees of refinement in costs depending upon the purpose for which the costs are intended. The ascertainment of the costs of transporting a particular commodity over a single railroad or a group of roads, for instance obviously requires more refinement in procedure than the calculation of relative costs for transporting all traffic, or important and well-defined segments of traffic, by territorial groups of carriers. It is the latter type of cost computation that we now have before us."

The Commission's order in the *Class Rate Investigation* was challenged by Western Railroads and certain Eastern states in suits reported in *New York v. United States*, 331 U.S. 284 (1947), wherein the Court, after due regard to the relative cost data for the several territories and the conclusions of the Commission with respect thereto (315-332) sustained the Commission's order.

In the *Official-Southwestern* case, 287 I.C.C. 553 (1953), at pages 566-568, the Commission took note of the territorial costs under the

[11]

Rail Form A formula as presented by Eastern lines. The following excerpts therefrom are here pertinent:

"Shortly after our 1939 report was issued, we established a cost-finding section, which is now part of our Bureau of Accounts and Cost Finding, having as one of its objects, the development of improved methods for determining transportation costs. After exhaustive investigation that section constructed what has come to be known as Rail Form A, a formula for computing railroad freight service costs, including a separation of the line-haul and terminal elements and differentiation in respect of load and tare weight per car."

* * *

"The eastern lines applied Form A to the expenses and statistics for the eastern district (including as well as excluding the Pocahontas region) and the southwestern group for 1946, adjusted to the cost level of January 1, 1948. Later they made a study based on 1943 figures."

* * *

"What are here termed 'territorial average costs' are not those which embrace traffic carried wholly within southwestern or eastern territory but are based on all the operations of the railroad carriers classified under those groupings. The cost study is fundamentally based on the principle that the performance of transportation service requires the production of a number of homogeneous service units, such as gross ton-miles, car-miles, consignments billed, cars interchanged by switching, et cetera. The fact that different commodities are handled or that the movement is entirely within one territory or partly within one territory and partly in another does not affect the ac-

cumulation of the homogeneous service units which are necessary to the rendition of the service. Essentially the costs are dependent on the quantities of the service units required of the carriers in moving loads of various weights per car in various kinds of equipment with various percents of empty

[12]

returns and various lengths of haul. Because of the fact that 35 percent of the tonnage of the southwestern lines in 1948 consisted of interterritorial traffic, 8.5 percent being to and from eastern territory, the Form A costs for those lines necessarily reflected conditions affecting interterritorial operations to a considerable extent."

In view of the foregoing findings by the Commission, it is significant to note that both Southern lines and Northern lines participated substantially in interterritorial traffic and that the former emphasized the fact that Official-Southern traffic represents approximately 21.4 percent of their total traffic (V.S. 36, Ex. 5).

By comparison, the volume of class rated traffic involved in Docket 28300 was a small part of the total traffic of the involved carriers, as shown at page 479 of the report in that proceeding (262 I.C.C. 447). The evidence in Docket 28300 indicated that for the United States as a whole the volume of traffic moved under class rates was 4.1 percent of total carloads and 6.3 percent of revenue on all traffic (262 I.C.C. at p. 564). The present record shows that the North-South carloads constitute 10.45 percent of the total carloads of Official Territory carriers (calculated from V.S. 75, Appendix A, p. 3, and V.S. 1, Ex. D, p. 1). The figure for the Southern lines would be substantially higher than that shown for the Northern lines since the proportion of North-South to total traffic is greater for the Southern than for the Northern lines. The revenue involved in the North-

South traffic, as shown in Southern lines' traffic study, constitutes 10.06 percent of the combined total freight revenue of Northern and Southern lines during the twelve-month period. It constituted 6 percent of the total freight revenue of Official Territory lines and 21.4 percent of the total freight revenue of Southern lines, during the twelve-month period (V.S. 36, Ex. 5).

It is very clear, therefore, that the block of traffic involved in this case is considerably greater in relation to the total traffic of the lines involved than was true of the block of traffic that was involved in the *Class Rate* case. This is true of both sets of lines. It is very markedly true of Southern lines. The Commission having found,

[13]

therefore, that class rate traffic constitutes one of the "important and well-defined segments of traffic" moving by "territorial groups of carriers" for which territorial average Form A costs were appropriate, that conclusion must *a fortiori* be true in the present case which also involves all railroads in the North and all railroads in the South and a much higher percentage of their total traffic than was true in the case of the traffic under review in the *Class Rate* case.

In Docket 30416, *Class Rates, Mountain Pacific Territory,* 296 I.C.C. 555 (1955), which also included Docket 30660, *Class Rates, Transcontinental Rail, 1950,* in which the Commission also considered group average Form A costs, the involved class rate traffic was only 1 percent of the total traffic (p. 614). The instant proceeding involves a much larger block of traffic, being all class-rated, exception-rated and commodity-rated traffic moving on joint rates between Official and Southern territories, with the exception of coal, coke and certain items of traffic eliminated by stipulation.

On the basis of these important precedents, therefore, it is clearly proper to use Form A territorial average costs in determining the relative cost to Northern and Southern

lines of transporting the traffic. Reliance on such costs in this case would be in harmony with the Commission's conclusion in its decision of March 21, 1963, in No. 31503, *Akron, C. & Y.R. Co. v. Atchison T. & S.F. Ry. Co.* (mimeographed sheet 45). There, after considering a number of adjustments in Rail Form A costs proposed by the Transcontinental lines as restated by it in comparison with unadjusted territorial costs, it concluded:

> "One substantiates the other and supports the view that, *for a large and varied body of traffic as here* at issue, *territorial average costs will be the substantial equivalent of specific costs.*" (Emphasis supplied.)

It is respectfully submitted that the Commission should make a similar finding in the instant proceeding.

[14]

3. Southern Lines' Costs Are Simply Form A Averages With Adjustments Selected With the Object of Improving Southern Lines' Relative Cost Position.

The costs upon which Southern lines rely are basically the same costs as set forth in Northern lines' evidence, namely, costs resulting from the application of Form A to their traffic study.

Southern lines' costs are average costs, system averages and territorial averages, which do not even purport to pertain only to the transportation services rendered on the traffic here in issue. These averages inhere in the very vitals, in the most basic figures, of their cost study. The expense figures for the amounts paid employes, for the purchase of fuel, materials and supplies, for taxes, for passenger deficits and return on investment, the number of cars, tons, ton miles, car miles—all of these expenses and the statistical units by which they are apportioned relate to the entire operations of both the Southern and Northern lines. The basic unit costs that underlie Southern lines' cost evidence are developed from and reflect the cost of

handling all traffic moving over the lines of the two contending carrier groups.

With regard to evidence of the relative costs of service, the Commission is confronted with the basic question of whether the Rail Form A formula more nearly reflects the relative costs of the North-South traffic to the two groups if it is applied on this tremendous body of traffic in the manner which the formula intends under these circumstances or whether those costs are more accurately developed through highly selective adjustments made by partisans who would not suggest such adjustments were it not to their advantage to do so.

Having started out then, with the same average costs for handling all traffic by types of car, which the Commission previously found and Eastern lines here urge to be appropriate, Southern lines proceeded to make "adjustments" which are said by them to bring the average figures closer to the cost of handling the North-South business here

[15]

in issue. As might be expected, the effect of the adjustments turned out to be an increase in Southern lines' proportion of the total cost and a consequent reduction for Northern lines (one adjustment slightly increased Northern lines' shares if Pocahontas costs are used (V.S. 80, Section E). For equally obvious reasons the selective adjustments that were made on this occasion differed from those made by Southern lines and urged as appropriate to reflect the characteristics of the traffic when these divisions were previously before the Commission, at which time Southern lines' efforts at adjustments were found to be "unconvincing".

If Southern lines had a genuine desire to make impartial adjustments in Rail Form A in pursuance of their stated objective of bringing the costs closer to the involved North-South traffic, there are other adjustments that might well have been made with at least equal appropriateness.

But these would have had the result of substantially reducing their costs and increasing those of Northern lines. For example, in testifying for the Southern railroads in *Crude Sulphur, Louisiana and Texas to Virginia,* I.&S. 6177, Mr. Cole, a cost witness for the South herein, stated, in 1954:

> "I would like to make a few comments with respect to Rail Form A: In 1942 and '43 I was employed as senior transportation cost analyst for the Board of Investigation and Research, and one of the duties of that organization was to determine the relative economy and fitness by carriers by rail, water and truck. Among other things, I made a very intensive study of Rail Form A as it existed at that time. I pointed out to the public, through a report that was circulated to the railroad industry, and was also given to Dr. Edwards for criticism, and to Dr. Lorenz, who was Chief Statistician for the Commission at the time, that the method used in Form A, the cost formula, certainly had a tendency to overstate long-haul costs and understate short-haul costs, for this reason: Once a long-haul shipment makes its first junction point it tends to move by two [through] routes to its final destination, or to the last junction point."

[16]

Notwithstanding the fact that the Southern haul on North-South traffic is substantially longer than the haul of the Northern lines (about 40 percent according to the Southern lines, V.S. 11, Tab. A, p. 1), and notwithstanding Mr. Cole's conviction that the cost formula "certainly had a tendency to overstate long-haul costs and understate short-haul costs", no adjustment for this factor was offered by Southern lines (V.S. 80, Section H, p. 4).

Moreover, although over 67 percent of the traffic handled by the Southern lines within the South (South to South) is intrastate traffic, and although Southern railroad witnesses have testified in case after case, covering the en-

tire South, that the cost of performing intrastate transportation is higher than that of providing interstate service, there is no suggestion by the Southern lines, despite their professed desire to provide "refined" costs, that the higher cost of such intrastate transportation be extracted from their average costs so as to recognize and arrive at the lower-than-average costs to Southern lines of performing interstate transportation service which alone is here involved. The various witnesses for the Southern railroads in the 13th Section cases, the testimony from some of which appears in V.S. 80, Exhibits G-1 to G-11, inclusive, were quite specific as to the reasons that Southern intrastate transportation is more costly than interstate operations. They pointed out in each instance that a much greater proportion of intrastate traffic is handled in local trains than is the case with interstate traffic and that the former are substantially more costly to operate than through trains because, *inter alia* (1) the average train tonnage is less, (2) the rate of pay is higher, (3) more overtime is incurred, (4) the number of men on the crew is greater, (5) more locomotive units are tied up, and (6) the locomotive's ultilization is much less on the local than on the through trains (see, for example, the statement of Witness Tolleson, Ex. G-1, to V.S. 80 and that of the other witnesses whose testimony is reproduced in Exhibits G-1 through G-11 to V.S. 80, all to the same effect). The greater relative amount of intrastate than interstate transportation on branch lines was another factor mentioned by the Southern witnesses whose testimony appears in Exhibit G-7 to V.S. 80.

[17]

It should be noted that these witnesses did not testify in these several 13th Section cases simply that there was nothing about intrastate transportation which called for lower rates than interstate. They did not testify simply that operating conditions or costs were substantially the same. They uniformly testified that *costs are higher on intrastate than on interstate traffic.* Their evidence was

consistently to the effect that conditions were generally the same with the exception of the more burdensome and costly attributes of intrastate transportation which they emphasized.

Sand and gravel, crushed stone, and pulpwood are said in this divisions case to have very favorable cost characteristics which must be extracted from Southern lines' costs on North-South traffic lest they dilute those costs. But in the 13th Section cases the Commission was told that these commodities move in local trains and that the cost of transporting them is higher than the cost of transporting interstate shipments (see *e.g.*, Forlines, V.S. 80, Ex. G-6, pp. 137, 8; Rush, V.S. 80, Ex. G-7, p. 52). One of the witnesses pointed out that not only does the pulpwood move generally in locals but that it has special cars, which entail an empty return movement (Forlines, Ex. G-6, p. 138, V.S. 80). And in the South 67 percent of all pulpwood traffic and from 82 percent to over 90 percent of sand and gravel, crushed stone and phosphate rock moves intrastate (V.S. 80, Table G-1).

Thus, the Southern lines, had they submitted the objective adjustments that might have been made by a neutral actually seeking to produce more reliable relative cost comparisons would properly have allocated a larger part of the territorial average costs to the traffic handled within the South (over 67 percent of that traffic being intrastate and of higher cost), thus reflecting the fact that, judged by their own statements, their costs on Official-Southern traffic are lower than average. But they did not do so; since obviously it was not their objective to lower the costs on interterritorial movements over Southern lines.

Rail Form A costs are used, of course, day in and day out by litigants before the Commission and constitute the basis of countless

[18]

Commission decisions. Northern lines have shown a large, but still only partial, number of recent proceedings in which

they have been relied upon by Southern lines, even with respect to individual commodities between individual points (V.S. 80, Sec. H). Clearly no case could be more appropriate for the use of the average costs produced by Rail Form A than the present one which involves the divisions of *all* rates on *all* classes, *all* exceptions, and *all* commodities (except coal, coke and those few stipulated out) between *all* stations on *all* railroads in the North, and *all* stations on *all* railroads in the South.

4. Northern Lines Presented Evidence to Show That Form A Average Costs Properly Measure the Cost Pertaining to the Traffic Involved in This Case.

In addition to the precedents cited above as establishing that Form A average costs properly may be used in a case such as this, Northern lines presented evidence to show the propriety of the use of Form A averages in this proceeding. They presented, through Witness Nancarrow (V.S. 8), a train utilization study for the Pennsylvania, Baltimore and Ohio, Erie, Nickel Plate and New Haven (Ex. A) and a detailed diagrammatic tracing of 14 Pennsylvania Railroad trains moving to and from the principal gateways of Cincinnati and Potomac Yard, at which traffic to and from the South is delivered and received (Exhibits C-P).

a. *Train Utilization Study.*

The train utilization study, as stated by Witness Nancarrow (V.S. 8, p. 6) "is simply intended to demonstrate the extent to which the total train service of Eastern Railroads participates in the movement of Southern interterritorial traffic." In order to achieve a representative cross-section of Official Territory lines in this study, the Erie and Nickel Plate, which are both primarily East-West rather than North-South carriers, were included along with carriers such as the Pennsylvania and Baltimore and Ohio, which participate very substantially in Official-Southern traffic. The five study lines were

[19]

asked to furnish, for a selected week in May of 1959, the total number of freight trains operated during the week, classified between through and local trains, and the number of the trains in each such classification which were found, upon investigation, to contain at least one car of Official-Southern interterritorial traffic.

As shown in Witness Nancarrow's Exhibit A, as revised, of the total of 13,647 loaded trains shown for the five study lines, 6,099 trains, or 44.7 percent, were found to be transporting at least one loaded car moving from or destined to Southern territory. And, of course, additional trains undoubtedly participated in the movement of empty cars between the two territories. Thus, it is seen that traffic which, according to Southern lines' evidence, is claimed to represent only 6 percent of the total carload traffic of Eastern lines (V.S. 36, Ex. 5), nevertheless, was found to require utilization of almost half of the train facilities of those lines in its movement *during the brief period of one week.* And, as Witness Nancarrow further pointed out (p. 9), obviously if train utilization tests were to be extended over a longer period, it would be found that every transportation facility maintained by Eastern lines is, at one time or another—even if not always concurrently—necessary to the *assembly, movement and distribution of Southern business.* Hence, it cannot be said that Official-Southern traffic does not encounter all of the operating conditions and transportation burdens incurred by Eastern lines on their general traffic.

b. *Train Tracing Studies.*

The diverse character of Official-Southern traffic and its movement within Official Territory as an integral part of the general traffic complex of that territory is also demonstrated by the studies of selected representative Pennsylvania Railroad trains depicted in Exhibits C through P, inclusive, to Verified Statement No. 8 of Witness Nancar-

row. The Pennsylvania Railroad serves both Potomac Yard and Cincinnati, the two principal points of interchange between Northern and Southern carriers, and its service to and from those gateways is typical of that provided by Eastern lines on the involved traffic (V.S. 8, pp. 4-7).

[20]

Accordingly, Mr. Nancarrow, supervised the study of both long distance preference trains and shorter haul trains between the foregoing two gateways and important Northern terminals. The operations of 14 such trains in both directions on March 16, 1956, the day during that study month which most nearly reflected average volume (V.S. 8, p. 11), were traced in detail. Four of the selected study trains operate to and from Cincinnati and the remaining ten have as their southernmost terminal Potomac Yard. In each case, the schematic diagrams, Exhibits C-P inclusive, trace from Pennsylvania Railroad origins or connections to Pennsylvania Railroad destinations or connections, as the case may be, every car which was, at any time during its journey, a part of the consist of the subject train, whether or not that car moved interterritorially to or from the South. Official-Southern cars, however, are readily identifiable in Exhibits C-P, and their movement in both the particular study trains and in the complex of connecting trains required to effect their origination or delivery is clearly shown, thus permitting a ready appraisal of the relationship of such cars to the total traffic handled. It may be noted that included in the exhibits was traffic to and from Canada requiring additional interchange service, some of which was described by Witness Shea in Verified Statement No. 78, as well as other extraordinary operating burdens.

It is unnecessary, at this point, to further elaborate upon the details of the schematic train diagrams. The very intricate detail of these exhibits itself demonstrates the complexity and extent of the railroad plant which must be maintained by the Pennsylvania, and similarly by other

Official Territory carriers, in order to provide necessary service on Official-Southern traffic. The foregoing Exhibits C-P of Witness Nancarrow provide a documented and detailed demonstration of the fact that Official-Southern traffic is not and cannot conceivably be handled in the North nor, indeed, as it will be seen below, in the South, as a distinct entity. Rather, they establish that it is transported as an indiscriminate part of the whole influenced by and in turn influencing the general traffic of the involved carriers.

[21]

On the basis of the foregoing studies and in the light of his experience, Mr. Nancarrow concluded that a car of Official-Southern traffic utilizes the transportation facilities and services of Eastern railroads to the same degree as any other car; that such cars receive service no less complex than that of traffic generally; that such cars, by virtue of their integration into the general traffic pattern, receive substantial cost benefits as a consequence of the existence of other traffic with which they are transported; that correspondingly, the services rendered by Eastern lines on Official-Southern traffic create burdens upon the other traffic of those carriers; and that Official-Southern traffic is so commingled with other traffic "that it is erroneous to conclude that Eastern lines' costs of handling Southern traffic, if possible of determination, are any different from their average costs of handling traffic generally" (V.S. 8, p. 43).

The witness made it plain of course, that in thus referring to average costs he referred to Form A costs, such as those used by Witness Heywood, rather than some outmoded method of costing on a per-car or per-car-mile basis with all expenses aggregated (both line-haul and terminal) in one lump sum (R. 552). Mr. Nancarrow expressed confidence, in view of the method by which railroad facilities and services are planned and operated, that the North-South traffic is handled on Southern lines as well as on Northern lines as an indistinguishable part of the overall

operation (V.S. 8, p. 3) and he concluded that the involved interterritorial traffic is average traffic, judged by every criterion of service and "hence may properly be measured by the Eastern and Southern Region costs attributable to all traffic" (V.S. 8, p. 44). Mr. Nancarrow's conclusion, as it relates to Southern lines, is strongly supported by the fact that their North-South traffic is a higher proportion of their total traffic than is true in the case of the Northern lines.

In connection with this point, reference is made to Eastern lines' brief at pp. 44-64 in which the operating testimony of Southern lines is analyzed and in which by this and other evidence it is shown that the attempt of Southern lines to make the North-South traffic appear to be more burdensome cannot possibly succeed.

[22]

5. Northern Lines Have No Burden in This Case to Disprove Cost Adjustments Suggested But Not Proved by Southern Lines.

In the light of a background which includes the prescription of the present divisions on the basis of the Form A average costs, the holdings by the Commission that such costs are appropriate in cases involving large blocks of traffic, the fact that Southern lines' own costs are basically territorial average costs, and the fact that Northern lines gave evidence of the propriety of using territorial average costs herein, it would seem clear that Northern lines made a *prima facie* showing of the relative service costs properly applying to the traffic here involved by the presentation of evidence based on Form A average costs for the Northern and Southern roads.

If Southern lines desired, then, to establish that in some respect the territorial averages used both by Northern and by Southern lines themselves did not properly measure the cost of performing the service on the North-South traffic here in issue, clearly the burden had shifted to them to

establish their contention by proper proof. It would manifestly be improper to hold that when one litigant establishes a *prima facie* case, the opposing litigant can defeat such a case by bringing forward speculations and contentions based upon surmise and assumption concerning some part or parts of the first litigant's proof. The adjustments in the Form A averages which Southern lines offered were either patently unsound or were based upon inapplicable facts, surmise and assumption. This is demonstrated in a discussion of each of these adjustments in Eastern lines' brief at pp. 103-187.

Southern lines endeavor to overcome the effect of their failure to prove their adjustments by stating and reiterating throughout their discussion of the burden of proof point that Northern lines were at fault in this failure by the "withholding by Northern lines of their records", by Northern lines' "failure to produce more refined data in their possession", by Northern lines' "blocking the development of actual and comparable cost evidence . . ." (Southern lines' Exceptions, pp. 13 to 17).

[23]

Let us examine this contention with respect, for example, to the most important adjustment for which Southern lines contend, namely, that relating to cost of cars. It is discussed in Southern lines' exceptions at pp. 19 to 36. A reference to that discussion will show that the only thing said to be in our possession and not available to Southern lines is that indicated by the following on p. 35 of Southern Railroads' Exceptions:

> "The requirement that the Northern lines prove with specific evidence that their costs of cars carrying Official-Southern traffic are higher than the costs of the Southern lines for the same cars is particularly appropriate in this case where the Northern lines had in their possession at least at the time of the rebuttal hearing specific facts which would have confirmed or disproved

the application of territorial average car costs to the Official-Southern traffic handled in box cars.

"The rebuttal hearings in this case were held on February 7-13, 1961. At that time, the carriers had completed but had not released the results of a special study of car costs for the year 1960 which the Commission had ordered in its general investigation, *Railroad Freight Car Per Diem Charges*, Docket Nos. 31358 and 33145. This special study of car costs provided, for the first time, a separation of car costs by type of car (V.S. 40, Ex. C, p. 13).* Despite the availability of these data, the Northern lines' rebuttal witness on the subject of car costs presented no facts at all as to the actual costs for box cars as contrasted with the average cost for all cars on Northern lines (V.S. 76). Their witness disclaimed any knowledge of the results of the special study of car costs ordered in the *Per Diem* investigation, even of the study made by his own Pennsylvania Railroad Accounting Department (Tr. R. 2509-12). It may fairly be concluded that, if the facts as to box cars supported the use of territorial average car costs, such data would have been forthcoming."

[24]

Now, let us see what the record shows with respect to the "availability of these data" to Northern lines. The record reference on the subject, as given in Southern lines' exceptions, is R. 2509-12. At R. 2509-10, the following appears:

"Q. [Counsel for Southern Lines] I would like to ask you whether you are familiar with the Commission's orders in what you will probably recognize as the

"* The Commission's orders, dated December 18 and 23, 1959, required that the individual carriers furnish data in great detail, including information showing car repair costs, investment, utilization and per diem payments and receipts, separately by type of car (home and foreign)."

per diem litigation; are you familiar with the Commission's orders and questionnaires calling upon the individual railroads to develop facts, both as to costs and as to operating data, respecting car costs?

"A. I would say I know that there are orders on that subject. I am not familiar with them.

"Q. You are sufficiently familiar, are you, with them to know whether the Pennsylvania, as an example, has already completed and filed with this Commission a statement for at least one quarter of the year showing the percent that user car costs are of account 314?

"A. I do not know. I do not even know whether it has been filed."

Then, on R. 2511, counsel for Southern lines stated:

". . . in the near future, both as to your road and as to all roads, . . . we will have the facts as developed by this rather detailed questionnaire."

And on R. 2512, the following appears:

"The Witness: When all of the facts would become available to me or to anyone else and when I could understand those facts and know that I was able to use them properly, they could be of value. But they have not been available to me; *they will not be available for a long time*—in fact you said that the figure that was furnished so far was one-quarter of the year or represents one quarter of the year, I forget how it was phrased."

* * *

"Q. (By Mr. Trienens) ". . . we are in this *interim period* awaiting the results of that study . . ." (Italics supplied.)

[25]

Thus, with respect to the most important single cost adjustment contended for by Southern lines, the data alleged to have been withheld and said in Southern lines'

Exceptions to have been "completed" but ". . . not released", it appears (a) that at the time of the rebuttal hearing the data would "not be available for a long time" and (b) that the small fragment thereof which had been completed was "filed with this Commission" and as available to Southern lines as to Northern lines.

The second most important adjustment for which Southern lines contend in the Form A average costs relates to empty return ratios on box cars. With respect to this adjustment, in what respect was there "withholding by the Northern lines of their records . . . .(Southern Exceptions, p. 13). The only such thing charged by Southern lines with respect to this adjustment regarding box cars was that Southern lines proposed that a joint study be conducted and it is stated that all that Northern lines were requested to contribute to the proposed study were the car initial and number and the loaded and empty miles of each box car moving over their lines during the study period. It is then stated that Northern lines refused to furnish the data in the form requested or to make any alternative suggestions that would provide any separation in the empty return ratio as between general purpose box cars and box cars used for automobile parts (Southern Exceptions p. 46).

It will be seen that what was here proposed entailed far more than simply handling over to Southern lines some record in the possession of Northern lines. Southern lines proposed a joint study. The essential theory of the study was so faulty that the study would have been worthless (Eastern lines' brief, pp. 140-142). Moreover, whereas the Commission's seven-days study embraced days that were spaced throughout a twelve-month period, the three-day study suggested by Southern lines would have been for Monday, January 25, 1960, Wednesday, February 3, 1960, and Friday, February 12, 1960, or a period covering a span of but eighteen days. It is obvious that the period was not representative. In addition, specially equipped cars were in heavy demand during that period because the movement

[26]

of auto parts in the Fall, when model changeovers take place, was seriously curtailed by a strike and was, therefore, heavy during the period which would have been covered by the three-day study, thus resulting in a heavy demand for the cars and a consequent greater empty return movement to meet this demand than would have applied throughout the year (V.S. 73, p. 4).

But Southern lines say that Northern lines did not "make any alternative suggestions" for the study. A proper study would have required the selection of days *through a year's period.* Not only would such a study still have been subjected to the unwarranted assumptions which would have rendered it worthless, but, in addition, it would have resulted in an intolerable delay in the disposition of this proceeding. And Southern lines repeatedly refused to stipulate that the Commission's findings might be made retroactive. Hence the delay would have been at the expense of Northern lines.

With respect to refrigerator car empty return ratios it is charged that Northern lines did not "come forward with the data in their records showing the empty return experience of other ownerships" (Southern lines' Exceptions, p. 58), that is ownerships other than those studied by Southern lines.

Northern lines acceded to Southern lines' request that the former's consent be given to Southern lines examining the records of Fruit Growers Express. The data put in evidence as a result of this examination and the examination of other refrigerator car ownerships related to empty versus loaded car mileage of the entire operations of those car lines, not to the North-South traffic. It is not stated that Southern lines asked Northern lines for records relating to refrigerator cars and that such a request was denied. Northern lines pointed out that Southern lines' adjustment related to the entire operations of the refrigerator car

lines, including a very large use of refrigerator cars of F.G.E. in the West and that, therefore, the result was no closer to the North-South traffic involved in this case than the figures used in Form A; indeed, not as close. So, when Southern lines say, as they do, on p. 58 of their Exceptions, that ". . . Northern lines have the

[27]

comparable figures in their records", and that in their rebuttal Northern lines did not come forward with that data, Southern lines are simply saying that Northern lines failed to produce "comparable data" which also would have shown empty versus loaded miles of *all refrigerator cars wherever used.* In other words, Southern lines failed to relate the information relied upon in any manner to the Official-Southern traffic, and the same would have been the result if "comparable data" had been brought forward in rebuttal by Northern lines.

It is very easy, therefore, for Southern lines to charge that Northern lines withheld evidence in their possession. But when the charges are examined, they are found to be baseless.

With respect to their next adjustment—switching costs —the Southern lines do not allege that Northern lines refused them access to any data or failed to produce any document within their possession. They say merely that Northern lines failed to make switching studies comparable to the hand-picked switching studies made by Southern lines at selected origins in the South (Southern Exceptions, pp. 84-85), which were shown by Northern lines to be worthless (Eastern lines' Brief, pp. 151 to 172), and so found by the Examiners (Sheet 52). The Northern lines having presented evidence that North-South traffic was inextricably intermingled with the rest of the traffic handled by Official Territory lines and that the interterritorial traffic between North and South "is average traffic (except in

relation to heavy-volume coal and ore traffic) judged by every criterion of service, and hence may properly be measured by the Eastern District and Southern Region costs attributable to all traffic" (V.S. 8, p. 44) and having thus made out a *prima facie* case for the use of Form A average costs, Northern lines had no duty of any nature to make individual cost studies either to rebut the obviously worthless cost studies of Southern lines, or otherwise.

The remaining adjustments made by Southern lines in average Form A costs relate to the count of cars, equalization of gateway interchanges, application of costs in accordance with relative participation of the carriers, constant costs as related to transit com-

[28]

modities and the exclusion of suburban service deficits. In only one of these is there any suggestion about "withholding data". That appears on p. 99 of Southern lines' exceptions, relating to the count of cars point. We shall now discuss that matter and, having done so, shall then have discussed each and every one of the contentions made in Southern lines' exceptions that Northern lines had data dealing with Southern lines' cost adjustments which was withheld by Northern lines.

The count of cars originated or terminated and interchanged, which is used as a divisor to get a switching cost per car for these services comes from the Freight Commodity Statistics. The Southern lines were not satisfied with these figures in a certain respect, contending that specified traffic should have been reported as originated or terminated rather than interchanged. They believed that certain data from the One Percent Waybill Study would enable them to adjust the figures and they filed a petition requesting that the data be made available for the purpose of adjusting the car count. This is recited on p. 96 of their Exceptions. It is not there stated, however, that Eastern

lines consented to Southern lines having access to that data, a fact which is recited in the Commission's order of March 18, 1960 granting the request of Southern lines' petition. The data thus sought and made available with the consent of Northern lines was the only data with respect to this adjustment which was sought by Southern lines.

What, then, is it that Southern lines now say was "withheld" by Northern lines? The testimony of Southern lines' witness purporting to make adjustments in the Freight Commodity Statistics on the basis of the One Percent Waybill data is contained in V.S. 40, Ex. C, pp. 5-12. The testimony given therein simply indicates that the witness testified "I summarized the data necessary to remove the inconsistency . . ." (p. 11). It was pointed out in Northern lines' rebuttal evidence, V.S. 80, Sec. A, p. 5, that the information requested by the Commission based upon the One Percent Waybill Study "is not sufficiently complete to permit the making of the adjustment even if it were otherwise appropriate . . ."

[29]

It was also pointed out by Northern lines that the Southern lines' witness had made no attempt to eliminate company material cars from the car counts other than where the carriers' only reported adjustment covered such cars. Company material cars cannot be considered as a part of any such adjustment as they are not included in the car count in the Freight Commodity Statistics (V.S. 80, Sec. A, p. 6). In discussing this subject, at Sheet 36, the Examiners pointed out that "The reconciliation between the Waybill Study and the Freight Commodity Statistics has to do only with terminations, and therefore the large blocks of traffic received by boat, transferred to car, terminated on rail, and which were counted as interchanged at the port had to be estimated by respondents. How much was estimated, or how reliable the estimate, is unknown."

Southern lines now first go outside the record to tell how much was estimated (a large amount) and then urge

that the Northern lines are guilty of "withholding data in their possession" (Southern Exceptions, p. 99) by not developing the facts which were assumed by their witness in making the secret, undisclosed estimate. It is obvious that Northern lines had no duty to correct the estimates and unsound assumptions made by Southern lines' witness in support of a point which Northern lines believed to be erroneous in any event. Moreover, the task of going to the billing and compiling information in some way other than as compiled pursuant to the Commission's order governing the compilation of commodity statistics is obviously a long and time-consuming process. It is not a matter of looking into the file and getting the desired figure. Finally, in stating that the Northern lines withheld data in their possession which would have enabled them to correct Southern lines' estimate and assumptions, Southern lines overlook the fact that not only the Official Territory carriers were involved in the "correction" of the car count, but the Southern Region lines as well (V.S. 40, Ex. C, p. 11).

Each of the charges of withholding information that has been made by Southern lines in connection with the cost adjustment

[30]

submitted by them has now been reviewed. It is respectfully submitted that each is shown to be devoid of merit. None could have any effect whatever from the standpoint of transferring to Northern lines the burden of proving the adjustments advocated by Southern lines. The charge of withholding data is patently a charge that is made to give flavor to a law point which Southern lines are endeavoring and hoping to develop. In the light of the above analysis, Northern lines are confident that the Commission will not be misled by Southern lines' reckless charge of "withholding data".

One last word on this subject, and this relates to Southern lines' quotation from Corpus Juris on page 12 of

their Exceptions. It is clear from a reading of the rule, as there stated, that said rule has no application with respect to the several situations reviewed above, as to which Southern lines would invoke it in the present case. The unfavorable inference from failure to produce applies, according to the rule, only "in the absence of explanation" and as to data which is within the power of a party to produce and not equally accessible to his opponent. It clearly does not apply, moreover, where the fact is not readily available but would have to be made the subject of time-consuming and costly studies (see in this connection, *Boileau v. Pittsburgh & Lake Erie Railroad Co.*, 22 I.C.C. 640, 651 (1912)). Moreover, in quoting as they did from § 156 of 31 C.J.S. Southern lines omitted to bring to the Commission's attention the fact that § 156 goes on to say that:

> "The unfavorable presumption or inference arising from the withholding of evidence is not conclusive against the party, but is merely a fact for the consideration of the jury; *and such failure cannot be relied on by the other party as affirmative proof of facts as to which the burden of proof is on him.*" (Italics supplied.)

Hence, even if it were to be assumed, contrary to fact, that Northern lines had withheld evidence in their possession, the very section of the authority upon which Southern lines rely establishes that any such withholding would have availed Southern lines nothing in the way in which they seek to use it.

[31]

6. The Authorities Support Northern Lines' Position With Respect to Burden of Proof.

The principle which governs with respect to Southern lines' contentions concerning burden of proof is set forth in summary fashion in *Delaware Coach v. Savage*, 81 F. Supp. 293, 296 (Del. 1948):

"Upon the establishment of a prima facie case the burden of evidence or the burden of going forward with the evidence shifts to the defensive party. It then becomes incumbent upon such defensive party to meet the prima facie case which has been established."

To the same effect is *Terminal Charge on Order Bills of Lading Shipments,* 315 I.C.C. 327, 329-30 (1962), where the Commission referred to the provision of Section 7(c) of the Administrative Procedure Act that "Except as statutes otherwise provide, the proponent of a rule or order shall have the burden of proof", and went on to state:

"In most proceedings before the Commission, the burden of proof is primarily a rule of evidence to insure orderly procedure. Its principal effect is to require the party who asserts the affirmative of an issue—that is, the party who would fail if no evidence were offered—to go forward in the proof. *Cf. Pacific Portland Cement Co. v. Food Mach. & Chem. Corp.,* 178 F. 2d 541 (9th Cir., 1949). However, the other parties who are proponents of a different result then must proceed to sustain their burden of going forward." *Att'y Gen. Manual on the APA 75* (1947).

Also, in *2 Davis, Administrative Law Treatise* § 14.14, it is stated:

"Section 7(c) of the APA provides: 'Except as statutes otherwise provide, the proponent of a rule or order shall have the burden of proof.' The Committee reports explained: 'That the proponent of a rule or order has the burden of proof means

[32]

not only that the party initiating the proceeding has the general burden of coming forward with a prima facie case but that other parties, who are proponents of some different result, also for that purpose have a burden to maintain.'"

Clearly, therefore, after Northern lines had established their *prima facie* case, it was incumbent upon Southern lines to implement by proof whatever contentions they saw fit to make in their effort to overcome that *prima facie* case.

With respect to Southern lines' burden of proof argument, the Commission should find as follows:

Northern lines established a prima facie case (and established prima facie the propriety of using unadjusted Form A Group average costs in this proceeding) in support of an increase in divisions for that group. Thereupon, the burden of adducing evidence to rebut that case shifted to Southern lines. No part of Southern lines burden of going forward with such evidence can properly be put onto Northern lines, either with respect to individual adjustments in items of cost for which Southern lines contend, or otherwise. Northern lines are not guilty of withholding any information from Southern lines (or of failing to cooperate in making studies to produce information) which properly should have been produced.

Reply to Exception No. 1, B-1, Regarding Southern Lines' Contentions Concerning Car Costs.

Several times in the course of their discussion of this subject, Southern lines say that Official-Southern traffic moves in the same car between the North and the South and that the characteristics of that car do not change as the car crosses the territorial border. This, of course, is a misleading oversimplification of a complex set of facts. The car costs of a given railroad are influenced by such things as wage rates, relative use of its cars by other lines and by it of the cars of other lines, utilization of equipment, depreciation and return factors, charges for repairs to its cars while being used

[33]

by other lines, and many others. The combination and interplay of all of these factors results in that railroad

having a certain cost per car and per car-mile with respect to the cars used and owned by it. More accurate than Southern lines' statement that the characteristics of a car do not change at the territorial boundary would be a statement that car costs do not change for a railroad when it delivers a car to another railroad at a territorial gateway.

Throughout the Southern lines' discussion of the car cost exception, it is stated that the Northern lines' car costs are 32 percent higher than those of the South. This 32 percent results from an assumed set of facts under which unit costs are applied to hauls of 350 short-line miles in the North and South respectively (V.S. 39, p. 62). The assumption is far removed from the actual facts with respect to movements between the North and the South, wherein average route of movement miles for box cars North and South are 428 and 564 miles respectively. Moreover, at any distance greater than 396 miles, the percent of cost North versus South must be less than 32 percent even on a mile for mile comparison.

It is interesting that, although professing in justification of most of the cost adjustments urged by them to "refine" the group Form A cost to bring them more close to the handling of the traffic involved, when it comes to the adjustment in car costs Southern lines disregard the car costs for the two territories and substitute average car costs for the United States, thereby greatly reducing the costs shown for Northern lines below the actual expenses incurred on this account while at the same time increasing their own. Southern lines say (at p. 21 of their Exceptions) that Northern lines had the burden of proving that car costs with respect to North-South traffic are 32 percent higher in the North, and that the Examiners shifted to Southern lines the burden of establishing that average United States car costs should be used in place of the costs of the Official and Southern groups respectively. The Form A formula which both Northern and Southern lines used establishes a method of accounting for all of the

complex car costs incurred by a railroad or group of railroads. Northern lines established

[34]

the propriety of using in this case costs produced by that formula (see discussion re burden of proof, *supra*, at p. 5 et seq.). They made their *prima facie* case. If Southern lines wanted then to rebut that case and establish that car costs for all railroads of the United States are closer to the costs of the Northern and Southern groups respectively, in the transportation of North-South traffic than the average costs for Northern and Southern lines themselves, it was quite obviously Southern lines' burden to prove that patently extreme proposition. Moreover, the reasons for the differences in costs are established by the record, as appears in the Examiner's report and as will appear in the following discussion.

In discussing the Examiners' conclusion that the national average car costs conceal important territorial differences in costs and that separate territorial car costs will be used, Southern lines first discuss the Examiners' reference to the fact that utilization of cars is greater in the South than in the North, 49.5 car-miles per day in the South as against 39.4 car-miles per day in the North (Southern Exceptions, p. 24). Southern lines argue that these figures are average figures representing all traffic in all types of cars. It is important to note that Southern lines concede (Exceptions, p. 25) that "Low utilization of the average car in the North could explain the 32 percent higher territorial average car costs in the North . . ." But they say that system average utilization does not cast any light on the utilization experience with respect to box cars carrying Official-Southern traffic. It may be observed that Southern lines would impute to average car utilization by all railroads throughout the United States a closer relationship to North-South traffic than the average utilization on the lines which perform the North-South transportation.

Contrary to Southern lines' contentions, Northern lines showed that North-South traffic is handled in all respects the same as traffic in general on their lines. It is handled in the same trains, in the same yards, and in all other respects the same as average traffic (V.S. 8). Southern lines say, however, that the record establishes that the utilization of hopper cars is "especially low in the North because of the special car

[35]

detention privileges granted by Northern lines to coal shippers and receivers" (p. 23 of Southern Exceptions). From this, of course, Southern lines (p. 23) ask the Commission to infer that the lower utilization in the North is due to the high percentage of hopper cars "both serviceable and unserviceable". The record shows, however, that (a) the Pocahontas Region, with 67.6 percent of its ownership of per diem cars in open hoppers, secured a utilization in terms of car-miles of 72.2 percent for hopper cars, or considerably more than the percentage that their open hoppers were of their total ownership; (b) Eastern District carriers with an open hopper ownership of 33.5 percent secured a utilization of 30.6 percent thereon and Official Territory as a whole with open hoppers comprising 40.4 percent of their ownership had a utilization of hoppers of 40 percent in car-miles, in contrast with the Southern Region, where the ownership consisted of open hoppers to the extent of 32.8 percent and a utilization in terms of car-miles of only 23.6 percent (V.S. 76, App. A). The poor utilization of hopper cars, therefore, is in the South and Southern lines have no proper objection to a comparison of average utilization on this basis. Indeed, it substantially favors them.

Southern lines insert a table on sheet 26, which purports to show, by an example, that a 23 percent difference in utilization, as measured in terms of car-miles per car day, is produced by a separation between line-haul and

terminal "even if there is no difference at all" in the cost per car-mile or in the cost per terminal service between the two territories. This is an impossible hypothesis. If there is a difference in utilization there is a difference in unit costs. Hence Southern lines' argument that the use of equal car costs per terminal handling and equal car costs per car-mile gives the Northern lines full credit for a difference in utilization by applying those equal unit costs to the cars and car-miles of Northern and Southern lines is entirely without substance. If all of the conditions which a railroad encounters enable it to get substantially more use out of a car than another railroad gets, it is quite obviously cheaper for the first railroad to provide that car than for the second.

[36]

Coming to the second category of causes for higher costs in the North than in the South—differences in taxes and wage rates—Southern lines say first that there is no evidence to support a claim of any difference in taxes "which may affect car costs . . ." (Southern Exceptions, p. 26). They say that the tax comparison was based upon taxes per mile of road and that this "plainly has nothing whatever to do with car costs" (p. 27, Southern Exceptions). This is not correct. The taxes included in Northern lines' figures related to cars, among other things. They embraced all taxes "Other than Federal Income and Payroll Taxes" (Ex. F-4 to V.S. 80). For comparison between the North and the South these total tax figures were expressed in dollars per mile of road, but they applied to cars, to car shops, and other items of property.

Southern lines also state that the "only relevant difference in wage rates cited by Northern lines was a 3 percent difference in maintenance of equipment wage rates" and that such a difference "alone" hardly explains, for application to Official-Southern traffic, "a 32 percent difference" in car costs (p. 27, Southern Exceptions). The fact is that

the wage difference is 4 percent rather than 3 percent. Moreover, it is not claimed that this "alone" explains the entire difference in the costs as between the Northern and Southern roads.

Next, Southern lines say that the difference in wage rates must be considered with "the offsetting fact that material prices are higher in the South than in the North . . ." (Southern Exceptions, p. 27). For this statement they give reference to Tr. 2494-96. A reference to those pages will show that they do not in any way support this statement of Southern lines. There is not one word on these pages, or elsewhere in the record, to establish that material prices are higher in the South than in the North. The fact that they have risen at a higher rate in the post-war period obviously does not establish that prices in the South now are higher than those in the North.

Southern lines also contend that the car costs as presented by Northern lines from Rail Form A are faulty in that those for Southern lines

[37]

are reduced by per diem payments made to Southern lines by other lines for use of Southern cars while operating on the roads of said other lines. They say that if car costs as calculated under Rail Form A were produced by the same methods as under the formula approved by the Commission for per diem rates in *Chicago, B. & Q. R. Co. v. New York, S. & W. R. Co.*, 297 I.C.C. 291 (1955), the fact that differences exist between the two groups of railroads with respect to per diem debits and per diem credits would not be of significance. But Southern lines say that there is an "inconsistency" between the two formulas which results in giving the credit road—the Southern group—an "artificial profit" which is used to reduce its car costs even though the credits accrued to Southern lines with respect to cars carrying traffic not here in issue. The inconsistency is said to result from the fact that depreciation and return on in-

vestment are calculated in the per diem formula on the basis of undepreciated reproduction costs (as to depreciation) and cost of reproduction less depreciation (as to the return element) with return on the latter calculated at 6 percent, while Form A uses original cost in both instances and a 4 percent return.

It may first be observed with respect to this matter that the Commission's decision last cited did not prescribe per diem rates. As the Commission stated, at p. 294:

> "The complainants expressly disclaim any intention to invoke the only specific power with respect to per diem which we have; namely, in section 1(14)(a) of the Interstate Commerce Act to establish 'the compensation to be paid and other terms of any contract, agreement, or arrangement for the use of any locomotive, car, or other vehicle not owned by the carrier using it (and whether or not owned by another carrier), * * *.'"

The Commission's finding, at p. 308, was:

> "We find and declare that the per diem charges of $1.75, $2, and $2.40 were not in excess of reasonable compensation during the periods in which they were effective, and that the latter charge is not in excess of reasonable compensation for present use."

[38]

The $2.40 per diem rate which the Commission found and declared to be not in excess of reasonable compensation was based, as to value of cars, not on cost of reproduction less depreciation but upon an "investment base which was the average of depreciated cost of reproduction and depreciated ledger value" (297 I.C.C. at p. 303).

It may be observed, also, that the per diem formula approved in *Chicago, B. & Q. R. Co. v. New York, S. & W. R. Co., supra,* was designed to give the owning road more than merely the cost of money as measured by current in-

terest rates (297 I.C.C. at 304). Southern lines here recognize "the Commission's purpose in using the reproduction cost base in determining per diem rates" as being an inducement "in the interest of an adequate car supply . . ." (Exceptions, p. 33).

The Southern lines did not show what the effect of the difference in method amounted to, in dollars, in this case. They cite some evidence to the effect that the net credits earned by the Clinchfield's hopper cars result in giving it a negative car cost with respect to the traffic here involved. Instances such as this may be found with respect to individual roads within the groups, but it is group costs which are controlling. Apparently Southern lines did not examine to see if they could duplicate that situation with respect to individual Northern railroads which are heavy per diem credit roads.

After quoting from the recommended report to the effect that the fixing of a per diem rate which is fair as between all railroads and sections of the country is a difficult problem "into which many considerations enter", and that after the rate is determined "it becomes an actual receipt or disbursement settled in dollars and cents and properly a part of the costs for each road and territory in the year incurred" (Southern Exceptions, p. 32), Southern lines state that the theory of the Examiners may have been sound before the inflation of the postwar period but that since the inflation the difference between original and reproduction cost bases produces an artificial profit when per diem credits reflecting the reproduction cost level are applied against Rail

[39]

Form A costs for the same cars calculated by use of the original cost base. It is submitted, however, that the Examiners were correct and their comment is correct now as well as in former years. It is not the manner of determining the per diem rates that is significant. It is the

fact that money was collected for the rental of cars and that the money so collected reduced to the owning roads their total outlay for the provision of a supply of cars to be used in performing their transportation services.

It should be noted that while the stated basic cause of the problem which Southern lines erect is the so-called inconsistency between the per diem base and the Form A base, one of the Southern roads principally involved in the North-South traffic does not agree that there is any inconsistency. In the Southern Exceptions, it is stated at p. 28:

> "Southern Railway System lines do not agree that there is any inconsistency between using original costs in Rail Form A and the use of actual per diem debits and credits. Furthermore, the Southern Railway maintains that, in computing the costs of car ownership, it is proper to credit the excess of per diem credits over cost of ownership to the cost of ownership of the cars involved."

While the Southern Exceptions then go on to say that Southern Railway joins in "the controlling argument" that it is improper to take territorial average car costs influenced by per diem debits and credits on hopper cars, for example, and apply such average car costs to the box car traffic at issue in the present case, it should be noted that actually Southern lines' point is dependent upon the alleged inconsistency (denied by Southern Railway) between the use of original costs in Rail Form A and the reproduction cost in the per diem formula (Exceptions, p. 32).

The case of *Louisville & Nashville R. Co. v. Southern Ry. Co.*, 319 I.C.C. 639 (1963), cited on page 33 of Southern lines' Exceptions is not applicable here. In that case, as the Commission pointed out (p.

[40]

654) the L.&N. furnished "all the coal cars used" in the movement involved, and the per diem charges paid by the

Southern for these cars was "the only actual cost of these cars to the Southern, and must be used in determination of the Southern's costs." It was then stated that the use of reproduction cost for the L.&N. would place the carriers "on an equal footing". Here, no one group or groups of carriers furnishes all of the cars used in the movement. We have here the whole complex of car costs to deal with. It is not the simple situation involved in the cited case. It is interesting that Southern lines have reservations about the sentence of the decision which they cite, for they observe on page 33 of their exceptions, "Whether or not the approach approved by Division 2 in the L.&N. case is correct where the cars that produce the net per diem debits and credits are the cars hauling the traffic at issue, . . ." Thus, Southern lines seem to be suggesting that the L.&N. decision may not have been correct in the L.&N. case but that it may be correct for application in this very different divisions case now before the Commission.

Northern and Southern lines have provided a large number of all kinds of cars that are used in transportation locally on the line of the owning railroad, intraterritorially within the South and within the North respectfully, on one or more lines of railroad, between the North and the South, and between those areas and other sections of the country. The cars are used by shippers and receivers for all of those movements. Rail Form A devises a method to account for the costs of using the cars for transportation on a unit basis. Amounts received for the use of these cars with respect to movement other than those here in issue obviously must be subtracted from the amounts that are otherwise aggregated in arriving at the unit costs per mile and per car. As a matter of principle, the procedure of Form A which require this are, therefore, correct.

It may be observed, in this connection, that in applying Form A in making its burden studies, the Cost Section of the Commission follows the formula just as Northern lines

have followed it in this case. They do not substitute national average costs (V.S. 76, p. 3).

In arguing for the substitution of nation-wide car costs, Southern lines, as previously observed, are proposing that the Commission take

[41]

the cost showing away from the lines which perform the traffic and substitute for their figures a national figure. This, of course, is contrary to what they have been urging with respect to other adjustments. They state that the per diem debits and credits are "substantially offsetting on a national basis" (p. 34, Southern Exceptions). This cannot be persuasive. The Official territory car-mile costs included in Group I for running service, interchange switching, and intertrain and intratrain switching total approximately $291 million. Using the United States car costs as computed by Southern lines' Witness Remington and as applied to the total car miles of Official territory railroads produced $250 million, an amount which is short of the total dollars expended by those lines to the extent of nearly $41 million. While only North-South traffic is involved in this case, if Southern lines' theory with respect to United States car costs were carried to its ultimate conclusion, other interterritorial traffic in which Eastern lines participate (Transcontinental and Western Trunk Line, for example), would have to be priced out on the same basis, thereby leaving Official territory intraterritorial traffic to bear not only the burden of car costs associated with the handling of that traffic but also a large part of the burden of car costs properly assignable to the interterritorial traffic. This, obviously, is improper (V.S. 76, pp. 14-15).

A computation similar to the foregoing one showing a car cost deficit of $41 million for Official Territory carriers on all traffic shows that as to the Eastern District lines United States car costs would leave almost $62 mil-

lion that Eastern District lines would have to "absorb"—an obvious impossibility—by their intraterritorial traffic. This figure represents 25 percent of the total car mile costs of the Eastern District lines. On the other hand, United States car cost applied to the Southern Region statistics in this case would add costs amounting to nearly $9 million, which were never, in fact, incurred by those lines (V.S. 76, pp. 14 and 15).

Southern lines also state that United States car costs are "separated by type of car" (Exceptions, p. 24). This alleged separation by type of car was made by Witness Remington. In the first place, it may be observed that the witness allocated the aggregate car costs among the several types of cars and, in so doing, he assumed that the average

[42]

cost for expenses, rents, and return on investment are the same per car regardless of the type of car (V.S. 76, p. 22). It is superficial in the extreme for Southern lines to say that Northern lines showed costs without separation as between type, while Southern lines separated the costs "by type of car". Secondly, the point is shown to amount to nothing in the light of Mr. Remington's admission that the differences between the several types of cars is insignificant (V.S. 40, Ex. C, p. 14).

Southern lines also contend that the Rail Form A costs for Northern lines represent to the extent of 40 percent the cost of hopper cars "including both serviceable and unserviceable hopper cars" (p. 23 of Southern Exceptions). We have already answered Southern lines' contention with respect to *utilization* of hopper cars. In addition, it should be pointed out that if the effect of a large ownership of open top hopper cars were to increase average car costs, it would be expected that Pocahontas Region car-mile costs would be substantially greater than those for the Eastern District, since, based on the 7-day study, 72 percent of Pocahontas lines' car-miles were made in open hopper cars

as against only 34 percent for Eastern District lines. Yet the car-mile car cost for Pocahontas lines developed by Rail Form A was 1.79 cents as against 3.27 cents for the Eastern District (V.S. 76, pp. 10 and 11).

In here taking the position that hopper car costs are a major factor in making Eastern District car costs higher than those in the Southern Region, Southern lines are inconsistent with the testimony given by their present cost witness on this point, in *I.&S.* No. 6177, *Crude Sulphur—Louisiana and Texas to Virginia,* wherein, at the hearing on April 2, 1954, he testified at page 435 of the transcript as follows:

> "I previously testified in the Grain Case, Docket No. 30744, that in my opinion the cost of maintaining a box car was considerably higher than the cost of maintaining an open trap [top] car."

And certainly the difference in cost (which influences the return and depreciation factors) as between the purchase of a box car and that of an open hopper or gondola is not in favor of Southern lines'

[43]

contention that average car costs deal unfairly with box cars. In 1959, for example, the average cost of general service box cars in the United States was $9,851; that of open hoppers, $8,715; and gondolas, $8,409 (V.S. 76, p. 11).

It is stated also by Southern lines on p. 23 of their Exceptions that a greater percentage of Eastern District hopper cars are over 25 years old than is true with respect to the hopper cars of the Southern Region roads. If the percentages of hopper and all freight cars given for Official Territory and Southern Region on p. 47 of V.S. 39 are applied to the cars owned as shown in Appendix A to V.S. 76 and the "old" hopper cars are subtracted from the "old" freight cars of all categories it will be found that the re-

mainder of the cars over 25 years old—that is cars of this category other than open hopper cars—are as follows:

	Cars	*Percent of Old Cars that are Non-Hopper*
Official Territory	181,784	57.96
Southern Region	54,641	69.48

If the age of freight carrying cars is an important factor in accounting for car cost differentiation within territories, Southern lines may not properly object to the use of a territorial Rail Form A cost which reflects the cost of maintaining cars involved in handling the traffic at issue which constitute approximately 69% of their cars that are over 25 years old.

Moreover, with respect to the matter of old cars in the North, it should be observed that many of these cars have been rebuilt. This is true, not only with respect to hopper cars, but applies to all freight cars and the rebuilding, at least from a cost standpoint, puts so much new material into an "old" car that it may be considered as a new car (V.S. 76, p. 10).

Southern lines' complaint that there are unserviceable hopper cars in the North also overlooks the fact that there are cars undergoing or awaiting repairs—"unserviceable" cars—of all types, not just in Official Territory but in the South as well (V.S. 4, Ex. A, p. 8).

[44]

It is stated on p. 20 of Southern lines' exceptions that the Examiners seek to minimize the importance of the difference in car costs by showing that the difference for an illustrative box car is $3.93, and comparing this with the total out-of-pocket cost of the same service in the Southern Region of about $85.00. Southern lines state that the source of the $85.00 figure is not known. The sentence may be eliminated as not important to the consideration of car costs.

Southern lines suggest that car costs are greatly influenced by types of cars owned by each group and that over 80 percent of the per diem cars used in the North-South traffic are box cars. But if national car costs are to be used because box car use is here greater than the percent of box car ownership by Official or Southern lines, the same reason would disqualify the use of the national average since national box car ownership is only 43.3 percent (V.S. 76, pp. 7-8 and App. A). Even the box car percentage in the Western District, which is the highest, does not approach the percentage of box car use here.

The fact that the same tare weights are used by the Cost Finding Section obviously does not mean, as Southern lines would have the Commission infer, that a national car cost should be used. The matters are completely different.

The allegation of Southern lines on page 35 of their Exceptions to the effect that Northern lines withheld certain information relating to box car costs was answered under our discussion of burden of proof, *supra*, at pages 23-25.

The Commission should find that the Examiners were correct in adhering to the car costs as produced by Rail Form A, that each of the objections of Southern lines with respect thereto is without merit, that the average car costs of Northern and Southern lines as determined under Rail Form A is closer to the traffic here in issue than the average car cost of all railroads in the United States as calculated in connection with the per diem rate, and that the use of the United States average costs, as suggested by Southern lines would be improper.

[45]

Reply to Exception No. 1, B-2 Concerning Empty Return Ratios.

Southern lines' criticisms of the Examiners' conclusion as to the appropriateness of suggested adjustments in box and refrigerator car empty return ratios for the two terri-

tories, clearly reveal the oversimplification indulged in by Southern lines in their "special studies" of this important element of cost. Alleged "refinements" which, as here, cannot be shown to constitute a measure of the traffic at issue, except through reliance upon the feeble foundation of half-truth and uncorroborated assumption, cannot properly be substituted for valid and comprehensive studies affirmatively shown to be applicable to the subject traffic.

Southern lines themselves display a noteworthy lack of confidence in their own proposed adjustments in box car and refrigerator car empty return ratios by arguing upon Exceptions in the alternative (1) that such adjustments are sound and should have been adopted by the Examiners and (2) that even if those adjustments weren't very reliable, Northern lines have not sustained the burden of establishing the appropriateness of the territorial empty return ratios based upon the Commission's 7-Day study. It will be seen that both of these contentions are utterly lacking in substance.

Southern lines are understandably content to gloss over the precise details of the special studies upon which they rely for the suggested adjustments of empty return ratios—notably that for box cars in Official territory—since they will not withstand careful scrutiny, as the Examiners recognized. This demonstrated tendency towards reliance upon the unproved generalizations is best typified by the frequency with which the Exceptions employ the word "solely" in claiming cause and effect. Such obvious oversimplification demonstrates an inexcusable failure to appreciate the intricacy of railroad operations and the fact that the interrelationship of a number of variables often pulling in opposite directions, precludes the determination of the effect of a

[46]

given influence. It is fair to characterize this failure as inexcusable because the Southern lines' witness who made and sought to justify the suggested "refinements" in empty

return ratios readily acknowledged that many factors contribute to empty ratios (R 1665).

The impression is conveyed upon Exceptions that the special studies made by Southern lines were simply aimed at correcting the box car empty return ratios for automobile parts traffic and the refrigerator car ratios for fresh meat traffic and that the adjustments largely reflect the elimination of such influences. Only casual reference is made to the fact that the suggested adjustment for Official territory from 39% to 30% was originally said to be premised also in part upon alleged imbalance in Official-Canadian traffic and most significantly, no mention whatsoever is made of the last stage of that adjustment (from 32.53% to 30%) which rests upon nothing more substantial than the admittedly untested assumption by Witness Cole that there is more assigned box car service in the North, on commodities other than automobile parts, than in the South because the former is said to be more industralized (R 1694-95). It will hereinafter be demonstrated in further detail that each of the suggested adjustments in territorial empty return ratios is the result of a pyramiding series of assumptions, each more drastic and unreliable than its predecessor, and all rendered the more misleading by being interwoven with facts the existence of which, in some undisclosed degree, no one has ever denied.

It is further submitted that Southern lines' argument respecting the burden of proof is effectively disposed of and, indeed, the Examiners' ultimate conclusion confirmed, by the holding of the Commission in the *Transcontinental Division* case, *supra*. Northern lines' burden of demonstrating the relative service costs which justify the relief sought herein, was fully satisfied by the presentation of cost studies which reflected, among other refinements, the territorial average empty return by car types developed in the Commission's 7-Day study. The factors used reflect the compilation of actual data on a comparable basis under

the Commission's order and, for this reason, are clearly superior to the unsubstantiated and non-comparable adjustments advocated by Southern lines.

The appropriateness and fairness of applying the Commission's empty return factors to the involved Official-Southern traffic is amply demonstrated by the evidence of record that this substantial block of traffic partakes of all of the myriad operating conditions which influence the loaded and empty movement of railroad equipment. In the *Transcontinental Divisions* case, *supra*, the Western railroads likewise disputed the applicability of territorial empty return ratios and introduced a cost adjustment based upon a partial tracing of a traffic sample.* The Commission expressly rejected such adjustments in its restatement of costs in that proceeding and adopted the empty return ratios from its 7-Day study. The Commission there concluded that "for a large and varied body of traffic as here at issue, territorial average costs will be the substantial equivalent of specific costs" (Sheet 45).

(a) Box Car Empty Return Ratios.

The Examiners have accurately summarized the several adjustments in box car empty return ratios developed by Southern lines as reflecting a decrease for Official territory from 39% as developed in the 7-Day study to 30% and a corresponding, but vastly more modest, "refinement" from 33% to 30% for Southern Region. The very fact that Southern lines undertook to reduce Northern lines' box car ratio by three times as many percentage points as their

* It is interesting to observe that the adjustment urged by Western lines in the *Transcontinental Divisions* case would have substantially reduced the Official Territory empty return ratio to 18%. If credence were to be given to each of the adjustments separately urged by Western and Southern carriers in the several interterritorial divisions proceedings, it would be necessary to conclude in defiance of the laws of mathematics, that each of the parts has a lower average ratio than the whole.

own ratio is so striking as to require a clearcut showing of justification for such obviously biased adjustments. This becomes particularly true when it

[48]

is noted that the methods employed for each were markedly dissimilar, as the Examiners properly recognized (Sheet 44). This will become more apparent upon detailed consideration of the Official territory adjustment submitted by Southern lines. It is not here proposed to discuss the box car adjustment for Southern Region (from 33% to 30%) which must fall of its own accord for lack of comparability upon demonstrating the invalidity of the adjustment made in the box car empty return ratio for the Official territory carriers.

Southern lines' great emphasis in their Exceptions upon automobile parts traffic previously noted, would leave the impression that the entire adjustment in the box car empty ratio for Official territory, from 39 to 30 percent, or in any event the greatest part of it, had been made to allow for the asserted influence of this traffic upon the costs here shown by Northern lines. In actuality, however, no such broad claim was made by Southern lines' witnesses. As Witness Cole very clearly indicated on the record, the adjustment in the box car empty return ratio for Official Territory carriers which he had developed for Southern lines, was accomplished in three independent stages. Only the first of these steps, the net effect of which was to reduce the ratio from 38.93 to 34.66 percent, purported to eliminate the claimed influence of automobile parts traffic upon empty box car miles in the North. It necessarily follows, therefore, that even if the Commission were to embrace all of the assumptions upon which the vehicle parts portion of the total adjustment is premised, the box car empty return ratio for which Southern lines contend could not be sustained. Those lines did not contend that the asserted influence justified reducing the Official Territory ratio below 34.66 per-

cent, still substantially higher than the adjusted box car ratio of 30 percent computed for Southern Region.

The second stage in Southern lines' box car adjustment for Official Territory was said by Witness Cole to account for a further reduction in the ratio from 34.66 percent, which naturally assumes the validity of the first step adjustment for auto parts, to 32.53 percent (V.S. 39, p. 32). This further decrease was sought to be justified by an alleged inbalance in the directional flow of Official-Canadian traffic to be further discussed below.

[49]

Of most striking significance is the third stage of Southern lines' adjustment of the box car empty return ratio for Official Territory from 32.53 percent to the final 30 percent figure reflected in Southern line's cost studies. Whereas the auto parts and Canadian traffic steps which produced the 32.53 percent ratio had at least some pretense of justification, the third stage adjustment is clearly a blatant "judgment" distortion. Southern lines' noteworthy silence concerning this stage upon Exceptions is readily understood in the light of the testimony by the witness who undertook to support this adjustment that he hadn't even made a calculation, let alone an investigation, of the purported basis for the adjustment (R. 1694-95). It is in part upon the strength of this unadulterated assumption, accounting for almost 30 percent of the total claimed adjustment, that the Commission is here asked to reject the results of its comprehensive 7-day study of box car empty return experience. The particular arguments respecting box cars advanced by Southern lines upon Exceptions will now be examined in further detail.

(i) Empty Return Ratios for Application to Automobile Parts Traffic.

The careless generalizations and assumptions to which reference has previously been made are rampant in Southern lines' discussion of the influence of auto parts traffic

upon box car empty return ratios in Official territory. The Examiners have very carefully considered the five categories of proof adduced by Southern lines in support of this adjustment and, after analysis, soundly concluded that while they "tend to show that these cars have an effect on the empty ratio", they "do not support any conclusion as to the amount of the effect" (Sheet 42).

This is a necessary conclusion from the series of assumptions made by Southern lines to bridge the gap between evidence isolating empty experience by car types and statistics showing the volume of commodities handled. The sequence of assumptions underlying Southern lines' adjustment whereby they sought to bridge this gap, reduced to its fundamentals, is, in effect, that (1) automobile parts move in special device box cars, (2) special device box cars are un-

[50]

suitable for return loading, (3) box cars unsuitable for return loading move in assigned service, and (4) cars in assigned service incur a 100 percent empty return movement (V.S. 39, 24-25). The auto parts portion of the adjustment falls down, however, once it is recognized that none of these assumptions is entirely true. It is Southern lines' willingness to generalize about mixed factual situations (degree of fact and fiction unknown) which is here so inconsistent with the purported purpose of producing more accurate refinements in costing out the particular traffic here in issue.

The general categories of special device and general purpose box cars here sought to be distinguished by Southern lines each include numerous distinct classes of equipment of varying physical characteristics. The general description of special device box cars was employed by Southern lines to refer to the six classes XAP, XAR, XML, XMP, XMR, and XT (R. 1690-91). Thus, while it is true that "many of these cars are fitted with special devices to pro-

tect the automobile parts in transit" as stated by Southern lines (p. 39) it is equally true that many others are not so equipped. Hence, as Witness Clark pointed out (V.S. 73) some special device cars, particularly Classes XML, XMP and XMR, need not be dedicated to particular commodities and are regularly used for a variety of miscellaneous commodities with consequent reduction in empty mileage. It naturally follows that cars falling within the category of special device box cars which are, in fact, suitable for return loading do not incur the 100 percent empty return assumed in Southern lines' cost restatement, and are actually indistinguishable from general purpose cars in this respect.

Neither may it fairly be assumed, as Southern lines have done in endeavoring to distinguish between special device and general purpose box cars, that the latter cars are *not* in assigned service and, hence, would not incur a 100 percent empty return with any degree of frequency. Witness Clark pointed out that in Official Territory, in any event, general purpose XM cars are often assigned to particular industries (R. 2383).

[51]

The degree to which empty return mileage is incurred depends, in the ultimate, upon the service in which the car moves rather than the Railway Equipment Register classification of the car as a general purpose or special device box car. It is not disputed that the tendency on the part of many shippers to request assigned cars has had an effect upon the empty mileage of carriers in all territories. But such assignments are found for both special device and general purpose box cars and there is no study of record which will enable the Commission to determine the degree to which each type of car is moving in assigned service. Certainly the extent of box car assignments and, hence, of empty return mileage, cannot be determined with any reasonable degree of accuracy from the commodity statistics as here urged by Southern lines.

A major illustration of the foregoing defect in the causal chain here sought to be forged by Southern lines is found with respect to the very commodity, vehicle parts, upon which they rely in justification of the first stage in the advocated adjustment. It is acknowledged upon Exceptions that not only does 12 percent of the Official territory automobile parts traffic not move in any type of box car, but the record is clear that, of the box car movement of this commodity, a substantial proportion moves in general purpose cars (R. 2393). Moreover, included among the other commodities regularly handled in special device box cars within the South as well as elsewhere are stoves, refrigerators, freezers, washing machines, dryers, dishwashers and numerous other commodities (R. 2355). Clearly, therefore, the claimed direct relationship between special device box car equipment and the volume of automobile parts traffic moved in the North, has not been established.

Southern lines' reliance upon the findings of the Commission in the so-called *"Border Point" Division* case, *Louisville & N. R. Co. v. Akron, C. & Y. R. Co.*, 309 I.C.C. 491 (1960), cannot properly be made the basis for here rejecting the conclusions recommended by the Examiners. As indicated by the Southern Exceptions (P. 42) that proceeding involved but about 32,000 cars as contrasted to the 967,554 cars here involved. Even more significantly, the L.&N. "border

[52]

point" traffic was largely composed of vehicle parts and electric appliances moving to or from Louisville, Ky. It is a vastly different situation to suggest the development of specific data for a dominant commodity such as vehicle parts in the *Border Point* case, and to here conclude, as urged by Southern lines, that a "large and varied body of traffic" "including virtually all commodities and all types and degrees of service and equipment be similarly adjusted.

Whatever the appropriateness of the Commission's finding as to the heavy automobile parts traffic involved in the *Border Point* case, clearly they should here be governed by their more pertinent and more recent conclusion in the *Trans-continental Divisions* case that the empty return ratios developed by the Commission's 7-Day study are a fair and valid measure of the entire body of interterritorial traffic such as here in issue, and that relative service costs should be restated accordingly.

(ii) Empty Return Ratios for General Purpose Box Cars.

The difficulty of matching separately developed data respecting car types owned and operated to statistics showing commodities transported, even for all traffic in the aggregate, has already been discussed. The additional problem, where a particular body of traffic is sought to be isolated from the total, of assigning intervening empty mileage in whole or in part to prior or subsequent loaded movements presents still another insuperable task. Manifestly, if equipment were to be exclusively dedicated to a particular body of traffic such as the Official-Southern interterritorial movement here in issue, the latter task would be vastly more possible of achievement, but that, of course, is hardly a practical solution. This difficulty becomes significant with the realization that cars, of whatever type, often incur empty mileage between two loaded moves only one of which may be here involved. The Commission early recognized the difficulty of allocating such empty mileage to particular traffic. *Rate Structure Investigation, Part 12 Nonferrous Metals,* 204 I.C.C. 319, 351. More recently, the essentially systemwide overhead character of empty cars and empty miles was reiterated in *Export Soybeans—Southwest and South to Gulf Ports,* 309 I.C.C. 455, 459.

[53]

The problem of allocating empty miles which is common, of course, to all cars, is worthy of comment at this juncture because it points up the difficulties inherent in all

necessarily arbitrary allocations of data respecting versatile and interchangeable units, including that workhorse of the railroads, the box car. Southern lines' practice of concealing significant distinctions by employing sweeping—but inaccurate—generalizations is aptly illustrated by their reference to special device box cars as being synonymous with assigned cars, and general purpose box cars as being equivalent to cars which are not in any assigned service. In actuality, while the degree of assignment, and, hence, presumably empty miles, may well prove to be greater for special device cars, nevertheless as previously demonstrated, there are a substantial number of box cars, classed as special device in the Railway Equipment Register, which are suitable for and in fact used for general loading. Correspondingly, there are a growing number of general purpose box cars which, in practice, are assigned to a particular service. Thus, where the inquiry is directed towards determining empty miles, the distinctions, whether in terms of car types owned, or tonnage handled by commodity, tend to break down and merge together.

Southern lines persist in "fighting the problem" by repeating upon Exceptions (p. 44) the arithmetic of applying an empty return ratio of 100 percent to special device box cars (or asigned box cars; it's not clear which) and 30 percent to general purpose box cars. This is precisely the same computation considered by the Examiners (Sheet 40) as to which they thereafter concluded:

> "This is merely a computation showing what the effect would be if certain assumptions are made. By itself it does not prove that those conditions actually exist." (Sheet 42)

While Southern lines' mathematical ability is here again above reproach, it is noteworthy that they do not even attempt to meet the Examiners' criticism by undertaking to show that the conditions in question do "actually exist". Instead, they resort once more to the oft-repeated argument,

apparently deemed to provide a valid excuse for their failure of proof, that Northern lines failed to sustain

[54]

the burden of proof and were at fault in refusing to supply the voluminous data sought by Southern lines to make further special studies of box car loaded and empty movements in Official Territory.

The soundness of the Examiners' rejection of the foregoing mathematical exercise as founded upon pure conjecture is confirmed by Southern lines themselves. The following statement upon Exceptions (pp. 44-45) is worthy of quotation for a number of reasons as will presently become more apparent.

> "Thus, *assuming* that the empty return ratio for each category of box cars is the *same* in each territory, the territorial average empty return ratio for all box cars is 18 per cent higher in the North (39 per cent instead of 33 per cent) *solely* because of the different and higher proportion of special box car to total box car movements in the North." (Some emphasis added.)

The 18 percent difference in the territorial empty return ratios upon which Southern lines here concentrate their firepower, represents the actual recorded difference between the two territories shown in the Commission's 7-Day study. The essence of the foregoing statement is that if things are assumed to be alike, they shouldn't be different, with which no one will disagree. It is abundantly true that if the ratios are assumed to be the same in each territory, as Southern lines suggest, one might well demand an explanation of the difference in the territorial average. But the simple fact is that the box car empty return ratios are not the same for the two territories; and all the illustrative computations in the world, even though they may be expected to be "arithmetically consistent" with Southern lines' theory underlying the adjustment in question, cannot make them the same.

It is consistency with fact, rather than with theory, which must here be controlling, and that showing, as the Examiners properly found, is noticeably lacking.

The above-quoted statement from Southern lines' Exceptions is additionally misleading and highly inconsistent in its suggestion that the assailed 18 percent difference between the territorial empty return ratios of 39 percent in the North and 33 percent in the South

[55]

exists "solely" because of the greater proportion of special device to total box car movements in the North. As indicated earlier, the cumulative three step adjustment in the ratio for Official Territory from 39 to 30 percent was based upon three independent assumptions and did not even purport to "solely" reflect any one of the assumed conditions. Thus, only a portion of the overemphasized 18 percent difference was ever claimed by Southern lines' witnesses to be justified by the "higher proportion of special box car movements in the North."

The basis for Northern lines' refusal to join in the empty return study, once again assailed upon Exceptions, is fully stated in their Brief (pp. 138-144), here requested to be incorporated by reference. It was there demonstrated in detail that Northern lines declined to furnish the data requested for the good reason that it could not be meaningful for the purpose for which it was sought. The soundness of Northern lines' conclusion not to join in the studies is confirmed by the Examiners' findings as to the inconclusiveness of Southern lines' special studies.

It is interesting to note that Southern lines' exact request contained in Appendix B to their Notice of February 15, 1960, was that Northern lines "join in furnishing data which will provide a precise separation of box car empty return ratios as between box cars available for general loading and special device cars not suitable for return loading." The statement upon Exceptions that "all that the

Northern lines were requested to contribute to the proposed study were the car initial and number, and the loaded and empty miles of each box car moving over their lines during the study period" (p. 46) makes it clear that no worthwhile data could thus have been developed. Any such tabulation would still have left unanswered the questions of: (1) the degree to which cars classified as special device box cars are suitable for and employed in handling general commodities; (2) the extent to which commodities predominantly moved in special device cars, such as automobile parts, also move in general purpose box cars; (3) the extent to which all box cars, whether general purpose or special device cars,

[56]

move in assigned service and incur 100 percent empty return mileage; and (4) the standards by which such a study could be used to develop empty return ratios "appropriate" to Official-Southern traffic.

Since it was clear that Southern lines' requested study would have disclosed no information whatsoever with respect to the commodities contained in the study box cars nor would it have provided any specific data as to empty return experience on Official-Southern traffic, the request was declined. This is the reason that Northern lines' witness explained the necessity to "consider the object when we consider whether we want to comply" (R. 2371) in the testimony quoted upon Exceptions (p. 46), and not because Northern lines had any crystal-ball indication of the result of such inquiry as Southern lines suggest.

The purport of Southern lines' Exceptions is that they should be excused for a failure of proof on their part and Northern lines should be penalized in this case because the latter declined to cooperate in a costly and time-consuming compilation of data which they knew to be useless for the purpose for which it was sought, in order to expand a study which the Examiners have now properly recognized

to be defective. The Commission will quickly recognize the substantial distinction between a request to produce *relevant* data in the possession of one party to a proceeding and the request of Southern lines on this record. The latter request would have shed no light upon Southern lines' contention that the Official Territory empty return ratio developed by the Commission's 7-day study is heavily influenced by the movement of a particular commodity, automobile parts, by allegedly imbalanced Official-Canadian traffic, and by allegedly greater industrialization in the North.

The necessary transition from empty return ratios developed by types of equipment to the application of those ratios to particular commodities or bodies of traffic has not been bridged by Southern lines' evidence on this record and would not have been accomplished had Northern lines joined in making identically deficient studies in Official Territory. In simple terms the issue here is not empty return

[57]

ratios separated between special device and other box cars, but rather the proper relative cost of handling the involved traffic. On the latter issue, the several assumptions inherent in the special studies of Southern lines produced a "generous margin of error", as the Examiners properly recognized, which would have been equally present in any corresponding application of data for Northern lines that might have been provided.

The second category of evidence presented in support of Southern lines' auto parts adjustment, fairly summarized by the Examiners at Sheet 40, partakes of the same difficulties as the requested study and Southern lines' other computations, in that the Commission is asked to translate car ownership into empty return ratios appropriate on Official-Southern traffic with no assistance other than a series of uncorroborated assumptions. Southern lines now

seek to nullify the Examiners' criticism of the ownership test as failing to reflect car miles operated in other territories, by indulging in still another assumption from their seemingly inexhaustible supply. It is now urged that the acknowledged fact that special device cars of Northern lines' ownership incur car miles in other territories "does not affect the comparison because this is offset by the fact that special device cars of Western (and Southern) ownerships run car-miles in the East." (p. 48).

The further assumption that car-miles in the several territories are equal and offsetting is entirely uncorroborated and, indeed, would seem to be effectively rebutted by the disparity in the numbers of special device cars owned, earlier pointed out by Southern lines. Neither is there any justification for the subsequent assumption by Southern lines that the ownership of special device cars "is in proportion to the service performed by the participating railroads" (p. 48). While it is undeniably true that car pools serving important plants at specified points are frequently composed of equipment contributions reflecting the line-haul participation of the contributors, it is unreasonable to make such an assumption with respect to the entire ownership of special device cars recited by Southern lines.

As a necessary part of Southern lines' contention that automobile parts traffic exerts a substantial influence upon box car empty return

[58]

experience in the North, they undertook to show, by reference to the commodity statistics, that Commodity Group 623, Vehicle Parts, represents a greater proportion of total Manufactures and Miscellaneous traffic in Official Territory than in Southern Region. This showing, reproduced by the Examiners in the Table at Sheet 41 of the Report, was appropriately recognized to provide an imperfect guide to the attempted distinction between special device box cars and general purpose cars. Thus, the Examiners soundly

concluded that the foregoing commodity comparison "does not measure the relationship of special box cars to total box cars for the reason that many box cars carried commodities other than manufactures and miscellaneous and that vehicle parts do not all move in special box cars" (Sheet 42).

The assorted utilization of box car equipment has already been discussed and is fully confirmed by Southern lines' comments upon Exceptions. Recognizing that only 88 percent of the total vehicle parts movement in the North was in any type of box car, Southern lines now suggest that it is immaterial whether the aggregate box car movement of this commodity group was in special device or general purpose box cars (p. 49). Certainly, this highly indiscriminate approach is at odds with Southern lines' earlier emphasis upon the necessity for segregating empty box car miles between special device and general purpose cars which, it might be noted, was the only thing that could conceivably have been accomplished by the extensive study in which Northern lines were requested to join.

Southern lines now seek to overcome this dilemma by arguing that it is of no consequence whether or not the box car movement of automobile parts was in special device or general purpose cars because "all the cars are assigned to the automobile parts movement and are returned empty to the parts mnaufacturing plants'" (p. 49). Analysis of this rather broad generalization reveals two familiar assumptions, neither of which is sustained by the record as previously demonstrated. First, there is no evidence that all of the box car automobile parts traffic moves in assigned cars. Secondly, to the extent that general

[59]

purpose cars are employed for this commodity, not only are such cars "suitable" for return loading but an illustrative study made by Northern lines established that the box cars carrying auto parts, even some of those classified as

special device, are in fact used for return movements (V.S. No. 73, pp. 14-15).

The further argument that traffic statistics for Manufactures and Miscellaneous afford "a convenient measure of total box car traffic, no other measure being available in the annual reports" (p. 49), hardly justifies substituting convenience for accruacy. Southern lines do not dispute the Examiners' finding that "box cars carry many commodities other than manufactures and miscellaneous" but rather urge that this defect in their evidence is "offset" by the further deficiency in the involved comparison occasioned "by the fact that many manufactures and miscellaneous commodities move in cars other than box cars" (p. 49). These contentions merely serve to confirm the Examiners' conclusion that there is no measurable correlation between commodity statistics showing the volume of Manufactures and Miscellaneous shipments and the type of rail equipment in which such commodities are in fact transported. If further support for this finding is required, it might be noted that a substantial volume of Manufactures and Miscellaneous movements including freight forwarder shipments, provide return loads for refrigerator car equipment. All of these comparisons confirm the comment by a Northern lines witness quoted upon Exceptions (footnote p. 46) that Southern lines' studies assumed "an inevitable relationship between a commodity class and type of equipment" (V.S. 73, p. 3).

Turning now to the fourth showing made by Southern lines summarized by the Examiners at Sheet 41 of their Report, it is submitted that the compared box car empty return ratios for selected Northern lines serving Detroit, Mich., likewise fail to sustain the adjustment for Official Territory here being considered. This comparison is but another illustration of Southern lines' undertaking to account for all differences in terms "solely" of the particular variable that they deem to be influential which, of course, necessarily assumes all other things to be equal. Whatever

the nature and degree of the influence of automobile parts traffic upon the empty return ratios of participating carriers

[60]

whether serving Detroit or not, which clearly has not been determined on this record, the Commission is well aware that such ratios are a composite reflection of a number of independent variable factors. Absent a showing that all other variables affecting empty return miles of the compared carrier groups are equal, it is impossible to attribute any differences between the respective ratios to the influence of automobile parts traffic, as Southern lines here urge, or to any other category of traffic. The Examiners properly recognized the presence of such other factors in concluding, as they did with respect to this showing, that "a comparison based on only three observations could easily be a coincidence or caused by some unknown factor" (Sheet 42).

The existence of such other factors influencing empty return ratios is demonstrated by the very comparison upon which Southern lines here rely. Referring to the subject Table at Sheet 41 of the Report it should be observed that for the Official lines, other than those shown as serving Detroit, vehicle parts traffic represents 4.2% of total box car traffic. These "Other Official" lines are shown as having a box car empty return ratio of 34% based upon the 7-day study. Similarly, the Southern region carriers with but 2.6% of their box car traffic represented by vehicle parts have the almost identical empty return ratio of 33%. Thus, it can be concluded from this comparison with equal appropriateness that a 60% increase in the vehicle parts proportion of total box car traffic (4.2% as compared to 2.6%) exerts virtually no influence whatsoever upon the box car empty return ratios of the compared "Other Official" and Southern Region carriers (34% v. 33%). This conclusion is equally as reasonable as that here urged by Southern lines from the same data based upon the total experience

of the Detroit carriers and serves to substantiate the Examiners' conclusions that, first, the data is too sparse for any sound conclusions and, second, there are clearly other unknown and untested factors present which likewise affect the several empty return ratios here compared.

The foregoing comments apply with equal force to the argument premised upon the empty return experience of the Detroit, Toledo & Ironton Railroad, an acknowledged volume auto parts carrier. As

[61]

may be noted from the testimony of Witness Heywood, to which Southern lines refer upon Exceptions (p. 51), Northern lines have never disputed the likelihood that auto parts traffic has some unmeasured influence upon box car empty return ratios to the extent that the traffic may move in directly assigned cars. The Examiners have expressly found that such cars "have an effect on the empty ratio, but do not support any conclusion as to the amount of the effect" (Sheet 42). The record here confirms this conclusion by demonstrating, first, the impossibility of measuring that effect with any degree of reliability and, second, the existence of other variable factors which likewise "have an effect on the empty ratio" and cannot properly be discounted on the uncorroborated assumption that all such variables are equal in the two territories. Clearly, the pyramiding assumptions indulged by Southern lines in seeking to isolate the influence of vehicle parts traffic upon territorial box car empty return ratios cannot properly be made the basis for substituting equal ratios in each territory in lieu of the more comprehensive and reliable experience reflected in the Commission's 7-day study. This is particularly true in view of the affirmative evidence of record that the large body of Official-Southern traffic here in issue runs the gamut of service in both territories and therefore encounters in equal degree all of the variables affecting box car empty return ratios.

The validity of the second step adjustment in the Official Territory box car empty return ratio, sought to be justified by Southern lines as compensating for an alleged imbalance in Official-Canadian traffic, has already been alluded to briefly in describing the three cumulative stages whereby Southern lines undertook to reduce the ratio North from 39% to 30%. It has been seen that this particular theory was made the basis for "adjusting" the Official Territory ratio by 2.13%, i.e., from 34.66% to 32.53%. The rationale of this adjustment, as explained by Southern lines Witness Cole, was "to exclude the 1,275,000 miles of empty movement that can be attributed solely to directional flow of this Canadian traffic" (V.S. 39, p. 32). Here again all other variable influences were arbitrarily rejected on the theory that differences, if any, are "solely" attributable to the selected variable, not-

[62]

withstanding the witnesses' recognition of the existence of such other factors (R. 1665). Witness Cole further acknowledged that he would expect a box car empty return ratio of about 25% on all traffic, including Official-Canadian, as a consequence of other factors, irrespective of directional flow or imbalance between loaded and empty cars (R. 1664-65). This would confirm the obvious fact that directional flow, like other variable influences sought to be isolated by Southern lines, cannot be separately assessed but rather must be treated as an integral part of the sum total of the several variable factors affecting empty mileage.

Thus, clearly, while the hypothetical 19% empty return ratio computed by the examiners for Official-Canadian traffic (Sheet 43) theoretically could occur, it is most improper to add that ratio to the territorial average ratio for general purpose box cars, which is apparently what Southern lines now suggest (pp. 53-54). Furthermore, even if it could be determined with any degree of reliability that the factor of directional imbalance "solely" produces

a 19% empty return ratio on Official-Canadian traffic it would be manifestly improper to adjust the territorial ratio for Northern lines to reflect this assumed influence without at the same time independently appraising the separate effect of each of the other variables upon this traffic to determine whether the result is cumulative, as suggested by Southern lines, or offsetting as the Examiners undoubtedly concluded in finding that "the figures given as to the unbalance in traffic flow do not appear to indicate that Canadian traffic has a greater empty return ratio than other traffic" (Sheet 43).

It should again be emphasized in concluding the discussion of box car empty return ratios that Southern lines' Exceptions completely fail to reflect the totality of the arguments previously advanced in justification of the proposed adjustment in the Official Territory box car empty return ratio from 39 percent to 30 percent, whereas they discuss at some length the asserted impact upon this ratio of auto parts traffic and imbalance in Canadian traffic, the entire adjustment was a *three*-step computation, as previously noted. It follows that even if the Commission were to accept Southern lines' contentions respecting

[63]

the influence of auto parts and Canadian traffic upon the box car empty return ratio for Official territory, and were further to assume the validity of Southern lines' efforts to measure such influences, these two steps would justify an adjustment only to 32.53 percent rather than to the 30 percent figure which Southern lines substituted in their cost presentation. The deficiencies in the first two steps have already been fully disclosed. The fact that Southern lines elected to entirely ignore the third step in this adjustment upon Exceptions should itself be convincing proof of the invalidity of this computation. As previously indicated, the final step adjustment from 32.53 percent to 30 percent designed to make the ratio North conform to that

in the South, as adjusted, was based upon the admittedly uncorroborated and, indeed, untested assumption by Southern lines' Witness Cole that there are more box cars in Official territory in assigned service, other than for the movement of auto parts, than in the South because the former is more industrialized. Even if the assumption were a valid one, the record fails to disclose the method whereby Southern lines assessed the degree of this purported influence at precisely 2.53 percent.

The foregoing discussion of box car empty return ratios fully demonstrates the inadequacy of Southern lines' evidence on this subject and the shocking extent to which their contentions rest upon both unwarranted generalizations of fact and a series of untested assumptions, each of which ignores the existence of other variable factors influencing empty return. The Commission should properly find, therefore, as did the Examiners, that the Commission's 7-day study provides the most accurate and reliable measure of empty return ratios on box cars for the respective territories.

(b) Refrigerator Car Empty Return Ratios.

The rationale of Southern lines' adjustment in empty return ratios for refrigerator cars in the two territories is similar in substantial part to that previously discussed for box cars. Thus, whereas the allegedly influential commodity affecting box car ratios was said to

[64]

be auto parts, a similar role is claimed for fresh meats in the refrigerator car adjustment. The stated purpose of the adjustment as explained by Witness Cole was:

> "to apply separately the empty return ratios of 100% for such special movements as fresh meats [215] and bananas originating at New Orleans on the Illinois Central, and to develop an appropriate empty return ratio for the general movement of refrigerator car

traffic which are not influenced in different degrees in the respective territories by the empty return ratios for specialized commodities." (V.S. 39, p. 35)

In lieu of the empty return ratios of 90 percent for Eastern District and 86 percent for Pocahontas Region, Southern lines substituted a 75 percent ratio for Official territory based upon a fragmentary study of Fruit Growers Express Company cars to be further discussed below. At the same time that the refrigerator car ratio for Northern lines was *reduced*, Southern lines *increased* their own ratio from 76 to 84 percent. The ratios first recited above were developed by the Commission's 7-day study. This study is now said to be unreliable for failure to reflect the "highly seasonal characteristics of the traffic moving in refrigerator cars" (p. 54). But, as the Commission is well aware, the separate 7-day studies are customarily spaced at intervals throughout the calendar year in order to reflect the very seasonal characteristics to which Southern lines refer. The fact that both in-season and out-of-season experience was included in the 7-day refrigerator car study is shown by the range in results for individual days from 96 to 66 percent in Southern Region as shown in the Report at Sheet 43. Clearly, if seasonality affects the ratios, the foregoing wide range demonstrates that this has been duly reflected in the 7-day refrigerator car study.

It is interesting to note that Southern lines now urge upon Exceptions that the Examiners should have rejected the Commissioner's 7-day study in favor of the 87 percent and the 84 percent ratios, North and South, reported by the A.A.R. on Form CS-57-A. But, as the Examiners correctly state (Sheet 44) the Southern lines them-

[65]

selves were "unwilling to accept the empty return ratios for refrigerator cars in Official territory developed in either the 7-day study or the CS-57-A reports". Rather they

urged for Official Territory a reduced refrigerator car empty return ratio of 75 percent based upon reported experience for FGE cars. The impropriety of this "refinement" is readily discerned from the facts, duly noted by the Examiners, that Fruit Growers Express handles only 43.3 percent of the North-South refrigerator car traffic and that no corresponding data was developed for the companies handling the remaining 56.7 percent of the traffic.

Moreover, the recited FGE experience did not provide the refrigerator car ratio between loaded and empty miles for carriers in the two territories here involved but rather reflected all miles and all traffic moving in FGE cars. Included, therefore, in the miles shown for the Official Territory carriers are those incurred by FGE refrigerator cars moving between Official Territory and the West and Southwest. It logically follows that, whereas the study might be of assistance in determining a refrigerator car empty ratio for all cars of FGE ownership, such a ratio would be of no assistance in resolving the issues in this proceeding. The study made by Southern lines of Fruit Growers Express Company cars provides neither a refrigerated car ratio for all Official Territory traffic nor an accurate indication of such miles North and South, on the involved Official-Southern traffic. Clearly, therefore, the FGE study fell far short of its stated objective of providing "a closer representation of the empty to loaded ratio for refrigerator cars in the North on North-South traffic than a system average refrigerator car empty ratio based on the Commission's 7-day study" (V.S. 39, p. 38).

Again, as invariably true of most of the cost adjustments here urged by Southern lines, that developed for refrigerator car empty return ratios does not rest upon comparable data and methods for each territory. Unlike the study underlying the Official Territory adjustment, that providing the asserted basis for increasing the Southern Region ratio from 76 to 84 percent was not confined to FGE equipment,

[66]

but included loaded and empty miles made on Southern lines by refrigerator car equipment of all other ownerships. The source of the data in this instance was a questionnaire survey of Southern carriers. However, in this case, too, the empty and loaded miles reported represented the aggregate for all traffic and do not purport to reflect the particular characteristics of Official-Southern traffic.

Southern lines' Exceptions do not dispute the accuracy of the Examiners' statement that the refrigerator car adjustments are "not on a comparable basis in both territories" (Sheet 44). Compelled to acknowledge the demonstrated lack of comparability, they again seek to excuse the deficiency in the evidence relied upon to sustain their adjustments by assailing Northern lines' refusal to develop data respecting the movement of refrigerator cars of other than FGE ownership within Official territory. In view of the lack of specificity in the data secured, however, it is clear that, even had the requested information been provided, it would have shown only the aggregate experience of all refrigerator cars for all traffic, and would be thus duplicative of the Commission's 7-Day study. Clearly, neither Southern lines' special studies nor the data requested of Northern lines have any demonstrated relationship to Official-Southern traffic, notwithstanding the purported effort of Southern lines to develop the specific costs of providing service on the involved traffic.

The Commission should find:

1. That Southern lines' three-stage adjustment of the box car empty return ratio for Official Territory relies upon unproved assumptions and fails to reliably measure the several variable influences sought to be isolated; that the further failure to make comparable adjustments in the ratios for both territories distorts the relative cost showing urged by Southern lines; that the burden of justifying the proposed empty return

adjustments rests upon proponent Southern lines and is not excused by Northern lines' failure to make similar invalid special studies upon request; that

[67]

Southern lines' arbitrarily equalizing adjustments in the territorial box car empty return ratios from 39% North and 33% South to 30% for both territories cannot be sustained; and that the box car empty return ratios developed by the Commission's 7-day study constitute valid and reliable estimates for use in developing relative costs in this proceeding.

2. That Southern lines' adjustments in territorial refrigerator car empty return ratios, which seek to reduce the ratio North while concurrently increasing that for Southern Region, do not rest upon a comparable basis since that for Official Territory was confined to the experience of but one car company, Fruit Growers' Express; that such adjustments for both territories reflect all traffic rather than the specific Official-Southern traffic they purport to measure; and that, as in the case of the box car ratios, Southern lines have failed to sustain the burden of justifying the substitution of the revised ratios for the more reliable estimate of refrigerator car empty return experience provided by the Commission's 7-day study.

[68]

Reply to Exception No. 1, B-3 Relating to Switching Costs.

(a) The Examiners' Rejection of Southern Lines' Adjustment of Their Switching Minutes Was Proper.

In order that Southern lines' exceptions with respect to switching costs may be placed in their proper perspective, it should be re-emphasized that Northern lines have consistently urged the fairness of territorial Form A costs as a measure of the relative burdens experienced in handling

the involved Official-Southern traffic. In this they are supported by the Commission's reliance upon Form A group cost comparisons in No. 28300, *Class Rate Investigation, 1939*, 262 I.C.C. 447, 693, where, as here, there was involved the question of "relative costs for transporting all traffic, or important and well-defined segments of traffic, by territorial groups of carriers."

The propriety of a similar conclusion here is also confirmed by the Commission's recent conclusion in the *Transcontinental Divisions* Case, No. 31503 et al. (decided March 21, 1963), where at Sheet 45 of its mimeographed report the Commission, referring to a comparison of adjusted and "straight Rail Form A" costs, stated:

> "One substantiates the other, and supports the view that, for a large and varied body of traffic as here at issue, territorial average costs will be the substantial equivalent of specific costs."

Reliance upon such unadjusted territorial Form A costs effectively guarantees the comparability in method and result essential to the development of relative costs which the Examiners properly found to be lacking in the adjustments of switching costs advocated by Southern lines. But when, under the guise of seeking more refined costs, the proponent thereof departs from territorial Form A results by making adjustments relating to particular items of cost, the consequence may well be to distort the basic balance and comparability of the remaining items.

[69]

Southern lines, apparently to give their radical upward adjustment of their own territorial switching costs an aura of assumed comparability, made a token upward adjustment of Northern lines' switching costs related to the so-called "Pocahontas adjustment" employed by the Commission's Cost Section in its so-called "burden studies". Having failed to support the propriety of their adjustment of their

own switching costs, they now criticize the Examiners' report for not having also disallowed their own slight upward adjustment of the northern switching costs.

But Southern lines are in no position to urge such a change in the Examiners' restated costs, on the ground of comparability, since the whole effect of their own various adjustments is to *destroy* the basic comparability of the territorial Form A costs.

If, in a case having the broad territorial scope of the instant one, the Commission is to countenance, or rely upon, *any* detailed adjustments of territorial Form A costs—whether relating to switching minutes or other items—the Examiners' retention of the Pocahontas adjustment for Northern lines would appear to be justified. But the Commission would be on sounder ground to find here, as it did in No. 28300, *Class Rate Investigation, 1939,* 262 I.C.C. 447, 693, that Form A studies of territorial costs "possess sufficent attributes of accuracy to enable us to rely upon them in reaching our conclusions". This is particularly so in view of action of the Supreme Court in sustaining its order therein (*New York v. United States,* 331 U.S. 284), and its own subsequent conclusion in No. 31503, the *Transcontinental Divisions* Case, (March 21, 1963), wherein such detailed costing of Transcontinental traffic as could be justified was found to yield ultimate group cost relationships substantially identical to those produced by the territorial Form A costs.

Inasmuch as it is Southern lines that have disputed the appropriateness of such territorial Form A cost comparisons and urged the substitution of the adjusted switching costs here considered, clearly the burden of demonstrating the soundness and validity of

[70]

the adjustment rests squarely upon them. But as will appear from the following analysis their adjustment of their switching costs, viewed from any angle, is completely indefensible.

The Examiners properly found that because of "weaknesses" in the studies and the "major defect" of lack of comparability, Southern lines had failed to sustain this burden (Sheet 52). The claimed rationale of Southern lines' adjustments was accurately summarized by the Examiners in the headnote to the discussion of this subject as follows (Sheet 47):

"Adjustment of switching costs to eliminate the effect of volume switching at origin and destination." Thus, it was contended that the adjustment was required because so-called "volume commodities" not here involved exert a depressive effect upon the per car switching services of Southern lines. But even assuming this to be true, obviously it could have no effect upon the *relative* costs of the two adversary railroad groups unless it also could be established that the same depressive effect from the volume switching of non-involved traffic was not likewise generally reflected in the switching costs of Northern lines. This is a burden which Southern lines failed to meet. Indeed, the affirmative evidence of record fully sustains the Examiners' finding that "The depressing effect, if any, of volume switching commodities on the average would affect both territories and, for purposes of comparison, be largely offsetting" (Sheet 52). Although for ease of comprehension, Northern lines propose to reply in further detail to each of the asserted "four separate features of the switching cost problem" to which Southern lines refer (p. 62) it must already be abundantly clear from the foregoing that there is no confusion whatsoever in the Examiners' discussion of the switching adjustments here again urged upon Exception. The alleged "four separate features" are mutually interdependent and related, while the "switching cost problem" is one of Southern lines' own creation, occasioned by their espousal of unreliable and uncomparable adjustments undertaken in a futile effort to "adjust" to their own advantage the territorial average characteristics of the "large and varied body of traffic" which the Examiners recognized is here involved (Sheet 52).

[71]

(b) Discussion of Individual Adjustments.

i. The Effect of Volume Commodities on Southern Region Average Switching Costs.

As previously indicated, consideration of the "effect of volume commodities" (more appropriately characterized as volume-switched commodities or multiple-car movements) on the average switching costs for Southern Region is a meaningless exercise in futility absent a showing by Southern lines *both* that (1) such commodities *and all others* moving elsewhere than to or from Official Territory require significantly less than territorial average switching service on Southern lines and (2) the average switching costs of Northern lines are *not* similarly depressed by non-involved traffic. The only logical comparison then, and again necessarily on a comparable basis, for each territory, must be between Official-Southern traffic service units, on the one hand, and the switching service rendered on all other traffic, so-called volume commodities included, on the other. Southern lines have not undertaken such comparisons. Rather they have confined their inquiry into the service characteristics of non Official-Southern traffic to a few commodities, such as pulpwood and phosphate rock, said to move within Southern Territory in multiple car volume.

Moreover, even assuming the claimed depressive influence upon the switching minutes per car on Southern lines as a consequence of handling such volume commodities, there is no evidence to demonstrate that non-involved single car traffic does not exert a contrary and offsetting effect upon the Rail Form A territorial average switching cost for Southern Region. If, as Southern lines reiterate at pages 60 and 81 of their Exceptions, the subject Official-Southern traffic represents only 8.93 percent of cars originated and terminated by Southern Region carriers, while volume commodities (said to be virtually all other than Official-Southern) constitute 45.86 percent of the total, then

by a simple process of elimination there remains 45.21 percent of Southern lines traffic which allegedly is neither Official-Southern nor volume commodities. Clearly, the influence of this 45 percent of non-involved

[72]

traffic upon the territorial average switching cost in the South is just as great as that claimed for the 45 percent said to be volume commodities, but the nature of that influence is in no way disclosed by Southern lines' several studies of this element of cost.

The foregoing analysis is obviously oversimplified, but it serves to demonstrate that even if Southern lines' evidence respecting the effect of "volume commodities" on switching costs in the South is viewed most charitably, it falls far short of refuting the Examiners' very sound conclusion that Southern lines failed to sustain the burden of providing a "better measure of relative switching costs on each side of the border" than the territorial average switching costs developed by Rail Form A. The oversimplification rests, obviously, in the unsupported assumption that every carload of the so-called volume commodities, such as pulpwood and phosphate rock, included in the indicated 45.86 percent of Southern lines' total traffic in fact receives only multiple car handling and is never required to be switched in single car service in the South. This, of course, even Southern lines do not suggest.

Inasmuch as the depressive effect claimed by Southern lines for volume commodities admittedly should vary directly with volume or number of cars of such commodities handled in a single switching operation (R. 1849), it is significant to note that Southern lines failed to develop any real facts concerning the average number of cars in volume movement. Certainly, while a block of two cars would fit within the multiple-car definition, no great economies over single-car handling can be expected. A showing of isolated

examples of movements of larger blocks of 20, 50 or even 80 cars do not alter the fact that on pulpwood, the volume commodity most emphasized by Southern lines, the typical multiple car block, when this commodity moves in this fashion, would appear to be no more than 4-8 cars (V.S. 72, pp. 23-24, 27, 40). Obviously a wide variety of commodities moves in small blocks of this number in all territories.

In an early landmark case involving multiple car rates, *Molasses From New Orleans, La. to Peoria and Pekin, Ill.*, 235 I.C.C. 485, the

[73]

minimum weight was equivalent to 38½ tank car loads. In *Eastern Coal to Chicago*, 306 I.C.C. 195, the multiple car rates there approved applied to average shipments of approximately 30 cars. On rock salt, rates applying on multiple car movements of at least 7 and 10 cars were approved in *Rock Salt—N.Y. to Del., Md., N.J. N.Y. and Pa.*, 313 I.C.C. 197. A multiple car rate on paper from a Southern Region origin to an Official Territory destination on shipments of at least 11 cars was likewise approved in *Paper From St. Francisville, La. to Chicago, Ill.*, 306 I.C.C. 703, demonstrating that Southern intraterritorial pulpwood and phosphate rock is not the only traffic handled in this manner.

Operating witnesses for Southern lines merely recited a self-evident axiom of railroad operations in pointing out that "a lesser amount of service per car is required to handle volume commodities than to handle non-volume commodities on a single car basis (V.S. 28, p. 24). The distinction sought to be made more precisely lies, however, not in the characteristics of the commodity but in the nature of the switching service, i.e., multiple car vs. single car handling. Pulpwood and phosphate rock were singled out as commodities which tend, on the average, to receive multiple car service in the South more than other commodities. But clearly the term "volume commodity" when applied to

pulpwood or phosphate rock—or to any other commodity—is misleading if construed to give the impression, as Southern lines do upon Exceptions, that the amount of multiple car handling in either territory can be determined simply by adding up the shipments of selected commodities.

It is true, as stated upon Exceptions that Southern lines' operating witnesses identified commodities said to be "regularly switched in multiple-car blocks in the South" (p. 63). Undeniably, there may be more multiple car handling of pulpwood and phosphate rock than most other commodities. But Northern lines' witnesses similarly identified corresponding commodities and the Examiners properly enumerated a number of commodities in both territories, notably coal and iron ore in the North, some of which they said "frequently move in multiple-car blocks at origin and/or destination with a con-

[74]

sequently lower switching cost than for commodities usually handled one car at a time" (Sheet 47).

But not only are the variations in the volume of shipments of all commodities of consequence but, in addition, obviously there are a number of other factors which exert a comparable influence upon switching costs. The Examiners recited some of these variables in the statement at Sheet 36 quoted upon exceptions by Southern lines (p. 63). The Examiners there referred to "the physical layout of the tracks, volume handled, and other causes" as accounting for the "great variation from one point to another" in switching service. The significance of this statement lies in the Examiners' recognition of the switching variations existing *within* each territory, all of which are entirely unaffected by the identification of the car switched as Official-Southern or other traffic. For example, where the physical layout of the tracks is such as to require greater-than-average switching service, that influence will be felt on all

cars, whether Official-Southern or intraterritorial, multiple or single car. The important consideration is that a body of traffic as "large and varied" as that here in issue runs the gamut of all variations in switching service, of whatever cause or effect, encountered by each group of carriers and is, hence, properly measured by territorial average switching costs.

The table entitled "Switching Studies on Intra-South Volume Commodities" reproduced at Page 64 of Southern lines' Exceptions itself demonstrates the influence upon switching services of operating variations other than volume or multiple-car handling. Ignoring for the moment the manner in which the thirteen volume commodity study points were selected, it should be noted that the switching minutes per car shown in the table range from a low of 2.75 minutes for wet phosphate rock at Achan, Fla. to a high of 13.03 minutes for pulpwood at Georgetown, S.C. This range of 10.28 minutes per car, which is significantly greater than the adjustments of 8.23 minutes for box cars and 6.23 minutes for other cars, said by Southern lines to offset the effect of volume switching, typifies the wide variations in switching

[75]

service attributable to factors other than volume or multiple car handling since by definition and selection all are volume switching points. Clearly there is no more justification for Southern lines' generalizations regarding switching service on so-called volume commodities than exists for the inverse generalization that Official-Southern traffic requires greater than average switching service in the South.

Illustrative of the latter fact is the comparison by the Examiners of the switching minutes shown by Southern lines for the only two points for which they presented both a volume commodity switching study and a study of such service on an Official-Southern "sample" car. At both of

these points, as Southern lines themselves note upon exceptions (pp. 64-65) the inbound commodity was pulpwood and the outbound load was paper. At Georgetown, S.C., the car of paper is shown as requiring 4.43 minutes more than that of pulpwood inbound, but at Panama City, Fla., the difference is barely measurable, 11.72 vs. 11.55 minutes, or a difference of 0.17 minutes per car. While obviously no valid conclusions can be drawn from this fragmentary data, certainly these comparisons, which are the only ones of record which permit the Commission to test the soundness of Southern lines' switching theory, utterly fail to sustain the claimed asserted broad assumption that volume switching exerts a significant depressive influence upon territorial average costs. Moreover, even conceding the probability of a tendency in this direction, clearly the major adjustments made by Southern lines, amounting to 8.23 and 6.23 minutes per car for box cars and other cars, respectively, are not suported by the negligible differences shown for switching at the two points common to their separate volume and Official-Southern switching studies. It necessarily follows that, contrary to the assertion of Southern lines upon Exceptions (p. 65), the criticism by the Examiners, based upon these two common points, of the volume commodity argument is not only "rational" but, indeed, compelling.

Equally valid, and of even greater significance, is the Examiners' recognition that the thirteen points in the volume commodity study reproduced at Page 64 of Southern lines' Exceptions were "hand picked." Although Southern lines dispute this charge it is note-

[76]

worthy that there is no suggestion that even the pretense of a sampling process was employed in the selection of these thirteen study points. To the contrary, Witness Seigler,

who made the switching studies at these points, freely conceded that known heavy volume points were expressly selected—"hand picked" as he stated—with a view toward illustrating the effect of multiple-car handling upon switching service (R. 1853-54). Under the circumstances it was to have been expected as this witness recognized, that the 13 carefully selected study points would develop lower than average switching minutes (R. 1855). Certainly, even a more comprehensive and accurate study of intentionally selected points could hardly be made the basis for the general conclusion applicable to all traffic which Southern lines here urge upon the Commission.

The further argument that the Examiners erred in failing to consider more recent switching studies on pulpwood introduced in Docket 30958, *Reduced Rates on Pulpwood in Southern Territory,* entirely overlooks the fact that it is of no real consequence to the disposition of the issues in this proceeding to determine in absolute terms the average time required to switch pulpwood cars in the South. Even if this commodity in fact requires less-than-average switching service, there are innumerable other commodities which, of necessity, must entail offsetting greater than average service. The latter higher-than-average commodities also move other than interterritorially to and from Official Territory. Assuming that accurate switching minutes could be developed for each and every commodity, "it is requisite that any special studies be made on a comparable basis in each territory" (*Transcontinental Divisions* case, *supra,* sheet 27). Moreover, inasmuch as traffic in each territory runs the gamut of all service variables, of which multiple-car switching is but one, the end result must inevitably confirm the validity of applying territorial average switching costs to the involved Official-Southern traffic.

It must be reiterated that Southern lines' volume commodity switching studies were offered only to justify undertaking special studies of

[77]

switching service in the South rendered on the interterritorial traffic here in issue. The several adjustments of Rail Form A switching costs here urged by Southern lines do not rest upon the foregoing inconclusive evidence respecting multiple-car handling of selected volume switched commodities, but rather upon the Seigler switching studies in the South and the clearly distinguishable Remington adjustment of Northern lines' costs to be discussed hereinafter.

ii. The Switching Services Per Car Performed by the Southern Lines in Originating and Terminating Official-Southern Traffic.

The adjustment in the switching costs for Southern lines here again urged upon Exceptions is premised entirely upon a 41-car switching study conducted under the supervision of Witness Seigler (V.S. 42). The method employed to adjust such switching costs in the South is in marked contradistinction to that used by Southern lines' Witness Remington in computing the suggested adjustment of switching costs in the North. Turning first to the Seigler switching studies underlying the adjustment in Southern lines' costs, the record abundantly confirms the Examiners' general conclusion that such studies are unreliable on two counts, selection of the sample and execution of the studies.

The essence of Southern lines' Exceptions on this score appears to be a plaintive plea that the Examiners failed to provide the guidance of a detailed blueprint for the development of switching studies which would not possess the defects disclosed on the present record. Obviously, no such burden can fairly be imposed upon either the Examiners or this Commission. The Examiners' function and responsibility was to impartially and intelligently appraise and evaluate the evidence presented by the parties. The comprehensive discussion of this subject in the Report provides ample evidence that they have discharged that responsibility in this case. The Examiners' references to "cities, com-

modities, directional flow and proportion of yard and train switching" cannot properly be construed as a requirement that cars be arbitrarily added to an already inadequate and defective sample. Rather, the

[78]

Examiners have demonstrated by these several yardsticks of representativeness that Southern lines' 41-car switching sample reflects characteristics so inconsistent with the much larger 967,554-car estimate of total Official-Southern traffic as to preclude according any probative value to the former.

Southern lines here seek to cast both Northern lines and the Examiners in the role of unenlightened opponents of scientific sampling. Nothing could be further from the truth. The rejection of the 41-car switching sample which Southern lines claim to be representative of the switching services provided in that territory on 967,554 cars of Official-Southern traffic is far from a reversion to the Dark Ages preceding the development of modern sampling techniques. To the contrary, it rests upon the facts that the switching sample was improperly selected and far too inadequate for the purposes for which it was sought to be used, as demonstrated, among other things, by the marked variations from the more valid and more comprehensive sampling techniques used by the lines in both territories to develop the volume and nature of the involved traffic. Furthermore, the inadequacy of the sample is not to be justified by the effort involved in making switching studies, bemoaned by Southern lines upon Exceptions (pp. 73-74).

Significantly, Southern lines do not dispute the accuracy of the Examiners' description of the method whereby the 41-car sample was selected (Sheet 48). As there stated the switching study sample represents the culmination of a diminishing series of samples and sub-samples. The first step was the selection of a "preliminary sample" of 497 cars from the traffic study. It is noteworthy, as the Examiners pointed out, that this "prelim-

inary sample'' was selected in eight batches and not in ten subsamples as claimed. In the remaining steps, the 497-car sample was further reduced, first, to 83 cars, and ultimately to the 41 cars actually selected for study. Southern lines now place great emphasis upon the fact that the foregoing procedure was conducted under the supervision of Dr. Deming, an acknowledged expert in sampling. It should be highly persuasive, therefore, that this sampling expert made none of the grandiose claims respecting the sanctity of the switching sample advanced by less knowledgeable wit-

[79]

nesses for Southern lines and again by those carriers upon Exceptions. Thus, whereas Witness Seigler, who made the switching studies, loosely described the study cars as ''average'' and the sample as ''representative,'' Dr. Deming, on cross-examination, expressly declined to so characterize the sample and would do no more than simply state that the standard error of the sample can be interpreted for certain purposes (R. 1580).

The concept of standard error as it relates to the reliability of a sample is one that is often misconstrued. Southern lines now dwell at some length upon the standard error computed* for the 41-car switching sample, obviously in an effort to lend to that sample an aura of scientific accuracy that the sample does not in fact possess. Again, both of the sampling experts, Drs. Deming and Van Voorhis, were much more precise on this subject. Each of these witnesses, in the very testimony quoted by Southern lines at pages 72 and 73 of their Exceptions, pointed out in unequivocal terms that standard error is a computation obtained from the sample itself. Hence, the computation of its standard error cannot improve or cure a defective sample.

---

* It might be observed that in view of the emphasis on the role of Dr. Deming in the sampling process, this computation was in fact made by Mr. Seigler.

In simple terms, the standard error formula measures the variations between each of the individual subsamples and the total estimate derived from such subsamples.

Moreover, even if the standard error here computed by Witness Seigler were to be taken at face value as urged by Southern lines upon Exceptions, it indicates that the average switching time in the South could very well be 19.4 minutes, which is considerably closer to the 19.8 minutes shown by the Examiners after other adjustments (Sheet 47) than it is to the 26.03 minutes used by Southern lines as a basis for adjusting the average switching costs in that territory.

At page 73 of their exceptions the Southern lines state:

> "The reliability of the sample result in measuring the average of the whole body of traffic is measured by mathematical principles

[80]

> in terms of the 'standard error,' as Dr. Deming testified . . ."

Dr. Van Voorhis similarly testified (V.S. 2, pp. 5 and 8):

> "The reliability of an estimate made from a sample is measured by its standard error and is obtained from the sample itself from the laws of probability."

> "The standard error of an estimate makes it possible to make statements in the language of probability about the reliability of an estimate obtained."

Standard error does not measure the usefulness of the estimate.

The standard error of 2.2 switching minutes per car does not measure the validity of the estimated 26.03 switching minutes per car for costing purposes.

Dr. Deming has written:*

> "Limitations of the standard error. *The standard error of a result does not measure the usefulness thereof.* The standard error, however helpful in the use of data from samples, *only gives us a measure of the variations between repeated samples.*" (Emphasis supplied.)

This means that if many more 41-car samples are drawn from the frame used, and using the same sampling plan, 99 percent of the estimates from these 41-car samples will fall between the estimate of 26.03 switching minutes per car plus and minus 3 times the 2.2 standard error (between 19.43 and 32.63 switching minutes per car). One percent of the estimates will exceed or be below these limits.

It is the use that will be made of the estimate that determines what standard error is acceptable. And based on the use made of the estimate by the Southern lines, it must be concluded, as did the Examiners, that the 41-car switching sample is useless. In fact, results of all the 41-car samples that could be drawn, using the same frame and sampling plan, would be useless as a factor to develop switching costs.

[81]

Southern lines' 41-car switching sample is not acceptable using Southern lines' own acceptance criterion.

Below we show a comparison between the estimates produced and the standard errors for many of the pertinent characteristics of the North-South traffic as developed from the Southern lines' traffic sample:

Source: V.S. 40, Exhibit A, pages 1-3, Exhibit B, page 3.

[82]

To establish what the Southern lines considered to be acceptable precision with regard to the estimates for the important statistics, one need look only at column 3 above. For the relevant factors listed above, the percent that the standard error is of the estimate is less than one percent in every

instance. Out of the 24 estimates listed, the percent standard error is of the estimate is below one-half of one percent in 20 of the items.

The standard error produced by the 41-car switching sample was 2.2 minutes per car. The estimate of switching minutes per car was 26.03. The standard error is *8.45 percent of the estimate.* As can be seen, this percent, for this extremely important element, falls far short of the standard of precision generally accepted by the Southern lines.

In Appendix A hereto there are set forth the computations of standard error for cars, for constant cost per car, and for total origin or destination switching costs in the South. As indicated by the tabulations in said Appendix, the Southern lines used the 26.03 switching minutes per car as a constant. Also the standard error of a constant is zero. Therefore, the only acceptable standard error, based on the use made of the estimated 26.03 minutes per car and mathematical principles dealing with the standard error of a constant, is one which has a value of zero or a value so close to zero that it can be assumed to be zero. But, the standard error of switching minutes per car based on Southern lines' sampling procedures is 2.2. It is clear that the standard error is too large for the use made of the estimate, and the only method of reducing the 2.2 standard error is by increasing the sample size.

Southern lines ignored completely the variance in the switching sample in producing cost per car and origin and destination costs.

Southern lines produced $12.824 switching cost per car by multiplying the estimated 26.03 switching minutes per car by $.49266 switching cost per minute. The variance of the estimated 26.03 minutes per car was completely ignored in computing the switching cost per car. Actually this cost, even though treated as a constant by the Southern lines, would also vary.

[83]

The standard error of this cost per car would be the standard error of the switching minutes per car (2.2) times the constant cost per minute ($.49266), producing $1.084. The 3-standard error band is $12.824 plus and minus 3 times the standard error of $1.084, or $9.572 to $16.076.

Ignoring the foregoing error range, based on mathematical principles, also affects the total origin and destination costs reflected in Southern lines' cost study. Thus, using the extreme 3-standard error values of Southern lines' estimated cars and switching minutes per car one can make the following comparisons:

99 Percent Probability Range of Costs
As Used by Southern Lines

	Switch. Min/Car	Cost/ Car*	Cars	Total Origin and Destination Cost
Upper limit	26.03	$12.824	973,089	$12,478,893
Lower limit	26.03	$12.824	962,019	$12,336,932

99 Percent Probability Range of Costs
As Ignored by Southern Lines

	Switch. Min/Car	Cost/ Car**	Cars	Total Origin and Destination Cost
Upper limit	32.63	$16.076	973,089	$15,643,379
Lower limit	19.43	$ 9.572	962,019	$ 9,208,446

As shown above, the variance of total origin and destination costs was reduced merely by ignoring the variance in switching minutes per car; merely by using 26.03 switching minutes per car as a constant factor, when, in fact, it is an estimate of a random variable with a standard error of 2.2 minutes per car. Therefore, the variance of switching minutes per car is not reflected in the Southern lines' cost application and all standard error of cost totals which include the effect of the 26.03 estimate as a factor, are incorrectly computed.

* Developed by applying cost per minute $.49266 to 26.03 minutes per car.

** Developed by applying cost per minute $.49266 to 32.63 and 19.43 minutes per car.

[84]

The unacceptability of the 2.2 standard error as validating Southern lines' adjustment of their switching costs is manifest from the fact that the range of error is so relatively vast that the difference between the upper and lower limits of Southern lines' total origin and destination switching costs is $6,434,933, which is *more than half* the total switching costs of $12,407,912 used in Southern lines' cost study.

Southern lines' 83-car sample has same defects as the 41-car sample and must be rejected also.

The Southern lines state at page 74 of their exceptions:

"The Examiners do not mention at all a most persuasive confirmation of the results produced by the 41 car sample. When it became apparent that counsel for the Northern lines were making an attack on the size of the sample, the Southern lines completed a study of the switching services performed on additional movements comprising a related sample which was twice as large (83 cars) (Ex. R-15). The switching minutes per car for this larger sample were found to be 25.0 minutes with a standard error of 1.7 minutes (Tr. R. 1569). The standard error for the enlarged sample was lower than the standard error for the 41 car sample (2.2 minutes), as would be expected (Tr. R 1589-90), and the result of the larger sample was relatively close to the result produced by the 41 car sample (26.0 minutes per car). As Dr. Deming testified, the result produced by the enlarged sample vindicated the integrity of the smaller sample (Tr. R 1602). This vindication of the reliability of the 41 car sample after it had been attacked on Cross-examination by counsel for the Northern lines is most significant in considering the "common sense" of the situation, . . ."

But even the 83-car sample with its standard error of 1.7 produces variations so great, when considered in relation to

the total switching costs used by Southern lines, as to make it wholly unacceptable and unworthy of any reliance by the Commission. Thus, employing computations similar to those set forth above for the 41-

[85]

car sample, it develops that the standard error of 1.7 would represent a range of switching costs from $14,909,407 to $9,431,567, a difference of $5,477,840, or *46 percent* of the total switching costs of $11,916,879 which would have been used by Southern lines in their cost study had they employed the results of the 83-car sample. Such results would still have been intolerable and useless for the purpose of producing reliable switching costs.

By way of further comment upon standard error it should again be emphasized that this formula computation is limited to measuring variations in data *included* within the sample. Dr. Deming frankly agreed that a standard error could be impressively low even though relevant data had been erroneously *excluded* from the sample (R. 1595). Thus, he acknowledged that the standard error would probably be even less than the 2.2 minutes claimed for the 41-car sample, if the only cars included were those receiving yard switching service—a definite sampling bias which would obviously subvert Southern lines' stated effort to measure both yard and train switching in the proportions actually provided on the involved traffic (R. 1597).

Recognizing that the average yard engine minutes developed by the Seigler studies were almost twice those shown for cars receiving train engine service (30.75 minutes versus 17.84 minutes), which in this instance appears to be consistent with general experience, the failure to include a representative number of cars in the latter category within the sample necessarily *overstated* the average switching minutes here claimed for terminal service in the South. Where, as here, the original 967,554-car sample disclosed a 60-40 rela-

tionship between yard and train switched cars, a 41-car sample reflecting 63.4 percent yard engine switching and only 36.6 percent train engine switching substantially distorts the result perhaps by as much as five minutes per car because of the exaggerated effect of a few cars in a small sample.

Similar comparisons between the 41-car switching sample and the Southern lines' traffic study from which it was selected, in terms of direction, important cities, commodities, and other characteristics

[86]

equally demonstrate that this infinitesmal sample cannot be accepted as representative of Official-Southern traffic. Manifestly, under the circumstances, the Examiners were fully justified in concluding, as they did, that "the switching studies in the South have weaknesses, both in the sample and in the studies themselves" (Sheet 52).

The Examiners' conclusions respecting the nature of the switching studies conducted by Southern lines on the 41 cars in the sample are fully as consistent with the evidence as those previously referred to relating to the selection of the sample itself.

The "single car basis" of the switching studies referred to by the Examiners points up the fact that, in imputing 1960 switching factors to 1958-59 sample movements, Southern lines failed to determine whether or not multiple car handling, upon which they otherwise place such great emphasis, was an attribute of the study car. Southern lines' contention (p. 70) that the lower switching minutes shown for the "A" car confirms the validity of the study entirely misses the point of this criticism. The critical fact is that while purporting to develop actual switching experience, Southern lines were unable to state whether this car, or any of the other 40 cars in the sample in fact moved in a multiple car block or not. Thus, Witness Seigler acknowledged with respect to the car from the "A" abstract to which the Examiners referred

(Sheet 50), that he had made no investigation to determine whether or not the 82 cars listed thereon had moved in a multiple car block or blocks. Upon inquiry as to the reason such an investigation was omitted, the witness himself acknowledged the invalidity of using as a divisor in the switching studies the number of cars moved in the week of such studies rather than the earlier period when the sample car, in fact, moved (R. 1880 and 1954). Moreover, it is easy to visualize the impact upon the result had just one more Multiple "A" car been included in the fragmentary switching sample.

Southern lines' criticism (pp. 70-71) of the Examiners' statement that a comparison of operations in 1960 with those when the sample car moved might have been appropriate, is most unwarranted. There

[87]

is no suggestion implicit in the Examiners' finding that historical fact is to be developed for its sake alone, while at the same time ignoring the necessity for determining present and future operations. The very aim of the switching cost adjustment here urged by Southern lines is to have the Commission find, as representative of the present and future, services which allegedly have been rendered in the past. It necessarily follows that Southern lines' determination of those past services must be demonstrated to be accurate and reliable. Certainly, no such reliance can be placed upon the Seigler switching studies. This witness, himself, acknowledged that underlying the studies is the assumption that the 1958-59 sample car moved under conditions identical with those encountered during the 1960 study week; that he made no investigation to determine the validity of this assumption; and that, in some instances, where he did not find a service in 1960 of the same character as that presumably rendered on the study car, he "took the next best thing" (R. 1881, 1839, 1938, 1945). Under the circumstances it can fairly be said that even for the 41 car splinter sample, Southern lines failed to

show actual switching minutes incurred but relied entirely upon imputed service units. Clearly, in view of the foregoing manifestations of unreliability disclosed on the record, the Examiners' indictment of Southern lines' switching studies for failure to demonstrate a sufficient similarity between 1960 switching minute factors and 1958-59 services to warrant imputing factors developed for the former to the latter, is fully justified.

One final comment with respect to Southern lines' suggested adjustment of switching costs within that territory is so obvious as to almost escape attention; that is, the substitution of a conglomerate 26.03 minute factor for all car types in lieu of the switching minutes developed in Rail Form A separately for box cars and other cars for which the former is to be substituted. If, as Southern lines emphasize upon Exceptions (p. 76), it is significant to reflect the relative proportions of box cars and other cars used in the Official-Southern movement, then, clearly, any adjustment purporting to particularize the characteristics of that traffic should have been developed separately by the same two equipment groups. This was not attempted

[88]

by Southern lines for switching services rendered in their territory, although for Northern lines they undertook to retain the distinction between box cars and other cars in adjusting the average switching minutes in Official Territory.

iii. The Absence of Any Showing of a Need for Upward Adjustment in the Average Switching Minutes Per Car for the Northern Lines.

The fundamental fallacy in Southern lines' comments respecting their proposed adjustments in the switching minutes of Northern lines is quickly revealed in the first sentence of the exception under this subject. It is there stated that:

"The Northern lines relied upon territorial average costs and they presented no proof that would justify any upward adjustment in their territorial average switching minutes per car for application to the origination or termination of Official-Southern traffic in the North." (p. 80)

The patent inconsistency in this criticism should be readily perceived. It is for the very reason that Northern lines do indeed rely upon territorial Form A costs as appropriate for the involved traffic, and properly so, that they did not undertake to inflate those costs by making an "upward adjustment" in their switching minutes of the type indulged by Southern lines. It is Southern lines which, in seeking to circumvent the obvious conclusion to be drawn from a comparison of relative costs in this proceeding, advanced the theory that switching minutes on the involved traffic should be inflated to compensate for a claimed disproportionate movement of volume commodities in multiple-car movements elsewhere. Having themselves advanced this thesis, unproven on this record, Southern lines now seek upon Exceptions to indict Northern lines for failing to endorse it by undertaking special studies, presumably of the caliber of those in the South previously discussed.

Once it is understood that the depressive effect claimed for volume commodities in the South rests entirely upon the operating

[89]

efficiencies occasioned by the one unmeasured variable of multiple-car, as contrasted to single car, handling, it is incredible that Southern lines can now dispute the finding of the Examiners that "if volume commodities exert a depressing effect upon system average switching minutes in the Southern region, the presence of volume traffic in the North produces at the very least a corresponding influence on the

eastern lines" (Sheet 48). Southern lines themselves recognize the presence, if not the extent, of this counterbalancing influence on Official Territory costs by the inadequate adjustments in Northern lines switching minutes developed by Witness Remington and fairly summarized by the Examiners in the Table at sheet 47. Overlooking for the moment the minimal degree of such revised switching factors, this witness stated that such adjustments were "made to eliminate the effect of volume commodities upon the switching minutes per car at origin or destination" in Official Territory, thus clearly recognizing the existence of such effect (V.S. 40-A, p. 5).

The computations made by the Examiner to determine the nature of the offsetting effect North, now assailed by Southern lines, rest upon the indisputable premise that whatever depressive effect upon switching costs may be credited to multiple-car handling in one territory can be expected in the other. This most obvious conclusion was not disputed by Southern lines' operating witnesses. For example, Witness Andrews agreed that he would expect multiple-car movements to assert the same influence upon system average statistics of Northern lines as that claimed for the handling of volume commodities within the South (R. 1130-31). Witness Clark, for Northern lines, demonstrated that "Southern lines have no monopoly upon this operating principle" referring to multiple-car handling (V.S. 70, pp. 22-33).

Certainly, the Commission will not be led astray by the tongue-in-cheek argument of Southern lines that no witness for the Northern lines testified that the commodities identified by Southern lines' operating witnesses as moving primarily in multiple-car blocks in the South,

[90]

pulpwood and phosphate rock, are handled in multiple car blocks in the North (p. 82). No such claim was ever made. But while there may be no pulpwood and phosphate rock movement of any significance in the North, Witness Gill enu-

merated those other commodities which do move in multiple-car lots in the North to a greater than average degree (V.S. No. 71, Ex. 12). The principal such commodities are those shown by the Examiners for Official Territory in the Table at Sheet 47 of the Report. It must be emphasized that this Table does not exhaust the list of those commodities handled in multiple-car blocks. For example, the traffic involved in Rock Salt—*N.Y. to Del., Md., N.J., N.Y. and Pa., supra,* moves within Official Territory in multiple-car blocks of at least 7-10 cars and clearly falls within the definition of multiple-car handling used by Southern lines' operating witnesses in identifying so-called volume commodities.

In the light of the foregoing compelling evidence of record, it is clear that the conclusion of the Examiners as to the counter-balancing effect of volume commodities in the two territories does not, as now asserted, rest "solely" upon the computations made at Sheet 51 of the Report for the obvious purpose of testing the validity of the grossly disparate adjustments in switching minutes within the two territories urged by Southern lines. But certainly these computations constitute a meaningful test of such adjustments and clearly corroborate the conclusion of the Examiners that Rail Form A territorial average switching minutes are a "better measure of the relative switching costs on each side of the border." The Examiners' computations made clearly-identified alternative assumptions for the purpose of evaluating Southern lines' claim that involved Official-Southern traffic requires switching service in the South 50 percent and 35 percent greater than average on box cars and other cars, respectively, while at the same time urging that corresponding increases for Northern lines should not exceed 6.5 percent and 6.6 percent respectively. In each case, the operating practice of multiple-car switching underlying the several upward adjustments is not shown to be any more prevalent in the South than it is in the North. The manifest disparity between the adjustments urged by Southern lines is sufficiently shocking on its face

[91]

to justify the conclusion, confirmed by the Examiners' computations, that the increase shown for Northern lines "is inadequate by from four to seven minutes in comparison with the adjusment they made for their own region" (Sheet 52).

Southern lines' attack (p. 81) upon the Examiners' computations as allegedly asuming that "Official-Southern and other non-volume commodity traffic" possess similar switching characteristics is obviously nothing more than a desperate effort to overcome the inevitable conclusion drawn by the Examiners from Southern lines' inability to establish the validity of the suggested adjustments. In this instance, they undertake to assail the Examiners' assumptions, made only for testing purposes, by impeaching their own theory for disputing Rail Form A average switching costs. Having divided their total traffic into two categories insofar as switching service is concerned, multiple-car volume commodities and all others, as a pretext for substituting their own upward adjustments in lieu of Rail Form A switching costs, they now inject a new variable by arguing that Official-Southern allegedly non-volume traffic and all other non-volume traffic do not necessarily possess the same switching characteristics. Southern lines fail to indicate, however, what factors would influence the average single car moving to or from Official territory that would not similarly affect a single car moving intra-territorially or otherwise. Eliminating all consideration of volume commodities, if, as now suggested, the remaining 54.14 percent of Southern lines' total traffic is not average, it is certainly difficult to visualize how it could be very far removed from average. Moreover, inasmuch as the involved Official-Southern traffic has never previously been stated to be distinguishable from the majority of Southern lines' cars, and indeed, has been affirmatively demonstrated to run the gamut of all variables affecting switching service, average switching costs are equally appropriate for application to Official-Southern cars, as the Examiners

properly concluded after a comprehensive appraisal of the record on this subject.

[92]

iv. The Northern Lines' Failure to Develop Any Facts as to the Switching Services Which They Perform in Handling Official-Southern Traffic.

Reduced to its essentials, the substance of Southern lines' argument respecting switching services in the North is that, notwithstanding Northern lines' showing of the reliability of territorial Rail Form A as a fair measure of the involved Official-Southern traffic, Northern lines in addition should have made several inconclusive switching studies—presumably Southern style—in order to corroborate this conclusion as to switching minutes. This contention is but another example of the repeated efforts upon Exceptions to shift the burden of proof to Northern lines in every instance where they did not see fit to make their evidence correspond to that presented by Southern lines, and where the latter's advocated adjustments are so flagrantly lacking in comparability.

Northern lines both asserted and proved the appropriateness of territorial costs as a fair and reliable measure of the relative burdens of providing rail service on the involved traffic. It is Southern lines, disputing the validity of such Rail Form A costs, that endeavored to refute this showing by embarking upon the unrepresentative and inconclusive switching studies previously discussed. In so doing, Southern lines were fully aware of the obligation upon them of developing comparable data for both territories which would not distort the relative cost evidence so significant to the disposiion of this proceeding. As the Commission observed at Sheet 27 of its recent report in the *Transcontinental Divisions* case,

> "In this case, where the relationship of one territory to another is of critical importance it is requisite that any special studies be made on a comparable basis in each territory." (Sheet 27)

Certainly it was not incumbent upon Northern lines to pursue every avenue of inquiry, however irrelevant or ill-advised, suggested by Southern lines at the risk of otherwise forfeiting their just claim to equitable divisions. Such, however, would be the result of the finding here urged by Southern lines upon Exceptions. Any such

[93]

holding would confer upon parties to litigation the absolute power to dictate the evidence to be presented by adversary parties. Northern lines are confident that the Commission will not now declare this to be the rule of procedure. Rather, it is presumed that the Commission will adhere to established practice and permit each party to develop and offer into evidence (at its own risk) those facts which it considers to be persuasive, leaving it to the Examiners and the Commission to attach such weight and draw such conclusions from the evidence as may be appropriate.

The refusal of Northern lines to make special switching studies similar to those underlying the considered adjustment in Southern Region switching costs has been entirely vindicated by the Examiners' conclusion that such studies "have weaknesses, both in the sample and in the studies themselves" (Sheet 52). Since it is clear that the foregoing finding is fully supported and, indeed, compelled by the record, and requirement that Northern lines undertake the burden of developing similar unreliable data could only compel a meaningless and wasteful act. It is submitted that this argument by Southern lines should be summarily rejected by the Commission.

It is only by closing their eyes to most substantial evidence of record that Southern lines could assert, as they do upon Exceptions, that "Northern lines failed to present any substantial evidence supporting the application of even their territorial average costs, much less any higher costs, to the traffic at issue in this case" (p. 86). Operating evidence was

introduced to demonstrate that Official-Southern traffic encounters the same operating conditions as traffic generally. Included among such operating conditions, of course, is terminal switching service. The train utilization study, presented by Witness Nancarrow (V.S. 8, Exhibit A) is a representative cross-section of Official Territory operations which shows the "extent to which the total train service of Eastern Railroads participates in the movement of Southern interterritorial traffic (V.S. 8, p. 6). This witness also presented illustrative diagrammatic tracings of 14 Pennsylvania Railroad trains moving to and from the principal southern gateways of Cincinnati and Potomac Yard which followed the progress of every study car.

[94]

The widespread dispersion of Official-Southern cars throughout the former territory disclosed by these studies demonstrates that the great variation in switching services pointed out by Southern lines as between particular points is equally true of the involved traffic and renders appropriate the use of territorial average switching factors. This is necessarily so because such variations are an attribute of physical handling and location entirely unrelated to the incidental determinations of origin and destination territory. If anything, it can fairly be concluded that the switching services of Northern lines, performed to a greater degree in congested metropolitan areas, exceeds that provided by Southern lines on this same traffic.

It is highly significant that Southern lines do not even attempt to dispute the Examiners' finding that "the adjustment in the North was not made on a basis comparable to that in the South." Nor can they take issue with the consequent conclusion that "in this case where the relationship of North and South is of primary importance, this is a major defect" (Sheet 52). It is submitted that these undisputed findings must be found to be determinative of the switching issue.

The Commission should find:

That Southern lines' adjustment of Southern Region switching costs rests upon an inadequate and unreliable 41-car sample that cannot logically be deemed to be representative of the involved Official-Southern traffic; that the special switching studies conducted on such cars are defective and fail to sustain the underlying assumption as to the asserted influence of multiple-car volume commodities in the South; that, to the extent such volume commodities affect switching minutes, there is a corresponding and offsetting influence upon the switching costs of Northern lines; that the record fails to justify the grossly disproportionate adjustments in the switching minutes, North and South, urged by Southern lines; and that, even if the special studies of switching in the South were assumed to be representative, Southern lines, as the proponents of the advocated departures from Rail Form A, have failed to overcome the "major defect" of lack of comparability in the relative cost adjustments which they urge with respect to switching.

[95]

Reply to Exception No. 1, B-4, Re Count of Cars.

This exception relates to Southern lines' contention that cars of lake cargo and tidewater coal and ex-lake iron ore should have been regarded as cars originated and terminated, rather than cars interchanged, in allocating total switching costs as between terminal and interchange. It is submitted that the exception is not well taken.

Under the heading "Consistent Count of Cars Originated and Terminated", Southern lines' Witness Remington, in Exhibit C of his Verified Statement No. 40, makes certain adjustments in the count of cars developed from the Freight Commodity Statistics, which are used in computing

costs under Rail Form A. These adjustments add a portion of the cars therein reported as interchanged to the number of cars reported as receiving terminal handling. The effect of thus increasing the number of cars counted as terminated and decreasing the number counted as interchanged under Rail Form A, is to assign less switching expense to interchange service, which is a line-haul item, and thereby to reduce line-haul costs. The transfer of switching expense to terminal service, however, does not significantly affect the terminal unit cost per car, because of the accompanying increase in the count of cars given terminal service (V.S. 80, Sec. A, p. 1).

Witness Remington's Exhibit G, corrected p. 9, shows the effect of this adjustment to be an increase of 0.23 percent in the Southern lines' share of the total cost of the North-South traffic. The result of an increase of 0.23 percent would be to increase Southern lines' share of the cost by almost $1,250,000.

This adjustment, as stated, relates principally to lake cargo coal, tidewater coal and ex-lake ore. It is based upon the theory that, "For cost purposes, a car is originated when lading is placed in a car for outbound movement, and car terminated is a car in which lading is removed and the car is made empty" (Ex. C, p. 5 to V.S. 40). Thus, his sole test as to whether a shipment is interchanged or is originated

[96]

or terminated is whether the lading was put into or taken from a car. All other characteristics of the operation would be disregarded. Such a test obviously has no relation to cost. It has no relation to whether a given operation is more like an interchange from the standpoint of the service performed and, hence, of the costs incurred, or whether its transportation characteristics are more nearly those of terminal service.

Northern lines' Witness Heywood testified (V.S. 80, Section A, p. 2):

> "That the service at tidewater ports on coal, and at the lake ports on coal and ore, is interchange rather than

terminal is apparent from the facts with respect to these services. Taking lake cargo coal as an example, the coal trains go to the railroads' lake front yards at the ports. Unlike cars which are to be terminated, the lake cargo coal cars are not then moved to various industries in transfer runs and then switched to effect delivery at the consignee's plant. Rather, they are moved to a dumping machine at the railroads' water front yards and there dumped into the lake vessel. It is obvious that this service is much more akin to a movement to an interchange track than to a transfer and switching movement to effect delivery to a consignee. The fact that the car is not given over to the boat line along with the lading cannot, in itself, mean that the shipment is not interchanged. The interchange of an l.c.l. shipment between railroads is not accompanied by a delivery of the car which carried the shipment; but, nevertheless, it is an interchange. Also, the fact that the interchange is with a boat rather than with a railroad—that the movement is to a dumping machine rather than to an interchange track with another railroad—cannot detract from the essentials of the operation and their significance from a cost standpoint."

Mr. Heywood also pointed out that in Lake Cargo Coal Rates, 1925, 126 I.C.C. 309, 313, the Commission stated, with respect to lake cargo coal rates:

[97]

"The rates thereon apply from the mines to the raised or hump tracks beyond the classification yards at the Lake Erie ports. From these tracks the loaded cars are dropped by gravity to dumping machines at the docks. A separate tariff charge for transferring the coal from cars to vessels is not in issue. *The rates on lake-cargo coal are treated as in the nature of proportional rates to the ports for part of a through movement to cross-lake destinations. They include no termi-*

nal delivery to consignees at the ports. The local rates on so-called commercial coal to the port cities cover such delivery. For this and other reasons as, for example, concentrated movement at times when commercial coal is not moving heavily, rates on lake-cargo coal always have been lower than the local rates on commercial coal." (italics supplied.)

Thus even the rates on lake cargo coal indicate interchange rather than delivery service. They are either (1) proportional rates (differing from the rates to the port cities for local deliveries) the application of which is conditiond upon further movement from the port by water; (2) lower proportionals than those just mentioned, if the shipment is to have a further movement at the termination of the water haul; or (of more recent origin) (3) joint rail-water, or rail-water and rail rates (V.S. 80, Sec. A, p. 3).

The facts with respect to lake cargo coal as set forth above are true also in their essentials as to iron ore (which moves in the reverse direction of lake cargo coal) and tidewater coal (V.S. 80, Section A, p. 3).[2]

---

2. The Commission's conclusion in *Institute of Scrap Iron & Steel, Inc., et al. v. Akron, Canton & Youngstown Railroad Company, et al.*, ICC Docket No. 33535 (April 2, 1962) that scrap iron rates may not be based upon iron ore rates in Official Territory is corroborative of the classification of ex-lake iron ore as interchange rather than originated traffic. In reaching its conclusion, the Commission found, at Sheet 12, that: "The movement of iron ore is highly concentrated. Ninety percent of the total traffic moves from seven Lake ports and three north Atlantic ports, and is delivered to the railroads by vessels in quantities averaging over 12,000 gross tons at the lake ports and 23,000 gross tons at the Atlantic ports", that the entire traffic of over 60 million net tons is delivered at approximately 90 destinations, that the origin and destination points for iron ore are "constant from year to year" that it moves "largely over single-line direct routes" and that "Because iron ore is frequently delivered to the railroads in quantities in excess of trainloads, it does not require the very expensive terminal services involved in waytrain and classification-yard services which are characteristic of the movement of any commodity such as scrap, where the typical movement is a single carload.

Witness Remington stated (V.S. 40, Ex. C, p. 5) that in many instances, cars which are originated or terminated "in every sense of the word so far as rail services are concerned" are nevertheless counted as cars interchanged in the freight Commodity Statistics. In this connection, he was referring to lake cargo and tidewater coal and ex-lake iron ore. He did not, however, give any facts to support this statement. It is clear, from the foregoing, that his statement is not in accordance with the facts.

In their exceptions, Southern lines state that the Examiners erroneously accepted the foregoing contention of Northern lines that the switching characteristics of the traffic involved are more akin to interchange than to terminal service. They state that the Examiners quoted Mr. Heywood's testimony on this point and that he was not qualified with respect to it because he "spent his entire career in the 'Accounting Department of the Pennsylvania Railroad' " (Southern lines' Exceptions, p. 90). Even if this were true, the witness testified that he has been engaged in the analysis and preparation of cost studies since 1930. It is obvious that in this capacity and over that long span of years, the witness would, of necessity, come into close contact with operating matters. The facts concerning which he testified —and which the Commission has corroborated by formal decision—are, moreover, not of the kind which only an expert is competent to know. The Southern lines say that they find it strange that an accounting man and not an operating witness testified on this subject. The fact is that the Southern lines attacked the classification given to the items in question in the Freight Commodity Statistics. Mr. Heywood's duties "include direct supervision over the compilation of statistics" (V.S. 3, p. 1). It was natural that the subject (with which Northern lines dealt on rebuttal) should be assigned to this witness, whose testimony was required on other subjects also.

[99]

On p. 90 of their Exceptions, Southern lines say that Mr. Heywood revealed a "lack of familiarity with the oper-

ation of port facilities of the Northern lines on cross-examination, while admitting that the count of cars in the Freight Commodity Statistics differed for cars which received identical services". The comparison put to the witness in this cross-examination was as between switching on export coal and switching on coal transshipped to a domestic destination. The witness did *not* admit that the two classes of traffic received "identical services" as alleged by Southern lines. He said that he did not know as to this (Tr. 2579-80). It should be noted that this question and all of the testimony of Mr. Heywood quoted on p. 91 of Southern lines' Exceptions did not relate to the point made by the witness that the coal cars classified as interchanged had service more akin to an interchange than to an origination or termination. On the contrary, it went to a comparison of the switching service rendered on European as compared with domestic coal transshipped at Eastern ports.

On pages 92 to 93, Southern lines quote the testimony of Mr. Clark, a witness for Northern lines, describing certain operations at the South Amboy Coal Pier of the P.R.R. The witness's conclusion was that the operations are "complex and costly". But interchange service can be "costly and complex". The witness did not compare those services which have been classified as interchange services at the port with an origination or delivery to an industry in Northern New Jersey or around New York Harbor, or elsewhere. Southern lines conclude from the testimony quoted that a minimum of four classifications and three transfer movements is required to place cars of coal for dumping and to remove the empty cars, as contrasted with a single classification and one-way transfer of interchange traffic to rail connections. In making this comparison, Southern lines simply assume that there is no switching in connection with an interchange to a rail connection except a "single classification and one-way transfer". But this is not supported by evidence. Why not assume, for example, that some cars of coal destined to a locality on the New Haven or Long Island were in the train with the tidewater coal which was consigned to South

[100]

Amboy, that after the train arrived at Brown Yard, the coal for the New Haven and Long Island was classified, then moved to Waverly Yard in a train with coal for deliveries in the Newark area, was further classified there for movement to the Long Island and New Haven, transferred to Greenville Pier, then put over a float bridge onto a car float for delivery to the New Haven and another car float for delivery to the Long Island, then taken by water to Bay Ridge and there put into the New Haven and Long Island trains. Such an assumption would be at least as good as the assumption made by Southern lines.

It is said on p. 93 of the Southern Exceptions that the Examiners disregarded the testimony of the P.R.R. operating witness bearing on the "operations here in question". The "operations here in question" are those of originating or terminating the traffic involved (coal and ore) as against interchanging them. The testimony of the P.R.R. operating witness referred to (from another case) was in no way related to that question.

Southern lines next say that the Examiners disregarded testimony from another case "which shows that the switching service required to handle coal at ports far exceeds the interchange services accorded average traffic and is the substantial equivalent of that required to originate or terminate average traffic" (Southern lines' Exceptions, p. 93). In support of this contention Southern lines state that the average switching time per car originated or terminated in Official Territory is 28.2 minutes, average switching time per car interchanged is 13.6 minutes, and that a Reading Company witness testified in a former case that it requires approximately 21 minutes per car to switch coal traffic from the Storage yard to the dumping facilities (Southern lines' Exceptions, p. 93). It is interesting that Southern lines refer to this 21 minute figure, but not to the 13.69 minute figure relating to the Jersey Central Pier and appearing in testimony included in the same exhibit as the 21 minute

figure. In its decision in the case from which both sets of testimony were taken, the Commission characterized the 21 minute figure as an estimate and the 13.69 minutes as actual.

[101]

It said (*Eastern Bituminous Coal Assn. v. Baltimore & O. R. Co.*, 299 I.C.C. 691, at p. 718):

> "In pricing traffic terminated at the tidewater ports, the factor of 13.69 minutes per car was used as the switching time for that service. The figure was based upon the records of the Central New Jersey for switching at pier 18 at the Jersey City terminal. A witness for the Reading Company estimated the time as 21 minutes per car on that railroad, while the Central of New Jersey maintains a current record of the time required to switch its pier."

The 13.69 minutes is obviously very close to the 13.6 minutes which is the average time for cars interchanged in Official Territory (Southern lines' Exceptions, p. 93).

At pages 93 and 94 of their Exceptions, Southern lines infer that the 21 minutes at the Reading Pier relate only to switching from the hold yard to the dumper and that the complete service from the road train to the dumping facilities and return requires substantially more switching service than the system average time for interchange when a reasonable allowance for classification and transfer services are "added to the 21 minutes per car required to switch the coal cars from the storage tracks to the dumping facilities" (p. 94, Southern Exceptions). Here again Southern lines' point is based upon pure assumption. Actually the testimony in connection with the 21 minutes per car does not indicate the place at which the time was started. In addition, it is obvious that track delivery coal would also have to go first into the yard where the train was broken up, then taken to yard tracks for classification, then (with possibly additional intervening steps) taken in a transfer run

to a point that might be miles away, then taken out of the transfer train and switched to a private siding. All of this is ignored in the comparison and conclusion urged by Southern lines in the first paragraph on p. 94 of their exceptions.

On page 94, the Southern lines state also that there is no basis for the Examiners' assumption that switching coal at a port facility "lends

[102]

itself to multiple-block switching". In V.S. 80, Section M, p. 1, Witness Heywood referred to lake cargo and tidewater coal as especially heavy movements, permitting of the greatest economy "both in switching and line-haul transportation". In stating that the testimony of Northern lines' operating officers in previous cases shows that the cars are "individually" classified, the word "individually" was added by Southern lines. For example, the testimony concerning the Jersey Central's pier was that the shipper "may order 5 or more cars each of several classifications, or certain cars by number to obtain the tonnage required. In other cases it is ordered according to day of arrival with some old coal being ordered, also some newly arrived coal being ordered" (V.S. 37, App. D, Sec. K, p. 3). The fact that the shippers order the coal dumped by classifications or by day of arrival does not mean that the traffic does not lend itself to "multiple car block switching". Obviously cars of the same classification or which arrived on the same day and which are together on the hold track can be switched in multiple-car blocks to the dumper. Moreover, that is simply the final switching movement. Preceding switching movements would obviously be in multiple-car blocks.

On pages 89 and 90 Southern lines first quote from testimony given by the Commission's then Chief Cost Analyst in I.C.C. Docket No. 28300, to the effect that the traffic here in dispute is correctly reported "for statistical purposes in determining the national production" but that from the

standpoint of cost the count is incorrect as the rail terminal service at point of interchange with water lines is a complete origin or destination operation and should be counted as such. No facts whatever are given to establish that what the witness himself refers to as the operations "at point of interchange" are in fact not similar to interchange but to complete origin or destination operations. It is stated that the Cost Section "cured this error" and that the Chief Cost Analyst "corrected the costs", citing *Class Rate Investigation, 1939,* 262 I.C.C. 447, 576 (1945). The citation referred to establishes simply that the figures quoted thereinafter in that report are based on cost scales introduced by the Commission's Head Cost Analyst "but

[103]

adjusted to reflect the corrections of record made by him in response to criticisms of the study, and corrected to reflect the revised assignment of commodities to classes of equipment." This is just a general statement and whether or not the data here involved was "corrected" cannot be known from the citation.

Then, on p. 90, Southern lines state that the Examiners err in omitting any reference to the "prior acceptance by the Commission and its Cost Section of the validity of the criticism . . ." It is not shown that the Commission has accepted the criticism as valid. And neither has the Cost Section. The Cost Section, in applying its Form A to produce the cost scales which are used week in and week out by the Commission and parties before it, uses the freight Commodity Statistics and their classification for the car counts, just as the Northern lines did in this case (V.S. 80, Sec. A, p. 7). And in *Class Rates, Mountain-Pacific Territory,* 296 I.C.C. 555, 604 (1955), where this specific criticism was offered and the matter put in issue, the Commission refused to make the adjustment sought. Southern lines endeavor to distinguish that case in a footnote on pages 89 and 90 of their Exceptions. They say that whereas the effect

on costs was small in the Mountain-Pacific case, it is important here, and that whereas the Commission stated in the Mountain-Pacific case that the subject requires further study as to the relative switching service performed for the coal and iron ore traffic as compared with other carload traffic, Southern lines say that the burden of proof is on the Northern lines to justify the use of an "admittedly" inconsistent count of cars. Northern lines make no such admission. Moreover, the burden of proof to change this practice is not on Northern lines but on Southern, and they have introduced no evidence whatever as to the "relative switching service performed for the coal and iron ore traffic as compared with other carload traffic". The statement in their footnote on p. 90 that the present record shows that the cost of handling coal at dumping facilities requires at least as much switching per car as is required to originate or terminate average traffic is without any support in the record.

[104]

On p. 95 of the exceptions, Southern lines complain of the Examiners having stated that Rail Form A equating factors reflect the relative amount of switching "based on careful studies". It is stated that the Examiners have either assumed something without support or had been given this impression by someone in the Cost Finding Section. Rail Form A is the formula upon which the Southern lines rely. It is the basis of their cost study. Hundreds of origins and interchanges which take place in the South use the equating factors of which the Examiners speak. Are Southern lines now indicating that the switching studies upon which these factors are based were not carefully made? If figures from Rail Form A are presented and relied upon and no exception is taken by the parties so relying (and none has been taken with respect to the equating factors), it is certainly unreasonable to take the kind of exception that is taken here. There having been no objection to the equating factors, however, the phrase which offends Southern

lines ("which reflects the relative amount of switching based on careful studies") is unnecessary and can as well be eliminated.

In the next paragraph on p. 95 of its Exceptions, Southern lines state that even if the equating factors are perfect ". . . that still leaves open the only issue here, that is the justification, if any for counting identical services as interchange services if the contents of cars are loaded into a boat destined to a North Atlantic port but as terminal services if the contents of the cars are unloaded at the same dumping facility into the next boat bound to Europe." As to this, Northern lines reply (1) that, as shown above, Southern lines have not shown that the two services are, in fact, "identical services", and (2) the "only issue" as stated by Southern lines is not the issue here. The only issue is whether what is now classified as interchange is, from the standpoint of its operating incidents as affecting costs, more like terminal than like interchange service. Certainly Southern lines fall far short of establishing that the Commission's practice of many years of classifying the involved traffic as interchange should be changed.

Next, the Southern lines state that the remaining question relates to the reliability of data used by the Southern lines in making

[105]

the "necessary correction". They refer to the Examiners' statement that how much of the data behind Southern lines' "correction" was estimated, or how reliable the estimate is unknown. Southern lines say that "substantially all" the necessary data was available from the One Percent Waybill Statistics to which they refer, and that this data provides "adequate detail for the adjustment reflected in Southern lines' cost study" (Southern Exceptions, p. 96). This conclusion has no support in the evidence.

Continuing, on p. 97, Southern lines state that "Only with respect to a very limited category of traffic (received

at a port and delivered to a connecting carrier) was any estimate required, and that estimate was based upon the data filed by the carriers with the Commission (V.S. 40, Ex. C, p. 11)." Actually, Southern lines' witness did not reveal that there was any estimate, let alone indicate what data it was based upon. There is nothing whatever in V.S. 40, Ex. C, p. 11 to support the statement for which that reference is cited. The fact that an estimate was made was first revealed in the rebuttal testimony of Mr. Heywood (V.S. 80, Sec. A, p. 6).

It is stated on p. 98 of Southern lines' Exceptions that the "reasonable method of making this estimate was set out in the working papers and was not challenged as to method or specific result by the Northern lines." The record does not show that the "reasonable" method indicated was set out in the working papers, and Mr. Heywood stated that the estimate "cannot be considered as of any value for the purpose" (V.S. 80, Sec. A, p. 6). In the first paragraph of p. 99 of their exceptions, Southern lines purport to give the percentage of the data involved in the estimate. This is beyond the record. Even if it were in the record, it would show that a substantial portion of the data was estimated.

Next, Southern lines endeavor to put the burden of proof on this point over to the Northern lines. We have replied to this approach above in discussing burden of proof (pp. 28-29).

With respect to the alleged inconsistency between classifying the Northern traffic involved as interchange and certain Southern traffic

[106]

(phosphate rock) as terminated, it is sufficient to answer that Southern lines made no attempt whatever to establish by evidence that the two services are comparable from the

standpoint of the operations involved. The Commission should find with respect to this point that:

1. For many years the Commission's regulations have specifically required that the traffic involved in this adjustment for which Southern lines contend, be classified as cars delivered to connections or received from connections, i.e., as interchange traffic.

2. The Commission has treated the service at the lake ports as delivered to connections in prescribing the lake cargo coal rates.

3. The treatment of the traffic as received from or delivered to connections rather than as originated or terminated is consistent also with the rates which are applied thereto, these being proportional rates different than rates applied for local delivery or local origin service at the ports.

4. The present evidence confirms the propriety of the classification of the disputed traffic as traffic delivered to or received from connections.

5. The Southern lines have offered no evidence comparing the services involved in handling the disputed traffic with typical or average service in connection with originating or terminating freight in the Eastern district.

6. Southern lines have not proved comparability of service as between the disputed traffic and traffic delivered to boat lines on Southern lines, such as phosphate rock.

7. The evidence does not establish that the classification deliberately given to the disputed traffic by the Commission should be changed for the purposes of costing in this case, or otherwise.

[107]

Reply to Exception No. 1, B-5—Proposed Equalization of Gateway Interchange Costs.

At pages 99-105 of their Exceptions the Southern lines criticise the Report for its disallowance of their proposal to equalize gateway interchange costs. But an analysis of the situation fully sustains such disallowance for the reasons to be stated.

NEITHER EQUALITY OF ENGINE-HOURS NOR OF CERTAIN OUT-OF-POCKET COSTS CONNOTES EQUALITY OF FULL COSTS OF INTERCHANGE AT THE GATEWAYS.

For the cars involved in their traffic study (967,554) less those interchanged with Northern lines at interior Illinois and Indiana junction (86,843), the Southern lines, for the purpose of this adjustment use—in lieu of the territorial Form A interchange costs of $4.95 in the North and $3.14 in the South—an average of those figures. Accordingly, they would decrease the Northern costs by $797,043 and increase the Southern costs by a like amount.

To support this adjustment Southern lines refer to certain equalizations of *engine time*, where practiced, is attended by precise lines in accomplishing interchange at certain gateways and (b) of *charges* made by a common agent covering interchanges at certain other gateways.

But there is nothing of record to warrant the assumption that equalizations of *engine time*, where practiced, is attended by precise or even substantial equality of ultimate full cost. Of necessity there are variations in costs North and South due to differences in wages, taxes and other types of costs such as maintenance. In such instances, as well as where similar charges are made for the interchange services rendered by a common agent, there are differences in other elements of costs, including overhead and constant costs, which would serve to make different the full costs

of interchange service by the carriers of the respective groups.

[108]

THE ADJUSTMENT, IF MADE, WOULD BE INCOMPLETE.

Another substantial objection to the suggested adjustment is that it would be incomplete. If Southern lines are assumed to have incurred interchange costs at the gateways at the rate of $4.045 per interchange as compared with their 1956 Form A average of $3.14, that would necessarily mean that their costs for other interchanges would be reduced by $797,043. Conversely, the corresponding adjustment of Northern gateway interchange costs would require an *increase* of the same sum in the costs of other interchanges in Official Territory. But in proposing the making of such adjustment in respect of this item the Southern lines did not attempt to show to what extent their costs of the other interchanges on the traffic involved would be *decreased* or to what extent the Northern costs of other interchanges would be *increased*. Further, they presented no such data as would permit the completion of such an adjustment. Undoubtedly it was for this reason that they did not include this item with their major adjustments, but left it with other general considerations of a catch-all character.

Hence, the adjustment suggested by Southern lines in respect of this item cannot be allowed, because obviously it is incorrect even on their own theory.

This illustrates a basic difficulty attendant upon adjustments of Rail Form A territorial costs which frequently produce unreliable results. When for particular items of service greater or lesser costs are assigned than under the formula, lesser or greater costs of corresponding amounts must be assigned to the remaining units of service. Otherwise the essential wholeness and accuracy of the cost study is destroyed.

THE ADJUSTMENT RESTS ON AN UNSOUND ASSUMPTION.

An additional objection which applies to this adjustment in common with others is that it necessarily assumes that the interterriorial traffic

[109]

is to be costed for its handling by Eastern (or Northern) lines on a preferentially low basis which will enable it to escape its full ratable proportion of all Eastern territorial costs and thereby to excuse it from making its full proportionate contribution to the revenue requirements of Eastern railroads. Such an assumption is contrary not only to sound transportation economics but also to the policy of the Congress as manifested in the Transportation Act of 1920 which conferred upon the Commission its present division-making power.

Accordingly, the Commission should find that the Examiners correctly disallowed Southern lines' contention in respect of equalization of gateway interchange costs.

[113]

Reply to Exception No. 1, B-7 Concerning the Allocation of Constant Costs to Pulpwood and Wet Phosphate Rock.

Southern lines contended that there should be added to the costs south of the gateway an amount sufficient to make up the difference between their rates on pulpwood and wet phosphate rock and the fully distributed costs thereon. The movements of these commodities are wholly within the South. Southern lines' pretext for seeking this addition to their costs is that a "tacit" transit arrangement exists under which the outbound movement of paper products and dry phosphate rock depends upon the inbound movement of woodpulp and wet phosphate rock, respec-

tively. The Examiners rightfully recommend against this addition to Southern lines' costs.

This matter is fully discussed in Eastern lines' brief at pages 176 to 187. The following points, among others, are made in that discussion:

1. The reason for the adjustment, as stated by Southern lines, arises from the Northern lines' having shown relative costs on a fully distributed basis. This is a thesis that is no longer mentioned, at the exceptions stage of the proceeding, but was the primary reason advanced by Southern lines' Witness Burroughs in support of making the adjustment (Eastern lines' brief, pp. 177, 178). Probably the reason for abandoning this theory of support for the adjustment lies in the realization that Northern lines can make their case as well, or even better, on the basis of out-of-pocket costs than on the basis of fully-distributed costs (Recommended Report, Sheet 55).

2. Northern lines are not parties to the rates on wet phosphate rock or pulpwood. They have no control over them, no voice as to their level. Indeed, at least one object —if not the sole object—of Southern lines in making these rates as low as they are was to induce paper companies to move from other locations—obviously on Northern lines—to locations on Southern lines. Thus, Mr. Marks, of the Southern Railway, testified in *Reduced Rates on Pulpwood in Southern Territory,* I.C.C. Docket No. 30958:

[114]

> "The pulpwood rates in the South, from the very inception of the production of paper in the South, have been made with the definite object in mind of developing the industry. We realized that with the vast reservoir of pulpwood in the South, there was a golden opportunity to encourage the industry to locate in the South." (V.S. 80, G-12, pp. 17, 18.)

And, on p. 18, of the same statement, Mr. Marks said:

> "That our theory of rate making is correct is evidenced by the enormous growth of the pulp and paper industry in the South, and we feel very keenly that it is an obligation of the railroads to make freight rates that will foster the continued growth of the pulp and paper industry in the South.
>
> "It is our position that the Interstate Commerce Commission should not fix freight rates that will hamper the railroads in their endeavor to assure the continued growth of this industry, but the railroads should be permitted to exercise their managerial discretion in making rates for the future that will assure the continued growth of this important industry in the South."

The situation, therefore, is that these rates on pulpwood, as to which Northern lines have no control, were made on a low basis to attract plants from the North, and now the Southern lines want the Commission to require Northern lines to help make up the deficit under constant costs which they incur. The injustice of sanctioning any such adjustment as that here proposed is manifest.

3. Even if this proposed addition to the cost of Southern lines were otherwise valid—and obviously it is not—it could not be applied in favor of Southern lines without a like addition being made to the costs of Northern carriers. If Southern lines were entitled, for example, to the addition with respect to pulpwood, Northern lines would likewise be entitled to it with respect to such raw materials as iron ore, coal and fluxing stone which go into the manufacture of iron and steel which moves, among other places, from the North to the South. Southern lines' excuse for confining the adjustment to their own traffic is that

[115].

is a "tacit" transit privilege on such traffic. There is nothing to this point, as was shown in our brief (pp. 183-

187), and even if there were, no such distinction could be allowed to govern. Otherwise, form would be substituted for substance.

4. Southern lines' theory involves the assumption that a railroad is entitled to get from every ton of traffic its fully-distributed cost, that the two raw materials involved cannot (under the premise that low rates are deliberately made on the inbound commodity to induce outbound movement) recover fully-distributed costs and that the deficit under a full allocation of costs with respect to the movements of raw materials must be recouped from the outbound movements of paper products and dry phosphate rock. As the Examiners pointed out, this involves a misunderstanding of the "nature, significance and use of constant costs" (Report, Sheet 56).

Southern lines' theory on this point is indicated by Mr. Burroughs' typical statement that:

> "The critical fact here is that the ton and ton-mile allocation of constant costs assigns to pulpwood a cost that the Southern lines must recover from their share of the revenue on the essentially transit movement of paper." (V.S. 41, p. 8.)

If pulpwood and wet rock fail to provide their pro rata share of revenues necessary to offset overhead costs, the asserted deficit, if it were properly and necessarily incurred, would be a burden of Southern lines' traffic generally rather than of any particular segment of that traffic whatever its physical relationship to the so-called deficit commodities. Constant cost, created as a burden of all traffic, must be shared by all traffic jointly in proportion only to the revenue-producing abilities of each segment. In placing the entire alleged pulpwood deficit on paper, for example, Mr. Burroughs himself made an allocation of constant cost, in this case to the paper traffic, which he would give precedence over the ton and ton-mile basis he here assailed.

Northern lines challenge the merits of the allocation urged by the witness which, in effect, represents a pyramiding and, hence

[116]

duplication, so far as paper and dry phosphate here in issue are concerned, of raw materials deficits added to fully distributed costs for the former already computed on the customary basis. It is submitted that cost is an independent determination capable of computation quite apart from ability to pay or revenues received. The costs incurred in handling pulpwood and wet phosphate rock do not become the costs of handling paper or dry rock or some other commodity, of whatever nature or physical relationship, simply because revenues may be inadequate on the former. A necessity to resort to general funds developed from traffic in the aggregate for general overhead expenses cannot possibly justify the arbitary assignment of pulpwood costs to the paper traffic, or wet phosphate rock costs to the subsequent movement of the dry commodity.

5. Southern lines characterize the described pulpwood and wet phosphate rock traffic as involving "an essentially transit" relationship (V.S. 40-A, p. 8). *But a transit relationship is one that is readily identifiable from the tariff and either exists or doesn't exist. If an actual transit relationship exists, then the through rates from the initial origin of the raw material via the transit point to the ultimate destination of the finished product would have been established with the concurrence of Northern lines and would here be in issue if that movement were between the territories involved.* In that situation the through cost would likewise appropriately be considered in fixing divisions. But here no transit is in fact provided by the appropriate tariffs.

The only joint interterritorial rates here before the Commission are those applying on paper and paper products and on dry phosphate rock. The so-called "tacit transit arrange-

ment" is at best an express recognition of the obvious physical fact that the production of finished and semi-finished products necessitates an inbound flow of basic materials. Pulpwood, for example, is no more essential to the production of paper than are the myriad raw materials which enter into the production of other commodities moving freely in commerce between the two territories here involved as well as elsewhere throughout the United States. As Mr. Marks stated in the *Pulpwood* case cited above: "Pulpwood is the very heart of the paper industry to

[117]

the same extent that iron ore is the very heart of the steel industry." (V.S. 80, G-12, p. 18.)

6. There is a contribution of almost $5 million annually toward constant costs from the pulpwood traffic (V.S. 41, p. 6).

7. An analysis of the evidence with respect to the so-called "tacit transit arrangement" in relation to pulpwood and phosphate rock appears at pages 183 to 187 of our brief. It is there demonstrated that there is not even the tacit arrangement for which Southern lines contend. There is no real transit arrangement and there is no other kind of transit arrangement.

Witness Burroughs himself demonstrated conclusively that the transportation of pulpwood is not a necessary precedent to the routing via Southern lines of the paper produced from that pulpwood.

At page 3 of his Verified Statement No. 41, Witness Burroughs showed that Southern roads hauled 23,068,500 tons of pulpwood and originated 8,506,900 tons of paper and products. Thus, notwithstanding the claimed strict adherence to the inbound-outbound ratio, those railroads were required to originate and terminate only 2.71 tons of pulpwood for each ton of paper and products outbound rather than 5.5 tons as alleged. In effect then, the "burden" of handling pulp-

wood, said to be a prerequisite to securing paper traffic, was only half as great as asserted.

If, as stated, 5.5 tons of pulpwood are required to produce one ton of paper, it can be determined that the pulpwood handled by Southern lines produced only 4,194,272 tons of the total of 8,506,900 tons of paper and products originated by those lines. The remaining 4,312,628 tons, or over half of the total, constituted "free tonnage" secured by Southern lines without the necessity of any "burdensome" pulpwood haul. Using the same ratio of 5.5 to 1, this "free tonnage" obviously required the movement of 23,719,450 tons of pulpwood by carriers, presumably by water and highway, other than Southern railroads. Thus, in supplying the raw materials for this "free tonnage", truck and barge lines handled more pulpwood than all Southern railroads and did so

[118]

without receiving a single pound of outbound paper and products. This comparison makes it apparent, first, that pulpwood traffic is desirable, certainly, at least, to competing modes of transportation, for the revenues from that traffic alone and, secondly, and fortunately for Southern railroads, that there is clearly considerably less than strict adherence to the claimed practice of awarding the higher-rated paper traffic to the carrier hauling the inbound pulpwood.

Moreover, by this analysis, Mr. Burroughs' admitted speculation (p. 9) that the pulpwood rates might be increased and the paper rates reduced without injury to Southern lines but with serious impact upon Northern lines, is shown to be utterly removed from reality. Since there are water and motor carriers actively participating in the pulpwood traffic, for the sake of that traffic alone, rates on pulpwood are subject to competition; and, moreover, increased rail rates would run counter to Southern lines' policy to attract the paper industry to the South and to encourage its growth there. And so far as rate reductions on paper and paper products are concerned, Southern lines would hardly reduce

rates which are already sufficiently competitive to attract more uncommitted "free tonnage" for which truck lines are already competing than tonnage allegedly earned by handling pulpwood under the so-called tacit arrangement.

Inasmuch as it is the position of Southern lines that the principles asserted with respect to pulpwood and paper apply as well to the wet phosphate rock and dry phosphate rock (V.S. 41, p. 9), the foregoing comments are pertinent as well to the latter. While reference is made to certain transit tariffs, there is no rate adjustment to the shipper and no claim that the rate here being divided is that on the entire wet rock-dry rock movement (R. 1767). It follows that this is no more a true transit arrangement than was the case with pulpwood.

In their exceptions, Southern lines state that the sole issue is whether, in fact, transit relationships exist and it is said that the "uncontroverted fact" is that the Southern lines maintain rates on the

[119]

two raw materials which are conditioned upon outbound movement by rail of the dry phosphate rock and paper products. Again, it is stated that "The issue here is not whether such conditions upon the inbound rates exist, but whether such conditions create transit relationships" (Southern lines' Exceptions, p. 109).

How Southern lines can justify such statements in the light of the above facts is difficult to see. Southern lines' own evidence, as set forth above, disproves the relationship for which they contend. The statement that Southern lines sacrifice revenue on short-haul movements of the inbound commodities in order to get the outbound overlooks not only the existence of competition for the inbound commodities (Eastern lines' brief, p. 185) but, as well, the device of using the low inbound rates in order to attract the paper industry to the South.

It is stated, on p. 109 of Southern lines' exceptions that since Northern lines participate in the outbound movement

"made possible by the transit arrangements" Southern lines' divisions should "in all fairness" reflect the services performed as an integral part of the joint enterprise. Northern lines, having no control over these rates which were established, in part, to draw the paper industry to the South, have no objection whatever to Southern lines increasing them.

On p. 110 of Southern lines' exceptions, it is stated that the restated costs in the Recommended Report "unfairly assign to the movement of pulpwood or wet phosphate rock into the transit points the full pro rata constant costs per ton and per ton-mile, the bulk of which must, in reality, be borne by the outbound finished product." This is not correct. The restated costs make no assignment of constant costs to the movement of pulpwood or wet phosphate rock. The restated costs do not deal with those movements. Moreover, as the Examiners pointed out, this concept is an erroneous concept of the use of constant costs.

On page 111 of their exceptions, Southern lines endeavor to gain factual support for their theory about the relationship between inbound pulpwood and outbound paper by quotation from *Reduced*

[120]

Rates on Pulpwood in Southern Territory, 297 I.C.C. 735, 738 (1956). As indicated above, the facts now shown are quite contrary to those sought to be supported by quotation from the cited case. See Eastern lines' brief at p. 185.

It is stated on p. 112 of their exceptions that the Examiners do not directly challenge the "foregoing facts" set forth in Southern lines' exceptions. This is incorrect (Sheets 55 and 56 of the Recommended Report). Southern lines' attempt to avoid the force of the Examiners' conclusions concerning the nature of fully-distributed costs (an attempt which simply reiterates the theory that the commodities in question "are essentially and realistically related to the movement of paper and dry phosphate rock", p. 113, Southern lines' exceptions) has been sufficiently answered above.

Contrary to Southern lines' contention that the Examiners' "premise" that the movements involved are "intraterritorial traffic" and that that premise has "no reality", the record shows that the traffic is indeed intraterritorial traffic, that the rates applied thereto are wholly intraterritorial, that Northern lines have no participation whatever therein,, no voice in fixing them and, if they did, would unquestionably find it to their interest to increase the rates, at least on pulpwood.

The Commission should find that the Examiners were correct in rejecting the proposal to add to Southern lines' costs the so-called deficit on woodpulp and wet phosphate rock and, in so doing, find that the Northern lines are not parties to the rates on pulpwood or on wet phosphate rock, that they have no control whatever as to their level, that an important consideration in making the rates on pulpwood was to attract paper manufacturing plants to the South, that the rates are not transit rates, either alone or in conjunction with outbound rates, that, as a matter of substance, any such adjustment as that proposed by Southern lines would require like adjustments on raw materials moved wholly within Official Territory and followed by movements of finished products from Official Territory to the South, and that proposal misconceives the nature of constant costs.

Reply to Exception No. 1, B-8 Relating to the Exclusion of Suburban Service Deficits.

The eagerness of Southern lines to seek out ways to adjust Eastern lines' costs downward is well illustrated by their exclusion of suburban service deficits (V.S. 40, pp. 21, 22; V.S. 40-A, p. 10). Although both Northern and Southern lines have large passenger deficits, in ascertaining the relative transportation costs of Northern and Southern lines under the rates here involved, Southern lines urge the exclusion of only a part of the deficit, the part, of course, that is

more weighty in the North than in the South, that incurred in suburban service. By this adjustment, the Southern lines hope to reduce Eastern lines' relative share of the cost on this traffic by over $2½ million annually (Compare Tables 10 and 12 from V.S. 40).

The theory in justification of this adjustment is set forth in Mr. De Butt's Verified Statement No. 14. He says, at pages 12 and 13:

> "It is essential to an understanding of the passenger problem that it be realized that the deficits associated with intercity passenger service must be sharply distinguished from the deficits also incurred by some roads in providing suburban service within certain metropolitan areas in the North. They are separate types of operations, both physically and in the problems which they present.
>
> "Intercity passenger service is, in large part, performed over the same tracks, bridges and other facilities as are used in freight service. As a result, an important portion of passenger costs represents the allocation of costs common to freight and passenger service.
>
> "However, elimination of all intercity passenger trains experiencing out-of-pocket losses will not eliminate the reported passenger deficit. The passenger deficit will still reflect the large portion of carrier costs which would continue in any event if all passenger service ended. Under such circumstances, the intercity passenger

[122]

> deficit is treated as a burden to be recovered from the freight service. This becomes largely a matter of terminology, since the freight service is paying for the use of the common facilities that must be maintained for freight service in any event."

It is, if course, admitted that Southern lines have a large passenger deficit. Mr. De Butts admitted also that the railroads in the South have "local and branch line passenger trains which represent a serious drain against the railroad's other revenues" (R. 945). It would seem obvious that, from the standpoint of its relation to North-South traffic and the cost of performing it, there is no difference between that part of the passenger deficit which results from suburban operations and that part of the passenger deficit which result from the operation of through or local passenger trains. If the Southern lines should not properly be charged with any part of the deficit incurred in handling commuters from "A" to "B" in the East, it would seem logically to follow that the Northern lines should not be required to bear any part of the Southern lines' deficit from transporting passengers from "X" to "Y" in the South.

But Mr. DeButts's attempted distinction is that the suburban service is largely a separate service, using facilities not common to freight service, while other passenger service generally uses facilities that are also used in freight service. He suggests further that if the latter type of passenger service is discontinued the passenger deficit "will still reflect a large portion of carrier cost which would continue in any event if all passenger service ended", and that "Under such circumstances, the intercity passenger deficit is treated as a burden to be recovered from the freight service. This becomes largely a matter of terminology . . ." (V.S. 14, p. 13).

Southern lines' exceptions to the refusal of the Examiners to allow this arbitrary adjustment continues this theme (p. 115): "The basic reason justifying the inclusion of intercity passenger deficits as a part of the cost of providing freight services is that such passenger deficits are almost entirely attributable to the apportioned costs of common facilities *which must be incurred in any event to provide freight service.*" (Italics supplied.)

[123]

There is no proof whatever to establish as a fact that intercity passenger deficits "are almost entirely attributable to the apportioned costs of common facilities which must be incurred in any event to provide freight service." The summary assertion of this conclusion by a witness without data to support it certainly does not establish it as a fact.

The complex matter was examined by the Commission in *Railroad Passenger Train Deficit*, 306 I.C.C. 417 (1959), from which decision the Southern lines, at p. 115 of their exceptions, quoted a "criticism" of the rules for the separation of passenger and freight expenses, but not the result of the Commission's examination of that criticism. In that case, the Commission pointed out, at p. 423, that some parties took the position that "because of the nature of the separation rules, the soundest criterion of the profitability of railroad passenger service is solely related passenger operating expense plus an additional amount to reflect taxes, rents, interest on depreciated investment, and certain other items."

Among the studies introduced to show the *avoidable costs* of passenger train service was one that was "introduced in evidence at our [the Commission's] request . . ." (p. 424). The conclusion of that study, as quoted by the Commission on p. 425 of its report was that:

> ". . . 'the total passenger operating deficit as estimated by a statistical approach would amount to $708 million' in 1955, 'somewhat higher than the I.C.C. estimate for 1955 of $476 million."

Then, at p. 426:

> "The conclusion from the study that its 'statistical estimates of avoidable costs more often exceed than fall short' of the showing in our statistical reports bearing on the passenger deficit is of major significance and *serves as a warning that common costs cannot be lightly dismissed.*" (Italics supplied).

[124]

This obviously puts to rest the entire basis for Southern lines' attempted distinction between suburban service deficits and deficits from other kinds of passenger operations, their assertion that common costs would go on even without intercity passenger service and that they are "largely a matter of terminology."

It may be noted, also, that the passenger service deficit that is determined by comparing passenger revenue with common and solely related expenses gives no consideration to "an additional amount to reflect taxes, rents, interest on depreciated investment, and certain other items." (306 I.C.C. at 423). These, obviously, are very large amounts.

In their analysis of the contention that the passenger deficit on other than suburban service is fictional, Northern lines pointed out that Southern lines had a deficit simply on the basis of matching passenger revenue with solely related passenger expenses. At p. 118 of their exceptions, Southern lines attribute to Northern lines a theory that it is no more inappropriate to assign suburban service deficits as part of the cost of Official-Southern traffic than it is to assign deficits representing a deficiency in all passenger revenues as compared to *solely related passenger expenses.* Northern lines advanced no such theory. If the language referred to in the Examiners' report at Sheet 53 is susceptible of a construction that they did make such a contention, it should be made clear that they did not and that they presented the solely related costs simply to show in one conclusive manner the error of Mr. De Butt's contention that the passenger deficit on intercity service is largely fictional (Eastern lines' brief, p. 176). This, however, in no way implied that the common expenses apportioned to that service should be disregarded (Eastern lines' brief, p. 176). It is disregarded in the calculation offered at p. 119 of Southern lines' exceptions wherein they purport to adjust Southern lines' passenger deficit as allocated to the North-South

traffic by confining the deficit to the difference between revenues and apportioned common expenses. This maneuver must fail in the light of the total absence of any evidence

[125]

to support Southern lines' assertion that the apportioned common cost "must be incurred in any event to provide freight service" (p. 115, Southern Exceptions), a contention which is contrary to the Commission's conclusion in *Railroad Passenger Train Deficit, supra.*

It should be noted also that the evidence adduced by Southern lines with respect to the nature of the suburban deficit does not indicate that *all* of the expenses of providing such service are exclusive to the lines and operations used in providing it. The evidence quoted on pages 116 and 117 of their Exceptions related primarily to "roadway facilities". The Examiners referred to this evidence and pointed out that while certain track expenses could be saved by abandoning the suburban service referred to in the evidence, "other costs related to the roadway would continue, such items as land taxes, grading, ditching, culverts, bridges, and signaling systems" (Sheet 54). Southern lines complain that these conclusions of the Examiners are contrary to the record made by the Northern lines before Congress. As shown in Southern lines' Exceptions at pp. 116-117, this is not so.

It is implied, on p. 116 of Southern lines' exceptions, that there was no proof to support the finding that without suburban service the expenses for such items as land taxes, grading, ditching, culverts, bridges, and signalling systems would continue. It is manifest from the fact of the presence of a railroad that such items of expense as those mentioned by the Examiners must be incurred in some degree.

For the above reasons, the Examiners were obviously correct in rejecting this proposed adjustment of Southern lines. And Northern lines wish to bring to the attention of the Commission one additional fact which, if it stood alone,

would completely dispose of the point. The Northern lines which perform the suburban service are, of course, the lines of the *Eastern District*. Exhibit B to V.S. 3 shows, at p. 15, the unit costs for Eastern District lines excluding passenger and l.c.l. deficits. At the average haul, and using the 1956 costs, this showed

[126]

Eastern lines as incurring 50.5 percent of the total costs. Using the I.C.C. basis, which includes passenger and l.c.l. deficits, Eastern lines incurred 50.7 percent of the total costs. Again, comparing the I.C.C. out-of-pocket basis with the I.C.C. fully-distributed basis, using 1956 costs at average haul, Eastern District lines have 51.7 percent of the box car out-of-pocket costs, which do not include the passenger and l.c.l. deficits, and 50.7 percent of the fully-distributed box car costs. The figures for refrigerator cars are 35.7 percent and 35.6 percent, respectively. (V.S. 3, Ex. B, p. 14). Thus, from the standpoint of relative costs, Eastern lines have demonstrated their entitlement to increased divisions even if no consideration were to be given passenger deficits by the Commission. This deficit must be viewed as an entirety, however. Obviously, it would be unfair to pick and choose a part of the passenger deficit to be excluded, selecting in such manner as to distort cost relationships to the advantage of Southern lines. Either the passenger deficit should be excluded from the cost figures in its entirety or it should be included in its entirety. On either basis, the higher costs in the North are manifest.

The Commission should find that:

There is no valid basis in the evidence for distinguishing between suburban passenger deficits and other passenger deficits, that Southern lines' assertion that the expenses related to so-called intercity passenger service would largely continue if such service were abandoned and that they are, therefore, largely fictional

is not convincing, that although Southern lines have not asked that their own passenger deficits be excluded in calculating their service costs to be applied to the North-South traffic involved in this case, if it were proper to exclude deficits resulting from any passenger service, the entire passenger deficits of both Southern and Northern lines should be excluded, and that if the total passenger deficits were excluded the Northern lines' share of the costs of performing the freight service here involved would be higher than with the deficits included. Southern lines' proposed cost adjustment relating to the suburban service deficits is rejected.

BEFORE THE
INTERSTATE COMMERCE COMMISSION

(Title omitted in printing.)

REPLY OF EASTERN RAILROADS TO THE EXCEPTIONS OF SOUTHERN GOVERNORS' CONFERENCE ET AL. TO EXAMINERS' RECOMMENDED REPORT

---

[1]

Come now Eastern railroads respondents in No. 29885 and complainants in No. 29799, herein termed northern lines; and make this their reply to the exceptions jointly filed by Southern Governors' Conference and Southeastern Association of Railroad & Utilities Commissioners, interveners, to the recommended report and order of the

[2]

Examiners, and to the separate concurring exceptions of intervener North Carolina Utilities Commission. For brevity interveners will here collectively be termed "Southern Interveners"

Introduction

To an important extent the exceptions of the Southern interveners deal with contentions raised and chiefly urged in the exceptions of Southern Territory Railroads. Accordingly, what is said in reply thereto should be understood as also applying to the similar points presented by the Southern Interveners. But the exceptions of the latter raise some additional points that warrant discussion here.

A. The Importance to the Public of the Transportation Services of the Carriers Is Not a Sectional Concept.

Running throughout the exceptions of the Southern Interveners is the assumption that the statutory item of "the importance to the public of the transportation services of such carriers"—to which the Commission is required to give due consideration—is a purely sectional or regional concept.

[3]

But this assumption is contrary to the statute itself and to the policy of the Congress.

By reference to the preceding language of Section 15(6) the expression "such carriers" will be found to refer to "the several carriers" and "the carriers concerned" in the transportation under the rates to be divided. Such carriers are *all* carriers, or in a case such as the instant one where primary divisions are being fixed between two groups of carriers, *both* carriers groups. Thus, what is required of the Commission in its consideration of this item is a *balancing* of the situation of the carrier groups concerned. Only so can the Commission's determination subserve the Congressional policy which is of *national*, rather than of purely sectional, scope.

There can be no doubt as to the nature and scope of the policy of the Congress in this respect. Thus, in construing the scope of the Commission's authority under Section 15(6) the Supreme Court, in *New England Divisions Case*, 261 U.S. 184, pages 189-190, held in part:

> "The Transportation Act, 1920, introduced into the federal legislation a new railroad policy. • • • The 1920 Act sought to ensure, also, adequate transportation service.
>
> • • •

To preserve for the *nation* substantially the *whole transportation system* was deemed important. By many railroads funds were needed, not only for improvement and expansion of facilities, but for adequate maintenance. On some continued operation would be impossible, unless additional revenues were procured. A general rate

[4]

increase alone would not meet the situation. There was a limit to what the traffic would bear. * * * It was necessary to avoid unduly burdensome rate increases and yet secure revenues adequate to satisfy the needs of the weak carriers. To accomplish this two new devices were adopted: the group system of rate making and the division of joint rates in the public interest * * *. This, it was hoped, would enable the *whole transportation system* to be maintained, without raising unduly any rate on any line." (Emphasis supplied).

Where the Commission, as in *New England Divisions*, 62 I.C.C. 513, and 66 I.C.C. 196, or as in the *Citrus Divisions case*,* gives weight in fixing divisions to the importance to the public of the transportation services of particular carrier groups, it does so not on the basis of sectional considerations, but in the light of the Congressional policy to maintain an adequate *national* system of transportation.

The same purpose for the Nation as a whole was expressed in the National Transportation Policy declared by the Congress in the Interstate Commerce Act as amended in 1940, wherein its objective was stated as follows:

"—all to the end of developing, coordinating, and preserving a national transportation system by water, highway, and rail, as well as other means, adequate to

---

* *Atlantic Coast Line R. Co. v. Arcade & A. R. Corp.*, 194 I.C.C. 729, 760-762, *Baltimore & O. R. Co. v. United States*, 298 U.S. 349, 361.

meet the needs of *the commerce of the United States, of the Postal Service, and of the national defense.*" (Emphasis supplied.)

[5]

The same ultimate objective was also declared by the Congress in enacting the provisions for Loan Guaranties in the Transportation Act of 1958. Thus, in Sec. 501 (49 U.S.C. §1231) the Congress declared:

> "It is the purpose of this part to provide for assistance to common carriers by railroad subject to this Act to aid them in acquiring, constructing, or maintaining facilities or equipment for such purposes, and in such manner, as to encourage the employment of labor and to foster the preservation and development of a *national transportation system* adequate to meet the needs of the *commerce of the United States*, of the *postal service*, and of the *national defense.*" (Emphasis supplied).

In the light of the definite policy of the law in this respect, the exceptions of the Southern Interveners, insofar as they criticize the Examiners' report for not giving 100 percent effect to their evidence on the subject of the importance of the Southern carriers' service to the economy of the South, are without justification. Clearly, the Examiners fully understood the national scope of the policy of the law and measured the evidence of the Southern Interveners in the light thereof. While such evidence, when produced, will have the Commission's consideration, the Commission is not relieved from the statutory requirement of giving due consideration to this element by the absence of other than carrier evidence on the subject. The division of rates is not a mere partition of private property (*New England Divisions Case*, 261 U.S. 184, 195), but is a proceeding which may well affect the national public interest as well as that of the carriers immediately concerned.

[6]

Accordingly, in considering evidence addressed to this issue —or even without other than carrier evidence addressed to this issue—the Commission must necessarily act in the light of its previous holdings relating to the same general subject matter. An illustration of this would be the predominant extent to which its approvals of loan guaranties have involved applications from Eastern District railroads.*

The Examiners' full understanding of the Commission's duty to consider in cases such as the instant one the importance to the public of the transportation services of the several carriers—quite regardless of the presentation of the evidence on that subject by members of the public in the territories concerned—is shown by their statement at Sheet 59 that—

> "In prior territorial-wide divisions cases the public generally has not concerned itself with such issues which primarily are viewed only as a struggle between the railroads."

Thus, whether with public participation or not, the Commission is obliged to consider facts bearing on this issue, although from a national rather than from a sectional standpoint.

[7]

The implicit argument of Interveners, that the element of public importance as an item for consideration in divisions cases is a purely sectional concept, is inconsistent in principle with the contention of the complainants in *State of Alabama v. New York Central R. Co.*, 235 I.C.C. 255, the so-called *Southern Governors' case,* wherein they were seeking reduction of certain northbound interterritorial commodity rates. Thus, at page 308 the Commission, in setting

* See 74th Annual Report of the Commission, page 70; 75th Annual Report, page 81; and 76th Annual Report, pages 83-84.

forth the positions of the parties, described complainants' position in part as follows:

"Positions of the Parties

Complainants take the position that the present interterritorial rate structure prevents that freedom of movement of articles produced in the South which is contemplated by the act. They point to the vast natural resources of the South as evidence, in itself, of a need and demand for rates which will permit products manufactured therefrom freely to move to the great consuming centers of the North. In their view section 15a(2) of the act—since the amendment thereof by the Emergency Railroad Transportation Act, 1933, which eliminated therefrom the words 'rate groups or territories'—places emphases on the freedom of movement of traffic and on the public interest. *They urge that the public interest referred to is not that of the public in a particular rate group or territory but is the national public interest.*" (Emphasis supplied).

B. The Southern Public Alone Does Not Bear the Burden of Interterritorial Rates.

The exceptions of the Southern Interveners to an important extent proceed upon the implied assumption that the Southern public—and the Southern public alone—bears the burden of interterritorial rates. This is manifest from their

[8]

contentions that seek to retain uniform interterritorial divisions as long as uniform class rates remain in effect. Thus, their argument assumes that interterritorial rates and the divisions thereof should be viewed wholly from a sectional standpoint in which the interterritorial rates are properly to be regarded as the concern only of the Southern public in competing with shippers in other territories.

This concept is much too narrow. For every shipper there is a receiver; for every transaction a buyer and a seller. Similarly, for every producer there is a consumer. Subject to temporary maladjustments, it is the consumer who ultimately pays and bears the transportation burden. Thus, it is not true that the Southern producer of northbound commodities is more affected than the receiver or consumer. Nor is it true that the Southern receiver or consumer of southbound commodities is more affected than the Northern shipper or producer. Thus, there is no sound ground for the view that the Southern public is more affected than that in the North by reasonable and nonprejudicial rate adjustments.

C. No Injury Would Result to the Southern Economy From Fair Divisions of Interterritorial Rates.

Exception No. 3 of the Southern Interveners contains a most remarkable contention—remarkable in its extremeness and obvious inconsistency. Thus, at page 30 their

[9]

exceptions state in effect that a proper recognition of the Southern public interest requires the maintenance of the present equal-factor divisions *even if the costs and revenue needs of the Northern railroads were shown to be higher* with respect to the interterritorial traffic than those of the Southern roads. In other words, the contention is that higher costs in the North under equally efficient management and greater revenue needs of Northern railroads, although established, should here be disregarded in the light of the Southern Interveners' showing of the Southern public interest.

1. The Contention of the Southern Interveners on This Subject Is Unsound.

The foregoing contention not only places the public interest of a section of the country above that of the na-

tional public, but inconsistently assumes that sectional public interest could outweigh the national interest in satisfying demonstrated revenue needs of an essential carrier group. But this would be directly contrary to the policy of the law, as above explained, which views such matters in the light of the *national* interest.

2. The Earnings of the Southern Group Would Not Be Unduly Depressed by the Establishment of Fair Interterritorial Divisions.

At page 12 of their Exceptions the Southern Interveners state that—

[10]

> "The Northern railroads are here seeking to deprive the Southern railroads of more than $25,000,000 annually of their present revenues. Although the divisions recommended by the Examiners probably do not accede to the full extent of this outrageous demand, they certainly go a long way in that direction."

Misunderstanding this assertion, the exceptions of North Carolina Utilities Commission, at pages 1-2, state that the Examiners' report and order *would* transfer from the Southern to the Northern railroads $25,000,000 in revenue.

As indicated at page 22 of Eastern Lines' Exceptions, the Examiners' report would afford Official territory lines an increase of approximately $11,000,000 on the basis of Southern lines' traffic study. This result would distribute total revenues in substantially the same total proportions as would *1956* group costs as restated. Relative costs as of 1959, without reference to the greater revenue needs of the Northern carriers, would justify an annual increase in their divisions of about twice that amount.

But if, based on their higher costs and greater revenue needs, the Northern lines were accorded divisions which

would accord them an increase of $25,000,000 annually, that result would not unduly or improperly reduce the earnings of the Southern carrier group. This is shown by the following statement, in which the rates of return for the Southern Region and the Eastern District plus Pocahontas Region are shown as set forth at page 10 of Exhibit No. 1 to V.S. No. 36, and as

[11]

adjusted to reflect an assumed divisional transfer of $25,000,000 annually subject to payment of Federal income tax.* However, as to such of the Eastern lines as paid no Federal income taxes in the years indicated, the increased divisions would represent 100-cent dollars.

	Rates of Return			
	Actual		Assumed $25 Million Transfer	
	South	North	South	North
1956	5.02	4.05	4.69	4.15
1957	4.14	3.29	3.82	3.40
1958	3.68	2.00	3.37	2.10
1959	3.63	2.27	3.32	2.38

3. If Divisions Are Basically Fair, Their Revenue Result Is Not Controlling.

As long as the divisions prescribed by the Commission do not differ from what "justice merely as between the parties would suggest",** the revenue results to the participating carriers do not affect the lawfulness of the Commission's order. The fact that such divisions may apply to rates of high or low level, with resulting surplus or deficiency of revenues to the carriers above or below their relative costs, is not important. Under normal conditions relative costs of service furnish the real measure of what "justice merely as between the par-

* With a 52% Federal corporate income tax this computation assumes a net reduction South and a net increase North of $12,000 annually.

** Baltimore & Ohio R. Co. v. United States, 298 U.S. 349, 370.

[12]

ties would suggest."

4. Fair Interterritorial Divisions Would Not Force Increases in Southern Intraterritorial Rates.

At pages 13-15 of their Exceptions the Southern Interveners suggest in effect that if the prescription of fair divisions of the interterritorial rates should serve to reduce Southern lines' revenues, such reductions would have to be made up, in part at least, from an increase in their intrastate rates. This is a highly speculative point. There is a singular omission, moreover, in Interveners' failure to show that any such increases resulted from the Commission's 1953 order herein. No consideration is given, either, to the fact that whatever risk southern intraterritorial shippers may be exposed to in this regard, it would be no different in kind from that which has confronted other intraterritorial shippers whenever the Commission by rate or divisions orders has heretofore decreased the revenues of a carrier group, and that here it would be a risk of substantially less degree in the light of the presently greater competition from motor trucks, barges, mine-mouth generation of power, and other such factors.

D. Uniform Class Rates Do Not Require Uniform Divisions.

1. The Contention of Southern Interveners to the Contrary Is in Error.

The Exceptions of the Southern Interveners in effect contend that, regardless of the higher costs and greater revenue needs of Northern lines, the interterritorial divisions

[13]

should remain on an equal-factor basis as long as class rate uniformity is maintained. This contention is completely in

error. It is quite plain from the foregoing quotation from the *New England Divisions Case, supra,** that a primary purpose of Congress in giving the Commission the authority conferred in Section 15(6) was to enable it to make disparate divisions of uniform rates where to do so would serve the declared Congressional policy.

The suggestion of the Southern Interveners—that the prescription of higher divisions for Northern than for Southern lines, even though justified by relative costs and greater revenue needs, would require Southern lines to "subsidize" the Northern carrier group—involves a basic misunderstanding of the situation. The point is well expressed in the concurring opinion of Commissioner Potter in the Commission's report on reargument in *New England Divisions,* 66 I.C.C. 196, at page 207. There Commissioner Potter stated in part:

> "The majority report now filed requires no taking from the respondents of anything that belongs to them. It proposes only to insure a disposition of joint earnings necessary to promote the purpose for which, under the transportation act, the earnings were authorized to be collected from shippers."

[14]

2. The Decision in Docket No. 24160 Does Not Assist Interveners' Contentions.

In their Exception No. 4 the Southern Interveners appear to rely upon the decision in Docket No. 24160, *Divisions of Rates, Official and Southern Territories,* 234 I.C.C. 175, to support their contention that the Commission need give no weight to relative service costs, but may appropriately rely on relative rate levels as a basis for fixing interterritorial divisions. Such reliance is not well placed.

---

* *V. supra,* pp. 3-4.

As is evident from the tabulation at page 187 of that decision, the average costs North and South, for the several ton-mile and car-mile units therein set forth, were for the 10-year and 5-year periods ending with 1936. The decision itself is dated July 25, 1939. This was prior to the development of the Rail Form A formula designed by the Commission's Cost Section. That the Commission did not then have any reliable basis for comparing the costs of the Northern and Southern groups on the interterritorial traffic is manifest. Thus, at page 189 of its decision, in concluding its discussion of such relative cost data as were of record, it stated:

> "These differences make it hazardous to express a definite opinion as to relative costs of transportation in the two territories. Perhaps the most significant figures bearing on the problem are those submitted by the northern lines, before referred to, show-

[15]

> ing that the southern lines' average cost per revenue ton-mile in the period from 1927 to 1936 was 11 percent greater than that of the northern lines and in the period from 1932 to 1936 was 16 percent greater. This comparison takes no account of the fact that the average haul in the South is apparently somewhat greater than that in the North and that the average carload weight is less in the former territory, these two factors tending to offset each other. The statistical evidence, unsatisfactory as it is, leads to the conclusion that transportation costs on the traffic here considered may properly be considered to be higher in the South, and that, although the exact degree of difference is indeterminable, it is not negligible, as the northern lines argue."

That the assumption that higher costs then obtained in the South was definitely a contributing reason for the Commission's prescription of higher divisions for Southern lines

than for Northern lines in No. 24160 is confirmed by Chairman Eastman's dissenting opinion in *State of Alabama v. New York Central R.R. Co.*, 235 I.C.C. 255 (1939) (the so-called *Southern Governors' case*), wherein at page 343 he stated in part:

> "Complainants contend that cost of service is, on the average, at least no higher in the South than in the North, and they maintain that it is somewhat lower. From their findings I infer that the majority agree that the cost is not higher. The southern carriers, however, emphatically repudiate this conclusion. They insist, as they always have insisted, that their average cost is materially higher. *For this reason they have demanded, and have received, relatively greater divisions of the interterritorial rates than are accorded the northern carriers.* We have quite recently passed upon the divisions of all these rates, except those on coal, coke, and lumber. Under the normal basis which we fixed, the southern lines receive divisions which are relatively higher by 25 percent than the divisions of the northern lines. The bases which they were accorded on fruits
>
> [16]
>
> and vegetables, including citrus fruit, from Florida are still more favorable, and by a wide margin. Only where the interterritorial rates are on, or approximate, the northern level did we make the divisions proportionately equal." (Emphasis supplied).

Thereafter the Commission in *Class Rate Investigation, 1939*, 262 I.C.C. 447, herein termed No. 28300, had before it the results of the studies made by its new Cost Finding Section. The territorial cost studies there before it were computed under the Rail Form A Formula by the Commission's Cost Section for the *year 1939* and were approximately equal for the Northern and Southern groups (262 I.C.C. 557). As the Commission found at page 693 thereof,

such costs were deemed by it to be reliable as "relative costs for transporting all traffic, or important or well-defined segments of traffic, by territorial groups of carriers". It is costs of this character that Northern carriers here presented for Commission consideration.

3. Relative Levels of Territorial Costs Have Changed Substantially Since 1939.

Interveners' contention that the present uniformity of interterritorial divisions should be maintained while class rate uniformity exists is unsound. The uniform class rates prescribed in No. 28300 were essentially based on territorial cost relationships *as of 1939*. Since that time there have been substantial changes in the cost relationships of the Northern and Southern groups.

In the original proceedings herein Eastern lines

[17]

presented evidence of relative territorial costs under the Rail Form A formula as of *1948*. These disclosed that freight service costs for a 26-ton load in box cars at 350 miles was 10 percent higher for the Eastern District including Pocahontas Region than costs within the South. Eastern District costs were 16 percent higher. In its original decision herein, however, the Commission concluded that such higher costs were of transitory character and that the costs for the future would be approximately equal. Thus, at page 526 of its original report herein (287 I.C.C. 497) the Commission stated:

> "If we were to give controlling weight to the cost studies of the northern lines for 1946 and 1948 in this record, the differentially higher basis of divisional factors sought by those lines would be justified. We do not accept that showing at face value because, admit-

tedly, there were certain important items of expense in those years which may reasonably be regarded as transient, particularly in the northern lines' accounts for maintenance of way and structures and equipment. This was particularly true of the Pennsylvania, which in 1948 and the two following years had high freight-car repair costs apparently cyclic in nature. We consider it to be the safest assumption for the future upon the facts before us that neither contesting group will have an appreciably lower basis of operating costs than the other, and that there are no other relevant circumstances which are of sufficient importance to justify higher divisional factors for one group than the other."

However, the instant record demonstrates that the Commission's expectation was not realized, but that on the contrary the costs in the North continued generally to rise in relation to those in the South (Exhibit B to V.S. No. 3).

[18]

But, for the reasons already explained, a change in divisions is not dependent on a change in rate levels. Indeed, the expanded power given the Commission over divisions by the Transportation Act of 1920 was in part based upon the propriety, upon a proper showing, of fixing *disproportionate* divisions of a uniform structure of rates.

E. Interveners' Contentions Concerning Relative Costs Are Unsound.

To the extent that Interveners in their exceptions raise questions concerning relative costs which are treated in the separate reply of Eastern lines to similar contentions of the Southern carriers, reference is here respectfully asked to such treatment. Some additional comments on Interveners' contentions in this respect, however, are here warranted.

1. There Is No Burden on Northern Lines to Justify the Form A Territorial Cost Relationships.

Interveners in effect contend that Northern lines are in no position to take advantage of the Form A territorial cost relationships without undertaking by detailed operating and statistical evidence to explain the reasons for the differences in the Form A results north and south. This is not only erroneous, but completely disregards the experience of the Commission and the carriers in the earlier cases before Form A territorial costs were available.

Formerly, when reliable cost data were not

[19]

to be had, the usual carrier approach to a problem basically involving rail costs was to adduce large quantities of detailed operating testimony. This was upon the theory that the more work and difficulties involved in the performance of transportation service, the greater the consequent cost. Necessarily, this was a most inexact method of proof. This was clearly recognized in *Rates on Petroleum Products*, 167 I.C.C. at pages 139-140. The Commission, speaking through Commissioner Eastman, dealt with this subject as follows:

> "Evidence in regard to difficult operating conditions is unsatisfactory unless accompanied by evidence showing the effect upon operating expense. Proof that a railroad has severe grades and curves may justify a conclusion that its operating costs, unless there are offsetting advantages, are relatively greater than those of railroads which encounter lesser difficulties; but it throws no light upon the degree of excess cost. If physical difficulties enhance operating cost, the results must, of course, in some way reflect themselves in the accounts."

To similar effect was the decision in *Divisions of Freight Rates*, 203 I.C.C. 299. The Commission on this subject stated at page 312:

"*Operating Conditions.* The transcontinental group submitted a great mass of evidence purporting to show that transportation costs are relatively higher west of the gateways, but of such a nature that it throws no light whatever on the amount and extent of the excess, if there be any when all factors are considered."

But with the advent of reliable territorial costs as developed under the Form A formula of the Commission's Cost Section, the need for extensive operating and statistical evi-

[20]

dence as a means of explaining the reasons for such relative costs was diminished or largely eliminated. Whatever refinement of Form A costs may be necessary or appropriate in considering the reasonableness of rates for transporting a particular commodity over a single railroad or group of railroads, the Commission's decision in *Class Rate Investigation,* 1939, 262 I.C.C. 447, establishes that Form A territorial costs may safely be relied upon by it when considering "relative costs for transporting all traffic, or important or well-defined segments of traffic, by territorial groups of carriers". In sustaining the Commission's order in this case the Supreme Court gave specific consideration to the Commission's findings concerning relative costs of service. *New York v. United States,* 331 U.S. 284, 315 *ff.* (1947).

Accordingly, there was no occasion for Eastern lines in making their prima facie case in respect of relative service costs to burden the record—either in explanation of why the costs are different or for any other purpose—with an extensive description of operating testimony, statistical data, and detailed analyses of accounts, since all those elements, insofar as they had cost consequences, were distilled into the Form A group costs.

[21]

2. The Record Nevertheless Indicates the Basic Reasons for Eastern Lines' Higher Territorial Costs.

Interveners in their Exceptions argue in effect that higher group costs in the North are not of significance in the fixation of group divisions unless shown to flow from "natural disadvantages". For the reasons just stated this contention is clearly unsound. Nevertheless, it may be noted that the record in the instant investigation contains ample evidence of the differences in conditions north and south which reflect themselves in cost consequences. Thus, Eastern lines operate in a more populous territory, where they have shorter hauls and a greater proportion of terminal to line-haul service. As shown in V.S. 69, at pages 5-8, railroad terminal expenses tend to rise much faster than line-haul costs. Further, wage rates and taxes are higher in the North than in the South. As demonstrated in V.S. 80, Section F, had the Northern lines in 1956 had the benefit of Southern lines' wage and tax bases they would have realized savings of $135,208,800 for the railroads of the Eastern District alone, and of $168,598,737 for the lines of the Eastern District including Pocahontas Region.

3. Interveners Introduced No Cost Evidence.

To the extent that Interveners discuss the issue of relative costs they rely wholly upon the evidence adduced by the Southern respondents. Those lines undertook to "adjust"

[22]

the Form A results to meet certain of their theories. Northern lines' answers thereto have had the consideration of the Examiners, which are sound apart from items specified in exceptions of Eastern lines.*

* See, in this connection, Eastern Exceptions, pages 52-55, dealing with the Examiners' elimination of Platform costs.

4. Interveners' Contention Concerning Suburban Deficits Is Unsound.

For their principal reply to Interveners' contentions that deficits from suburban passenger service should be eliminated, the Northern lines rely upon what is said in their separate reply to Southern lines' contentions on the same subject. The following points, however, may here be noted:

(a) The Suburban Deficits Are an Unavoidable Incident of Northern Lines' Service.

It is the greater population of Official territory that makes the great Eastern markets so important to Southern producers and which is responsible for the manufacture of much of the goods consumed by the South and which it does not produce for itself. This population must be served to some extent by passenger service as well as by freight service. Insofar as the expense of the suburban passenger service is not met by fares the public will pay or by public assistance, such deficits become a part of the necessary costs of operation of the Eastern railroads. In principle there is no difference

[23]

between this situation and that in respect of Platform costs concerning which the Commission in *Class Rates Mountain-Pacific Territory*, 296 I.C.C. 555, at page 604, stated:

> "The effect of excluding the costs of platform handling of carload freight, * * * and the incidental revenues from these services, from a territorial cost study would result in a portion of the expenses not being considered. If the revenues from these services do not equal the costs associated therewith, the difference in costs must be covered by the line-haul rate as the only remaining source of revenues. In a territorial study of relative cost levels, all items of expense should be given consideration."

The Examiners' conclusion on the subject of suburban deficits at Sheet 54 of their report is in harmony with this principle.*

The basic principle which calls for consideration *of all passenger deficits, including those from suburban service,* was well expressed in the dissenting opinion of Commissioner Potter in *New England Divisions,* 62 I.C.C. 513, at pages 577-578. Since the views of the minority in this decision became those of the majority in the Commission's report on reargument, 66 I.C.C. 196, its decision in which was upheld by the Supreme Court,** this opinion is entitled to greater weight than the ordinary dissent. At

[24]

this point Mr. Commissioner Potter stated:

> "A too-narrow meaning has been given to 'service' as the term is used in the transportation act in connection with the division of through rates. Everything which the carrier provides and does makes up the service rendered and which is to be considered in determining divisions. In carrying its many burdens, whatever they may be, in operating its transportation machine under the conditions which surround it, the carrier is rendering service must be considered. In this case these burdens are the short hauls, the light train load, the complicated and expensive terminal arrangements, disadvantageous position respecting car hire, disproportionate burden of transportation of company fuel, and all factors of burden and expense which the carriers bear in order to furnish transportation. It is no answer to say that the conditions under which the New England lines operate are responsible for their

* Quite inconsistently, however, as pointed out in Eastern lines' Exceptions at pages 52-55, the Examiners' report fails to include the net costs of Platform service in restating Southern lines' adjustment of Form A cost results.

** 261 U. S. 184.

poor showing. These are the very conditions which these lines are entitled to have allowance made for in determining what is a fair division of the compensation which the shipper pays for all that goes to make up the service rendered to him. These are the conditions which the transportation act says, in a way that is new, must be taken into consideration. As the burdens change, divisions should in common fairness change, and this is both the letter and spirit of the transportation act."

(b) If Any Passenger Deficits Are to Be Included, All Such Deficits Should Be Taken Into Account.

The Southern lines propose that the Commission include passenger deficits except to the extent that they include those from operating suburban service. This represents an arbitrary and illogical approach. If any passenger deficits are to be included, all should be taken into account. There is no difference in principle involved.

But it is to be noted that when all passenger deficits as well as less carload deficits are taken into account,

[25]

their inclusion is of advantage to the South to the extent there is a difference in cost results. This is shown in Exhibit B of V.S. No. 3 by comparing pages 7 and 8 and pages 7a and 8a.

5. Northern Lines' Relatively Higher Costs Are Not the Result of Over-capacity of Plant.

At page 21 *ff* of their Exceptions the Southern Interveners criticize the Examiners' report for "failure to recognize inefficiency and over-capacity as the real causes for whatever problems the Northern railroads might have". The suggestion of inefficiency will be dealt with hereinafter,

but in view of Interveners' implied suggestion that over-capacity is the explanation for Northern lines' relatively higher costs, the following points may be noted:

The argument of the Interveners on this subject appears to suggest that prior to the establishment of uniform class rates as a result of the Commission's orders in No. 28300, Northern lines enjoyed an "artificially high level of economic activity", and that their present difficulties stem in part from over-capacity.

This contention confuses the possibility of savings as a result of mergers with the question of relative service costs. While it is not yet clear what mergers will be approved and what and when resulting savings therefrom will be obtained, it cannot be doubted that such savings will affect all carrier groups.

[26]

If in the absence of mergers there were deemed to be any over-capacity in any carrier group, it would have to be in plant. Certainly in view of the present demand for cars no such contention could relate to over-capacity in equipment. But if such over-capacity were assumed to exist in railroad property, the effect thereof, for the purpose of determining relative territorial costs, could be eliminated by making comparisons on an *out-of-pocket* cost basis, which eliminates *50 percent of the return on road property* as well as *20 percent of all expenses* (including those of *maintenance*), *taxes, and rents.*

But when comparison is made of Northern and Southern territorial costs on an out-of-pocket basis the Northern proportion of total costs is *larger* than when using fully distributed costs. See in this connection page 14 of Exhibit B to V.S. No. 3.

This comparison indicates that as a practical matter there is no over-capacity as between the two groups which affects their relative cost relationships.

6. The Higher Costs in the North Are Not a Transitory Condition.

In every interterritorial divisions case involving Northern lines in which relative cost has been given serious consideration they have met the contention that their higher relative costs represented a merely transitory condition and that the future would show a return to costs substantially equal.

[27]

Such a contention was made by Southern lines in the original phase of this case and by Southwestern lines in *Official-Southwestern Divisions,* 287 I.C.C. 553. On the facts before it the Commission accepted this view, and the equal-factor divisions prescribed in 1953 were the result thereof. But, as shown in the instant record, the results of time have proved the contention and estimate erroneous.

Throughout the whole period Northern lines have been controlling their costs and improving their operations to the full extent their finances permitted. The fact that the higher costs in the North have persisted, and have tended to increase relatively over those in the South, furnishes cogent evidence that there are solid reasons for such relatively higher costs which should no longer be disregarded if this important item is to be given the due consideration contemplated by the statute.

F. Interveners' Suggestions of Inefficiency Are Unsupported and Insupportable.

Without tendering or pointing to any proof thereof, the Southern Interveners have no hesitancy in reiterating their assertions and suggestions that Northern lines' relatively higher costs stem from inefficiency. Yet even Southern lines made no such charge. Indeed their studied efforts to prove such an assertion in the initial phase of this case failed completely. *Official-Southern Divisions,* 287 I.C.C. 497, 510-519.

[28]

As stated in the Examiners' report herein (Sheet 17): "In this reopened phase Southern lines do not question the relative operating efficiency of the opponents."

What Interveners have to say on the subject of "self help" by Northern lines relates to the subject of revenue needs,* which will next be noted. But as concerns any issue of efficiency no such issue has herein been raised or tried, and Interveners' suggestions in that respect are not here pertinent.

G. Interveners' Contentions on the Subject of Revenue Needs Are Without Foundation.

To the extent that the contentions of Southern Interveners concerning the item of general revenue needs parallel those of the Southern railroads, such contentions are met and answered in the separate reply thereto by Eastern Railroads. But since Interveners' exceptions erroneously assume that the Examiners' recommendation is founded on the greater revenue needs of the Northern lines, brief mention of this subject is here necessary.

As already noted, the divisional basis recommended by the Examiners would accord Official lines a proportion of revenues roughly corresponding to their proportion of the total service costs as found by the Examiners based on *1956 cost relationships*. This would represent roughly $11,000,000 annually

[29]

on the basis of Southern lines' traffic study. Had *1959 cost relationships* been observed (see General Exception II of Eastern lines' exceptions) the Examiners would have been justified in recommending for Northern lines an increase *twice as great* and this would accord the Northern respondents *nothing* for their greater revenue needs.

---

* Cf. Examiners' Report, Sheet 18.

H. The Financial Health of the Northern Railroads Is Important to the Interests of the Nation, Including the South.

Because of the large population in Official territory the Northern markets are important to Southern producers, not only of raw materials, but of finished products. On the other hand, there are many products originated in the North which are also important to receivers and consumers in the South, as well as throughout the nation.

Excluding citrus fruit and fresh or green vegetables, over 58 percent of the northbound cars of traffic involved is classified as "Manufactures and Miscellaneous", and of the southbound cars 84 percent falls in this general category. Nearly 63 percent of the total revenue on northbound shipments is obtained from "Manufactures and Miscellaneous" traffic, and over 87 percent of the total revenue on southbound traffic is in the same general commodity group. (V.S. No. 1, Exhibit A, Sec. 2, page 2).

These figures also indicate, quite apart from the

[30]

tonnages of Products of Mines and of Forests northbound, as there also shown, that the ability of Northern as well as Southern lines to provide adequate transportation is in the common interest of the producers and consumers in both the South and the North. As integral parts of a single national transportation system by rail, the Northern and Southern carriers are alike essential to meet the needs of the commerce of the United States, the Postal Service, and of the national defense. To assure and maintain this adequacy the financial health of all is essential.

The Southern Interveners seek to minimize the importance of the traffic involved to the Northern roads. But their argument in this respect, if valid, would apply to *all* interterritorial traffic of Official territory lines. Yet that

traffic as a whole is of great importance to them, not only because of its relative volume (see V.S. No. 75, Appendix A), but because the interterritorial traffic is on the whole better able to contribute ratably to meeting their revenue needs than their local traffic.

Conclusion

For the reasons set forth above, and for those detailed in the separate reply of Eastern Railroads to the Exceptions of the Southern carriers covering subjects discussed in the Exceptions of Southern Interveners, the Eastern Railroads

[31]

respectfully submit that the exceptions of said Interveners are without merit and should be disallowed by the Commission.

Respectfully submitted,

(Subscription and Certificate of Service omitted in printing.)

ORAL ARGUMENT BY SOUTHERN LINES' COUNSEL

(February 18, 1964):

[R-2764]

(By Mr. Trienens) Now, in this case before the Commission today, the Northern Lines made no effort to meet any of those standards which were held controlling by the court. The Northern Lines' evidence contained no evidence relating to particular divisions, rates, services on this Official-Southern traffic, or the effect on individual railroads. It is all grouped, one big happy group with the Norfolk & Western and the New Haven in there all mixed together.

I might say we have in this case an issue which was not referred to by Mr. Kaier and which we discuss in our exceptions, as to the construction of the scale. We say the terminal allowance is too big, it isn't supported by any findings, it isn't supported by any evidence, particularly of terminal costs. Because the North has a shorter average haul, they benefit from this.

The Denver court emphasized that the construction of a scale must be supported by findings and evidence. *You just can't come out of thin air with a scale.*

I might note that the Denver court case is now on appeal and might well reach the Supreme Court this spring.

• • •

ORAL ARGUMENT BY NORTHERN LINES' COUNSEL

(February 18, 1964):

[R-2869]

Commr. Walrath: Mr. Kaier, you have touched on a point that interests me a little bit just in passing.

Doesn't your argument about the per diem impact lead you to a conclusion that a deficit road, a deficit owning road would be at a real advantage in a divisions case?

Mr. Kaier: Oh, I don't think so, sir. If you had a deficit owning road aligned against another road, and you

were dealing with those two roads, you would have to take a look at the situation and decide what you are going to do. I don't know what it would be. But here you have got a deficit road, the Clinchfield was pointed to as being a road that wouldn't have any car cost. You can pick out roads like that in the North. I am sure the P&LE would be in the same situation. But if you have the group of car costs for the South and the group of car costs for the North, you are going to come out with a fair result in a case like this.

• • •

[R-2877]

In the course of his argument this morning, Mr. Trienens adverted very, very briefly to the decision of the court in Denver which set aside the Commission's order in the Western Trunk Line case.

I do not know if Mr. Trienens is raising the point in this case that there is any failure to satisfy the so-called typical evidence rule. But the way he spoke in that brief reference to the subject this morning leads me to believe that possibly he is making that contention, and if he is, he is making it now for the first time.

Mr. Chairman, I don't think we should be left in the dark on the question, and I would ask you, sir, if you would address a question to Mr. Trienens as to whether or not he is now asserting that the evidence in this case fails to satisfy the typical evidence rule.

Mr. Trienens: I don't have any hesitation to answer that. The answer is we think it does. Their whole case is based on these conglomerate averages, and we think that is the wrong way to try divisions case; and this is an inadequate record besides. We clearly do.

Chairman Goff: Very well.

Mr. Kaier: Mr. Chairman, I should like to make a brief argument on that point.

Chairman Goff: You have time.

ON APPEAL FROM THE UNITED STATES DISTRICT COURT
FOR THE EASTERN DISTRICT OF LOUISIANA
NEW ORLEANS DIVISION

JURISDICTIONAL STATEMENT

Appellants ("Northern lines") The Baltimore and Ohio Railroad Company et al., listed in Appendix E hereto (168a-170a),[1] appeal from the final decree of the United States District Court for the Eastern District of Louisiana, New

1. Figures with suffix "a" refer to pages of the appendices, *infra*.

Orleans Division, setting aside an order of the Interstate Commerce Commission entered upon further hearing in proceedings known as the *Official-Southern Divisions case.*

OPINIONS BELOW

The opinion of the District Court is reported in 270 F. Supp. 695 and is set forth in Appendix A hereto (1a-32a). The reports of the Interstate Commerce Commission are published at 325 I.C.C. 1 and 325 I.C.C. 449. These reports and accompanying orders are set forth in Appendix C hereto (37a-163a).

JURISDICTION

This action was begun by a complaint filed in the United States District Court for the Eastern District of Louisiana, New Orleans Divisions, under 28 U.S.C. §§ 1336, 1398, 2284, and 2321-2325 and Section 10 of the Administrative Procedure Act, 5 U.S.C. § 1009, subsequently codified as 5 U.S.C. § 706, praying that an order of the Interstate Commerce Commission be set aside. The final decree of the District Court, set forth in Appendix B hereto (33a-34a), was dated August 8, 1967, and was entered August 22, 1967. These appellants filed their notice of appeal in the District Court on October 2, 1967. The jurisdiction of this Court to hear this appeal is conferred by 28 U.S.C. § 1253. *New England Divisions Case,* 261 U.S. 184 (1923); *Baltimore & O. R. Co. v. United States,* 298 U.S. 349 (1936); *Chicago & N.W. R. Co. v. A., T.&S.F. R. Co.,* 387 U.S. 326 (1967).

STATUTES INVOLVED

Sections 1(4) and 15(6) of the Interstate Commerce Act, 49 U.S.C. §§ 1(4) and 15(6), and Sections 8(b) and 10(e) of the Administrative Procedure Act, now codified as 5 U.S.C. §§ 557(c) and 706, are set out in Appendix D hereto (165a-167a).

The provisions of Section 15(6) of the Interstate Commerce Act here most particularly involved, read:

> "Whenever, after full hearing upon complaint or upon its own initiative, the Commission is of opinion that the divisions of joint rates, fares, or charges, applicable to the transportation of passengers or property, are or will be unjust, unreasonable, inequitable, or unduly preferential or prejudicial as between the carriers parties thereto (whether agreed upon by such carriers, or any of them, or otherwise established), the Commission shall by order prescribe the just, reasonable, and equitable divisions thereof to be received by the several carriers, * * *. In so prescribing and determining the divisions of joint rates, fares and charges, the Commission shall give due consideration, among other things, to the efficiency with which the carriers concerned are operated, the amount of revenue required to pay their respective operating expenses, taxes, and a fair return on their railway property held for and used in the service of transportation, and the importance to the public of the transportation services of such carriers; and also whether any particular participating carrier is an originating, intermediate, or delivering line, and any other fact or circumstance which would ordinarily, without regard to the mileage haul, entitle one carrier to a greater or less proportion than another carrier of the joint rate, fare or charge."

QUESTIONS PRESENTED

The District Court set aside orders (herein termed "order") entered by the Interstate Commerce Commission in proceedings held pursuant to Section 15(6) of the Interstate Commerce Act. The order found existing divisions of joint rates, for the carriage by rail of all freight (other than coal and coke made from coal) between Official Territory and Southern Territory, to be unjust, unreasonable, and inequitable and prescribed new divisions which the Commission found would be just, reasonable, and equitable for the future.[2] Over 200 railroads, respondents in the principal proceeding, were involved, but the case was tried by the parties and decided by the Commission as a controversy between two contending groups of rail carriers—Eastern (or Northern) railroads and Southern railroads. Having found all other elements requiring consideration to be in balance as between the two groups, the Commission prescribed the new divisions with reference to the relative costs of the services involved to the Northern and Southern lines. The District Court set aside the said order and remanded the cause to the Commission for further proceedings.

The questions presented are these:

1. Whether the District Court invaded the authority of the Commission in holding that the relative costs relied upon by the Commission, which it had found adequate, reasonably accurate, and reliable for the purpose, were insufficiently refined to support its prescription of new intergroup divisions, and that accordingly the Commission was obligated as a matter of law to develop more refined cost data described by the District Court as the "actual costs of handling the specific traffic at issue."

---

2. Official Territory is comprised of the area lying generally east of the Mississippi River and north of the Ohio River, and certain points in Virginia. Southern Territory lies generally east of the Mississippi River and south of Official Territory.

2. Whether, when the Commission in the exercise of its powers under Section 15(6) of the Interstate Commerce Act makes findings of relative costs on a fully-distributed basis for the purpose of prescribing just, reasonable, and equitable divisions of joint freight rates, it is required as a matter of law in determining such relative costs to consider only passenger expenses which would remain to be borne by freight service if passenger operations were discontinued, and whether there was any error prejudicial to the southern railroads in the Commission's treatment of passenger service deficits.

3. Whether the District Court improperly equated such overhead costs as are an integral part of fully distributed costs with general revenue needs and as a consequence erred in holding that the Commission having adopted a relative cost basis for determining fair divisions, acted without findings and substantial evidence in relying upon relative costs which reflected an appropriate proportion of the deficits from all passenger operations including suburban service.

4. Whether the District Court erred in remanding the cause to the Commission without retaining jurisdiction to require equitable resettlements of revenues received by the parties from interterritorial freight rates in the event of a further order of the Commission on remand.

STATEMENT

Proceedings Before the Commission

The order under review was made by the Commission upon further hearing in an investigation instituted by it in 1947 in which it originally prescribed "equal-factor" divisions for the Northern and Southern carrier groups. *Official-Southern Divisions*, 287 I.C.C. 497 (1953). The Commission there noted that if it were to give controlling weight to the cost studies of Northern lines for 1946 and 1948, the relatively higher divisions sought by those lines would be justified. But it did not accept them at face value because of certain important items of expense in those years which might reasonably be regarded as transient. It considered it to be the safest assumption for the future that neither group would have an appreciably lower basis of operating costs than the other, and that no other relevant circumstances of importance justified higher divisional factors for one group than the other (p. 526).

Upon Northern lines' petition, alleging that their costs had not declined to the level of Southern lines' costs, but had risen in relation thereto, the Commission, on July 29, 1959, reopened the proceeding for further hearing (39a-40a; JA 22, 51-52).[3]

Lengthy hearings followed in which both groups of respondents sought to prove that the Commission should fix relatively higher divisions for themselves (78a-81a). The hearing examiners found the then existing divisions unfair to Northern lines and recommended new divisions (40a; JA 53-137). Exceptions to their report and replies to such exceptions were filed by both parties, and the Commission heard them in oral argument (40a).

---

3. Figures prefaced with "JA" refer to pages of the Joint Appendix prepared at its order for the District Court, which is included with the record brought up on appeal.

The length of the hearings and size of the record reflect the substantial revenue involved and the importance of the case to the carriers. Southern lines' traffic study indicated that the annual volume of the North-South traffic involved amounts to over 967,000 carloads of freight, yielding an annual revenue of over $496,000,000 (47a).

To develop the relative service costs of the carrier groups in handling this traffic the parties basically employed the territorial Rail Form A costs for the year 1956 as prepared by the Commission's Cost Finding Section at the fully distributed level (67a).[4] Southern lines presented their cost studies in several forms, the last consisting of the territorial costs modified to include twelve adjustments they deemed necessary (65a). The Commission accepted certain of these adjustments and rejected others for reasons stated (106a-148a). Restating Southern lines' costs accordingly, the Commission found (67a):

> "Apart from the adjustments rejected in appendix B, our restatement is based on the southern lines' cost computation, as applied to their traffic studies, which, we find, more reliably and accurately reflect the movement of the traffic in question." (67a)

Concerning the restated costs, the Commission found (97a):

> "Our restatement of the costs, which are reasonably accurate and reliable for purposes of determining the relative contribution by the groups on a cost-of-service basis, shows that the cost level in 1956, the year both groups used in the final cost analysis, is somewhat higher in the North than in the South for like services. A consideration of all factors indicates that this situation will most likely continue in the immediate future."

---

4. "The sum of the out-of-pocket costs plus a pro rata distribution of the constant or fixed costs is referred to as fully distributed cost." *New York v. United States,* 331 U.S. 284, at 316 (FN 21).

The Commission considered all of the specified statutory factors and then determined that there were no differences between the groups of carriers with respect to those factors that indicated that either group was entitled to a share of the joint rates larger than that it would be entitled to receive on the basis of relative costs.

Southern lines asked the Commission to prescribe scales of divisional factors based upon costs, using the method adopted in *Louisville & Nashville R. Co. v. Southern Ry. Co.*, 319 I.C.C. 639,[5] and they pointed out that, to the extent that the Examiners were found to be correct in their rejection of specific aspects of the Southern lines' cost evidence, the cost evidence as thus modified would provide the basis for constructing the divisional scales (Southern lines' exceptions to recommended report, pp. 188, 189; JA 796). The Commission agreed; after accepting several of Southern lines' proposed adjustments and rejecting others, it prescribed the new divisions on the basis of Southern lines' cost evidence as thus modified, citing *Louisville & Nashville* (67-68a, 82a, 98-99a).

The Commission's ultimate findings were that just, reasonable, and equitable divisions should be determined by the use of percentages formulated on a relative cost basis.

Proceedings in the Court Below

On March 31, 1965, the Southern lines filed suit in the United States District Court for the Eastern District of Louisiana, New Orleans Division, praying that the order of the Commission prescribing the new divisions be enjoined and set aside. Contemporaneously, plaintiffs filed application for an interlocutory injunction and, if needed, a temporary restraining order. This resulted in the granting of a temporary restraining order, but following hearing before the three judges on plaintiffs' application for inter-

5. Sustained in *Carolina & Northwestern Ry. Co. v. United States*, 234 F. Supp. 112 (W.D., N.C. 1964) (Aff'd 380 U.S. 526).

locutory injunction, the temporary restraining order was dissolved and the application for interlocutory injunction was denied subject to conditions for refunding the money involved to Southern lines in the event they should be successful in permanently setting the order aside. As a consequence the newly prescribed divisions became applicable as of April 20, 1965, the effective date of the Commission's order (150a-151a).[6]

The District Court disregarded the findings of the Commission concerning the adequacy, reasonable accuracy, and reliability of the relative costs to the two groups of handling the traffic involved, on which the Commission had relied in prescribing the new intergroup divisions, and held such costs not a costing of the particular movements but insufficiently refined to support the Commission's order, and that accordingly the Commission was obligated to develop, or to require the parties to develop, more refined cost data described by the Court below as the "actual costs of handling the specific traffic at issue." The Court thereupon set aside the Commission's order and remanded the cause to the Commission for further proceedings. *Aberdeen & Rockfish R. Co. v. United States*, 270 F. Supp. 695 (1a-32a).

In its opinion, the court below—with obvious lack of appreciation of the years of work necessary to prepare traffic and cost studies of the completeness of those here of record, to say nothing of the more refined costings envisioned by it—suggested that the Commission make a new traffic study as well as a new study of costs which would meet the views of the court as to the "actual costs" of handling the specific traffic (29a-32a).

---

6. A modification sought by the Norfolk Southern, a Southern line, was granted by the Commission in its supplemental report dated May 18, 1965 (152a-163a). Except for such modification the order of May 18, 1965, merely affirmed in all respects the Commission's original order of February 3, 1965. The supplemental order requires no further discussion here.

Under the protective conditions attached to the District Court's denial of interlocutory injunction, which are carried forward by its order staying decree (32a), Northern lines would be obligated, in the event the Commission's order is permanently set aside, to resettle their accounts with Southern lines on all shipments made on and after April 20, 1965, with interest. By April 20, 1968, this would represent a principal amount of some $25,000,000 to be paid Southern lines by Northern lines.

THE QUESTIONS PRESENTED ARE SUBSTANTIAL

The court below set aside the Commission's order because it disagreed with the Commission's appraisal of the voluminous evidence relating to the relative cost of service. The court held that the Commission erred in relying upon territorial costs determined in accordance with Rail Form A, which embodies formulas and directions prepared by the Commission's Cost Finding Section and normally used by the Commission in determining costs, and that the Commission could lawfully act only on the basis of what the court described as the "actual" costs of the "specific traffic" involved. In so holding the court disregarded the fact that the Commission had made detailed findings, which were supported by substantial evidence, explaining its reasons for relying upon the Rail Form A costs and rejecting certain adjustments in those costs proposed by the Southern carriers.

The court below in thus substituting its judgment for that of the Commission on matters that are peculiarly within the Commission's expert knowledge and competence has disregarded the standards for judicial review many times enunciated by this Court. Its decision if allowed to stand is likely to have consequences whose importance will transcend the particular issues here involved. Rail Form A was developed by the Cost Finding Section of the Commission for use in determining costs for a variety of purposes, and costs determined in accordance with that Form have been used by the Commission in resolving issues not only in divisions cases arising under Section 15(6) but also in rate cases arising under Sections 1, 3, 15(1) and 15(3) of Part I of the Interstate Commerce Act. Similar cost forms, i.e., Highway Form B and Barge Form C, have been developed and used by the Commission in resolving issues under comparable provisions in Parts II and III of the statute. The decision below by rejecting the

cost accounting methods and principles developed by the Commission's own experts and customarily used by the Commission in favor of an illusory and impractical concept of "actual cost" threatens to disrupt the Commission's administration of its statutory obligations.

Although the court below paid formal deference to the established standards of judicial review, its decision in fact rests on an assumption as to the function of the reviewing court which if applied generally would mean that the technical problems involved in determining transportation costs would not be determined uniformly by the expert judgment of the agency charged with the administration of the National Transportation Policy but rather by the varied views of the numerous District Courts which have jurisdiction to review Commission orders.

In addition this case is in itself sufficiently important to warrant plenary review of the District Court's departure from the accepted standards of judicial review. As previously indicated, the District Court's decision, if not reversed, would require a cash payment of some $25,000,000 by the railroads of the northeastern part of the country, which includes some of the most necessitous carriers in the nation, to the Southern lines, and an immediate reduction in the divisions of the former by $8,000,000 per year, at least until the Interstate Commerce Commission could undertake a new investigation, in a futile search for "actual costs", which would consume an additional four or five years at the least.

I.

The District Court's Condemnation of the Adequacy of the Relative Costs Relied Upon by the Commission Would Seriously Impair Its Ability to Administer the Interstate Commerce Act.

A. *The Form A Territorial Costs Used by the Commission Were Here Properly Relied Upon by the Commission.*

The proceeding before the Commission was one of great scope. At issue was the reasonableness of the divisions of the joint rates on all commodities except coal and coke between every station on all railroads of the North and every station on all railroads of the South. Although the Southern lines advocated certain adjustments therein, they, like the Northern lines, basically relied upon the territorial unit costs, as developed under the Rail Form A formula by the Commission's Cost Finding Section, for the Northern and Southern groups of railroads. The Commission acted on the basis of the Southern lines' cost evidence, as restated by it to include certain of the Southern lines' adjustments and to exclude others (65a-69a, 97a). The validity of using Form A territorial costs in a case of this scope was clearly indicated by numerous facts now to be summarized.

(1) The Commission in discussing and relying upon Form A territorial costs as first presented to it in *Class Rate Investigation, 1939,* 262 I.C.C. 447, 693 (1945) found:

> "There are different degrees of refinement in costs depending upon the purposes for which the costs are intended. The ascertainment of the costs of transporting a particular commodity over a single railroad or a group of roads, for instance, obviously requires more refinement in procedure than the calculation of

relative costs for transporting all traffic, or important and well-defined segments of traffic, by territorial groups of carriers."

This decision was upheld by this Court in *New York v. United States,* 331 U.S. 284 (1947) wherein the Court, after due regard to the data based upon Form A territorial costs and the conclusions of the Commission with respect thereto (315-332), sustained the Commission's order. The Court was well aware that while the costs on which the Commission acted were territorial unit costs, the orders involved "affect class rates and class rates alone" noting also that ". . . this proceeding pertains only to class rates, which move but a small percentage of the traffic" (331 U.S. at 330 and 343).[7]

(2) The Southern lines themselves basically used the Form A territorial unit costs. Indeed, some 89.45% of the total North-South costs attributed by those lines to the traffic involved were unadjusted Form A territorial averages, the adjustments which they advocated accounting only for 10.55% of the total.[8] The Commission acted upon the cost evidence submitted by the Southern lines, saying "Apart from the adjustments rejected in appendix B, our restatement is based on the southern lines' cost computation, as applied to their traffic studies, . . .". (67a).

(3) Northern lines' evidence showed that the North-South traffic is handled as an indiscriminate part of the whole and that territorial costs properly show the cost

7. Carload traffic moving at class rates in the United States was shown in *Class Rate Investigation, 1939,* 262 I.C.C. 447, 479, as 4.1 percent of the total carload traffic. The present record shows Northern lines' former revenues from the North-South traffic as constituting 6.0% of their total revenues and Southern lines' revenues from this traffic to have constituted 21.4% of their total revenues (19a; JA 535-536). Combining the figures the total North-South revenue on the traffic in issue represents 10% of total revenues of Northern and Southern lines (V.S. 36, Ex. 5).

8. Computed from Southern lines' Verified Statements 40 and 40-A (J.A. 594-600).

of performing the service on the North-South traffic (V.S. 8).[9]

(4) The cost evidence used in the 1953 case in which the original divisions were prescribed was based upon Form A territorial costs (287 I.C.C. 497, 507, 526).

(5) The evidence shows that Southern lines have employed Form A territorial unit costs in cases of far less scope than the present (V.S. 80, Sec. H; JA 656-660). One of the principal Southern lines employed such costs (with minor adjustments) in a current divisions case, *Illinois Central R. Co. v. Great Northern Ry. Co.*, I.C.C. No. 34699 (unreported, recommended report and order of Oct. 27, 1966 adopted, with inconsequential changes, by Division 2 of the Commission on July 31, 1967). There it was stated that the defendant criticized the Illinois Central's use of Rail Form A as not tending to disclose the cost of handling the traffic in issue because, it urged, the formula is designed to portray broad, territorial costs. The case involved but one commodity. The Illinois Central was sustained. It was stated in the report that costs determined in a similar manner have been relied upon in other divisions cases involving a single commodity, citing a case involving two other prominent Southern railroads—each of which relied upon Form A costs with certain adjustments—(*Louisville & N. R. Co. v. Southern Ry. Co.*, 319 I.C.C. 639, sustained in *Carolina & Northwestern Ry. Co. v. United States*, 234 F. Supp. 112 (W.D., N.C. 1964), affd. per curiam, 380 U.S. 526 (1965)).

The insistence of the Court below (30a) that the Commission was required to determine the "actual costs" of

---

9. Under the special rules of practice the Commission prescribed for this proceeding virtually all direct evidence was presented in verified statements with the witness being subject to cross-examination. Verified Statement No. 8, Witness Nancarrow, and two of its 16 exhibits are reproduced at JA 312-340.

"the specific traffic" involved sets up a standard that is illusory and impractical. Any given shipment or category of shipments uses terminals in common with other shipments, is handled by the same switching crews, moves over track and in trains maintained and operated for all traffic and in cars and by locomotives that are repaired in central shops. Of necessity, any shipment's cost is an apportionment of expenses incurred in providing and maintaining facilities and conducting operations.[10] Form A classifies the expenses of the railroads and reduces them to a unit basis by dividing the various classes of expenses by appropriate statistics, such as cars originated, tons, ton-miles, etc. This produces a cost per ton for some services, and costs per car-mile, per ton-mile or for other service units for other services, depending upon which unit is most appropriate. These unit costs are then applied to the units of service involved in the particular traffic, here the North-South traffic, which units are ascertained by making a traffic study. This application of the unit costs to the number of service units involved results in the apportionment of the railroads' unit costs to the exact units of traffic involved in the case at hand.

B. *The Holding of the Court Below Would Seriously Impair the Commission's Ability to Administer the Interstate Commerce Act.*

A particularly damaging aspect of the District Court's decision, obviously growing out of its unfamiliarity with matters of common carrier costs and administrative requirements, is the substantial extent to which the principle of its holding would cripple the ability of the Commission to administer the Interstate Commerce Act in proceedings in which cost data are customarily presented. The Court below has held that Form A territorial unit costs, as modified by the adoption of five adjustments advocated by

10. The practical impossibility of securing "actual" rail costs is recognized in *New York v. United States*, 331 U.S. 284, 328, 335, and note 33.

Southern lines, did not constitute substantial evidence of the cost of the service involved in this case, which deals with transportation of virtually all commodities, over all railroads, between every station in the North and every station in the South.

Aside from the substantial inaccuracy and inadequacy of the court's statement that the Form A formula was designed to measure the cost of handling all traffic and aside from the court's misapprehension of the nature, reliability, and significance of costs developed thereby for particular traffic, of which opportunity to file briefs on the merits would permit demonstration, it is here noteworthy that this holding leaves nothing to the discretion of the administrative body. The court below thus holds as a matter of law that territorial or regional unit costs applied to the specific service units of a particular traffic cannot be accepted by the Commission in arriving at its "opinion" (49 U.S.C., § 15(6)) that existing divisions are unreasonable and its prescription of fair and equitable divisions on that traffic "without further evidence". But since the instant record contains such further evidence (e.g., V.S. 8 which, with two of its 16 exhibits is reproduced in JA 312-340), which the Court below noted (19a, n. 12) but disregarded, and since it likewise disregarded the adjustments of the Form A costs which Southern lines proposed and the Commission accepted and incorporated into the unit costs it employed and relied upon, the holding becomes a virtually absolute condemnation of the use or acceptance of relative costs for particular traffic—albeit important segments of traffic by territorial groups of carriers—based laregly on the application of regional unit costs to the service units of such specific traffic. This holding is central to the court's decision.

In terms the opinion of the court below on this point refers to "a divisions case" (24a), but the principle announced is broad enough to relate to other types of issues before the Commission and to other types of carriers. Thus, the Rail Form A formula is but one of the formulas

developed by the Commission's Cost Section for the determination of costs of common carriers subject to its regulation; others including Highway Form B and Barge Form C. The Cost Section has prepared numerous studies of regional cost data for both rail and motor common carriers.[11] The wide use and acceptance of these studies is indicated by the Commission in its Annual Report to the Congress for 1961, at page 153, and in that for 1957, at page 108.

Were the decision of the court below to stand as to the legal inadequacy of rail costs ascertained by the application of territorial unit costs to the specific service units of the vast interterritorial traffic here involved, the same principle would apply with greater force where the particular traffic was of lesser volume and scope, and it would also apply to the use of regional costs developed by the Commission's Cost Section for other types of carriers in determining costs on their particular traffic. No such result or possibility of result should be permitted without plenary consideration of the nature and scope of the holding below.

C. *The Decision Below Misconstrues and Is Inconsistent With, Chicago & N.W. R. Co. v. A.T.&S.F. R. Co., 387 U.S. 326 (1967).*

That the District Court misapplied and misconstrued this Court's decision in *Chicago & N.W.R. Co. v. A.T.&S.F. R. Co.*, 387 U.S. 326 (1967) would seem beyond dispute. There, in sustaining an order by which the Commission prescribed interritorial divisions between Midwestern and Mountain-Pacific railroads, this Court considered and rejected contentions similar to those successfully advanced, through the same principal counsel, by Southern lines in the present proceeding. The District Court in the present case referred to *Chicago & N.W.R. Co.*, and stated that:

11. See, for example, I.C.C. Annual Reports: 1949, p. 76; 1950, pp. 71-72; 1955, pp. 71-72; 1957, p. 107.

"There, the Commission based its cost findings on a special cost study and analysis prepared by the Mountain-Pacific carriers and made certain adjustments which it considered more accurately reflected the true costs of the traffic involved. These adjustments (3) were derived from Rail Form A. The Supreme Court held that the attack on the legal validity of these adjustments to costs were unsubstantial. Here, of course, the entire inflation is pegged on relative costs derived from Rail Form A." (25a-26a)

Thus, the District Court construed *Chicago & N.W.R. Co.* as involving Form A costs only to the extent of three adjustments. The fact is that there, as here, the basic cost study upon which the Commission relied was predicated upon Form A territorial averages, with certain adjustments advocated by Appellees (Mountain-Pacific lines) being allowed by the Commission and others rejected. This is clear from the Commission's decision which was sustained in that case. *Akron, C. & Y. R. Co. v. Atchison, T. & S.F. R. Co.*, 321 I.C.C. 17, 29-53; 322 I.C.C. 491, 492-499. Indeed the Commission concluded in that case that ". . . for a large and varied body of traffic as here at issue, territorial average costs will be the substantial equivalent of specific costs" (p. 50).

The cost issues in *Chicago & N.W.R. Co.* and those involved here are so similar in character that the intervenors in the instant case—Southern Governors' Conference and the Southeastern Association of Railroad and Utilities Commissioners—obtained leave to file a brief as *amici curiae* in the appeal in *Chicago & N.W.R. Co.* in order to present to this Court their contention that the cost issues in that case should not be decided by the Supreme Court, lest such a decision govern the decision of the District Court in the instant case. They stated in their *amici* brief of April 5, 1967, to this Court:

"However, the Commission's cost findings in the *Official-Southern* case reflect the very same approach that

it used in the *Transcontinental* case. There, as here, although the asserted basis of its action was 'the relative costs of the parties reflecting their respective operations as to this traffic' (325 I.C.C. at 50; see also 325 I.C.C. at 26, 56), the Commission relied almost exclusively upon the average costs of handling all traffic in these territories in reaching its conclusions. And there, as here, virtually every objection to reliance upon such territorial averages was brushed aside without either findings or evidence to support such action."

Likewise, the Mountain-Pacific lines in their memorandum of August 16, 1967, in support of a motion to the California District Court to clarify a passage in its decision (which was reversed in *C. & N.W.*) relating to the cost issues, stated, at page 14:

"The decision in the *Official-Southern Divisions* case is especially relevant here since that case, like this one, involved the use by the Commission of Rail Form A territorial averages to measure the actual costs of handling particular traffic."

It is clear, therefore, that the basic cost evidence upon which the Commission relied in *C. & N.W.*—and not just a few adjustments therein—was made up of territorial unit costs based upon Rail Form A, and that the District Court in the present case misconstrued *C. & N.W.* in its attempted distinction thereof. In contrast to the District Court's substitution of its judgment for that of the Commission on the representative nature of those costs and the need for greater refinement, the Supreme Court in *C. & N.W.* applied the usual rule of judicial review by accepting the Commission's judgment on accounting problems which the Court said "concerned matters relating entirely to the special and complex peculiarities of the railroad industry." (387 U.S. 326, 356).

II.

The Decision of the Court Below Exceeds the Bounds of Appropriate Judicial Review.

After a comprehensive review of the cost evidence (58a-69a, 106a-148a), the Commission concluded that Southern lines' territorial costs as restated by it "adequately reflect the costs attributable to the traffic at issue" (68a-69a), and "are reasonably accurate and reliable for purposes of determining the relative contribution by the groups on a cost-of-service basis, ..." (97a).

Going far beyond the limited task assigned to it, the District Court substituted its judgment for that of the Commission and declared that the costs relied upon by the Commission—which were based upon its restatement of Southern lines' adjusted territorial unit costs as applied to the service units of Southern lines' most complete traffic study—were not sufficiently refined to sustain its order prescribing divisions. It stated this conclusion in terms of lack of substantial evidence and of findings, but this asserted lack relates only to the difference between the Court's views and those of the Commission as to the adequacy of the costs used.

In so deciding, the Court below acted directly contrary to pronouncements of this Court with respect to the judicial review of cost evidence. Typical of this is *Illinois Commerce Commission v. United States*, 292 U.S. 474, 481 (1934):

> "Whether or not the cost study was representative, whether the study should have been more refined, and whether it should have been supplemented as appellants desired, are questions of fact, the determination of which is within the competence of the Commission. The Commission reached its conclusion after full hearing and thorough consideration of all questions presented. As the record affords a sufficient basis for the Commission's determination, it is not subject to review in the courts . . ."

See also *New York v. United States,* 331 U.S. 284, at 328, 331, 335, and note 33 (1947), where this Court was considering the Commission's initial reliance on Form A costs in *Class Rate Investigation, 1939,* 262 I.C.C. 447 (1945).

It would not be appropriate here to discuss each of the cost adjustments proffered by the Southern lines and rejected by the Commission, but an indication of the serious error into which the District Court fell in failing to follow such precedents as *Illinois Commerce Commission v. United States, supra,* may be gained by reference to several of those proposed adjustments which were specifically the subject of the Court's findings.[12]

The first which may be noticed is the Court's finding that the Commission's use of territorial averages for switching costs "rather than the specific costs" incurred with respect to North-South traffic, is not supported by reasoned findings or substantial evidence (31a). The adjustment of switching costs proposed by Southern lines purportedly was made to eliminate the effect of volume switching, i.e., the switching of multiple cars in a single unit, it being the Southern lines' contention that they had relatively more such cars moving within the South than the Northern lines had moving within the North, and that consequently the effect thereof should be excluded in determining the switching minutes (and, therefore, cost) applicable to the interterritorial traffic involved.

The Commission found that:

---

12. The District Court stated (11a) that it is uncontroverted that most elements of costs are no higher on Northern than on Southern railroads and that (19a) seven items account for the "entire inflation" of Northern costs over those of Southern lines. In fact, these statements were controverted (Brief for Intervening Defendant Railroads, p. 50, fn. 9). They are shown to be erroneous, for example, by the evidence showing higher wages on Northern than on Southern lines. Wages constitute the largest item of railroad expense. If Northern lines had the same wage levels as Southern lines, their total wage costs in 1956 would have been almost $58,000,000 less than they actually were (V.S. 80, Sec. F) (J.A. 644-654).

"Territorial average costs are particularly appropriate to the traffic in this case because it is a large and varied body of traffic moving to and coming from terminals in all parts of both territories" (140a), that the depressing effect of the switching of volume movements would be largely offsetting as between the two territories (140a), that the Southern lines' studies of switching within the South had weaknesses, both in the sample and in the studies themselves (140a),[13] and that Southern lines' switching adjustment within the North was not made on a basis comparable to that which they used within the South (140a). For these reasons the Commission concluded that Rail Form A territorial average switching costs more accurately measure the relative switching costs of the Official-Southern traffic than the switching costs computed by the Southern lines (140a).

The presence of "reasoned findings" and of substantial evidence in support of the Commission's conclusions concerning the Southern lines' proposed switching adjustment and the use of territorial average costs is clear (132a-140a). The District Court's conclusion to the contrary is based purely upon the substitution of its judgment for that of the Commission on the question of whether the territorial switching minutes are representative for use here or whether they should be more refined (23a-25a).

The Southern lines' adjustment for empty return ratios on box cars was also specially mentioned by the District Court as illustrative of what the Court called the Commission's general approach (22a). Without examining the Commission's discussion of this complex matter or making any review of the evidence, the Court quoted from the opinion of the single dissenting Commissioner (who agreed

13. The evidence offered by the Southern lines with respect to switching within the South was based on a study of but 41 cars, out of a total North-South movement of 967,000 cars. The Southern lines' sampling expert declined to characterize the 41 car sample as representative (Tr. 1580-1582). Moreover, the sample did not consist only of North-South traffic, and there were other defects in the study (132a-140a).

that Northern lines should have an increase in divisions, but not as much as the Commission allowed), and announced, as a conclusion of law, that the use of territorial average empty return ratios rather than the "actual empty return ratios for the North-South traffic in issue" was unsupported by reasoned findings and not based upon substantial evidence (31a).

The Commission discussed the empty return ratio adjustment fully (120a-129a). The proposed adjustment with respect to box cars was made by Southern lines in three steps. The Commission found, with respect to the first step, that the adjustment was "not adequately supported" and was, at best, "merely illustrative", that the adjustment for the second step "is in error" and that the third adjustment was "purely an unsupported assumption" (127a). Its conclusion as to the empty return adjustment was that ". . . the empty return ratios for both boxcars and refrigerator cars developed by the special studies of the southern lines are not as sound an estimate of the empty return incurred by the official-southern traffic as are the 7-day study territorial empty return ratios. The latter reflect the compilation of actual data reported by the railroads on a comparable basis in each territory under an order of this Commission".

It is manifest that the Commission made reasoned findings in support of the empty return ratios which it used.

The third adjustment to which the District Court specifically adverted was that regarding deficits from commutation service. This will be discussed below. At this point it should be noted that, in essence, the District Court simply disagreed with the Commission on the question of whether the territorial unit costs, as restated by it, were representative for use as a guide for the determination of relative contributions by the two groups of carriers in the transportation of North-South traffic. The Court found that the Commission took no independent action to require "the development of more refined cost data" (11a), and it con-

cluded that the Commission has a duty to use its powers to obtain cost evidence where such evidence is necessary to assure an adequate record (30a). The Commission, to whom is committed the duty of decision on this matter, found the cost evidence upon which it acted to be adequate, reasonably accurate, and reliable for purposes of determining the relative contribution by the groups on a cost-of-service basis. This conclusion was sustained by substantial evidence; and the Commission had no duty to require the development of other evidence to supplant that which it found satisfactory. Such a duty could not be created by the lower court's substituting its judgment for that of the Commission as to the necessary degree of refinement in the cost evidence. *Illinois Commerce Commission v. United States, supra.*[14]

III.

There Was No Error in the Commission's Treatment of Passenger Service Deficits.

The Northern lines excluded the entire amount of both Northern and Southern passenger deficits in their opening cost evidence (62a). The Southern lines objected to this, saying that the Cost Finding Section's application of fully-distributed costs includes the deficits and the allowance of a 4% return on the property devoted to the serv-

14. In Finding No. 7 the Court stated that the "typical evidence rule" requires evidence typical in character and ample in quantity with respect to the divisions and services performed under the particular rate being divided, and that the Commission must consider evidence of actual services performed on particular traffic involved. By the Southern lines' own representation, which was agreed to by the Commission, there was the best evidence of actual services on the particular traffic involved of any ever submitted in a divisions case (43a-44a, 50a). The disagreement of the Court as to the representative character of the costs applied by the Commission has been shown in the discussion of this point to be erroneous and beyond the scope of judicial review. The Court cannot acquire authority to substitute its judgment for that of the Commission by invoking the phrase "typical evidence rule", and that is all it has done here.

ices. They concluded that Northern lines' study "is defective in computing constant costs without consideration of passenger deficits . . .". (So. Lines Br. before I.C.C., pp. 117-118, 120).[15]

Although the inclusion of passenger deficits was to the advantage of Southern lines (because their deficits are relatively greater than those of Northern lines) the position of Northern lines was that they would have no objection to the Commission's including the deficits or excluding them, but that they would object to the selective approach advanced by Southern lines under which Northern lines' deficits from suburban operations would be excluded, while all of the Southern passenger deficits (excepting only the suburban deficits of Illinois-Central) would be included, in ascertaining the relative cost to the two groups of carriers in performing the service involved.[16]

The Commission included a pro rata portion of the entire passenger deficit, basing its figures upon the cost evidence submitted by Southern lines before the exclusion of suburban deficits by them.

Upon oral argument in the court below, the Southern lines admitted that they did not challenge the Commission's power to include suburban deficits and that they did not attack the Commission's consideration of such deficits from the standpoint of "policy" and, indeed, they admitted that deficits from suburban service might be considered, but only, they said, to the extent that they result from the apportionment of common costs (Tr. 34, 31).

---

15. The Commission recognizes that ". . . the railroads' passenger train deficit, until it can be eliminated, is in a sense a part of their overhead burden to which the freight service must make some contribution", *Railroad Passenger Train Deficit*, 306 I.C.C. 417, at p. 479 (1959).

16. The court below (20a) said that "through the use of average costs", passenger deficits were included in the cost computations. It was not through the use of average costs that such deficits were included, but through the insistence of Southern lines that they be added, along with other overheads.

The District Court found that the Commission erred in including suburban deficits because, it said, there was neither finding nor evidence to relate such deficits to the Commission's standard for decision, i.e., the relative cost of performing the North-South freight service involved (22a, 30a). The fact is, of course, that it is in the very nature of overhead, or constant costs, that they are not incurred in the performance of the service to which they are apportioned. *New York v. United States,* 331 U.S. 284, 316 (1947). But the District Court dismissed the Northern lines' point that these costs are treated as overhead, or constant costs, the allocation of which is required because of the need for revenue from the freight service to continue operations. It said that the Commission did not so treat them, it having rejected contentions of both Southern and Northern groups for divisions over and above the cost of service on the ground of revenue needs (21a).

The Court plainly erred in this holding. Each group had contended before the Commission that in fixing the divisions the Commission should include an additive—over and above divisional shares based upon fully-distributed costs—for their general revenue needs. In rejecting these contentions, the Commission made this finding, which was ignored by the District Court:

> "However, our prescription of divisions based on relative costs includes allowances for overhead and return, and in our judgment reflects a due proportion of the burden of maintaining the financial integrity and credit of the carriers involved. *Cf. New England Divisions,* 66 I.C.C. 196, 199. Accordingly, we see no justification at this time for adding any special increment favoring one group of carriers over the other." (98a)

The failure of the court to take note of that finding and to understand that by their very nature constant costs

are not directly related to particular traffic led it to decide, erroneously, that there was no finding rationalizing the conclusion that the suburban deficits reflecting some costs not common to freight service but solely related to suburban service, should be treated "as cost of North-South freight traffic" (22a).

It should also be noted that the court's holding that the Commission could consider only those expenses of performing commutation service which are common to freight and passenger has no basis in the practice of the Commission or the decisions of this Court. Contrary to the lower court's assumption, the basis for giving effect to passenger deficits in determining freight rates is that both services are important and that the freight must help to support the passenger when the revenue from the passenger service is insufficient, not any notion that the deficit results from the apportionment of common expenses which would remain if passenger service were discontinued. *King v. U.S.*, 344 U.S. 254 (1952); *Chicago, M. St. P.&P. R. Co. v. Illinois*, 355 U.S. 300, 307 (1958); *Public Service Commission of Utah v. U.S.*, 356 U.S. 421, 426 (1958); *Increased Freight Rates, 1948*, 276 I.C.C. 9, 32-39.[17]

In this connection it should be noted that the Commission found against Southern lines on a basic factual premise of their suburban deficit point. They had argued that this deficit could be eliminated by the discontinuance of commutation service, on the premise that suburban facili-

17. The lower court said that it is "generally agreed" that intercity passenger deficits should be considered as a part of the cost of providing freight service because such deficits are usually the product of costs allocated to passenger operations from common facilities which must be maintained to provide freight service (20a). That statement on this complex matter is the court's, not that of the Commission. Indeed, in *Railroad Passenger Train Deficit*, 306 I.C.C. 417 (1949), the Commission considered contentions that passenger deficit figures are fictitious because of alleged shortcomings in its accounting rules and it found that evidence indicating the contrary "is of major significance and serves as a warning that common costs cannot be lightly dismissed" (pp. 415, 426).

ties are maintained solely for such service and are not used for freight or intercity passenger service (142a). After considering this contention the Commission determined that although many individual items of suburban service can be considered solely related to that service the facilities and service as a whole cannot be considered solely related to suburban service and treated entirely apart from the freight service and intercity passenger service. It concluded, therefore, that the suburban deficits should not be excluded from the constant costs (143a). The District Court took the view that the Commission was required "to determine how much of the railroads' cost of commuter service was in fact common with the cost of freight service and how much was solely related to commuter service." (21a) But, the Commission having found that the commuter service and facilities "considered as a whole" could not be regarded as solely related to suburban service, it was reasonable for it to treat the costs as it did—i.e., in exactly the same manner as it treated the costs of all other passenger services. Clearly it was within the Commission's administrative competence to do so.

It is important to note that Northern lines' entire passenger revenues exceeded the expenses that are solely related to the performance of passenger service as a whole and that they had a deficit only when a portion of the common expenses was assigned to the passenger service, but that this was not true of Southern lines (142a). In the calculation of the cost of the North-South service, therefore, the net result of the Commission's action was to allocate to the Southern lines a pro rata share of a deficiency of solely related passenger expenses under passenger revenue as well as the additional deficit resulting from the allocation of common expenses to the passenger service, while the passenger deficit included for the Northern lines resulted from the apportionment of common expenses alone.

Overall, therefore, the lower court's view (that it was proper to apportion to the freight service only that part of

the passenger deficit which resulted from the allocation of common expenses) was actually met as to the Northern lines but not as to the Southern lines.

The District Court (22a) quoted from this Court's decision in *Chicago & N.W.R. Co. v. A.T.&S.F. R. Co., supra,* to the effect that while the Commission has sometimes offset passenger deficits in freight rate cases, the issues are different when, in a divisions case, it is argued that carriers in one part of the country should subsidize the passenger operations of carriers elsewhere, that if the Commission were to give controlling weight to passenger deficits in a divisions case, it might be appropriate to take more evidence and discuss it in greater depth than the Commission did in that case, but that in the light of the fact that there the passenger deficits were of negligible relevance to the Commission's decision, there were no errors that would justify setting aside the order there involved.

In the present case, of course, it was at the instance of Southern lines that the Commission included passenger deficits in determining the relative costs upon which it acted. If it had not considered passenger deficits, the Northern lines' share of the costs and, therefore, its prescribed divisions, would have been relatively greater than those the Commission prescribed. The inclusion of passenger deficits, therefore, may be said to have resulted in Northern lines subsidizing Southern lines.

From the foregoing, it will be seen that there clearly was no error prejudicial to the Southern lines in the Commission's consideration of passenger deficits.

IV.

Even If the Decision of the District Court Were Otherwise Correct, It Erred in Remanding the Case to the Commission Without Retaining Jurisdiction to Require Equitable Settlements in the Event of a Further Order of the Commission.

In the *C.&N.W.* case this Court referred to the fact that thirteen years had elapsed since the complaints which gave rise to that litigation were first filed and it then held that the attacks on the Commission's cost findings were so insubstantial that no useful purpose would be served by further proceedings in the District Court.

Approximately eleven years have elapsed since the Northern lines petitioned for the reopening of this proceeding on November 2, 1956. In contrast to the concern of the Supreme Court regarding the time consumed in the disposition of *C.&N.W.*, the District Court here concluded its decision not only by ordering the case back to the Commission for the development of the "actual costs of handling the specific traffic at issue" (30a) but it suggested that the evidence upon which the Commission acted had become stale and that the reception of new evidence was in order (32a).

Although no party, either before the Commission or the Court below, made any suggestion of staleness in the record, although Southern lines' brief to the Commission represented their traffic study to reflect the normal annual movement of the traffic involved (43a), and although the Commission had found that the somewhat higher cost level in the North will "most likely continue in the immediate future," (97a) the Court below is here suggesting to the Commission, in substance, that it start all over again, with new evidence and new traffic studies, the development and decision of which takes years. This, itself, would be a substantial denial of justice and would be greatly to the detriment of that portion of the national transportation system

which serves the most populous section of the country and which has already been deprived during many years by litigation before the I.C.C. of revenues which the expert body found it should have. Moreover, it would greatly enlarge the injurious effect upon Northern lines that would flow from setting aside the Commission's order.

As previously stated appellants would be obligated, in the event the plaintiffs are successful in permanently setting aside the order of the Commission, to refund to Southern lines an amount which by April 20, 1968 would represent some $25,000,000 plus interest. At the same time the old divisions would be reinstated, at an annual cost of $8,000,000 to Northern lines.

Under Section 15(6) the Commission is without authority to prescribe divisions retroactively except in circumstances not here present. *Brimstone R.R. Co. v. United States,* 276 U.S. 104, 117-123 (1928); *United States v. Baltimore & Ohio R. Co.,* 284 U.S. 195 (1931). Accordingly, such further order prescribing divisions as the Commission might enter following a remand would of itself have force only prospectively from its effective date. Thus, whether or not the Commission's new order made any change in its original prescription, it would lack power to protect these appellants for the entire period of years from April 20, 1965 to the effective date of its new order. Since there is nothing of record to suggest, and the Court below found nothing to warrant any inference, that development of the more refined costs it deemed essential would at all warrant lower divisions for Northern lines than those prescribed in the order under review, an additional loss to Northern lines, at the rate of some $8,000,000 per annum for all years prior to the effectiveness of a new Commission order, may reasonably be assumed.

In this situation if there were any justification for remand, which there is not, the rights of the parties should have been protected by a reservation of jurisdiction by the District Court to make such further orders as might be proper.

CONCLUSION.

For the foregoing reasons probable jurisdiction of this appeal should be noted and the case set down for full hearing on the merits.

Respectfully submitted,

APPENDIX A

Opinion of the District Court

IN THE
UNITED STATES DISTRICT COURT
FOR THE EASTERN DISTRICT OF LOUISIANA
NEW ORLEANS DIVISION

No. 15454

ABERDEEN AND ROCKFISH RAILROAD COMPANY, ET AL.,

Plaintiffs

v.

THE UNITED STATES OF AMERICA AND THE INTERSTATE COMMERCE COMMISSION,

Defendants.

Before WISDOM, *Circuit Judge,* and HUNTER and WEST, *District Judges.*

HUNTER, *District Judge:*

This is an action to set aside and enjoin in part the order of the Interstate Commerce Commission (Commission) in Docket No. 29885,[1] *Official-Southern Divisions,* 325 I.C.C. 1 and 325 I.C.C. 449, which prescribed divisions of

1. Also embracing No. 29799, Akron, Canton & Youngstown R.R. Co., et al. v. Aberdeen & Rockfish R.R. Co., et al.

joint-rail rates on freight traffic moving between Official and Southern territories.[2]

Freight traffic between the North and the South moves on joint rates which are established when two or more carriers publish a single charge to be paid by the shipper for carriage from the originating point on one line to a destination on another. The proportion of the joint rates which each line receives as its share is called a "division" which is normally determined by agreement among the participating carriers. Prior to the orders of the Commission in this proceeding, the primary divisions accruing from Official-Southern traffic were made under an equal-factor scale prescribed by the Commission itself in its 1953 decision in Docket No. 29885 (officially reported at 287 I.C.C. 497). This decision followed the landmark decision of the Commission in *Class Rates Investigation, 1939,* 262 I.C.C. 447 (1945), wherein the Commission found that the higher rate level which was at that time applicable to the movement of rail freight in Southern territory, constituted an unlawful discrimination against the South.[3] In the *Class Rates* proceeding, the Commission ordered the discriminatory class rate structure eliminated and replaced with a uniform rate structure to be applicable throughout the United States east of the Rocky Mountains. In the *Divisions* case that immediately followed the order removing the territorial differences in class rates, the Commission ordered that, in line with the new uniform class rates, a uniform divisional scale be used by both Northern and Southern railroads in dividing revenues from North-South

---

2. Official territory lies generally east of the Mississippi River and north of the Ohio River and certain points in Virginia. Southern territory lies generally east of the Mississippi River and south of Official territory.

3. The Supreme Court sustained this action in New York v. United States, 331 U.S. 284 (1947). The uniform rates prescribed by the Commission became effective in 1952. *Class Rates Investigation, 1939,* 281 I.C.C. 213 (1951).

traffic. *Official-Southern Divisions,* 287 I.C.C. 497, 523, 546-47 (1953).[4]

In 1956, the Northern railroads, dissatisfied with this equal-factor basis of dividing joint rates, called upon the Commission's statutory authority to determine that the joint rate divisions "are or will be unjust, unreasonable, inequitable or unduly preferential" and to prescribe "just, reasonable and equitable divisions" in their place (49 U.S.C.A. 15(6)).

Upon completion of the hearings, issuance of an Examiners' Report, exceptions and replies thereto, and after hearing oral argument, the Commission issued its 1965 report and order finding that the existing divisions were in violation of Section 15(6). Considering each of the Section 15(6) criteria, the Commission found that both groups of carriers were being operated efficiently and that neither group should be considered as more or less efficient than the other (325 I.C.C. at 18), that there were no dif-

4. "Divisional scales," are the form in which the Commission has consistently prescribed divisions of North-South revenues. Divisional scales are simply tools for determining percentage divisions by a most elementary use of the common fraction. The use of the uniform divisional scale prescribed by the Commission in 1953 may be illustrated for a shipment moving 200 miles in the North and 400 miles in the South. The Northern factor on such shipment under the uniform scale is 101; the Southern factor is 149. Accordingly, the Northern division would be 40.4% (101 divided by 250, or 101 plus 149); the Southern division would be 59.6% (149 divided by 250). Where the 400-mile haul is in the North and the 200-mile haul is in the South, the Northern division is 59.6% and the Southern division is 40.4%. For shipments moving equal distances in the two territories, the equal-factor scale yields equal divisions, as can be shown by an example of a shipment moving 300 miles in the North and 300 miles in the South. The factor prescribed for a 300-mile haul is the same in each territory (125) (287 I.C.C. at 552, Col. 1). As a result, the percentage division for the North is 50% (125 divided by 250) and for the South is also 50%. Thus, under the uniform scale prescribed in 1953, Northern and Southern railroads each received the same compensation from joint revenues for performing the same amount of service in carrying North-South traffic in their respective territories.

ferences in importance to the public attributable to the two railroad groups (325 I.C.C. at 28), that neither group had greater revenue needs than the other (325 I.C.C. at 49), but that there is a decisive difference in the relative costs of rendering the service as between the groups of carriers (325 I.C.C. at 50).

Finding everything else to be substantially equal and that an adjustment in the existing divisions was required to compensate the respective carriers according to their expenditures in the joint effort of handling the traffic, the Commission concluded that the relative costs of the parties can properly serve as a guide for the determination of just, reasonable, and equitable divisions for the future (325 I.C.C. at 50).

The order prescribed a new divisional formula which gives the Northern railroads 45% more than the Southern railroads for each terminal service performed and 10% more than the Southern railroads for each mile of line-haul service performed. The Commission went on to construct new scales which reflected the principles affecting long versus short hauls and then prescribed a scale of divisional factors based on fully distributed costs which divide the revenue in proportion to those costs (325 I.C.C. at 50-51). The net effect of the Commission's action was to reduce the revenue of the Southern railroads by $8,838,000.[5]

The action in this Court was originally brought by forty-two (42) railroads which together made up virtually the entire rail system in the States of Alabama, Florida,

---

5. The Commission found that the net effect of the scales which it prescribed would be to reduce the revenues of the Southern railroads by $7,948,004 (325 I.C.C. at 50). The Commission's calculation was based upon "an overall estimate" and the Commission abandoned any defense of the accuracy of that calculation in its supplemental report, taking the position that it need not find the revenue effect of its action (325 I.C.C. at 453, 454).

Georgia, Kentucky, Louisiana, Mississippi, North Carolina, South Carolina and Tennessee. The Southern Governors' Conference and the Southeastern Association of Railroad and Utilities Commissioners filed an intervening complaint asking that the Commission's action be set aside in part. Forty-eight (48) railroads serving primarily Northern areas intervened in defense of the Commission's order.

It should be noted that plaintiffs do not seek to set aside the order in its entirety. Their argument is that the Commission determined two precise issues which are severable, namely: (1) whether the Northern lines were entitled to an increase in their divisions because of higher costs than the Southern lines, and (2) whether the old scale of divisional factors was invalid because of an excessive terminal element of 37 integers in the initial mileage block. The effect of the Commission's action on the two subjects (as petitioners put it) would be:

(1) The reconstruction of the divisional scale benefited the Southern railroads by $7,426,000 annually.

(2) The inflations accorded the Northern railroads reduced the Southern railroads by $16,264,000 annually.

(3) The net effect of these two computations was to reduce the revenue of the Southern railroads by $8,838,000.

Plaintiffs argue that we possess the power and should set aside as unlawful only that part of the order which prescribed increased divisions for the Northern lines. They further contend that such action would leave in force the old uniform scale, minus 37 integers which resulted from the Commission's alleged "separate action correcting the excessive terminal factors in the existing uniform divisional scale." This Court, it is true, by virtue of its authority under 28 U.S.C.A. 2321, has the power to "set aside in whole or in part" an order of the Commission, and there

are situations where provisions excised from administrative orders are separable or so minor as to make remand inappropriate. This is certainly not the case here. The Commission gave weight to the plaintiffs' initial mileage block argument only "in light of our subsequent conclusion to be guided by the relative costs in our general determination * * *." It cannot be known what the Commission would have done with respect to giving weight to that argument if it were viewed independent of the other facts which induced the Commission to prescribe the divisional bases which it did prescribe.

The Commission determined only one issue in two steps, (I.E.) it determined the unlawfulness of the old divisions and prescribed new divisions for the future. If the plaintiff succeeds here in permanently setting aside the Commission's order as it prescribes the new divisional scales, there would remain no severable part of the order. This is true because there is nothing whatever in the record to even suggest that the Commission found reasonable (provisionally, contingently, or otherwise) any basis of divisions other than that which plaintiffs seek to annul in this action. Accordingly, since the Commission's order is not severable and this Court lacks jurisdiction to prescribe divisions, the the function of this Court ends if it finds the Commission's order prescribing divisions is contrary to law or unsupported by adequate findings or substantial evidence. *F.P.C. v. Idaho Power Company*, 344 U.S. 17 (1952); *Saltzberg v. United States*, 176 F. Supp. 867 (S.D. N.Y. 1959).

We proceed to a review of the Commission's findings, conclusions and the evidence. The applicable standards of judicial review are limited in scope by settled principles of Administrative law, both general[6] and statutory.[7] These standards are to be vigorously enforced.

---

6. See Roadway Express, Inc. v. United States, 213 F. Supp. 868, 873 nn. 18 & 19 (D.C. Del. 1963), aff'd, 375 U.S. 12, 84 S. Ct. 53, 11 L. Ed. 2d 38 (1963).

7. 5 U.S.C.A. § 1009(e); 5 U.S.C.A. 1007(b).

In *Burlington Truck Lines v. United States*, 371 U.S. 156, 167-168 (1962), the Supreme Court stated:

> "Expert discretion is the life blood of the administrative process, but 'unless we make the requirements for administrative action strict and demanding, *expertise*, the strength of modern government, can become a monster which rules with no practical limits on its discretion.' *New York v. United States*, 342 U.S. 882, 884 (dissenting opinion). 'Congress did not purport to transfer its legislative power to the unbounded discretion of the regulatory body.' *Federal Communications Comm'n v. RCA Communications, Inc.*, 346 U.S. 86, 90. The Commission must exercise its discretion under § 207(a) within the bounds expressed by the standard of 'public convenience and necessity.' Compare *id.*, at 91. And for the courts to determine whether the agency *has* done so, it must 'disclose the basis of its order' and 'give clear indication that it has exercised the discretion with which Congress has empowered it.' *Phelps Dodge Corp. v. Labor Board*, 313 U.S. 177, 197. The agency must make findings that support its decision, and those findings must be supported by substantial evidence. *Interstate Commerce Comm'n v. J-T Transport Co.*, 368 U.S. 81, 93; *United States v. Carolina Carriers Corp.*, 315 U.S. 475, 488-489; *United States v. Chicago, M., St. P. & P.R. Co.*, 294 U.S. 499, 511."

The statutory standards of judicial review are found in the administrative Procedure Act, which provides, to the extent here pertinent, that the reviewing court shall:

> "hold unlawful and set aside agency action, findings, and conclusions found to be (1) arbitrary, capricious, an abuse of discretion, or otherwise not in accordance with law; * * * (5) unsupported by substantial evidence in any case * * * reviewed on the record of an agency hearing provided by statute * * *. In making

the foregoing determinations the court shall review the whole record or such portions thereof as may be cited by any party, and due account shall be taken of the rule of prejudicial error." (5 U.S.C.A. 1009(e)).

* * *

"Section 8(b)—

"Prior to each recommended, initial, or tentative decision, or decision upon agency review of the decision of subordinate officers the parties shall be afforded a reasonable opportunity to submit for the consideration of the officers participating in such decisions (1) proposed findings and conclusions, or (2) exceptions to the decisions or recommended decisions of subordinate officers or to tentative agency decisions, and (3) supporting reasons for such exceptions or proposed findings or conclusions. The record shall show the ruling upon each such finding, conclusion, or exception presented. All decisions (including initial, recommended, or tentative decisions) shall become a part of the record and include a statement of (1) findings and conclusions, as well as the reasons or basis therefor, upon all the material issues of fact, law, or discretion presented on the record; and (2) the appropriate rule, order, sanction, relief, or denial thereof." (5 U.S.C.A. 1007(b)).

The statutory duty of the Commission is clear. Section 15(6) of the Interstate Commerce Act, 49 U.S.C.A. 15(6), directs it to set aside inequitable divisions of joint rates and then prescribe equitable ones. The ICC is explicitly directed to consider relative efficiency, public interest, terminal costs, revenue needs, and any facts which would, without regard to the mileage haul, entitle one carrier to a greater or lesser proportion of the joint rate. Among the "other facts" which the Commission may consider is the cost of service of the participating carriers, which issue may be entirely different from the issue of revenue needs. *Baltimore and Ohio RR v. United States,*

298 U.S. at p. 360. Here, the divisions were prescribed solely on the basis of the relative costs of handling the specific freight traffic at issue. The Commission said:

> "Everything else being substantially equal, the relative costs of the parties reflecting their respective operations as to this traffic can properly serve, as here, as a guide for the determination of just, reasonable, and equitable divisions." 325 I.C.C. at p. 50.

A fundamental rule of administrative law is that a reviewing court, in dealing with a determination of an administrative agency must judge the propriety of that action solely on the basis invoked by the agency. If this basis is inadequate, the court is powerless to affirm the administrative action. *S.E.C. v. Chenery Corp.*, 332 U.S. 194 (1947).

The *Chenery* rule was expressly applied in the review of an order of the Interstate Commerce Commission under the Administrative Procedure Act in *Burlington Truck Lines v. United States*, 371 U.S. 156, 168-169 (1962). The Supreme Court reaffirmed these rulings again in *N.L.R.B. v. Metropolitan Life Ins. Co.*, 380 U.S. 438, 443-444 (1965):

> "* * * the integrity of the administrative process requires that 'courts may not accept appellate counsel's post hoc rationalizations for agency action * * *,' Burlington Truck Lines v. United States, supra, 371 U.S. at 168; see Securities & Exchange Comm'n v. Chenery Corp., 332 U.S. 194, 196. For reviewing courts to substitute counsel's rationale or their discretion for that of the Board is incompatible with the orderly function of the process of judicial review. Such action would not vindicate, but would deprecate the administrative process for it would 'propel the court into the domain which Congress has set aside exclusively for the administrative agency.' Securities & Exchange Comm'n v. Chenery Corp., supra, 332 U.S. at 196."

This brings us to what petitioners refer to as the fundamental error, which affects virtually all of the Commissions's cost determinations. They put it this way: The higher costs claimed by the Northern railroads were found to have been incurred in handling this specific traffic in issue, but when it came to determining the relative costs which were to control this divisional formula, the Commission in at least seven instances relied, not upon the actual costs incurred by the two groups of railroads on the traffic in issue, but upon the unadjusted average costs incurred by the railroads on the average of all traffic handled in their respective territories. The Commission's rebuttal to this assertion appears on Page 6 of the Commission's original brief:

> "In a comprehensive analysis rejecting seven of Southern lines' adjustments as unsound in concept or based upon unsupported inapplicable facts or assumptions, the Commission accepted the Rail Form A costs, as restated by it, as reliably and accurately reflecting the costs attributable to the handling of North-South traffic. Whether these costs were adequate and whether they should have been more refined or supplemented as plaintiffs desired, are questions of fact within the exclusive competence of the Commission to determine, which were determined here and are based upon substantial evidence of record.

The Northern lines insisted throughout the hearing that unadjusted Rail Form A[8] costs reliably and accu-

8. Rail Form A is a formula for assigning the territorial or systemwide costs of operation including rents and taxes for any given year to the service units (ton-mile, car-miles, switching time, etc.) performed by the railroads during that year. This procedure assigns the costs as between those that are incurred in the origination and termination of a shipment, which are applicable to all shipments regardless of the distance of movement (terminal expenses), and those costs which are incurred in moving a shipment between the origin and destination points (line-haul expenses). It is adaptable for use in ascertaining the service unit costs of a single railroad or a group of railroads collectively. Territorial average costs here were based on the expenses and operations for 1956.

rately reflect the costs attributable to the handling of the traffic at issue. Only a relatively few elements of the Northern railroads' average costs are higher than the Southern railroads' costs. It is uncontroverted on this record that most elements of railroad costs (such as operating trains, maintaining roadways, etc.) are no higher in Northern railroads than for the Southern railroads. The inflation in the costs is attributable to a relatively few cost items. These include the cost of commuter operations, the cost of interchanging cars, the ratio of empty to loaded cars, the cost of railroad freight cars, and a few other items. As to each of these controverted items, the Commission relied exclusively on territorial average costs (Rail Form A). This was pegged on a finding that Rail Form A costs were reliable and reflected the costs attributable to the handling of the specific traffic. The theory is that in broadly based proceedings and interterritorial division cases, the territorial costs are entitled without more to full credence and weight as the initial indication of what would be fair and equitable. The Commission concluded in each of these instances that Rail Form A provided more reliable data for application to the Official-Southern traffic than did the adjustments prepared by the Southern lines. The Commission took no independent action to require the development of more refined cost data. Typical of this approach is the conclusion made by the Commission, in disposing of petitioners' request for an adjustment of switching costs:

> "For these reasons, we conclude that the contions of the northern lines are of merit and that Rail Form A territorial average switching costs more accurately measure the relative switching costs on each side of the border of the official-southern traffic than the switching costs computed by the southern lines." 325 I.C.C. at page 77.

Plaintiffs and intervening plaintiffs urge some 31 propositions as reflected in the Pre-Trial Order, but their

briefs resolve them into 17 separate questions of which the great majority relate to the Commission's treatment of relevant service costs. These are:

1. Section 7(c) of the Administrative Procedure Act provides that "The proponent of a rule or order shall have the burden of proof" (5 U.S.C. § 1006(c)); and this provision has been held to apply to proponents of changes in existing rate divisions. The Northern railroads here failed to satisfy their burden of proof, and the Commission failed to enforce that burden and thus violated Section 7(c) when it permitted the Northern railroads to rely entirely upon territorial average evidence, without showing that such averages were applicable to North-South freight traffic.

2. The Northern railroads had a duty to come forward with relevant evidence in their sole possession necessary to resolve the issues raised when the Southern railroads challenged the application of territorial average costs of all traffic to North-South traffic. The Commission erred in failing to enforce this duty and in holding instead that the absence of adequate and comparable evidence was a ground for resolving those issues against the Southern railroads.

3. The Commission has power to require the development of adequate and comparable cost data. Section 20(1) of the Act expressly grants the Commission the power "to require the carriers to provide full, true and correct answers to all questions upon which the Commission may deem information to be necessary" (49 U.S.C. § 20(1)). The Commission has a duty to use its powers to obtain cost evidence where such evidence is necessary to assure an adequate record. That duty was violated here as the Commission failed to take affirmative action to require the development of an adequate record as to the actual costs of handling the North-South traffic at issue.

4. Section 8(b) of the Administrative Procedure Act requires the Commission to "rule upon each * * * exception presented" (5 U.S. § 1007(b)). The Commission violated its statutory duty by failing to rule upon the Southern railroads' "Exception No. 1" dealing with the burden of proof, the duty of the party in possession of relevant evidence to come forward with it and the power and duty of the Commission to require a complete record.

5. The Commission stated as its standard the costs of handling North-South freight traffic, its reliance upon territorial average costs caused it to include in the Northern costs which it found, the Northern deficits from suburban commuter passenger service operations. This action constitutes a violation of both Sections 8(b) and 10(e) of the Administrative Procedure Act when judged against the standard stated by the Commission itself as governing in this case—that is, the relative costs of handling North-South freight traffic. The Commission made no reasoned findings and had before it no substantial evidence on which such a conclusion might be based. The lack of rational basis for the Commission's conclusion is highlighted by the Commission's own inconsistent finding that "many individual items of suburban service can be considered solely related * * * to suburban service" (325 I.C.C. at 78).

6. The Commission's prescription of divisions based on costs which include a separate allowance for "border interchange service" 58% higher for the North than for the South violates the requirement that the Commission's findings and conclusions be supported by substantial evidence within the meaning of Section 10(e) of the Administrative Procedure Act.

7. The Commission's action in using 32% higher car costs for the Northern railroads than for the Southern railroads violates Sections 8(b) and 10(e) of the Administrative Procedure Act since there were no reasoned findings

to support that action, nor was there substantial evidence in the record to support such a finding.

8. Section 15(6) of the Interstate Commerce Act provides that in a divisions case the Commission is to determine the costs incurred by the respective railroads which are "applicable to the transportation of passengers or property," a determination which has nothing whatever to do with the financial results of car rentals. Since the Commission's finding of 32% higher Northern car costs is in substantial part of the product of the greater amount of car rentals received by the Southern railroads (on traffic other than North-South traffic), the Commission's action also violates Section 15(6) because it fails to differentiate the railroads' separate function as car-owning or renting agencies as compared with their function as transportation agencies.

9. The Commission's use of territorial averages in computing the "switching costs" of the Northern and Southern railroads rather than the specific costs incurred by those railroads with respect to North-South traffic is not supported by reasoned findings and not based on substantial evidence in the record and thus violates Sections 8(b) and 10(e) of the Administrative Procedure Act. In addition, the Commission's rejection of the Southern railroads' special studies of switching costs on the traffic at issue because there were no comparable studies of Northern costs constitutes a violation of Section 7(c) of the Administrative Procedure Act in that it places the burden of proof on the Southern railroads rather than the proponents of the Northern inflation who had the evidence in their sole possession.

10. The Commission's use of territorial average "empty return ratios" rather than the actual empty return ratios for the North-South traffic in issue also violates Sections 8(b) and 10(e) of the Administrative Procedure Act

because it is unsupported by reasoned findings and not based on substantial evidence in the record. This also violates Section 7(c) of the Administrative Procedure Act which puts the burden of proof on the proponent of change, and the principle that those in possession of relevant data are obliged to come forward with it.

11. The Commission's inconsistent counting of cars interchanged and terminated and its rejection of the Southern railroads' attempts to correct that inconsistency violate the burden-of-proof provisions of Section 7(c) of the Administrative Procedure Act, the principle that those in possession of relevant evidence are obliged to come forward with it, and the obligation of the Commission to assure the making of an adequate record.

12. The Commission's use of territorial averages in dealing with the constant cost of transit commodities and its rejection of Southern adjustments designed to reflect the costs associated with North-South traffic also constitute violations of the burden-of-proof provisions of Section 7(c), the principle that those in possession of relevant evidence are obliged to come forward with it, and the obligation of the Commission to assure the making of an adequate record.

13. The "typical evidence rule" requires that there must be evidence typical in character and ample in quantity with respect to the divisions and services performed under the particular rate being divided. The Commission must consider evidence of actual services performed on particular traffic involved, and not rely wholly on averages which "are apt to be misleading." *United States v. Abilene & Southern R. Co.*, 265 U.S. 274 (1924), at p. 291; *Atchison, Topeka & Santa Fe R. Co. v. United States*, 225 F. Supp. 584, 592-600 (D. Colo. 1964).

14. The Commission's departure from uniform divisions related to uniform rate levels is not supported by the

reasoned explanation required by Section 8(b) of the Administrative Procedure Act.

Other alleged errors are:

15. The Commission's Supplemental Report invoked its quasi-judicial powers to decide this case as an aid to its executive function of defending its order before the Court. This resulted in an unconstitutional denial of notice and an opportunity to be heard. *Atchison, T. & S.F. Ry. Co. v. United States,* 231 F. Supp. 422, 428 (N.D. Ill. 1964).

16. Section 7(d) of the Administrative Procedure Act (5 U.S.C. § 1006(d)) requires that: "The transcript of testimony and exhibits, together with all papers and requests filed in the proceeding, shall constitute the exclusive record for decision * * *." The Due Process Clause of the Federal Constitution requires also that the Commission not go outside the record in reaching its decisions. The Commission violated both of these provisions when its use of its Cost Finding Section led it to rely on data not contained in the record in three separate instances.

17. The Commission's conclusion that the North suffers from inherent disadvantages in transportation conditions was supported by neither reasoned findings in the Commission's report as required by Section 8(b) of the Administrative Procedure Act, nor by substantial evidence, as contemplated by Section 10(e) of that Act.

Propositions 15 and 16 may be readily disposed of. The Commission's use of its Cost Section to give technical aid in analysis and evaluation of the cost evidence of record was an integral part of this administrative proceeding. This infringed the rights of no one.[9] The Commission's

9. The Commission's use of its staff assistants was specifically approved in T.S.C. Motor Freight Lines, Inc. v. United States, 186 F. Supp. 777 (S.D. Tex., 1960), aff'd sub nom. Herrin Transp. Co. v. United States, 366 U.S. 419 (1961).

issuance of its supplemental report was lawful and proper and constituted sound administrative practice.[10] Moreover, in issuing its supplemental report the Commission did not change its outstanding order in any respect, except as to divisions of the Norfolk Southern Railway, which is not here challenged.

Proposition 17 requires amplification. The failure to draw a clear line of demarcation between findings of fact, summaries, analyses and discussion had contributed heavily to the difficulty of reviewing this case. Intervening plaintiffs insisted before the Commission that for at least 30 years prior to this case, the Commission has consistently followed the view that primary responsibilty for meeting the costs and revenue needs of any territory lies with the people and industry of that territory, and that deviation from the equal division factor now in effect can be justified under 15(6) of the Act only if the higher costs found to exist are brought about by inherent territorial disadvantages. This is so, they say, because differences in cost which cannot be related to such inherent disadvantages might well be the product of nothing more than inefficiency or overcapacity on the part of one group of railroads. Plaintiffs insist that this was the express principle enunciated by the Supreme Court in *New York v. United States,* 331 U.S. 284. The Commission was cognizant of this contention, which was the main thesis of intervening plaintiffs before the Commission, and handled it as follows:

> "Relying on *New York v. United States,* 331 U.S. 284, 315 (1947), the interveners also take the position that natural disadvantages must be found in the North before we may increase the divisions of the northern railroads. In essence, however, other factors being equal, cost differences generally are the product of,

---

10. Alamo Express, Inc. v. United States, 239 F. Supp. 694, 697, 698 (W.D. Tex., 1965), aff'd 382 U.S. 19; Donaldson v. Read Magazine, 333 U.S. 178 (1948).

and reflect, the inherent advantages and disadvantages that go to make up the respective overall transportation conditions in the two territories." (Pgs. 27-28).

Plaintiffs read this language as an implicit holding by the Commission that the North suffers from inherent territorial disadvantages and a recognition of their judicial construction of Section 15(6), (i.e.) that only cost differences related to inherent disadvantages should be permitted to serve as a basis for an increase in interterritorial divisions. Defendants' answer to this is that the Commission made no finding on this question at all and "were simply commenting on Intervenors' contention." Surely, the Commission report should be so phrased that there be no room for such a dispute as this. We have read the language carefully and we have some hesitation in saying which interpretation is correct. The question of whether a showing of inherent disadvantages is prerequisite to an increase in territorial divisions is, at least in the first instance, a question for the Commission. If, as petitioners read the report, the Commission has held that such a showing is necessary, then this Court need only consider whether in view of such a test, the requirements of reasoned findings and substantial evidence of Sections 8(b) and 10(e) of the Administrative Procedure Act have been met. If, on the other hand, as defendants contend, the Commission has made no holding on the question of inherent disadvantages, the Court must consider whether the Commission's failure to resolve the material issue raised with respect to that question can be reconciled with the express requirement of Section 8(b). We are considering not a restriction upon the statutory powers of the Commission to make divisions, but whether the Commission followed requirements of the Administratve Procedure Act. The Administrative Procedure Act requires findings on material issues of law. N.L.R.B. v. Hearst Publications, 322 U.S. 111 (1944). If, as plaintiffs assert, the Commission has held that a showing

of inherent disadvantages is a pre-requisite to an increase in territorial divisions, then the Commission's conclusion (that higher Northern costs reflect inherent territorial disadvantages) is subject to attack because there are no findings as to what these inherent territorial disadvantages consisted of. Intervening plaintiffs have consistently and strenuously made the contention that as a matter of law the Northern railroads cannot have an increase in the absence of inherent territorial disadvantages. This case is to be remanded *for other reasons.* Upon remand, the Commission should decide and dispose of this contention in accordance with the Administrative Procedure Act.

The remaining exceptions to which we must address ourselves relate to cost evidence. Reduced to its simplest terms, the situation is this: All agree that the relevant costs are those of the North-South freight traffic to which the divisions apply. However, when it came to determining the relative costs which were to control this divisional formula, the Commission relied upon the actual costs incurred on the average of all traffic handled in the respective territories.[11] The Commission, as to each of seven specific items of unit cost (which account for the entire inflation) decided that the Northern lines established a prima facie case that Rail Form A costs properly measure the cost of the specific traffic.[12] In each instance the Southern lines introduced evidence and sought adjustments to reflect what they contended to be the actual cost of the specific traffic. In each instance the Commission rejected these adjustments, and employed Rail Form A territorial unit costs as accurately representing the cost of service. The Commis-

11. The North-South traffic in issue constitutes on 6.0% of the total freight revenue of the Northern railroads and constitutes 21.4% of the total freight revenue of the Southern railroads (V.S. 36, Ex. 5).

12. The Northern lines presented a train utilization study, which revealed that of the total of 13,647 loaded trains shown for five study lines for a selected week in May of 1959, 6,099 trains representing 44.7% were found to be transporting at least one loaded car moving from or destined to Southern territory.

sion did not assume any responsibility for the development of a more adequate record, and in several instances held that the absence of comparable evidence in the record itself prevented adjustments in territorial averages.[13]

Typical of the overall approach of the Commission was its inclusion of suburban passenger deficits as a part of the cost of handling North-South traffic. Through the use of average costs, deficits attributable to both inter-city passenger service and suburban commuter service were included in cost computations. It is generally agreed that the intercity passenger deficits should be considered as a part of the cost of providing freight service, because such deficits are usually the product of costs allocated to passenger operations from common facilities which must be maintained in order to provide freight service.[14] Suburban (commuter) deficits are in a different category. The railroads, which on today's market carry large numbers of people from their homes in the suburbs to their place of work in the cities, often, if not preponderantly, use separately constructed and maintained lines. These suburban commuter operations require equipment and facilities that in many instances have no other use whatsoever. The reason stated by the Commission for the inclusion of commuter deficits is that "the suburban service deficit includes common costs" which must be incurred to provide freight service (325 I.C.C. at p. 78). But the Commission also found as a fact that "many individual items of suburban

13. For instances in which evidence of the Southern railroads was rejected for lack of "comparable" data for the North, see 325 I.C.C. at 69 (refrigerator car empty return ratios); 325 I.C.C. at 76; 325 I.C.C. at 60. The same result was reached due to an absence of "adequate" data at 325 I.C.C. at 66 (box car empty return ratios).

14. The necessity for maintaining common facilities for freight service was explained by the Supreme Court in King v. United States, 344 U.S. 254, 265 (1952):

> "In Florida, moreover, the discontinuance of railroad passenger service would not permit the discontinuance of high-speed tracks and equipment because of the need for fast freight schedules to transport perishable fruits and vegetables from Florida."

service can be considered solely related * * * to suburban service." (325 I.C.C. at p. 78). This latter finding seems to be a concession that many commuter facilities are solely related to that service and have nothing whatsoever to do with the cost of handling North-South traffic or any other freight traffic. The critical issue on this cost item was to determine how much of the railroad's cost of commuter service was in fact common with the cost of freight service and how much was solely related to commuter service. But, in accordance with its general approach to these issues, the Commission, by adopting Rail Form A, inflated the Northern railroads' freight cost by the entire commuter deficit of those railroads, without regard to the plain conflict between this action and its own finding that "many individual items of suburban service can be considered solely related * * * to suburban service." Counsel for defendants, during argument, repeatedly suggested that the commuter deficits are properly chargeable to the traffic at issue as an "overhead." They argued:

> "* * * there has been a definite theory upon which the Commission has allocated these costs as a matter of policy, and that is that there is a need for that revenue to continue operations."

The complete answer to this contention is that the Commission did no such thing. The revenue need issue was hotly contested before the Commission, each group contending that its needs were greater—the Northern railroads, on the basis of lower rates of return; the Southern railroads, on the basis of their growing service responsibilities to an expanding economy. The Commission rejected both contentions, and categorically stated:

> "We find that no affirmative reasons appear in this record which would warrant any adjustment of the divisions in question over and above the relative cost of service, either on the grounds of greater revenue needs or otherwise."

There is no finding rationalizing the conclusion that suburban passenger deficits reflecting costs not common to freight service, but "solely related" to suburban passenger service, can or should be treated as cost of North-South freight traffic.

The Supreme Court, on May 29, 1967, in the cases of *C. and N.W. Ry. Co. v. A.T. and S.F.R. Co.*, and *U.S. v. A.T. and S.F.R. Co.* (Nos. 8 and 23, October Term, 1966) commented on a possible divisions case, where, as here, it is argued that carriers in one part of the country are being required to subsidize passenger operations elsewhere. There, it was said:

> "And while the Commission has sometimes acted to offset passenger deficits in freight rate cases, the issues are quite different when, in a divisions case, it is argued that carriers in one part of the country should subsidize the passenger operations of carriers elsewhere.
>
> "If the Commission were to give controlling weight to passenger deficits in a divisions case, it might be appropriate to take more evidence on the issue and discuss it in greater depth than the Commission did here. But in light of the fact that, in this case, passenger deficits were of negligible relevance to the Commission's decision to increase the Midwestern divisions, we find no errors in the Commission's findings and procedure on this point that would justify setting aside its order."

Another example of the Commission's approach is characterized by its use of a territorial average box car empty return ratios. The nature of this problem is summarized in the dissenting opinion of Commissioner Murphy (325 I.C.C. 54, 55):

> "The higher than average empty return ratios used for cars moving over the official lines is another instance where true costs have not been used. The

official lines handle approximately 800,000 carloads of automobile parts annually which originate in the Detroit, Mich., area and are destined to assembly plants in various parts of the country, including New Jersey, California and Georgia. Many of these cars are fitted with special devices to protect the automobile parts in transit. Because these cars carrying parts contain special devices and are assigned to particular plants manufacturing such parts in official territory, they normally experience an empty return movement which is, for all practical purposes, 100 percent. No adjustment is made in the cost data to cover the higher empty return costs of this type of equipment. Territorial average box car empty return ratios, as used in the report, overstate the costs of the official railroads when applied to Official-Southern traffic."

Another example of the general approach of the Commission is illustrated in its treatment of the issue of "Switching costs" (325 I.C.C. 71-78). The specific cost factor was the amount of the switching service actually performed in originating and terminating the traffic at issue. The Northern railroads placed their entire reliance upon the territorial average switching service for the average car in each territory.[15] The Southern railroads sought to develop the costs associated with the specific traffic in issue. In the face of these special studies, the Northern railroads continued to rely upon Rail Form A switching costs, which were substantially higher in the North. In its cost findings on this point, we repeat the Commission's finding at 325 I.C.C. 77:

"* * * the contentions of the Northern lines are of merit and that Rail Form A territorial average switching costs more accurately measure the relative switch-

15. The North-South traffic constitutes only 4.07% of the total cars originated and terminated in the North and 8.93% of the total cars originated and terminated in the South.

ing costs on each side of the border of the Official-Southern traffic than the switching costs computed by the Southern lines."

Although important as separate issues, the three items heretofore detailed are of greater significance as illustrations of the more pervasive error of the Commission in prescribing divisions on the basis of the average cost of all traffic for this series of important elements of cost which are higher in the North for reasons that have not been shown to have any relation to the North-South freight traffic here at issue. We are not suggesting that one might not dig out of the record argumentative support for the Commission's view, but it is not conducive to a fair administration of the Commerce Act, nor is it a proper discharge of this Court's duty, to require us to dig out indications of evidence from this massive record.

Defendants argue that the question of whether or not Rail Form A was representative, and whether it should have been supplemented are questions of fact, the determination of which is within the competence of the Commission. We start, of course, from the premise that on the subject of transport economics, the Commission's judgment is entitled to great weight. The appraisal of cost figures is itself a task for experts and, unlike a problem in mathematics, it cannot be precisely right or wrong. We know, too, that the Rail Form A cost formula was devised for the express purpose of measuring territorial average costs and has been widely used as an acceptable means of comparing relative transportation costs. It represents a comprehensive study entitled to full weight when the issue is one that it was designed to cover. However, this formula was designed to measure the cost of handling all the traffic in two or more territories, and cannot appropriately be accepted without further evidence for mechanical application to particular segments of traffic in a divisions case. The "many minute calculations" contained in

Rail Form A were used to measure the overall average costs and certainly produce a misleading appearance of exactitude when applied mechanically to measure a specific cost of a specific body of traffic such as that involved here. Evidence of overall territorial averages surely can and should be considered, but as to specific important cost items the Commission should not wholly and exclusively rely on such averages. *United States v. Abilene and Southern R.R. Co.*, 265 U.S. 274; *Atchison, Topeka and Santa Fe Ry. Co. v. United States*, 225 F. Supp. 584. The Commission stated its exclusive standard to be the relevant cost of handling the specific freight traffic to which the divisions apply. We are persuaded that the order is not based on substantial evidence nor supported by reasoned findings within the meaning of Sections 8(b) and 10(e) of the Administrative Procedure Act because the use of territorial averages accounting for the Northern inflation has not been supported with findings of evidence relating any such inflation to the North-South freight traffic.

What is appropriate in one case may be inappropriate in another. We do not hold that the Commission was required to start from scratch and construct a new divisional scale directly from cost data. We do find that, having stated its exclusive standard to be the relevant cost of handling the freight traffic to which the divisions apply, the Commission's order is not based on substantial evidence within the meaning of the Administrative Procedure Act. We note that in the Chicago and N.W. R. Co. case (supra, Supreme Court of the United States, May 29, 1967), disputes over the applicability of Rail Form A occupied a large part of the administrative proceedings. There, the Commission based its cost findings on a special cost study and analysis prepared by the Mountain-Pacific carriers, and made certain adjustments which it considered more accurately reflected the true costs of the traffic involved. These adjustments (3) were derived from Rail

Form A. The Supreme Court held that the attack on the legal validity of these adjustments to costs were unsubstantial. Here, of course, the entire inflation is pegged on relative costs derived from Rail Form A.

With the Commission's expertise in mind, it is our duty to review the record and the conclusions reached, as required by the provisions of the Administrative Procedure Act. As to the sufficiency of the evidence to support the order, it is not the proper function of this Court to substitute its judgment or to weigh evidence.[16] On the other hand, it is our duty to ascertain whether or not the findings and conclusions are supported by substantial evidence. We have endeavored to review the record without a rubber stamp approach. We repeat and reiterate that in making our decision we are not unmindful of the function that the Interstate Commerce Commission is to perform and the discretion that it has. The Commission has had a hard and difficult task here. The record reveals that this facet of this case began in 1956 and that the report and order of the Commission was not issued until February 3, 1965. This in itself certainly suggests the magnitude of the problem which faced the Commission.

"Expert discretion is the lifeblood of the administrative process, but 'unless we make the requirements for administrative action strict and demanding, *expertise*, the strength of modern government, can become a monster which rules with no practical limits on its discretion.' "[17] In 1953, in recognition of its previous action in prescribing

16. Illinois Commerce Comm. v. United States, 292 U.S. 474, 484, 54 S. Ct. 783, 78 L. Ed. 1371 (1933); Boston and Maine R.R. v. United States, 153 F. Supp. 952 (D. C. Mass., 1957); see Nashua Motor Exp., Inc. v. United States, 230 F. Supp. 646 (D.C. N.H. 1964); J. B. Acton, Inc. v. United States, 221 F. Supp. 174 (W.D. Mo. 1963), aff'd, 376 U. S. 779, 84 S. Ct. 1133, 12 L. Ed. 2d 83 (1963).

17. Burlington Truck Lines v. United States, 371 U.S. 156, 167, 83 S. Ct. 239, 245, 9 L. Ed. 2d 207 (1962).

a uniform rate level, the Commission prescribed divisions on a uniform basis with no inflation for either Northern or Southern railroads and concluded that (287 I.C.C. at 526):

> "* * * We consider it to be the safest assumption for the future upon the facts before us that neither contesting group will have an appreciably lower basis of operating costs than the other, and that there are no other relevant circumstances which are of sufficient importance to justify higher divisional factors for one group than the other."

Furthermore, for many years prior to this case the Commission has consistently followed the view that the primary responsibility for meeting the cost and revenue needs of the railroads of any territory lies with the people and the industry of that territory. *New England Divisions,* 126 I.C.C. 579, 599 (1927); *Divisions of Rates, Official and Southern Territories,* 234 I.C.C. 175, 190 (1939); *Official-Southern Divisions,* 287 I.C.C. 497, 523 (1953); *Akron, Canton & Youngstown R. Co. v. Atchison, T. & S.F. Ry. Co.,* 321 I.C.C. 17, 51 (1963). In this very case, prior to re-opening, the Commission held that the primary division of revenues accruing from this traffic were to be made on an equal-factor scale. We recognize that the Commission is not perpetually bound by their 1953 holding, but we do believe that the Commission has special responsibilities in a case of this magnitude when it departs from its prior finding (*Sec'y of Agriculture v. United States,* 347 U.S. 645). The Commission's duty to use its powers to obtain cost evidence where such evidence is necessary to assure an adequate record was stressed in *Pacific Inland Tariff Bureau v. United States,* 129 F. Supp. 472, 486 (D.C. Ore., 1955):

> "The Commission is not a passive arbitrator of disputes between carriers. It is the instrument chosen

by Congress to regulate interstate commerce in the public interest. When carriers fail to produce satisfactory evidence, the Commission may require them to produce additional and more satisfactory evidence. It may make its own investigation. It may consult with 'other interested and presumably better informed agencies of the Government as to particular question.' *Cantlay and Tanzola, Inc. v. United States,* 115 F. Supp. 81. However, the record does not disclose that any of those courses was followed in this case. *The fate of our national transportation system should not depend upon evidence either offered or withheld by competing carriers.*" (Emphasis added.)

The same principle was reiterated recently by the Second Circuit in *Scenic Hudson Preservation Conference v. Federal Power Commission,* 354 F. 2d 608 (2nd Cir. 1965). There, the Court set aside an order of the Federal Power Commission, saying (354 F. 2d at 620):

"In this case, as in many others, the Commission has claimed to be the representative of the public interest. This role does not permit it to act as an umpire blandly calling balls and strikes for adversaries appearing before it; the right of the public must receive active and affirmative protection at the hands of the Commission.

"This court cannot and should not attempt to substitute its judgment for that of the Commission. But we must decide whether the Commission has correctly discharged its duties, including the proper fulfillment of its planning function in deciding that the 'licensing of the project would be in the overall public interest.' The Commission must see to it that the record is complete. The Commission has an affirmative duty to inquire into and consider all relevant facts. See *Michigan Consolidated Gas Co. v. Federal Power Comm'n* 283 F. 2d 204, 224, 226 (D. C. Cir.), cert.

denied, 364 U.S. 913 (1960); *Isbrandtsen Co. v. United States*, 96 F. Supp. 883, 892 (S.D. N.Y. 1951), aff'd by an equally divided court, 342 U.S. 950 (1952); Friendly, *The Federal Administrative Agencies*, 144 (1962); Landis, *The Administrative Process*, 36-46 (1938); cf. *City of Pittsburgh v. Federal Power Comm'n*, 237 F.2d 741 (D.C. Cir., 1956)."

There is no doubt as to the Commission's statutory powers to require the development of adequate and comparable cost data. Section 12(1) of the Interstate Commerce Act authorizes the Commission to "obtain from such carriers and persons such information as the Commission deems necessary to carry out the provisions of [the Act]" (49 U.S.C. § 12(1)). Section 20(1) of the Act expressly grants the Commission the power "to require * * * special reports from carriers" and to require the carriers to provide "full, true and correct answers to all questions upon which the Commission may deem information to be necessary" (49 U.S.C. § 20(1)). This power was sustained in *Baltimore & O.R. Co. v. ICC*, 221 U.S. 612, 621 (1911).

The Commission in this case never mentioned or, for all that appears, even considered the possibility of developing a record on the specific cost at issue, but merely relied upon unadjusted territorial average costs to reflect the average cost of the traffic at issue. The Commission is not expected to merely call balls and strikes. The ICC is not the prisoner of the parties' submissions. It is empowered to investigate and gather evidence beyond that presented where exercise of that power is necessary to supplement the record and is in the public interest. The record here does not show, except in nebulous fashion, that the cost figures represent anything but the overall average territorial costs and they certainly are not computations of cost figures of the particular movements here involved. The ICC has tools to assemble complete factual records, it employed virtually none of them in this extremely important pro-

ceeding. (See Justice Brennan's concurring opinion in the Railroad merger cases, 386 U.S. 372, decided March 27, 1967).

This opinion has been rather lengthy and includes findings and conclusions. By way of repetition and emphasis we add the following specific conclusions:

Conclusions of Law

1. This Court has jurisdiction, under 5 U.S.C. § 1009 and 28 U.S.C. §§ 1336, 2284, 2321-2325, to suspend, enjoin, annul and set aside the enforcement, operation and execution of orders of the Interstate Commerce Commission.

2. The venue of this action is properly laid in the Eastern District of Louisiana under 28 U.S.C. § 1398.

3. The Commission has power to require the development of adequate and comparable cost data. Section 20(1) of the Act expressly grants the Commission the power "to require the carriers to provide full, true and correct answers to all questions upon which the Commission may deem information to be necessary" (49 U.S.C. § 20(1)). The Commission has a duty to use its powers to obtain cost evidence where such evidence is necessary to assure an adequate record. That duty was violated here as the Commission failed to take affirmative action to require the development of an adequate record as to the actual costs of handling the specific traffic at issue.

4. The Commission stated as its standard the costs of handling North-South freight traffic, but reliance upon territorial average costs caused it to include in the Northern costs deficits from suburban commuter passenger service operations. This action constitutes a violation of both Sections 8(b) and 10(e) of the Administrative Procedure Act when judged against the standard stated by the Commission itself as governing in this case—that is, the relative costs of handling North-South freight traffic. The Commission had before it no substantial evidence on which

such a conclusion might be based. The lack of rational basis for the Commission's conclusion is highlighted by the Commission's own inconsistent finding that "many individual items of suburban service can be considered solely related * * * to suburban service" (325 I.C.C. at 78).

5. The Commission's use of territorial averages in computing the "switching costs" of the Northern and Southern railroads rather than the specific costs incurred by those railroads with respect to North-South traffic is not supported by reasoned findings and not based on substantial evidence in the record and thus violates Sections 8(b) and 10(e) of the Administrative Procedure Act.

6. The Commission's use of territorial average "empty return ratios" rather than the actual empty return ratios for the North-South traffic in issue also violates Section 8(b) and 10(e) of the Administrative Procedure Act because it is unsupported by reasoned findings and not based on substantial evidence in the record.

7. The "typical evidence rule" requires that there must be evidence typical in character and ample in quantity with respect to the divisions and services performed under the particular rate being divided. The Commission must consider evidence of actual services performed on particular traffic involved, and not rely wholly on averages which "are apt to be misleading." Here, the Commission relied on "unsifted averages." *United States v. Abilene & Southern Railroad Co.*, 265 U.S. 274 (1924), at p. 291; *Atchison, Topeka & Santa Fe R. Co. v. United States*, 225 F. Supp. 584, 592-600 (D. Colo. 1964).

Conclusion

We are not unmindful of the complicated nature of this problem. However, when the outcome of factual issues is bound to cut deeply into economic relations on such a scale and when the result involves a departure from an equal division formula previously adopted, it is appropriate to

remand the case to the ICC for further study, followed by an explicit development of a record to assure adequate and comparable evidence with respect to the cost of the specific traffic at issue.

With the passage of each year, the 1959 test year adopted here becomes more and more vulnerable to the charge of staleness. It therefore has less and less to recommend it as a reliable basis upon which to predicate a division order. We make this observation not to indicate that it would necessarily be an abuse of discretion for the Commission not to re-open the investigation to receive later operating figures, but as a suggestion that such a re-opening well might be warranted.

The Commission Order, in its entirety, should be set aside and the cause remanded to the Commission for further proceedings consistent with the views expressed herein.

Counsel for plaintiffs will prepare and submit an appropriate decree in conformity with this opinion.

APPENDIX B

Final Decree and Stay Order of the District Court

U. S. District Court
Eastern District of Louisiana
Aug 22 1967
FILED
A. Dallam O'Brien, Jr.
Clerk

IN THE DISTRICT COURT OF THE UNITED STATES
FOR THE EASTERN DISTRICT OF LOUISIANA
NEW ORLEANS DIVISION

CIVIL ACTION
No. 15454
DIVISION "C"

ABERDEEN AND ROCKFISH RAILROAD COMPANY, ET AL., Plaintiffs,

VS.

UNITED STATES OF AMERICA and INTERSTATE COMMERCE COMMISSION, Defendants,

Final Decree

This action came on for trial before the Court, Honorable John Minor Wisdom, United States Circuit Judge,

Honorable Edwin F. Hunter, Jr., United States District Judge, Honorable E. Gordon West, United States District Judge, and the issues having been duly tried, heard and determined, an Opinion with the findings of fact and conclusions of law having been duly filed, Now, Therefore, in accordance with said Opinion and its findings of fact and conclusions of law,

IT IS ORDERED AND ADJUDGED that the order of the Interstate Commerce Commission dated February 3, 1965, as supplemented by the third ordering paragraph of the order of that Commission dated May 18, 1965 (each as entered by the Commission in the cause under its Docket No. 29799, *Akron Canton & Youngstown R. Co., et al. v. Aberdeen & Rockfish R. Co., et al.*, and Docket No. 29885 *Official Southern Divisions*), and each of said orders, be and the same are hereby set aside and that said cause be and the same is hereby remanded to the Commission for further proceedings consistent with the Opinion, findings of fact and conclusions of law of this Court.

UNITED STATES OF AMERICA and INTERSTATE COMMERCE COMMISSION, Defendants,

Order Staying Decree

IT IS HEREBY ORDERED AND ADJUDGED (1) that the effectiveness of the Decree signed, dated, and entered concurrently herein on this date is hereby stayed for the period of sixty (60) days from said date, and if a notice or notices of appeal to the Supreme Court are filed within such period, then this stay shall continue until final disposition or termination of such appeal or appeals; and (2) that during the aforesaid period or periods the protective provisions contained in Paragraph 3 of the Order of this Court of June 3, 1965, denying Application of Plaintiffs and Intervening Plaintiffs for an Interlocutory In-

junction and Dissolving the Temporary Restraining Order, shall continue in full force and effect.

Dated: August 8, 1967.

APPENDIX C

Reports and Orders of the Commission.

1

No. 29885 [1]

OFFICIAL-SOUTHERN DIVISIONS

IN THE MATTER OF DIVISIONS OF JOINT RATES BETWEEN OFFICIAL AND SOUTHERN TERRITORIES

Decided February 3, 1965

Upon further hearing, present divisions of joint interterritorial rates between official and southern territories found unjust, unreasonable, and inequitable. Just, reasonable, and equitable divisions prescribed. Prior reports, 287 I.C.C. 497, 289 I.C.C. 4, 291 I.C.C. 90, 294 I.C.C. 739, and 298 I.C.C. 83.

REPORT OF THE COMMISSION ON FURTHER HEARING

2

FREAS, *Commissioner:*

By complaint in No. 29799, filed July 24, 1947, the northern lines assailed as unlawful the divisions of joint rates on citrus fruit from points in Florida to destinations

1. This report also embraces No. 29799, Akron, Canton & Youngstown Railroad Company et al. v. Aberdeen & Rockfish Railroad Company et al.

in official territory. Thereafter, on December 4, 1947, we instituted, on our own motion, the investigation in the title case for the purpose of determining whether the then existing divisions of joint class and commodity rates between points in official territory and points in southern territory (as both territories are defined in *Class Rate Investigation, 1939,* 262 I.C.C. 447, 457) were unjust, unreasonable, or otherwise unlawful. All railroad carriers in the two territories were named as respondents.[2] Thus, as originally instituted, the two proceedings brought in issue the divisions of all joint interterritorial rates between the North and the South, except those on coal and coke made from coal which were excluded by mutual consent of the parties.

The original principal decision dated January 12, 1953, 287 I.C.C. 497, called the first 1953 report, embraced all involved traffic. By it, we prescribed primary divisions based upon equal mileage factors for the northern and southern lines, except that as to joint proportional rates on grain and grain products from East St. Louis, Mo., Louisville, Ky., and Cincinnati, Ohio, to points in southern territory, the northern factors prescribed were 75 percent of the northern general factors. That report also provided that arbitraries which were included in the joint rates should be deducted before prorating and that in lieu of specific apportionment of the arbitrary in respect of the rates on citrus fruit from Florida to official territory one percentage point should be deducted from the northern division and added to the southern division.[3] Also in that report the dividing points for such primary divisions were

2. Individual carriers will sometimes be referred to by their initials or other short titles.

3. Southern lines now ask that these findings relating to arbitraries be affirmed. Northern lines voiced no objection thereto, although they include as an arbitrary to be deducted before prorating an excess of $57 per car in the rates on vegetables to New York over the rates to New Jersey. This latter matter is discussed separately hereinafter and is denied. Under the circumstances, the prior findings as to arbitraries will be adopted herein.

fixed at the points of actual interchange rather than at the territorial boundaries.

In a report on reargument, 289 I.C.C. 4, decided May 26, 1953, called the second 1953 report, the prior report was modified so as to make the prescribed divisions applicable only to and from the existing primary dividing points. This report also postponed the effectiveness of the prescribed divisions to and from points on the Norfolk Southern
3 Railway Company, the Atlantic and East Carolina Railway Company, and the Beaufort & Morehead railroad Company (A. T. Leary, lessee) pending further hearing. The prescribed divisions became effective on July 15, 1953.

Upon petitions of various parties the findings in the two prior reports were interpreted and certain conclusions were revised in three supplemental reports. In 291 I.C.C. 90, of November 2, 1953, the definition of northern lines was broadened to include the Toledo, Peoria & Western Railroad Company, and the proceeding was reopened for further hearing with respect to divisions of rates between points on certain western trunklines and points in southern territory where no northern (official territory) carrier was a party to such rates, and with respect to divisions of joint interterritorial rates between points on the line of the Atlantic and Danville Railway Company west of Suffolk, Va., and points in official territory. The third and fourth supplemental reports, 294 I.C.C. 739 and 298 I.C.C. 83, made certain interpretations of previous findings.

On November 2, 1956, the northern lines petitioned for general reopening of these proceedings for further hearing and for modification of the order of January 12, 1953, as modified by the order of May 26, 1953. The petition was held in abeyance at the request of the interested parties until April 1, 1959, when the northern lines asked that the petition be processed. After replies had been duly filed, we reopened the proceeding for further hearing by order

dated July 20, 1959. The scope of the divisions now at issue is in some respects more limited than that covered in the 1953 reports. The joint interterritorial rates now excluded and the reasons therefor are listed in appendix A hereto.

The instant proceedings have been the subject of lengthy hearings during which considerable evidence was adduced by all parties in light of the criteria of section 15(6) of the Interstate Commerce Act. The hearing examiners found the present divisions unjust, unreasonable, and inequitable, and prescribed new divisions. Exceptions to the recommended report and order were filed by the official territory respondents, the southern territory respondents, and jointly by the Southern Governors' Conference and the Southeastern Association of Railroad and Utilities Commissioners. These parties also filed replies. Exceptions were also filed by the Norfolk Southern Railway Company and the North Carolina Utilities Commission. We have heard the parties in oral argument. Our conclusions differ in part from those recommended.

4 We consider the examiners' statement of facts to be substantially correct, as material, and in this report adopt it as our own. We have used here verbatim certain portions of that statement where necessary for clarity of discussion.

Prior to our consideration of the evidence, however, certain preliminary matters must be resolved. Initially, the southern lines contend on exceptions that our Section of Cost Fnding has consulted with and furnished advice to the examiners upon the issues, and although the southern lines specifically requested that they be given notice of and an opportunity to participate in any such consultations they were denied this right. Such action is said to deny the full and fair hearing guaranteed by section 15(6) of the Interstate Commerce Act, sections 5, 7, and 8 of the Ad-

ministrative Procedure Act, and the fifth amendment to the Constitution.

In our opinion, hearing examiners and the Commission itself may properly consult with staff members of the cost section or receive from them analyses of the cost evidence in the record, and such advice or analyses need not be furnished to the parties when given or prepared by cost section employees who have neither testified nor prepared exhibits in the case. See *United States v. Morgan*, 313 U.S. 409 (1941); *T.S.C. Motor Freight Lines, Inc., v. United States*, 186 F. Supp. 777 (S.D. Tex. 1960), affirmed *sub nom. Herrin Transportation Co. v. United States*, 366 U.S. 419 (1961). Any such cost section assistance is a part of, and solely in aid of, the internal process of decision. There was no error prejudicial to the southern lines. The southern lines also contend that the examiners erred in refusing to receive or mark certain exhibits dealing with switching minutes and empty-return ratios. However, the examiners' ruling related to exhibits offered after the southern lines had rested their case and after the date fixed for the submission of their evidence. Such action was in accord with the procedural order adopted in this proceeding. It did not constitute an abuse of discretion nor deny the southern lines a fair hearing. The ruling is affirmed.

The northern lines contend that the examiners erred in rejecting certain portions of their rebuttal cost exhibit. The involved rejected data was found by the examiners to be new and additional material beyond the scope of rebuttal. Since the northern lines refused to incorporate the material as part of their case in chief and to accord the southern lines the right of rebuttal, the examiners were correct in their ruling that the matter constituted improper rebuttal and in excluding it.

5 Finally, at oral argument, counsel for the southern lines in response to a question by counsel for the northern lines indicated an intent to rely on the holding as

to the typical evidence rule set forth in *Atchinson, T. & S. F. Ry. Co. v. United States,* 225 F. Supp. 584 (D. Colo. 1964), hereinafter called the *Western Trunklines* case. There, the court in reviewing the *Orient* case (*United States v. Abilene & S. Ry. Co.,* 265 U.S. 274 (1924)) and other decisions, held that in finding an existing scale of divisions unlawful the Commission cannot rely exclusively on aggregate or average data in making this initial determination but must have representative evidence which it considers typical in character and ample in quantity to permit a determination with respect to each division of each rate of every carrier. As we understand the position of the southern lines at oral argument, they contend that no such evidence is of record and that only "conglomerate averages" are shown.

The court in the *Western Trunklines* case stated, at page 595:

> Far from precluding Commission consideration and use of average data, the opinion in the *Orient* case states that "aggregate results should properly be taken into consideration by the Commission." The point of the *Orient* case is that the Commission may not rely wholly and exclusively on average or aggregate data. Before it relies on average or aggregate data, the Commission must make sure that the divisions formula under consideration (although seemingly just and equitable when viewed in terms of its impact on a group of railroads as a group), has not been construed in such a way that its impact on any particular division of any particular rate as applied to any particular carrier is unjust. This the Commission must do by considering evidence fairly representative of each division of each rate of every carrier in order that some inequity which might remain undisclosed by average or aggregate data is not permitted to slip in unnoticed.

It also indicated at page 592:

> The "typical evidence" rule in divisions cases, however, does not have to do with individual shipments made by particular carriers, as plaintiff's contend; rather, it has to do with particular divisions of particular rates among particular carriers. Evidence showing the volume and type of traffic moving subject to the representative rates, although highly probative, and probably otherwise essential to a just and equitable decision, is not absolutely required by the "typical evidence" rule.

Counsel for the northern railroads then indicated at the conclusion of oral argument that, if the Commission chooses to rely on the *Western Trunklines* case, it should require both sides to submit the abstracts of settlement statements among the various carriers which would reflect the specific data mentioned in the court's holding. It was urged,
6 however that the holding in the *Western Trunklines* case was erroneous, and that, in any event, no lack of evidence had been advanced of record by the southern lines, except perhaps as to grain and grain products, during the lengthy hearings herein. Both sides had freely exchanged such settlement sheets during the hearing, but they were not made part of the record. If submission of such data were required, the northern railroads indicated that they would waive cross-examination.

Except as hereinafter indicated, necessary typical evidence is of record, and we have properly considered and evaluated it. At this point, we note that the southern lines on brief have characterized their traffic study as providing—

> The most current data available with respect to the normal annual movement of Official-Southern traffic ever presented to the Commission. This information shows the services performed and revenue received by each carrier participating in the movement of the precise traffic at issue. It measures the participation of

Class I and Class II railroads, individually and as groups, in each territory, and shows the relative importance of Official-Southern revenues and ton-miles to the railroad groups and individual carriers.

Moreover, both the northern and southern lines' traffic studies are based on samples of the interline abstracts, the regularly maintained basic records, freely exchanged at the hearing, on which interline revenues from particular rates are divided among each participating carrier. Under the circumstances, as will be further shown and except as hereinafter indicated, we find the typical evidence contention of the southern lines to be without merit. To the extent that the *Western Trunklines* case also requires due consideration of all of the criteria of section 15(6), we have done so.

Traffic Studies

Introduction.—Both the northern and the southern lines made traffic studies for use in this proceeding. The northern lines introduced two studies developed from sampling, embracing carload shipments (except coal and coke made from coal) moving on joint rates (including aggregate-of-intermediate rates which automatically displace single-factor joint rates) between points in southern territory and points in official territory. The southern lines' study, also developed in accordance with a sampling procedure, was broader in scope and coverage than that of the northern lines. The studies of both groups do not
7 cover less-than-carload traffic.

The southern lines' tabulations show many of the characteristics of the traffic in the same form as that produced in the northern lines' study. The southern lines' study, unlike that of the northern lines, does not make separate showings as to citrus fruit and vegetables, such traffic having been included in the overall general study. However, the southern study shows separately the traffic units and revenue, and permits an application and comparison of costs thereto. Coal and coke made from coal

are not included in the southerns' final tabulations. Certain classes of traffic are not embraced in the study since, for reasons shown, the southern lines deem the divisions of rates thereon not here in issue. These segments are: (1) traffic to and from western carriers' stations in official territory, (2) traffic subject to grain proportional and reshipping rates subject to docket No. 29885 prescribed divisions, both categories having been excluded for the reason that no evidence thereon was introduced by an official territory respondent, (3) border traffic between border points and official territory which was the subject of litigation in docket No. 32055 (the parties have stipulated that this traffic is not in issue), (4) Norfolk Southern general traffic between stations on that line and points in official territory, having been excluded because docket No. 29885 divisions were not prescribed thereon and that respondent made a separate presentation thereof in a study including its overhead traffic, and (5) traffic to and from Morehead City, N.C., on the Atlantic & East Carolina, having been excluded for the same reasons as in (4) above.

Northern lines' general traffic study.—The northern lines' general traffic study embracing traffic for the months of March and September 1956 was expanded to a year's basis by multiplying by six. This study, so expanded, embraced a movement of 983,664 cars, 28,416,839.4 tons, with total revenue of $450,909,348. Northbound traffic exceeded the southbound by substantial amounts. About 70 percent of the carloads and 74 percent of the through revenue were in the manufacturers and miscellaneous category. About 75 percent moved in boxcars and refrigerator cars. As in the original case (the first 1953 report), the most important interchange points were Cincinnati, Richmond, and Potomac Yard, Va., with over half being interchanged at Varginia gateways, the remainder at the Ohio River crossings.

The average hauls on the general traffic per car-mile and per ton-mile are shown below:

8

Car-miles	*North* *Miles*	*South* *Miles*	*Total* *Miles*
Route of movement	408	519	927
Short line	362	475	837
Ton-miles			
Route of movement	392	508	900
Short line	347	464	811

The average hauls of the northbound traffic (not including Florida vegetables) in the southern lines' general 1947 study (based on average short-line ton-miles) were 370 miles in the North and 500 miles in the South, and of the southbound, 325 miles in the North and 440 miles in the South. On the same basis, the present northern lines' general traffic study shows on northbound traffic, 371 miles in the North and 496 miles in the South, on southbound, 313 miles in the North and 419 miles in the South, and on total traffic 347 miles in the North and 464 miles in the South, compared with the 1947 study figures of 345 miles north and 478 miles south.

The total revenue of $450,909,348, including the arbitraries was divided between the two groups, 45.44 percent north and 54.56 percent south. The study shows that the northern lines performed 42.8 percent of the short-line ton-miles of service, and 44 percent of actual route of movement car-miles, the southern lines 57.2 and 56 percent, respectively.

The citrus fruit and vegetables study.—This northern lines' study, also developed by sampling, covered the movement of these commodities from southern territory to points in official territory on lines of the northern lines for the 5 months, January through May 1956, and embraced 43,810 cars (713,618 tons). The total revenue was $19,660,843, which was settled 33.38 percent North and 66.62 percent South. The northern carriers performed 29.4 percent of the short-line ton-miles of service, the southern, 70.6 per-

cent. The preponderance of this traffic moved through Richmond and Potomac Yard. Cincinnati was the important Ohio River gateway.

The following table shows the average short-line hauls on this traffic:

9

	Short-line miles		
Car-miles	*North*	*South*	*Total*
Citrus fruit	356	830	1,186
Vegetables	360	893	1,253
Weighted average	359	871	1,230
Ton-miles			
Citrus fruit	355	830	1,185
Vegetables	361	890	1,251
Weighted average	358	860	1,218

Southern lines' study.—This study for the 12-month period July 1958 to June 1959 produced an estimated total of 967,554 cars containing 28,055,720.7 tons of freight yielding total through freight revenue of $496,086,766, including arbitraries totalling $1,365,705. The study included traffic originating or terminating on western or southern lines in official territory when a northern line participated in the haul, and, as stated above, coal and coke made from coal and certain other classes of traffic, not considered by the southern lines as here in issue, were not included in the final tabulations.

By directional flow, by commodity groups, and by types of equipment, this study follows closely those characteristics as produced in the northern lines' study. As in the northern study, Cincinnati led as the principal primary breakpoint, with Richmond and Potomac Yard in second and third place. Of the total cars embraced in the study, 55.4 percent passed through the Ohio River-Illinois-Kentucky gateways, and 44.6 percent through the Virginia gateways.

The average hauls per car and per ton, both route-of-movement and short-line, for the total traffic included in the study are shown below:

	North	*South*	*Total*
Per car	*Miles*	*Miles*	*Miles*
Route of movement	420	567	987
Short line	372	522	894
Per ton			
Route of movement	410	557	967
Short line	361	511	872

10

The following table compares the "as settled" division of the total through revenue in the two groups' studies:

	Combined northern lines' studies, including arbitraries	*Southern lines' study*	
		Including arbitraries	*Excluding arbitraries*
	Percent	*Percent*	*Percent*
North	44.93	44.64	44.75
South	55.07	55.36	55.25

The northern lines point out that the southern study is subject to criticism for failure to include Norfolk Southern traffic so as to permit such traffic to be considered separately or together with Southern traffic as a whole. As stated, the Norfolk Southern submitted a separate presentation for itself with respect to traffic originating or terminating on its line and passing over its line to or from stations on the Atlantic & East Carolina and the Beaufort & Morehead. The divisional situation as to these lines is the subject of later discussion herein. Inclusion of Norfolk Southern originated or terminated traffic reduces by 8 miles the average haul in the South, based on average short-line ton-miles.

Preliminary conclusions as to the traffic studies.—The studies of the two groups are basically similar as to the

general characteristics of the traffic. The least similar results are the average hauls. These differences may be accounted for principally in the difference in the periods studied as well as the inclusion or exclusion of certain traffic in the one and not in the other. The northern study does not include an estimated annual movement of 46,201 cars which originated or terminated on western district lines on which the northern lines performed only intermediate service. Also excluded was traffic (4,092 cars) to or from southern lines' stations in official territory on which the northern lines performed only intermediate service. A third category not included in the northern lines' study (2,955 cars) which the southern study embraces was traffic between the South and Canadian points moving on combination rates breaking at the international boundary on which the revenue accruing to domestic carriers is divided on the 1953 prescribed basis. On the other hand, the northern study includes traffic between points on the Norfolk & Western in southern territory and points in official territory. The extent of this traffic is not revealed but its inclusion tends to understate the southern lines' average haul since such traffic always has a relatively short haul in the South.

11

The northern study does not reflect the changes in effective divisions which have occurred since 1956, brought about by vacation of the 1953 order as to certain categories of traffic as requested by mutual petitions. Thus, the "as settled" revenue which the northern lines received is understated under present divisional bases. This is particularly true as to vegetables. Since 1957 most vegetable traffic to the New York rate group has moved on per-car rates, the divisions thereon providing that the charge of $57 per car in the New York City rates, over and above the rates to Jersey City, N. J., shall accrue to the delivering lines before prorating. Thus, the northern lines' study shows that during the first 5 months of 1956 the northern lines received 32.23 percent of the "as settled" revenue on

northbound fresh vegetables whereas the southern lines' study of 21,785 cars of fresh vegetables moved in a year subsequent to the establishment of the per-car rates shows the northern lines received 35.28 percent. The southern study includes vacated order traffic: (1) liquid soda and soda ash from Saltville, Va., to Kingsport and Port Rayon, Tenn., and (2) peaches and fresh vegetables moving on per car rates to piers 22, 27, 28, and 29 at New York City. These two categories represent only 1,209 cars, an inclusion of little significance, but the divisions thereon remain in issue here as do the divisions on trailer-on-flatcar traffic not covered by stipulation of the parties.

We agree with the aforementioned characterization by the southern lines, stated earlier, as to the evidentiary worth of their traffic study. The basic abstract sample of southern lines consists of 100 percent of those abstracts covering $10,000 or more of revenue ("A" abstracts) with a 5-percent random sample of the remaining abstracts ("B" abstracts). The northern lines accepted the reliability of the southern lines' study by using it as the basis for their own final cost computations, and we have used the service units produced by the study in our restatement of the costs. Moreover, a careful consideration of the traffic studies and the abstract samples reveals that there are typical and ample representations of the roads involved, large and small, covering typical movements in ample number for a normal annual period with appropriate adjustments to reflect seasonal variations. A totalling of the divisions on particular traffic (which reflects the rates involved) permits an appropriate consideration of individual carriers and their movements.

12

ECONOMIC TRENDS

At pages 501-505 of the first 1953 report, 287 I.C.C. 497, various statistical comparisons were set forth which supported a conclusion "that in the past 20 years the South has bettered its relative economic position in comparison

with the North" and "that the southern railroads have benefited from this improvement in the economic situation of the South." The record in this reopened phase indicates a continuation of these trends. The number of employees in the South in 1958 increased 28 percent over 1947, the number in the North was approximately the same in 1958 as in 1947, while there was an increase of 12 percent for the entire country. In absolute figures, the North in 1958 had almost 10 million employed persons, 5 times as many as the South. The value of manufactures for the Nation almost doubled between 1947 and 1958. It increased about 67 percent in the North, and slightly more than doubled in the South. From 1930 to 1958 the population of the United States increased 41 percent and in the southern States, 44 percent. The percentage population gains during the 20 years 1930 to 1950 were 22.7 percent for the entire country, 24.5 percent in the South, and 18.8 percent in the North, as shown in the 1953 report. A southern respondent in 1960 represented "that the South's economic development since World War II has outpaced the national rate of growth in practically every category you can name." Data adduced also show increases for the South of 40 percent in the number of manufacturing establishments, and 57 percent in the number of industrial and commercial firms, compared with respective national increases of 26 and 25 percent.

However, the South, as an area, was below national levels in several respects on a per capita basis. In 1956 manufacturers' expenditures for new plants and equipment per capita in the South were $48 as compared with $67 on a national level. In the same year value added by manufacture per capita in the South was $500 as compared with $835 in the Nation. In 1955, total bank assets per capita in the South were $670, or 48 percent of the national level of $1,398. The total value of farm products sold per capita in the South in 1954 was $131 as compared with $153 in the

Nation, while retail sales per capita in that year were $815 in the South compared with the national average of $1,054.

Operating and Revenue Results

There has been a relatively greater increase in freight traffic in the South than in official territory since 1947. The number of cars and tons handled within the South in 1958 were 100.40 and 120.21 percent, respectively, of that for 1947 while corresponding percentages for official territory were 64.14 and 68.19. Revenue ton-miles for the southern region in 1958 were 99.6 percent of those shown for 1947, and revenue tonnage originated and terminated in 1958 was 105.5 and 113.6 percent, respectively, of that handled in 1950. Corresponding percentages for the eastern district and Pocahontas region were for revenue ton-miles, 85.4 percent, and for tons originated and terminated, 77.3 and 77.5 percent, respectively. Revenue tons originated and terminated in the entire country in 1958 were 87.9 and 91.3 percent, respectively, of that in 1950.

As shown below, there has been a relatively greater increase in freight revenue of the southern lines since 1950 than in that of the northern lines:

Freight revenue	*Southern region*		*Eastern district and Pocahontas region*	
for—	*Amount*	*Percent*	*Amount*	*Percent*
1950	$1,098,229,000	100	$3,374,542,000	100
1958	1,175,318,000	107	3,217,516,000	95.3

The average net ton-miles of revenue and nonrevenue freight per annum in the southern region for 1956-58, 91.8 billion, were 2.1 billion more than those for 1950, and 37.9 billion greater than in 1940. The annual average for the eastern district and the Pocahontas region in 1956-58 was 253.2 billion, 6.3 billion less than in 1950, and 53.8 billion greater than in 1940.

In the first 1953 report, 287 I.C.C. at page 503, the operating ratios of the two groups of carriers shown for the

years 1941-50 indicate that ratios for the southern lines were consistently below the ratios of the northern lines. The present record does not show freight operating ratios separately. The total operating ratios continue to favor the southern lines as shown below:

Year	*Southern region*	*Eastern district and Pocahontas region*
	Percent	*Percent*
1951	75.14	79.58
1952	73.26	79.03
1953	72.64	78.79
1954	76.00	81.14
1955	72.79	77.09
1956	74.73	77.62
1957	77.68	79.53
1958	78.61	81.20
1959	76.22	80.52

14

The first 1953 report also showed that the increase in net railway operating income received by the southern lines in the period 1941-51 had been relatively larger than for the northern lines. Continuation of that trend is shown below:

Net railway operating income

Annual average for—	*Southern region*		*Eastern district and Pocahontas region*	
	Millions	*Percent*	*Millions*	*Percent*
1948-53	$157.8	100	$395.4	100
1954-59	162.4	103	361.1	91

The above table reflects operations of the two groups for the 6 full years prior to and after the presently prescribed divisions became effective under which the prior divisions giving the southern lines on general traffic a 25-percent factor advantage was eliminated. Revenue in 1956 for the northern lines from the traffic at issue was 6 percent of their total freight revenues, while for the southern lines the percentage was 21.4.

Rates of return on depreciated book investment, set forth in the first 1953 report, 287 I.C.C. at page 503, indicate that for the years 1941 to 1951 those for the southern lines consistently exceeded those for the northern lines. In this phase of the instant proceeding, the rates of return based on the net investment [4] are as follows:

Year	*Southern region percent return*	*Eastern district and Pocahontas region percent return*
1952	5.27	3.86
1953	5.45	4.01
1954	4.48	2.89
1955	5.45	4.19
1956	5.02	4.05
1957	4.14	3.29
1958	3.68	2.00
1959	3.63	2.27

Again comparing these statistics for the 6 full years since the present divisions became effective with the 6 years prior thereto, the average rate of return (net investment method) for the southern lines was 4.40 percent in 1954-59 and 4.79 percent in 1948-53, while the northern lines' average was 3.11 and 3.60 percent, respectively.

The southern lines take the position that returns for the calendar years 1958 and 1959 should not be used for comparative purposes to determine future divisions in view of the recession in business activity affecting the first half of 1958 and the severe steel strike affecting the last half of 1959, which affected the northern lines to a greater degree than the southern lines. The rates of return of both groups for these years were lower than for any other year since 1949. A comparison, omitting 1958 and 1959, shows average annual rates of return for the southern lines, 1954-57, 4.77

4. The net investment method is the carriers' investment in road and equipment, material and supplies, and cash, less accrued depreciation and amortization at the end of the year under consideration.

percent and 1950-53, 5.19 percent and for the northern lines during the same respective periods, 3.60 and 3.76 percent. Thus, the spread between the two groups in the 4-year period before the present divisions became effective, 1.43 percentage points, was reduced to 1.17 in the like period subsequent thereto.

The following table shows changes in revenue per ton and revenue per ton-mile for the two groups in the first 4 years since the present divisions became effective:

	Official territory		*Southern region*	
	Revenue per ton	*Revenue per ton-mile*	*Revenue per ton*	*Revenue per ton-mile*
Year		*Cents*		*Cents*
1954	$2.98	1.55	$2.98	1.46
1955	2.91	1.48	2.89	1.40
1956	2.95	1.49	2.82	1.43
1957	3.14	1.56	2.97	1.48

The southern lines observe that the location of new industries in the South near abundant sources of raw materials has meant that the long-haul movement of manufactured products into the South has been replaced by the movement of low-rated raw materials to nearby plants. Increased population in the South has caused finished products to be consumed locally, and the southern lines contend that they are left with less remunerative movements of low-rated raw materials. As an example, the Seaboard handled 33.9 percent more tonnage of low-rated commodities in 1959 than it did in 1951. Between the same years its tonnage of high-rated traffic increased only 5.6 percent. Its revenue increases in the same period were 28.7 percent on low-rated and 2.4 percent on high-rated commodities. The northern lines' tonnage and revenues in the eastern district for both groups of commodities decreased in 1959 compared with 1951. The decrease on low-grade tonnage and revenues was 27.4 and 15.8 percent, re-

16

spectively, while on high-grade, 22.4 and 15.2 percent, respectively.

In August 1959, 12.1 percent of the northern lines' cars were undergoing or awaiting repairs; the figure for the southern lines was 5.3 percent. In July 1959, 6.7 percent of the North's locomotives were in or awaiting shop; for the South, 3.1 percent. Using the 4-year period of 1950-53 as a base index of 100 for new rail laid in replacement, the northern lines' indices were 60.6, 60.9, 56.6, 54.4, and 20.5 in the 5 years, 1954-58, respectively, while the respective indices for the southern region roads were 101.2, 90.9, 76.7, 80.7, and 49.8. Indices for crosstie and secondhand rail replacements in the two groups follow similar patterns during the same 5-year period.

The first 1953 report, 287 I.C.C. at page 505, discussed the efforts by each group to show that its revenue was more adversely affected by motor and water competition. However, it was not found there that such competition would be felt more keenly in the future by one group than by the other. Facts respecting such matters, including truck registration, highway construction, truck versus rail tonnage, revenue, and ton-mile revenue, waterborne diversions, and competitive rate reductions, were shown. However, those factors are not shown to have a measurably greater effect on one group as against the other on interterritorial traffic. We find that no adjustment of divisions is in order as a result of competition from other modes of transport.

Efficiency of Operation

In prescribing divisions the Commission is required by section 15(6) of the act to "give due consideration, among other things, to the efficiency with which the carriers concerned are operated." In the original phase of this case the relative efficiency of the northern lines was the subject of substantial evidence directed to support the southern lines' assertion that "performance in the North reflects

less efficient operation than in the South." After reviewing the various statistical indicators of efficiency in the prior record, it was stated at page 519 of the first 1953 report: "In our opinion the figures disprove the charge that the northern lines are less efficiently operated than the southern lines * * *."

17 In this reopened phase, the southern lines do not question the relative efficiency, as such, of their opponents. Instead, they charge that the northern lines have been unwise in choosing to devote available funds to reduction of debt rather than making capital improvements in their transportation plant, that the primary problem confronting the northern lines must be met through the elimination of duplicate facilities and modernization of railroad plant, and that cost savings are available to those lines through elimination of excess and duplicate facilities.

The northern lines assert that the same conclusion as to relative efficiency as made in the first 1953 report is warranted upon this record. It was there stated at page 525:

> We do not interpret section 15(6) as requiring us to determine whether one group of carriers is more or less efficiently operated than another, but rather to give due consideration to any evidence which might tend to indicate that the showing as to cost of service is affected by wasteful or inefficient management.

The record shows that the traffic density in the North is appreciably greater than in the South. From this fact the southern lines reason that the unit costs shown in Rail Form A for recent years for the northern lines should be lower than for the southern lines. However, many factors other than density, as will be hereinafter discussed, affect the operating expenses of a group of railroads. In any event, railroads in the North, including the larger ones, are shown to be in the process of eliminating unnecessary facilities

and services. At the same time, the evidence shows that the northern lines exercised their best managerial judgment, when faced with rising debt, in dealing with problems affecting the cost of service at the time they were encountered. We find no basis for giving effect to criticism of such action. Nor is there a basis for criticizing the judgment of southern lines in expanding and developing their operations. Also the record does not establish that the northern lines' costs are overstated relative to the southern lines' costs as a result of differences in the timing of the modernization programs in each territory. It is true that the savings expected from proposed mergers and consolidations are not reflected in the cost studies of record. However, the southern lines themselves have noted that mergers are now going forward in all territories, including the South. If and when such proposed mergers are ultimately approved and finally consummated in both groups the savings produced thereby will be then reflected in the respective unit costs. The economies hoped to be effected thereby
18 and the savings exepected are not ascertainable for future operation to the degree required for any specific adjustment here of the cost studies of record. We find upon this record that the northern lines' cost of service is not shown to be affected by purported waste or inefficiency. More affirmatively, we find that both groups are being operated efficiently and that neither group should be considered as more or less efficient than the other.

Relative Cost of Service

It was stated in the first 1953 report, when prescribing the present divisions, that: "* * * it is to be the safest assumption for the future upon the facts before us that neither contesting group will have an appreciably lower basis of operating costs than the other, * * *." 287 I.C.C. at page 526. To demonstrate changed conditions, the northern lines presented evidence as to the relationship of territorial average costs, the trend of those costs over a period

of years, and the cost of moving the traffic at issue based on territorial average unit costs applied to traffic samples. They contend that their cost evidence reflects higher costs in the North than in the South for equivalent hauls and loads, that the difference has increased over a period of years, and that the division of the revenues which they receive for hauling the traffic at issue is less than their proportion of the costs of hauling it, thus proving the aforesaid assumption was not well founded.

The basic formula used by both parties was Rail Form A, entitled "Formula for Use in Determining Rail Freight Service Costs," which utilizes the expenses and statistics for a given year as reported to this Commission by the carriers as well as supplemental data derived from special studies made by the carriers. The traffic here at issue moves over three statistical and cost territories: the southern region south of the divisional breakpoints, the eastern district, and the Pocahontas region north of the breakpoints or border. The northern lines rely in these proceedigns upon eastern district territorial costs as developed by Rail Form A. It is their view that such Rail Form A costs—unadjusted—should be used to measure the relative costs of service for the two groups of carriers involved.

The southern lines contend that eastern district territorial costs are appropriate only for the eastern district, and that Pocahontas region costs should be used for the Pocahontas carriers; or that at least official territory cost should be used for official territory (made up of eastern district and Pocahontas region). It is also their view that territorial costs should be somewhat narrowed down to the North-South traffic in issue. Endeavoring to adjust Rail Form A costs to the interterritorial traffic in issue, there are a number of adjustments presented by the southern lines purportedly improving the accuracy of the territorial costs for the two groups of carriers. These adjustments are dealt with in full in subsequent treatment of this subject.

The following table shows the relative participation of the carriers in the traffic at issue as shown in the southern traffic study.

	Cars originated or terminated	*Percent*	*Car-miles*	*Percent*
Official-southern traffic north of gateway:				
Eastern district roads	769,700	79.55	276,278,108	67.98
Pocahontas roads	130,877	13.53	95,562,990	23.51
Class II roads ..	16,697	1.73	417,948	.10
Southern lines in official territory	4,092	.42	24,030,862	5.91
Western lines in official territory	46,201	4.77	10,108,571	2.49
Total	967,567	100.00	406,398,479	99.99
All traffic:				
Eastern district ..	25,434,220	——	6,124,710,420	——
Pocahontas region	5,056,002	16.6	1,397,141,776	18.6
Official	30,490,222	——	7,521,852,196	——
Official-southern traffic south of gateway:				
Southern region roads	894,461	92.44	532,811,465	97.15
Pocahontas roads	0	——	3,006,325	.55
Class II roads ...	55,829	5.77	3,228,070	.59
Western district roads	17,277	1.79	9,412,641	1.72
Total	967,567	100.00	548,458,501	100.01

The participation of the Pocahontas lines in the traffic at issue compared to all traffic is less when measured by cars originated and terminated and more when measured by car-miles. One is related to terminal costs and the other to line-haul costs. A part of the traffic at issue is carried over those portions of southern lines which extend into official territory and over those portions of western lines which extend into official territory and southern re-

gion. The relative participation of the Pocahontas lines in the issue traffic is not shown to be sufficiently different than in the total traffic so as to require separate costing, nor is there any sound evidentiary basis for applying western district costs to traffic moving in official territory which is carried on western lines which lap over into that territory. In view of the foregoing, we find that the most appropriate and reasonable approach to the determination of costs in official territory is the alternative urged by the southern lines; that is, official territory, costs for all traffic north of the gateways. A comparable basis in the South necessitates the use of southern region costs on traffic south of the gateways.

The northern lines presented evidence to show that the average unit costs for comparable service are higher in the North than in the South. The following summary table illustrates this point. The first six lines are based on the northern lines' application of Rail Form A and the last four lines on our cost section's application in its annual studies. These costs include a terminal service at one end only, reflect short-line miles, and are based on a load of 28.9 tons in boxcars.

Relation of northern to southern freight service costs

	100 miles	*300 miles*	*500 miles*	*1,000 miles*
	Percent	*Percent*	*Percent*	*Percent*
Official territory vs. South:				
1948	119	113	111	109
1956	131	123	120	117
1957	131	122	120	117
Eastern district vs. South:				
1948	125	119	117	116
1956	141	131	128	126
1957	141	132	130	126
Eastern district vs. South (cost section study):				
1948	124	116	115	113
1956	143	133	129	127
1957	143	133	131	128
1959	154	143	139	136

These costs indicate that levels thereof are higher in the North than in the South for like services, that official territory costs are not quite as high as eastern district costs, and that the northern lines' application of Rail Form A as compared to the cost section's study application results in a slightly lower relationship, particularly in more recent years.

The northern lines' application of Rail Form A differs from that of the cost section's annual studies in the following respects: (*a*) the use of a 6-percent rate of re-
21 turn without provision for Federal income tax in place of a 4-percent rate of return with provision for Federal income tax; (*b*) the base for return is book investment in road and equipment plus cash and material and supplies less recorded depreciation and amortization instead of on the basis of original costs except lands and rights, working capital, including material and supplies, less recorded depreciation and normalized amortization, plus the present value of land and rights; (*c*) the less-than-carload and passenger deficits are omitted from the constant costs; and (*d*) none of the costs of switching and terminal companies is included.

The northern lines' evidence as to the trends of relative costs over a period of years can best be summarized in tabular form as follows:

Northern percentage of total Form A costs at average hauls

	Citrus and vegetable traffic, refrigerator car— 16.3 tons	*General traffic, boxcar— 28.9 tons*
Average haul-miles:		
North	358	347
South	860	464

	Official territory	*Eastern district*	*Official territory*	*Eastern district*
	Percent	*Percent*	*Percent*	*Percent*
Northern lines' Form A computation:				
Year 1948	32.3	33.3	46.4	47.8
Year 1950	33.5	34.2	48.8	50.1
Year 1952	33.8	34.7	48.8	50.1
Year 1954	33.1	34.7	49.7	51.0
Year 1956	33.9	35.0	48.8	50.5
Year 1957	34.1	35.5	48.8	50.8

22

	Citrus and vegetable traffic, eastern district		*General traffic, eastern district*	
	Fully distributed costs	*Out-of-pocket costs*	*Fully distributed costs*	*Out-of-pocket costs*
	Percent	*Percent*	*Percent*	*Percent*
Form A cost from cost section annual study:				
Year 1947 as of Jan 1, 1949	32.9	33.5	47.0	49.0
Year 1948 as of Jan. 1, 1950	33.3	34.1	47.4	49.7
Year 1949 as of Jan. 1, 1951	31.9	31.8	46.7	47.5
Year 1950 as of Jan. 1, 1952	34.2	34.4	49.7	51.2
Year 1951 as of Jan. 1, 1953	34.5	34.5	49.9	50.8
Year 1952 as of Jan. 1, 1954	34.7	34.8	50.2	51.1
Year 1953 as of Jan. 1, 1955	34.2	34.3	50.0	51.2
Year 1954 as of Jan. 1, 1956	34.7	34.7	50.6	51.8
Year 1955 as of Jan. 1, 1957	34.9	34.9	50.5	51.5
Year 1956 as of Jan. 1, 1958	35.5	35.7	50.7	51.8

In the southern lines' traffic study, 69.3 percent of all car-miles were run by boxcars and 9.7 percent by refrigerator cars. The table above indicates that there was an increase in the northern lines' proportion of costs in the year 1950 but that the trend since that year is not pronounced. As to boxcar costs, the northern lines' computation shows no increase for official territory between 1950 and 1957 and only 0.7 percent for eastern district.

The out-of-pocket boxcar costs, based on our cost section's annual study, showed 0.6-percent increase from January 1, 1952, to January 1, 1958.

The northern lines priced out the traffic at issue as measured by their own traffic study both on the basis of Rail Form A unit costs of their own computation and on the basis of Rail Form A unit costs as computed by our cost section's studies. They also applied the cost section's unit costs to the southern lines' traffic study. The cost section costs used were at the fully distributed level; i.e., they included a ton and ton-mile apportionment of the constant costs. All costs were based on the year 1956 and included an allowance for loss and damage. The table following shows for each traffic study, the percentage of revenues received by the northern lines, and the percentage of costs incurred by them:

23

	General traffic (percent)			*Citrus and fresh vegetables (percent)*		
	Revenue	*Cost*	*Difference*	*Revenue*	*Cost*	*Difference*
Northern lines' traffic study:	45.44	——	——	33.38	——	——
Northern costs:						
Eastern district vs. southern region	——	49.78	4.34	——	34.62	1.24
Cost section study costs:						
Official territory vs. southern region ..	——	48.19	2.75	——	34.00	0.62
Eastern district vs. southern region ..	——	50.18	4.74	——	35.26	1.88
Southern lines' traffic study:	44.97	——	——	34.63	——	——
Cost section study costs:						
Official territory vs. southern region ..	——	47.34	2.37	——	33.69	(.94)
Eastern district vs. southern region ..	——	49.31	4.34	——	34.97	.34

The difference in the results for citrus and fresh vegetable traffic as between the two traffic studies reflects a revision in the divisions. The more recent southern lines' traffic study shows that the revenues as settled and the costs on this traffic are roughly equal. The following table indicates the dollar amounts involved on the general traffic:

	Traffic study of northern lines			*Traffic study of southern lines*		
	Percent		*Percent*	*Percent*		*Percent*
Total revenue ...	100.00	$450,909,348		100.00	$480,160,317	
Northern lines' share:						
Revenues as settled	45.44	204,889,448	100.00	44.97	215,915,212	100.00
Revenue if based on costs:						
Northern lines' costs ...	49.78	224,462,673				
Increase		19,573,225	9.6			
Cost section study costs:						
Official vs. southern ..	48.19	217,293,215		47.34	227,307,894	
Increase		12,403,767	6.1		11,392,682	5.3
Eastern vs. southern ..	50.18	226,266,311		49.31	236,767,052	
Increase		21,376,863	10.4		20,851,840	9.7

24 The southern lines urge that it is settled law that relative service costs are the decisive measure in determining just and reasonable divisions and that the costs of all roads participating in the official-southern traffic should be so applied and adjusted as to reflect the cost characteristics of the traffic here at issue. In order to develop the relative service costs of this traffic they applied Rail Form A adjusted unit costs at the fully distributed level for the year 1956 to their traffic sample described above. They presented the results of their cost studies in several different forms, but their principal cost evidence can be summarized as shown in the table below. It starts with the application of the costs as computed by the northern lines applied to the southern lines' traffic

study, then the unadjusted Form A costs applied to the same study, and lastly the Form A costs modified to include the effect of 12 adjustments they deem necessary.

	North of gateway	*South of gateway*	*Percent* North	South
Total revenues as settled under present divisions	$221,430,000	$274,656,000	44.64	55.36
Northern lines' costs applied to southern traffic study:				
Eastern district and southern region	158,427,000	170,708,000	48.13	51.87
Official territory and southern region	148,424,000	170,708,000	46.51	53.49
Unadjusted Rail Form A costs—official territory and southern region ..	169,618,000	194,306,000	46.61	53.39
Rail Form A costs including 12 adjustments	152,808,000	201,916,000	43.08	56.92

All of these costs are territorial average costs based on the expenses and operations for 1956, all are at the fully distributed level, and all are applied to the southern lines' traffic study.

The unadjusted Rail Form A costs above result from the standard computation applied to each territory. The specific adjustments made by the southern lines in the unadjusted official territory and southern region unit costs developed by cost section annual studies are discussed in appendix B hereto in full detail.

Restatement.—The differences between the parties as to the cost evidence run to the degree to which territorial average costs should be modified to fit the specific traffic at issue, and to the meaning and significance of various data and statistics.

·25 Both parties computed the cost of service based on the southern lines' traffic study and the territorial average costs (1956) in statement No. 2-58, Rail Carload Cost Scales by Territories, prepared by the cost finding section. The southern lines computed costs for all traffic for official territory and southern region and the northern lines computed costs for general traffic (all traffic except citrus fruits and fresh or green vegetables, not frozen, northbound) and citrus and vegetable traffic separately for official territory, eastern district, and southern region. The cost computation of each side furnished substantial verification of that of the other side. Further, positive verification was made by applying the unit costs in statement No. 2-58 to the service units by type of car. The assertion made by the northern lines that the southern lines omitted 70 percent of the cars in the traffic sample from their cost studies is not true of the latter's final cost presentation.

Our restatement is based on official territory (eastern district plus Pocahontas region) costs north of the breakpoints, for reasons previously discussed, and is at the fully distributed level,[5] as advocated by both groups, on all traffic. Apart from the adjustments rejected in appendix B, our restatement is based on the southern lines' cost computation, as applied to their traffic studies, which, we find, more reliably and accurately reflect the movement of the traffic in question. Incorporating the five adjustments advocated by the southern lines which we have found appropriate, our restatement is shown in the following table:

Restated costs

All traffic	*Official territory*	*Southern region*
Revenue as settled	$221,430,341	$274,656,425
Percent	44.64	55.36
Fully distributed costs—unadjusted	169,617,543	194,306,309
Percent	46.61	53.39

5. As found appropriate in *Louisville & N.R. Co. v. Southern Ry. Co.*, 319 I.C.C. 639, 660, sustained in *Carolina & N.W. Ry. Co. v. United States*, 230 F. Supp. 581 (W.D.N.C. 1964).

All traffic—continued	*Official territory*	*Southern territory*
Adjustments:		
Exclude platform cost	$—2,254,075	$—453,673
Way and thru train separation	—2,283,259	—3,595,230
Switching and terminal companies	—163,473	+1,039,610
Include short line (class II railroads) costs	—37,725	+529,347
Train tonnage—		
Pocahontas region	+867,319	0
Total adjustment (net)	—3,871,213	—2,479,946
Fully distributed costs—adjusted	$165,746,330	$191,826,363
Percent	46.35348	53.64682

As indicated, we have fully reviewed in appendix B and restated above the costs as presented by the parties. In addition, however, the southern lines urge that the evaluation of certain factors bearing upon costs establishes that their cost study overstates the costs of the northern lines relative to the costs in the South, all to the general effect that their showing of the northern lines' costs should be reduced by at least 5 percent. These factors include: (1) overstatement of line-haul costs, (2) costs of interchanges between northern and southern carriers, (3) differences in the timing of modernization programs in each territory, and (4) savings which would result from "necessary" elimination of alleged excess capacity and duplicate facilities. The only item to which they attach a cost figure relates to the equalization of gateway interchanges, amounting to $1.6 million. We have discussed this item in appendix B, pointing out our reasons why such an adjustment is not warranted. As to the remainder, they agree that a precise cost figure cannot be ascertained. We have fully considered these factors, and are of the opinion that the service unit costs as determined by the application of Rail Form A, as adjusted, adequately reflect the costs which are

attributable to the traffic at issue. Our overall appraisal of this evidence is reflected in our conclusions and findings.

IMPORTANCE TO THE PUBLIC

Section 15(6) of the act also requires that we give due consideration to the importance to the public of the transportation services of the concerned carriers. No real issue exists between the contending railroad groups themselves in this respect. Each group is considered to be of equal importance to the public.

27

The prior phase of this proceeding was viewed primarily as a struggle between the railroads. In this reopened phase, however, certain interests representing public bodies adduced evidence in support of the southern lines. The Southern Governors' Conference [6] and the Southeastern Association of Railroad & Utilities Commissions [7] endeavored to show why the divisions of the northern lines should not be increased. Unlike the request of the southern lines, their requested finding is that equal factor divisions should be maintained. These interveners contend that a shift of divisions from the southern lines would result in higher rates on southern and interterritorial and intraterritorial traffic, and diminution of services, facilities, and equipment. Thus, they foresee the impairment of the ability of southern shippers to compete in distant markets and diversion to other modes of transportation, thereby impeding the economic growth of the South.

In their exceptions, the southern interveners urge that the examiners failed to give effect to the overriding demands of the public interest which, they say, require uniformity in these divisions. We recognize that the public

6. In this proceeding, composed of the Governors of Alabama, Florida, Georgia, Kentucky, Louisiana, Mississippi, North Carolina, South Carolina, and Tennessee.

7. Composed of State commissions and their members charged with the regulation of common carriers and other public utilities in the States named in footnote 6.

interest must be considered and the importance to the public of the transportation services of the railroads is not a sectional concept. We are required under the act to preserve an adequate national system of transportation, and must therefore consider the public interest of all concerned. Such a consideration, however, does not by any means require a uniformity of divisions, nor can we find an affirmative virtue in it on this record. *Cf. Western Trunklines* case, 225 F. Supp. at page 604. Moreover, as pointed out in *New England Divisions Case,* 261 U.S. 184, 191 (1923), section 15(6) was designed to help the weak "by preventing needed revenue from passing to prosperous connections." Thus, an adherence to uniformity as such, without a careful evaluation of the statutory criteria and the evidence of record, can hardly result in the fixing of just, reasonable, and equitable shares.

Relying on *New York v. United States,* 331 U.S. 284, 315 (1947), the interveners also take the position that natural disadvantages must be found in the North before we may increase the divisions of the northern railroads. In essence, however, other factors being equal, cost differences generally are the product of, and reflect, the inherent advantages and disadvantages that go to make up the respective overall transportation conditions in the two territories. *Cf. Louisville & N. R. Co. v. Southern Ry. Co.,* 319 I.C.C. 639 at pages 646-47. Moreover, in the *New York* decision, a discriminatory class rate structure was found not justified by territorial conditions. No similar showing as to existing divisions has been demonstrated here by interveners. Indeed, the continued maintenance of divisions which, all other things being equal, do not reflect the relative costs of service would not suggest justice as between the parties. Such inequities being manifest here, we are of the opinion that divisions correcting them can result in no unlawful injury to the South.

28

In sum, we find that there are no differences in importance to the public attributable to the two contending groups of railroads.

DIVIDING POINTS AND DIVISIONS ON PARTICULAR MOVEMENTS

Dividing points.—In this reopened phase the northern lines again urge that the construction of divisions over fictional breakpoints rather than over actual points of interior interchange results in unjust inflation of southern revenues. They request a finding that the dividing points to and from which primary divisions shall apply are the points at which the traffic is interchanged between a northern and southern line.

This problem has been a difficult one ever since these general North-South divisions were first considered in docket No. 24160, the northern lines always contending that actual interchange points should govern, while the southern lines strenuously urged that the primary dividing points should be at the territorial border. In the original 1939 report in docket No. 24160 the Commission found for the northern lines, but reversed its initial determination in the report on reconsideration, 238 I.C.C. 149. Subsequent thereto, the interested lines in 1944 entered into what is known as the Roanoke Agreement as a compromise on traffic moving through the Ohio River gateways to points in central and Illinois territories. Details of this agreement, with which the northern lines are dissatisfied, are stated at page 528 of the first 1953 report, and need not be repeated here.

29 In the first 1953 report the Commission again agreed with the northern lines' contentions but upon reargument in the second 1953 report (289 I.C.C. 4) modified the finding, holding that it would not be desirable to require the use of points in Illinois and Indiana north of the Ohio River as primary dividing points.

The southern lines' traffic test, as stated, embraced a total of 967,554 cars. Of these, 86,843 or 9 percent were interchanged at interior Illinois-Indiana junctions, the most important of which were East St. Louis, 28,783 cars, Chicago, 19,441 cars, and Indianapolis, 12,599 cars.

The following tabulation shows the number of cars so handled by individual lines:

Railroad	*Cars*		
	Northbound	*Southbound*	*Total*
Illinois Central	30,838	15,463	46,301
Gulf, M. & O.	14,476	3,680	18,156
St. Louis-San Francisco	8,832	3,129	11,961
Southern	2,880	2,219	5,099
Louisville & Nashville	2,471	2,798	5,269
Missouri Pacific	—	57	57
Totals	59,497	27,346	86,843

A comparison of the total number of cars moving through primary dividing points with those moving through these points but not interchanged follows:

Dividing points	*Total cars*	*Cars not interchanged*	
		Number	*Percent*
Cairo, Metropolis Thebes-Gale	74,504	65,470	87.9
East St. Louis	55,767	11,005	19.7
Evansville	29,342	5,269	18.0
Louisville	90,538	5,099	5.6
	250,151	86,843	34.7

The total revenue on the 86,843 carloads was $49.6 million which was settled 63.9 percent south and 36.1 percent north. If the primary break were made over the actual points of interchange, the southern lines would have received 58.4 percent, and the northern lines 41.6 percent, reflecting a reduction in southern revenue of $2.7 million, averaging $32 per car. Some 28,136 cars, or 32.4
30 percent, were handled via joint routes that would have required new subdivisional arrangements.

The examiners recommended that the border dividing points be retained as at present. They were of the opinion that the record failed to show any changed conditions since 1953 favoring the northern lines as to the dividing point

issue. The northern lines except to this recommendation but are not joined therein by the Monon and the Chicago & Eastern Illinois, two of the carriers intimately concerned with the divisional break issue.

The northern lines contend that section 15(6) of the act requires that divisions be fixed as among the several carriers, which, they contend, means that the Commission may not recognize geographic areas or rate territories in establishing primary divisions. We do not agree with this view. This argument was rejected by the Supreme Court in *New England Divisions Case, supra,* shortly after the enactment of section 15(6) in 1920. We have administered the act accordingly over the years. See, e.g., *Atlantic Coast Line R. Co. v. Arcade & A. R. Corp.*, 194 I.C.C. 729 (1933), *Divisions of Freight Rates*, 253 I.C.C. 673 (1942).

The southern lines take the position that our order of July 28, 1959, reopening this proceeding, did not contemplate any reconsideration of the dividing point issue. The order was not so restricted. If we were to adopt this contention, our consideration of the divisions on Canadian-northern Maine traffic, which these carriers admit is at issue here for the first time, would likewise not be included in this reopened phase.

In the second 1953 report, 289 I.C.C. 4, it was stated at page 8:

> Upon further consideration we are of the opinion that it may be preferable from the standpoint of carrier competition and simplicity of accounting that the divisions for the service south of any given gateway be uniform and that upon all the facts before us it would not be desirable to require the use of points in Illinois and Indiana north of the Ohio River as primary dividing points. The prescribed divisions will therefore be made applicable only to and from existing primary dividing points.

The northern lines contend that circumstances and conditions have changed since 1953, but we find nothing convincing upon which to base a conclusion to reverse that made in the above-quoted portion of the second 1953 report. The examples given in 1953 as to competitive routes and carriers are much the same today as they were then. It
31 appears that these lines simply are endeavoring to have us reconsider the situation. But the positive virtues of the uniform treatment set forth above still obtain.

The northern lines also rely on the *Border Point* case, *Louisville & N. R. Co. v. Akron, C. & Y. R. Co.*, 309 I.C.C. 491 (1960), as an indication that the southern lines have advocated, and that we have accepted, the proposition that railroads assigned to the southern territory to the extent they operate in official territory are to be treated as southern carriers. However, that proceeding concerned traffic moving between primary dividing points or to and from stations on southern territory carriers which are located south of the primary dividing points, which traffic had not been included in the evidence when the Commission's 1953 reports and orders were entered. The *Border Point* decision merely prescribed the docket No. 29885 divisions on the border point traffic of the Louisville & Nashville and the Coast Line consistent with the divisions prescribed for the border point traffic of the northern lines. It did not include traffic of those two carriers north of primary dividing points.

All things considered, we conclude and find that the divisions prescribed herein should continue to be made applicable only to and from existing primary dividing points. *Cf. Official-Southwestern Divisions*, 289 I.C.C. 11, 16 (1953). Thus, railroads assigned to southern territory in their entirety for statistical purposes will continue to be treated as southern lines for that portion of the operations south of the territory border dividing points and to be treated in

accordance with geographical fact to the extent that they operate as northern lines north of the primary dividing points. Giving consideration to the revenues which will accrue to the contending groups as a result of this finding, together with the revenue division which our prescribed general basis of divisions produces, we are of the opinion that no unjust inflation of southern revenues is occasioned thereby. Further, here as in the second 1953 report, we express no opinion as to the fairness of the method of subdividing the northern primary divisions.

Divisions of rates to and from points in official territory on western lines.—Certain western trunklines requested that the divisions on this traffic which is interchanged by them directly with the southern lines, as well as that originating or terminating on southern lines with a northern line or lines participating in the haul, should be the same as are or may be prescribed herein for the northern lines. The examiners concluded that the evidence was inade-
32 quate to support findings with respect to traffic interchanged without northern lines' participation absent a showing of the present divisions on this traffic and the relative service performed by each group. They further concluded, however, that the divisional scale prescribed for the northern lines should also apply to traffic interchanged between the western trunklines and the southern lines in which there is participation by a northern line or lines. Such traffic is presently subject to the general prescribed basis and is embraced within the southern lines' traffic study. No exceptions were filed to the examiners' conclusions. While our findings call for cost based scales rather than the form prescribed by the examiners, we agree with their ultimate conclusions as to the treatment to be accorded in both situations.

Canadian-northern Maine traffic.—The southern lines' traffic study shows 2,955 cars (3 percent of the total) moved to or from Canadian points on combination rates made over

an international boundary point, 2,227 of which were northbound, and 728 southbound. A slight controversy exists as to the divisional basis applicable to this traffic, since two southern territory lines settled divisions on 245 southbound cars on the docket No. 24160 basis. The southern lines are now, in this reopened phase, for the first time asking us to avoid any similar controversy for the future by prescribing divisions on this traffic "that reflect its demonstrated characteristic, i.e., 'overhead' traffic for the official territory part of the haul." They urge that since the northern lines perform no terminal service thereon the northern factor should be adjusted to reflect the situation.

The northern lines oppose any special basis on Canadian traffic. They point out that these joint rates are the same as the domestic rates to and from the border points and, as such, contemplate two terminal services of which southern lines perform but one. Of the 2,955 cars involved, 1,324 cars moved through the Detroit gateway. Of this number, 609 moved in connection with the Chesapeake & Ohio, indicating that that road bears a heavy expense, in addition to that entailed by normal interchange in the Detroit-Windsor area, largely because of the international character of this traffic.

A similar situation exists with respect to traffic moving between the South and destinations in northern Maine on combination rates made over Brunswick or Lewiston, Maine.

The joint revenue accruing south of these points is
33 divided on the presently prescribed general basis.

Thus, the southern lines contend that the northern lines receive compensation for a terminal service which they do not perform. The southern study embraced 3,158 cars in this category, about 90 percent of which consisted of clay from Georgia origins to papermills in northern Maine, 80 percent thereof going to Maine Central points on combinations over Brunswick. On March 16, 1960, these clay rates were superseded by single-factor joint through rates

over protest of the Maine Central. Clay traffic to Bangor & Aroostook points remained on the combination basis.

The northern lines advance several reasons why the instant Maine traffic should not be excepted from the general basis of divisions. These include characteristics peculiar, in part, to New England territory, such as lower traffic density, higher level of costs, multiline hauls north of the gateways, and lower rates of return. These lines urge that the general basis of divisions is required to compensate them fully for the services they perform.

The Commission is required under section 15(6) of the act to consider "whether any particular participating carrier is an originating, intermediate or delivering line." It has frequently recognized the fact that intermediate carriers having no service to perform in originating or delivering shipments are entitled to a lesser proportion of joint rates for that reason. *Through Routes and Joint Rates,* 174 I.C.C. 477, 485; *Official-Southwestern Divisions,* 287 I.C.C. 553, 580; *Divisions of Rates, Official and Southern Territories,* 278 I.C.C. 89, 94.

The examiners recommended that the divisions on this traffic be determined by making the northern factors thereon 75 percent of the northern general factors recommended by them. The northern lines take exception to this conclusion but recognize that there may be some merit in establishing a special basis to govern these divisions. The facts establish that as to most of this traffic the northern lines perform purely intermediate service with no terminal service involved. These lines state that under the circumstances an equitable basis would result from the use of prorating factors 26 integers less than the northern general factors. The 75-percent basis prescribed in *Divisions of Rates, Official and Southern Territories, supra,* and continued in our 1953 reports in this proceeding, applied only on grain and grain products moving on proportional and reshipping rates

and were specifically related to the unusual characteristics of that traffic. It was not intended that such divi-
34 sional basis should become a precedent of all overhead traffic. Rather, in light of the foregoing, our general discussion and conclusions, and the scales hereinafter prescribed, we are of the opinion and find that the intermediate scale set forth in our ultimate finding 3, modified so as to contain no allowance for terminal service, will be just, reasonable, and equitable for the future on Canadian-northern Maine traffic. Similar action was taken in *Official-Southwestern Divisions, supra.*

Grain and grain products.—In the 1953 reports we prescribed, as stated previously, a separate specific scale of divisions to apply to the joint proportional rates on grain and grain products from East St. Louis, Louisville and Cincinnati to points in southern territory reflecting northern factors 75 percent of the prescribed northern general factors. The evidence upon which that finding was based was principally that which was adduced at a further hearing in docket No. 24160 and made part of the record in the original phase of the instant proceeding by stipulation (287 I.C.C. 543). The examiners recommended that the northern factors covering this traffic should remain at 75 percent of the recommended northern general factors. The southern lines take exception to this conclusion on the ground that no evidence was here adduced dealing with this divisional situation. Under the circumstances, lacking such evidence, we may make no assumptions as to such traffic. The southern lines' exception must be sustained. Our ultimate findings prescribing lawful divisions will include this traffic so as to embrace all North-South traffic except that specifically excluded, and for convenient reference we will incorporate the prior finding as to grain and grain products.

PROPOSED CHANGES

The northern lines favor simple modification rather than complete revision of the present divisional scales, and

ask that we make such modifications therein as shall serve to redistribute the total revenue between the two groups with primary regard for their relative general levels of costs and relative revenue needs. They urge that because of their greater revenue need, the Commission should add 10 percentage points to the 25-percent increase that would be justified on the basis of relative costs alone, and thus prescribe, on general traffic, the present divisional factors for southern lines and the present factors increased by 35 percent for northern lines. On citrus and vegetable traffic their proposition is the same except that they ask
35 that their present factors be increased by only 15 percent. They estimate that the divisions thus proposed would increase their total revenue about $35 million annually, making the adjusted rates of return for 1959 for official territory lines 2.42 percent and for southern region lines 3.19 percent.

The northern lines ask that the divisions of the per-car rates on vegetables to New York be excluded from the general basis and a special provision be applied thereto so that the excess of $57 per car in the New York City rates over and above the rates to Jersey City shall continue to accrue to the delivering lines before prorating. No significant specific evidence was adduced in support of the sought exclusion as to the instant rates and movements. Also, the per-car rates here referred to were found unlawful and the unlawfulness was ordered removed in *Port of New York Authority v. Aberdeen & R. R. Co.*, 321 I.C.C. 738 (1964). The Commission's order therein was restrained, however, and the matter is now the subject of court litigation in the United States District Court for the Eastern District of Pennsylvania. In the circumstances, the sought provision as to such traffic does not appear appropriate. The relief sought is denied.

The northern lines also ask that we exclude the divisions of joint rates on liquid caustic soda and soda ash from Saltville, Va., to Kingsport and Port Rayon, Tenn., as to

which the existing order was vacated in response to mutual petition of the interested carriers. Again, since no evidence was offered dealing specifically with this segment of traffic, we are unable to grant such relief. Similarly, no evidence was adduced as to their request for exclusion of the divisions of joint rates on all trailer-on-flatcar traffic, nor was this request renewed in their exceptions. It is therefore denied.

The southern lines would abandon the present scales of prorating factors and substitute therefor scales constructed directly from the costs developed in their cost study which we have not accepted in its entirety, as shown in our restatement. They oppose the use of divisional scales derived from rate scales because, they contend, partly curvilinear and partly straight line rate of progression favors the short haul in the North. Omitting 50-mile block factors, except for the initial block, the scales proposed by the southern lines are shown below:

36

Distance	*Column 1 (South)*	*Column 2 (North)*	*Column 3 (North)*
50 miles	155	137	144
100 miles	214	194	204
200 miles	330	307	323
300 miles	447	421	443
400 miles	563	535	563
500 miles	680	648	682
600 miles	797	762	802
700 miles	913	875	921
800 miles	1030	989	1041
900 miles	1146	1102	1160
1,000 miles	1263	1216	1280
1,100 miles	1380	1330	1400
1,200 miles	1496	1443	1519
1,300 miles	1613	1557	1639
1,400 miles	1730	1670	1758
1,500 miles	1846	1784	1878
1,600 miles	1963	1897	1997

The scales in columns 1 and 3 are those developed directly from the southern cost study for the southern and northern portions of the hauls, respectively. Instead of using column 3 as northern factors, the southern lines would use 95 percent thereof as reflected in column 2. They contend that such an adjustment is required in the northern scale to correct the alleged relative overstatement of the cost for the northern hauls. We have declined to recognize this adjustment as valid in our discussion of the cost evidence. It will be noted that the factors in columns 1 and 3 become equal at 400 miles but that the 5-percent reduction keeps the column 2 northern factors below the column 1 southern factors throughout the proposal. Such computations are to the advantage of the southern lines who have the longer average hauls. On the average hauls of 522 short-line miles South and 372 North the southern proposal would produce divisions of 58 percent South and 42 percent North. Such proposal obviously would be unfair to the northern lines on a cost of service basis as shown in our restatement of costs.

Construction of the divisional scales.—The examiners recommended the prescription of the factor scale we prescribed in the first 1953 report, except that the northern scale should be increased uniformly by 10 percent. They refused to change the construction of the scales on the ground that the Commission in the prior phase of this case considered the southern lines' contention as to the unsoundness of the prescribed scale and declined to modify the scale in the second 1953 report, 289 I.C.C. 4.

37 On brief and again upon exceptions, the southern lines urge that the construction of the existing scale operates unfairly upon them since they have the longer average hauls. They contend that the scale contains certain defects: (1) an unexplained and excessive allowance for short hauls; (2) the progression of the scale unlawfully depresses the revenues of the long-haul carriers; (3) the

value of each 50-mile block reflects services not performed because of the application of the scale to the upper limit of the mileage blocks; and (4) the value of the initial mileage block is excessive to the extent of 37 integers.

The new evidence adduced upon further hearing demonstrates that the foregoing contentions of the southern lines have merit, and we so find. Under the circumstances, and in light of our subsequent conclusion to be guided by the relative costs in our general determination, we have accordingly revised the general divisional factors to reflect warranted adjustments of record. The resulting scales, set forth in columns 1, 2, and 6 of Appendix C, are constructed from factors based on the fully distributed costs and give due and adequate consideration to terminal, way train, through train, and interchange costs, as incurred by the respective lengths of haul, and the factor for each mileage block has been computed at the midpoint, or median, for each block. We have utilized 50-mile blocks as in the past and as again urged by both groups. The basis of these scales is set forth as follows:

	Column 1 Official territory	*Column 2 Southern region*	*Column 6 Official territory*
Terminal and border interchange (mills per hundredweight)	64.17	44.08	——
Interchange for bridge traffic (mills per hundredweight)	——	——	17.07
Way train (mills per hundredweight-mile)	0.78905	0.67720	——
Way train miles	11	27	——
Through train (mills per hundredweight-mile)	0.63584	0.57756	0.63584

The scales are computed in the following manner using the 201-250 mileage block and column 1 as an example.

Terminal		64.17
Way train	0.78905 x 11 miles	8.68
Through train	0.63584 x 214.5 miles	136.39
Midpoint	225.5 miles	209.24
250 mileage block factor on appendix C, column 1		209

38 *The 15-percent minimum.*—The examiners recommended that the 15-percent minimum be retained under the divisional scales suggested by them. On exceptions the southern lines contend that if a proper divisional scale is used to reflect the services performed in handling the traffic at issue, full credit for terminal service, way train service and through train service (including interchange services) is reflected in the scale itself and there is no need for a minimum division. We agree with the southern lines in this respect. The prorating factors which we prescribe herein give full credit for terminal costs, thus appropriately protecting the very-short-haul carriers which, for the most part, perform principally originating or terminating service. Unlike, the existing scale which is weighed in favor of the very short haul, the scale prescribed herein, reflecting as it does the cost and service involved, gives each type of haul its proper share, and, therefore, no special protection for short hauls is warranted. In any event, the aggregate amount of traffic which would not be accorded a division of at least 15 percent of the through revenue appears to be inconsequential.

Divisions of the Norfolk Southern and Certain Other Lines

In the first 1953 report, 287 I.C.C. at page 544, portions of the 1939 report were quoted to explain why in that earlier proceeding the divisions of the Norfolk Southern Railway Company, except on peaches, were not made subject to the prescribed basis in 1939. Principally, reference was made

to the loss occasioned by such basis and to the resulting increase in the financial burden of this railroad.

This line's condition was found considerably improved in the 1953 phase of this case. The carrier then asked for some small relief through increased divisions, in which request it was joined by the Atlantic and East Carolina Railway Company and the Beaufort and Morehead Railroad Company. After consideration of the evidence concerning these carriers, the Commission was unable to find that a special basis of divisions for them would be justified. One of the considerations which led to this conclusion was the improved financial condition of the Norfolk Southern, particularly when compared with rates of return of the northern lines generally and those of the Pennsylvania in particular, with which line it was presumed that the greater portion of traffic through Norfolk was interchanged.

Thereupon, these three respondents filed sepa-
38 rate petitions seeking reconsideration. It was observed upon reargument (289 I.C.C. 4, 8) that the basis prescribed in the original 1953 report would cause these carriers to incur a proportionately greater reduction in revenue than the southern lines as a whole.

It was there stated:

> Upon further consideration we are in doubt whether the present record contains all the facts which should be currently considered in establishing a proper basis of divisions of joint rates between official territory and points on these lines.

Accordingly, the case was reopened for further hearing and the order as to these respondents was postponed pending the further hearing which was had in this reopened phase. Of the three carriers only the Norfolk Southern introduced evidence. No exception was taken to the examiners' conclusion that the divisions of the Atlantic & East

Carolina and the Beaufort & Morehead should be subject to the general basis prescribed. We affirm that conclusion.

The situation with respect to the Norfolk Southern requires separate detailed consideration. This line has in the past been classed as a weak line, having been awarded arbitraries in various instances. See *Southern Class Rate Investigation*, 100 I.C.C. 513, 128 I.C.C. 567. As noted in the first 1953 report, its condition had improved in years recent to that decision. Its main line extends from Norfolk, in a southwesterly direction, to Charlotte, N. C., 379 miles, with 210 miles of branch lines; 95 percent of its local mileage is in North Carolina, the remainder in Virginia. Its annual constructive year, later described, system freight revenues were $9,712,747, 34 percent, or $3,300,660 of which is involved here. For purpose of this case, the respondent has divided its traffic into three categories:

(1) Traffic in which the Norfolk Southern participates as an intermediate carrier moving between points in the South and points in official territory. The divisions on this overhead traffic are subject to the 1953 prescribed scales. During the constructive year revenue accruing to the Norfolk Southern in this category amounted to $879,069. No special basis of divisions on this traffic is requested, except that if a change is made in favor of the northern lines we are requested that this line's revenues as a whole not be diminished. Under the general basis of divisions prescribed in finding 2 herein we estimate that this revenue would be reduced by the 2.908-percent figure later indicated, or only $25,563. Revenue accruing here to the carrier is a subdivisional question and will not be made subject to a special basis.

(2) Traffic originating or terminating on the Atlantic & East Carolina and the Beaufort & Morehead railroads to and from points in official territory moving over the Norfolk Southern as an overhead or intermediate carrier. During the constructive year this category embraced the movement

of 1,655 cars, interchanged at Norfolk, only 60 cars of which were handled by the Beaufort & Morehead. It is estimated that Norfolk Southern's portion of the revenues would have been about $32,000 less annually if the 1953 prescribed basis had been applicable. The general basis of divisions in finding 2 herein would reduce the revenue by an estimated $47,079. All of the traffic in this category must be handled between New Bern, and Morehead City, N. C., or to and from points between Goldsboro, N. C., and New Bern by the Southern Railway. We find no circumstances which differentiate this traffic from that which originates or terminates on the Atlantic & East Carolina portion of the Southern Railway and is not interchanged with the Norfolk Southern. Revenue accruing to the latter in this category is again a matter of subdivisions and should not be made subject to a special basis.

(3) The third category, characterized as the most important, embraces that traffic which originates and terminates on the line of the Norfolk Southern and moves to or from points on lines of the northern railroads in official territory.

At page 545 of the first 1953 report it was stated:

> The divisions of rates to and from the Norfolk Southern are in an unsatisfactory state. To a large extent they are based on rate prorates running back for many years, as to which there is disagreement. The settlements of revenue apparently are determined by the line which collects the charges. It does not appear that the interested carriers have made any effort to adjust their differences, as we suggested in our 1939 report.

In this reopened phase the record shows that the divisional situation has not changed materially since the 1953 reports. Substantial evidence was adduced by the Norfolk Southern designed to support a finding that a definite

modernized basis of divisions be prescribed. As noted, however, it does not request an increase in its involved divisions, but asks only that the level of its revenue from this interterritorial traffic be preserved.

41 For the purpose of showing the characteristics of this category of traffic, this respondent submitted a traffic study covering all shipments of general traffic originated or terminated by it in the 2 months of November 1958 and March 1959, expanded to an annual basis by multiplying by six, and included separately all shipments of northbound fruits and vegetables for the year 1959. The general study, as expanded, covers what is referred to herein as the constructive year. The interterritorial traffic originated and terminated on the Norfolk Southern accounted for 15.1 percent of its total carloads, 12.6 percent of its total tonnage, and 23.4 percent of its total revenues, thus indicating that traffic in this category is relatively important to it. This general traffic study covers 17,292 cars, 638,394 tons, and total revenue of $5,588,844, of which the Norfolk Southern received $2,271,984 (including $10,284 in arbitraries) or almost 40 percent. The northern lines received about $3 million, almost 54 percent. In addition, there were 432 cars, 8,501 tons, of fruit and vegetables moved in 1959, all of which moved northbound via Norfolk; of the total fruit and vegetable revenue, $130,427, the Norfolk Southern also received about 40 percent. About 54.7 percent of the total cars in the traffic study were northbound, accounting for 50.8 percent of the total revenue. Southbound traffic generally consisted of higher rated commodities. By far the most important gateway on the total traffic was Norfolk through which moved 13,488 cars, 76.1 percent of the total. Second was Richmond, 1,590 cars, and in third place was Lynchburg, Va., 1,422 cars, other gateways sharing in the remaining traffic. Of the total 13,488-car traffic through the Norfolk gateway, the southern lines received about 43.4 percent of the total revenue or

$1,987,902. This latter figure excludes arbitraries of $7,488 accruing to the Norfolk Southern, but includes revenue of $1,326 for southern lines other than the Norfolk Southern, thus leaving for the latter revenues amounting to $1,986,576. However, on the 4,236 cars this respondent originated and terminated through other gateways, the southern lines received about 57.34 percent of the total revenue or $647,034. This latter figure again excludes arbitraries of $2,379 accruing to the Norfolk Southern but includes revenues of $320,052, or almost half, for southern lines other than the Norfolk Southern, the latter carrier thus receiving $326,982, or only slightly more than half of the total. Generally, intermediate southern lines participate in the movements via gateways other than Norfolk and, therefore, the situation presents a question of subdivisions.

42 The study indicates that if this traffic (including fruits and vegetables) during the constructive year had been subject to the 1953 prescribed basis, the revenue accruing to the Norfolk Southern would have been $450,362 less than that "as settled." Our analysis of the record indicates that the revenue accruing to the Norfolk Southern from this traffic, if it had been determined on the general basis provided in finding 2 herein, would have been $1,517,-242, or $796,316 less than that "as settled." As thus computed, the reduction on traffic through the Norfolk gateway would have amounted to $751,548 as contrasted to only $44,768 less than the revenue as settled via the other gateways. The line's net railway operating income in 1958 amounted to $267,700, and in 1959, $434,000. It can readily be seen that substantial deficits would have occurred in connection with the loss of revenue on originating and terminating traffic especially via the Norfolk gateway. The evidence demonstrates that the line is in pressing need of sufficient revenues to improve its physical plant and provide additional rolling equipment. It has paid no dividends since 1957.

Based on short-line ton-mile distances, the weighted average haul on all originated or terminated traffic during the constructive year was 162 miles south and 365 north via all gateways. On traffic moved only through Norfolk (13,488 cars) the averages were 136.6 miles south and 431.3 miles north. On the movement of the 432 cars of fruits and vegetables the averages were 55.2 miles south and 704.2 miles north which tended to reduce Norfolk Southern's average haul shown in the overall figures.

As stated, 76.1 percent of the cars in the traffic test were interchanged at Norfolk. This accounted for 85.9 percent of its total standard line revenue. At Norfolk it interchanges with the Chesapeake & Ohio, Norfolk & Western,[8] and the Pennsylvania. Various statistics of record show that the Pocahontas lines (C. & O. and N. & W.) participate in the traffic to a greater extent than the Pennsylvania. During the constructive year the 13,488 cars were interchanged at Norfolk as follows:

43

	Cars	*Percent*
Chesapeake & Ohio	3,412	25.30
Norfolk & Western	6,503	48.21
Total Pocahontas lines	9,915	73.51
Pennsylvania	3,573	26.49
Total	13,488	100.00

Of the cars shown above, 5,281 originated or terminated locally on the lines of the Chesapeake & Ohio and Norfolk & Western, and the remainder on the Pennsylvania. On a revenue basis the Pocahontas lines received 52.71 percent of the total (C. & O. 17.70 percent, N. & W. 34.39 percent, R.F. & P. 0.62 percent), the Pennsylvania 24.75 percent,

8. Data herein with reference to the Norfolk & Western, where applicable, include the Virginian Railway. These railroads merged December 1, 1959.

and all other northern lines 22.54 percent. The traffic moved by the Pennsylvania involves a marine service transfer across Chesapeake Bay at an expense of $35 per car.

Rates of return for the southern region and the eastern district plus the Pocahontas region, 1952 to 1959, are shown earlier in this report. A comparison of average returns 1946-50 of the latter with the Norfolk Southern and the Pennsylvania are shown at page 546 of the first 1953 report. Rates of return, 1952 to 1959, of the eastern district (excluding the Pocahontas region), the Norfolk Southern, and the three connecting lines at Norfolk based on net investment are shown below:

Percent return

Year	*Eastern district excluding Pocahontas region*	*Norfolk Southern*	*Chesapeake & Ohio*	*Norfolk & Western*	*Pennsylvania*
1952	3.43	2.33	6.65	5.43	2.98
1953	3.68	3.39	6.90	5.11	2.98
1954	2.48	1.88	6.16	4.76	1.96
1955	3.64	2.81	7.93	6.94	2.87
1956	3.33	2.81	8.20	7.19	2.76
1957	2.43	2.47	7.88	7.12	1.80
1958	1.13	1.01	6.68	6.63	0.49
1959	1.43	1.50	5.82	7.56	1.26

The northern lines assert that the foregoing comparisons of the eastern district, the Norfolk Southern, and the Pennsylvania are persuasive of the propriety, so far as primary divisions are concerned, of treating the Norfolk Southern in the same manner as other southern lines, leaving it to the respective groups to make any necessary special
44 provisions for the Norfolk Southern through the medium of subdivisional arrangements.

The Norfolk Southern urges that it would be absurd to diminish its revenue when the major beneficiaries would be the Pocahontas lines whose rates of return are rela-

tively high. It proposes that on traffic originated or terminated by it, interchanged at Norfolk, its prorating factors be made 149 percent of the factors presently prescribed for the northern lines, and on traffic moving through other gateways, 125 percent thereof.

The examiners recommended that the divisions on traffic originating or terminating on the Norfolk Southern be determined by the use of the equal-factor basis prescribed for general use on North-South traffic in the first 1953 report. This respondent takes exception to the examiners' report on the principal grounds that the recommended basis would place it in serious financial straits and would be confiscatory. It is supported on oral argument and exceptions by the southern interveners, including the North Carolina Utilities Commission which represents the interests of the State in which the principal operations of this respondent occur.

Respondent originates and terminates traffic of significant importance to itself, other carriers, and the shipping public. Despite its somewhat improved present day status of which we are officially aware, the record demonstrates that it can ill afford the loss of the involved revenue accruing especially on such traffic via the Norfolk gateway. It is apparent that if the Noroflk Southern's divisions on this latter traffic were determined on the general basis prescribed in finding 2 herein, it would be consigned to a deficit position so serious as to impair the rendering of adequate and continuous service to the public. We so find. Moreover, the southern lines' study excluded Norfolk Southern traffic from its scope. It is clear from the record, therefore, that the basis of divisions prescribed in finding 2 herein, derived from the southern study, would have an unjust and unwarranted impact on the Norfolk Southern to a degree not permitted under the *Orient* and *Western Trunklines* holdings. Our finding 4 herein will have the result of retaining for the Norfolk Southern a percentage

of revenue substantially the same as the present 43.4 percent received by it on the traffic through the Norfolk gateway. This will be accomplished by an increase of 108 percent in the factors of column 2 in appendix C. We have, therefore, divided the revenue on shipments originating on the Norfolk Southern moving via the Norfolk gateway on the basis of the cost progression, giving this respondent approximately the same total revenue it now enjoys on the traffic by means of the construction of column 5 in appendix C. We find that the aforementioned scale will result in just and reasonable divisions in the special situation of record with respect to the Norfolk Southern.[9] As noted, this respondent would be deprived of some revenue to the extent that the general basis prescribed would apply to other movements in which it participates with other southern lines. However, no justification for special treatment was presented and relief would involve principally a question of subdivisions, a matter not at issue here. On the whole, the Norfolk Southern, as compared with the other southern lines, would remain in the same relative position as now obtains. All other traffic of the Norfolk Southern will be subject to the general basis of divisions herein prescribed between the northern and southern lines.

45

One additional matter requires consideration as to the Norfolk Southern. Under a permissive order of the Commission in *Pooling of Refrigeration Earnings*, 258 I.C.C. 24, effective January 1, 1942, the proprietary lines of the Fruit Growers Express Company were allowed to enter into an arrangement whereby the net loss or gain realized in furnishing protective service could be pooled and at the close of the year such net loss or gain be distributed be-

9. As a matter of practicable scale construction, other southern lines will be subject to this same scale on Norfolk gateway traffic originating or terminating on the Norfolk Southern. However, their participation therein is shown to be relatively nil. Thus, any revenues accruing to them thereunder would be negligible.

tween the participating proprietary lines on the basis of loaded car miles handled by such lines. Members of the pooling arrangement were the major carriers in the South and certain eastern carriers that terminated perishable traffic. The Norfolk Southern joined about May 1, 1945. However, on and since April 1, 1959, several of the principal official territory lines, including the Pennsylvania, Chesapeake & Ohio, Norfolk & Western, and Baltimore & Ohio, have withdrawn, so that now only the Richmond, Fredericksburg & Potomac is still a member. As a result, the Norfolk Southern estimates it is losing an average of $49 on each car of originated fruits and vegetables given protective service. It requests that the prorating factor prescribed for it on its originated and terminated traffic interchanged at Norfolk be an additional 4 percentage points higher as a temporary measure until the pooling situation is adjusted. It contends that the Commission clearly recognized the pooling arrangement as an equitable solution of the divisional problem and that the withdrawal of the northern lines from that arrangement places an unjust divisional burden on it.

46

To give effect to the Norfolk Southern's position in this regard and on the limited evidence adduced, as pertinent, would penalize the carriers for withdrawing, despite the permissive aspect of the order. In essence, it would appear that the Norfolk Southern challenges the reasonableness of the level of the charges for protective refrigeration service. That issue is beyond the scope of the instant proceeding. In sum, the foregoing relief sought by the Norfolk Southern is not warranted.

At the time of the hearings herein, points on the line of The Atlantic and Danville Railway Company were generally understood to be in southern territory. As stated earlier, the divisions of joint interterritorial rates between points on the lines of this carrier west of Suffolk, Va., and points on the lines of respondents in official territory are

in issue in this reopened phase. The examiners recommended that the divisions from and to such points be those prescribed for other southern lines generally, to which no exception was filed. However, this carrier has been acquired by, and is now known as, the Norfolk, Franklin and Danville Railway Company, which in turn is under the control of the Norfolk & Western. See *Norfolk & W. Ry. Co.—Control—Norfolk. F. & D. Ry. Co.*, 320 I.C.C. 407. It is now classified in the Pocahontas region for statistical purposes. Our prior definition of northern and southern lines will be amended so as to give proper effect to the examiners' conclusion which we affirm.

The Georgia & Florida Railroad (Alfred W. Jones, receiver) made a presentation in its own behalf. We affirm the examiners' conclusion, to which no exception was taken, that this carrier is not entitled to a special basis of divisions. It has since been purchased by the Georgia & Florida Railway Company which in turn is under control of three subsidiaries of the Southern Railway System. See *Georgia & F. Ry. Co.—Acquisition—Georgia & F.R.*, 317 I.C.C. 745.

The New Haven has pointed to a general need of additional revenues in order to provide funds for maintenance, for capital improvements, and to make some return to its stockholders. We can find no basis here for according it any greater relief than that set forth in the general
47 basis of divisions prescribed hereinafter. Unlike the Norfolk Southern, it participates only to a limited extent in the traffic at issue.

General Discussion and Conclusions

Section 15(6) of the act provides in part as follows:

> Whenever, after full hearing upon complaint or upon its own initiative, the Commission is of opinion that the divisions of joint rates * * * applicable to the transportation of * * * property, are or will be unjust,

> unreasonable, inequitable, or unduly preferential or prejudicial as between carriers parties thereto * * * the Commission shall by order prescribe the just, reasonable, and equitable divisions thereof to be received by the several carriers * * *.

In its determination of lawful divisions, the Commission is directed by the second sentence of section 15(6) as follows:

> In so prescribing and determining the divisions of joint rates, fares and charges, the Commission shall give due consideration, among other things, to the efficiency with which the carriers concerned are operated, the amount of revenue required to pay their respective operating expenses, taxes, and a fair return on their railway property held for and used in the service of transportation, and the importance to the public of the transportation services of such carriers; and also whether any particular participating carrier is an originating, intermediate, or delivering line, and any other fact or circumstance which would ordinarily, without regard to the mileage haul, entitle one carrier to a greater or less proportion than another carrier of the joint rate, fare or charge.

In commenting upon the importance to be given the various factors, the district court in *Boston & Maine R. v. United States,* 208 F. Supp. 661 (D. Mass. 1962), *affirmed per curiam,* 371 U.S. 26, stated at page 675:

> "'Due consideration' is not the equivalent of 'primary consideration.' The importance to be given any of the factors enumerated in the statute must necessarily depend upon the case under consideration. The evaluation of the importance of the various factors in any given case is peculiarly the function of the Commission.

In one of the first decisions involving these provisions, *New England Divisions,* 66 I.C.C. 196, the Commission

stated at page 199 "that the relative amount and cost under economical and efficient management of the service
48 rendered is a prime factor in determining the fair and equitable share of joint revenue which each carrier shall receive." In the 1939 report the cost element was given weight upon a showing that from 1932 to 1936 the cost per revenue ton-mile in the South was about 16 percent higher than that in the North. At page 525 of the first 1953 report, as previously referred to, it was stated that the record then showed that "for more than a decade the southern railroads have not labored under a disadvantage of operating costs generally higher than those of the northern lines."

As stated earlier, both groups rely heavily upon relative costs of service as a determining factor in this reopened phase. The northern lines say:

> It is beyond dispute that the power of the Commission to prescribe divisions of joint rates rests upon Section 15(6) of the Act as that provision has been construed by the Commission itself and by the Courts. Those interpretations make it abundantly clear that relative service costs are a primary consideration and that the Commission must, in addition, weigh the relative financial needs of the carriers involved in the light of the public interest. It is the position of Eastern lines that the Commission should, first, undertake to fairly assess the relative service cost levels of the two groups of carriers, parties to the involved rates, and should thereafter adjust its determination made upon the basis of such relative costs to reflect any greater financial need on the part of one of the groups.

The southern lines' emphasis on cost-of-service basis is reflected in their proposed integer scales which, as indicated heretofore, are directly related to the showing of their cost study.

Our restatement of the costs, which are reasonably accurate and reliable for purposes of determining the relative contribution by the groups on a cost-of-service basis, shows that the cost level in 1956, the year both groups used in the final cost analysis, is somewhat higher in the North than in the South for like services. A consideration of all factors indicates that this situation will most likely continue in the immediate future.

Both groups also rely upon revenue needs in claiming that they should have a greater share of the joint revenue than the present divisions accord them. The northern lines take exception to the examiners' recommendation which would increase the northern divisions, on the ground that the proposed increase is not large enough. On the other hand, the southern lines contend that the examiners erred in failing to find that the needs of the southern railroads
49 for additional revenues are greater than those of the railroads in the North.

In every divisions case evidence relating to revenue need is material because section 15(6) requires that "due consideration" be given, "among other things" to "the amount of revenues required to pay their respective operating expenses, taxes, and a fair return on their railway property held for and used in the service of transportation." We are thereby authorized "to take into account and give due weight to revenues from all transportation service, the operating expenses and taxes chargeable to the same and the amounts available as compensation for the use of all carrier property," as well as "the revenues, expenses, taxes and returns attributable to the service covered by the divisions under consideration." *Baltimore & O. R. Co. v. United States,* 298 U.S. 349, 360, 370 (1936). We are free to give such evidence the weight which the particular circumstances appear to justify.

In our determination herein we have considered evidence relating to the cost and other factors concerning the

public interest in maintaining all essential parts of the transportation system. Neither the history of these divisions, the general economic trends, nor any other factor presented here offers a concrete basis on which to find that either group is entitled to a share of the joint rates larger than that accruing under the divisions hereinafter prescribed on the basis of relative costs. In essence, the basic position of the northern lines is that their revenue needs are greater since the southern lines' average rates of return are somewhat higher. However, our prescription of divisions based on relative costs includes allowances for overhead and return, and in our judgment reflects a due proportion of the burden of maintaining the financial integrity and credit of the carriers involved. *Cf. New England Divisions,* 66 I.C.C. 196, 199. Accordingly, we see no justification at this time for adding any special increment favoring one group of carriers over the other. We find that no affirmative reasons appear in this record which would warrant any adjustment of the divisions in question over and above the relative costs of service, either on the grounds of greater revenue needs or otherwise.

The question of prescribing equitable divisions involves the making of practical judgments rather than the solving of a problem with mathematical certainty. See *Boston & Maine R. v. United States, supra.* As we have indicated, a careful evaluation of the factors, other than costs, which we must consider under section 15(6) does not disclose that they require that one group be accorded relatively higher divisions of the joint rates than the other; in other words, there is no convincing evidence of record favoring one group over the other. However, weighing the cost evidence of record in the same balance and similarly considering it, without particular solicitude, we are of the opinion and find that it affords a reasonable basis for the exercise of a practical judgment. Stated in another manner, everything else being substantially equal, the relative costs of the parties reflecting their respective opera-

tions as to this traffic can properly serve here as a guide for the determination of just, reasonable, and equitable divisions. *Cf. Louisville & N. R. Co. v. Southern Ry. Co.*, 319 I.C.C. 639, at pages 657-658.

We have heretofore noted that the revenues in 1956 for the northern lines from the traffic at issue were but 6 percent of their total freight revenues, while for the southern lines the respective percentage was 21.4. In that year the northern lines received 44.64 percent of the revenue while incurring 46.35318 percent of the fully distributed costs. It is clear that an adjustment in the divisions is required to compensate the respective groups according to their expenditures in the joint effort of handling this interterritorial traffic. To the extent that the present divisions do not meet this test, they are unjust, unreasonable, and inequitable. The scales which we have prescribed in columns 1, 2, and 6 of appendix C herein are based on the fully distributed costs and divide the revenue in the same proportion to those costs. Based on the 1956 traffic study this will increase the revenue divisions of the northern lines with a corresponding decrease in those of the southern lines as follows:

Item	*North*	*South*	*Total*
Revenue as settled [1]	$221,370,940	$273,350,121	$494,721,061
Percentage of costs	46.35318	53.64682	100.00000
Proposed revenue [1] .... division	$229,318,944	$265,402,117	$494,721,061
Difference	$7,948,004	$7,948,004	——

1. Omits arbitraries of $59,401 in the North and $1,306,304 in the South.

The foregoing reflects a 3.590-percent increase in revenue, as settled in the North, and a 2.908-percent decrease in the South. In our opinion, the results achieved through the application of the divisional mileage scales here pre-
51 scribed will for the future be just, reasonable, and equitable, and we so find. However, as in *Louisville*

& N. R. Co. v. Southern Ry. Co., 319 I.C.C. 639, 661, the parties should be permitted to negotiate and agree upon any other modified scales, devised on the same basis, but with different mileage blocks and factors or pursuant to any other method they may deem appropriate. In the event that they fail to reach agreement prior to the effective date of the order herein, the scales set forth in appendix C hereto are prescribed to apply thereafter. The conclusions and subsidiary findings hereinbefore made are reflected in our ultimate findings.

ULTIMATE FINDINGS

Upon further hearing, we find:

1. That the present primary divisions of joint all-rail class and commodity rates (except those on traffic listed in appendix A) between official and southern territories are unjust, unreasonable, and inequitable.

2. That, except as hereinafter provided, just, reasonable, and equitable primary divisions of the rates referred to in finding 1 (including aggregate of intermediate rates which automatically displace single-factor joint rates), in which northern and southern lines [10] participate, should be determined by use of the prorating factors set forth in appendix C in computing percentages expressed as integers, the factor for the northern line or lines being that shown in column 1 for the short-line distance north of the dividing point and the factor for the southern line or lines being that shown in column 2 for the short-line distance south of the dividing point.

3. That just, reasonable, and equitable divisions of the joint combination rates on Canadian and northern Maine traffic to and from points in southern territory should be determined in the same manner as specified in finding 2, except that the factor for the northern line or lines should be that shown in column 6 of appendix C for the short-line

10. As defined in appendix C.

distance north of the dividing point and the factor for the southern line or lines should be that shown in column 2 of appendix C for the short-line distance south of the dividing point.

4. That just, reasonable, and equitable primary divisions of the rates on traffic originating or terminating on the lines of the Norfolk Southern Railway Company,
52 and moving to or from points in official territory, via Norfolk, should be determined by the use of the prorating factors set forth in appendix C in computing percentages expressed as integers, the factor for the northern line or lines being that shown in column 1 for the short-line distance north of the dividing point and the factor for the southern line or lines being that shown in column 5 for the short-line distance south of the dividing point. All other primary divisions of the Norfolk Southern shall be on the basis set forth in finding 2 herein.

5. That the evidence is not sufficient to support conclusions directed to the unreasonableness of the present divisions of the joint rates published between points on southern lines, on the one hand, and points on western lines in official territory, on the other hand, where a northern line does not participate in the movement north of the dividing point, and we find the present divisions not shown to be unjust, unreasonable, inequitable, or unduly preferential or prejudicial.

We affirm our prior finding (287 I.C.C. 547) that just, reasonable, and equitable divisions of joint proportional or reshipping rates on grain and grain products from East St. Louis, Louisville, and Cincinnati to points in southern territory should be determined in the same manner as specified in finding 2, except that the factor for the northern line or lines should be that shown in column 4 of appendix C for the short-line distance north of the dividing point and the factor for the southern line or lines should be that

shown in column 3 of appendix C for the short-line distance south of the dividing point.

We affirm our prior finding (289 I.C.C. 4, 8) that the dividing points to and from which the primary divisions shall apply are the present dividing points.

The prescribed primary divisions shall not be subject to a specific minimum. In disposing of fractions of 1 percent the odd 1 percent should be added to the percentage which contains the larger decimal, or if the percentages contain equal decimals 1 percent should be added to the smaller percentage.

Before the divisions herein prescribed are applied, differentials or arbitraries which are included in the joint rates so as to cause them to exceed standard rates, for hauls in either official or southern territories, whether for short or weak lines or otherwise, shall be deducted before prorating and added to the share of the carrier or carriers in the territory in which the differentials apply, pro-
53 vided, however, that in respect of rates on citrus fruit from Florida to official territory which include an arbitrary one percentage point shall be deducted from the northern division and added to the southern division in lieu of the specific apportionment of the arbitrary.

Our findings are without prejudice to the substitution of modified scales agreed upon by the parties in accordance with the discussion above.

An appropriate order will be entered.

COMMISSIONER MURPHY, dissenting in part:

In prescribing divisions we are required to divide earnings under joint rates according to what is fair and reasonable as between the parties. One of the main criteria used to make such a determination is the relative amount and cost of service performed by each of the several

carriers participating in the movement of the *specific* traffic involved from which this revenue is derived. The report of the majority purports to use as a basis for adjusting divisions the relative costs of service of the two groups of carriers, but in many instances territorial average costs are used which do not fairly measure the relative costs of handling the Official-Southern traffic here at issue. The record shows that the revenue obtained by the territory railroads from the traffic at issue constitutes only 6 percent of their total freight revenues. However, the average statistics used in arriving at the costs utilized by the majority in the report represent 100 percent of the traffic of the official lines. As a result, many of the cost figures have little or no relation to the movement of the traffic involved.

Although a number of adjustments in the Rail Form A statistics were made in the report, other necessary and important adjustments which would truly reflect the cost of moving the traffic involved were rejected or ignored. Consequently, costs for the service performed by the official lines in handling the traffic at issue are overstated. In *Louisville & N. R. Co. v. Akron, C. & Y. R. Co.*, 309 I.C.C. 491, 509, also known as the *Border Points Division* case, the Commission rejected the use of unadjusted Rail Form A costs, stating: "* * * the only comparable cost data for the complainants and the defendants are on the basis of territorial or systemwide averages, which are not determinative of the costs of these particular movements." The Commission therein did accept, however, specific costs supplied by complainants and complainants' adjust-
54 ments in territorywide average costs submitted by defendants. This finding by the Commission was sustained on judicial review, *Boston & Maine R. v. United States*, 208 F. Supp. 661 (D. Mass. 1962), *affirmed per curiam*, 371 U.S. 26.

Included in the cost computations for the official lines are suburban service deficits which are peculiar only to

the large metropolitan areas found in official territory. These deficits have no relation to intercity passenger deficits which normally are considered as part of the cost of providing freight services in that such passenger deficits are for the most part attributable to the apportioned costs of common facilities which must be incurred in any event to provide freight service. Almost all the expenses incurred in providing suburban passenger service have nothing to do with the costs of handling the Official-Southern traffic at issue in this proceeding. This service is provided over lines especially constructed and maintained for that sole purpose with equipment and facilities that have no other use whatever. It is unreasonable to require the southern lines and their shippers to defray a part of the costs of suburban passenger service in official territory cities so that the residents of the suburbs of those cities can travel at fares that do not even cover costs. This burden should be borne by the commuters who benefit thereby and the communities involved.

The higher than average empty return ratios used for cars moving over the official lines is another instance where true costs have not been used. The official lines handle approximately 800,000 carloads of automobile parts annually which originate in the Detroit, Mich., area and are destined to assembly plants in various parts of the country, including New Jersey, California, and Georgia. Many of these cars are fitted with special devices to protect the automobile parts in transit. Because these cars carrying parts contain special devices and are assigned to particular plants manufacturing such parts in official territory, they normally experience an empty return movement which is, for all practical purposes, 100 percent. No adjustment is made in the cost data to cover the higher empty return costs of this type of equipment. Territorial average boxcar empty return ratios, as used in the report, overstate the costs of the official railroads when applied to Official-Southern traffic.

The improper counting of a car interchanged instead of terminated by the official lines affects the weighting of that car in computing switching costs. The official
55 lines report a large volume of coal and ore terminated at port dumping facilities for loading onto boats as cars interchanged, while the southern lines report a large volume of phosphate rock hauled to ports for loading onto boats as cars terminated. These cars receive analogous services and should be treated as such. In both these instances the lading from the car is removed and the empty car is returned to the delivering carriers. The erroneous counting of cars terminated as cars interchanged on the official lines produces higher unit costs for official territory than for southern territory, both for origin and destination switching and for interchange switching.

If the above valid adjustments were to be made in the restated costs the difference between the relative costs of service of both parties would not be as great. In my judgment the amount of increase in divisions awarded the official lines by the majority is unwarranted.

Appendix A

Divisions of joint interterritorial rates prescribed herein do not apply on the following traffic:

1. Coal and coke made from coal, by common consent of the parties.

2. Trailer-on-flatcar traffic moving entirely over the lines of the A.C.L., B. & O., B. & M., F.E.C., N.Y.C., N.Y.N.H.&H., P.R.R., Reading, R.F. & P., and S.A.L., by stipulation at hearing.

3. Trailer-on-flatcar traffic via Potomac Yard, Va., from and to points on the Southern Railway (including its system lines as specified in the stipulation) and points on B. & O., B. & M., C.R.R.N.J., D. & H., L.I.R.R., N.Y.C.,

N.Y.N.H.&H., P.R.R., and Reading, by stipulation dated November 13, 1961.

4. Border point traffic embraced in docket No. 32055 (309 I.C.C. 491) by stipulation.

Appendix B

Southern lines' specific cost adjustments

a. Way and through train separation.—The Form A procedure provides for costing out traffic at either average train costs or a combination of way train and through train costs. Although the northern lines used average train costs in their study on the theory that it was adequate for overall territorial cost comparisons, they have no objection to the more refined procedure of using way and through train costs. This has the effect of giving slightly lower costs at the longer distances and higher costs at the shorter distances, and reduces the proportion of costs of the southern lines by 0.13 percentage point. We approve this adjustment.

b. Platform costs.—The southern lines excluded platform costs from their study of the costs of originating and terminating official-southern traffic. This brought about an increase of their proportion of the costs by 0.28 percentage point or in revenues about $1,389,000. This exclusion was based upon the conclusion that whenever a separate tariff charge was made for carrier loading or unloading, platform costs should be excluded. They examined 19 cars out of a 130,353-car sample of the involved traffic (967,554 cars), and contend that for all practical purposes none of the involved traffic received lighterage or any other service which would include platform handling as a part of the service under the line-haul rates being divided.

56

The northern lines took the same 19-car sample and showed that 11 originated on the eastern lines, 8 of which

were from Manhattan and 2 from Brooklyn, all 10 of which required either float or lighterage service and platform service. One car originated in New Jersey which was not involved in the issue of platform service. Of the eight cars destined to eastern carriers in the New York area, only two were actually delivered to Manhattan, one to Long Island City, and one to Brooklyn, the four likewise requiring harbor service. Three cars were destined and delivered to New Jersey points, and therefore did not require harbor service. The one remaining car was shown for diversion at Potomac Yard, but then no destination was shown, and there was no possibility of knowing what final service was required.

It is evident from the facts that platform service is incurred by some of the shipments of official-southern traffic. However, as noted, the southern lines excluded platform costs in each territory, contending that such costs are no longer part of the service covered by the line-haul rates but are covered by a separate charge collected and retained by the northern lines. The southern lines excluded their own platform costs in the interest of relative equality between the territories.

In prior years platform service was considered a part of the line-haul service covered by the through rate, and, accordingly, platform costs less the incidental revenues were correctly included in computing the cost for the line-haul service. Thereafter, however, the conditions at the unloading facilities changed. Whereas prior conditions necessitated that shippers be denied access to the cars for unloading at piers, the new conditions permitted shippers access to the cars. As a result, unloading was no longer a part of the line-haul service provided by the railroad but became the responsibility of the shippers, as it is at other destinations in all territories. The Commission took cognizance of these changed circumstances in *Increased Freight Rates, 1958,* 304 I.C.C. 289, 375, when it indicated:

The line-haul rates on this traffic are designed to cover only normal delivery and do not include compensation for the loading and unloading services, the line-haul rates on the perishable traffic being generally below out-of-pocket costs.

For the purpose of comparing relative territorial cost levels the inclusion of both the incidental revenue and the costs of platform service are correctly shown in Rail Form A; however, where the purpose is to measure the cost of services performed under the line-haul rates to be divided, it is correct to exclude platform service which is not within the scope of the rates. Our restatement reflects this view.

57 *c. Switching and terminal companies.*—An understanding of the switching charges at Chicago and St. Louis requires a consideration of Rail Form A procedures for switching and terminal companies. The Rail Form A procedures separate the costs for such companies as between the costs and services for intraterminal and other operations not chargeable to the origination or termination of cars for the account of class I roads (25 percent) and the costs and services which are so chargeable to class I roads (75 percent). The latter costs and services are then associated with class I line-haul railroads in whose statistics the cars originated or terminated are reported. This procedure is not questioned, but in dividing the switching and terminal company costs among groups of carriers the following complication arises.

The percentage separation of the (75 percent) costs of switching and terminal companies which are located on territorial borders is illustrated below:

	Eastern district	*Western district*	*Southern region*	*Total*
Chicago, Ill.	50	50	—	100
St. Louis, Mo., and East St. Louis, Ill.	50	50	—	100
New Orleans, La.	—	50	50	100
Louisville, Ky.	50	—	50	100

The southern lines consider the allocations at New Orleans and Louisville to be reasonable since carriers assigned to other territories do not reach those points. However, two southern region carriers reach Chicago and four reach St. Louis or East St. Louis. The southern lines maintain that since the reported statistics assign to the southern region carriers the cars switched for their accounts by the switching and terminal companies at those points, the portion of the switching and terminal companies' expenses which are associated with switching such cars must be allocated to the southern region carriers in order to determine the actual unit costs. To accomplish this end, the southern lines determined the proportion of the total transportation revenues of each switching and terminal company at the above-mentioned cities that was paid by the southern region carriers. They then assigned the relative proportion of switching and terminal company cost to the southern region.

The northern lines maintain a different viewpoint toward these switching points at the Chicago and St. Louis areas. They contend that Chicago is not now a primary breakpoint on the North-South traffic and that East St. Louis is such a breakpoint only with respect to certain Mississippi Valley traffic. They believe that it is improper to take any portion of the expense of switching and terminal companies in the North and put it into the costs used to price out southern lines' services south of the primary divisional gateways.

Regardless of where the breakpoint for dividing revenues is located, the cost on each side ought to be properly computed and the so-called territorial costs are, in reality, those for groups of carriers operating principally in each territory. We are of the opinion that the southern lines are justified in making this adjustment of the switching and terminal company costs at the Chicago and St.
58 Louis areas; the involved cars are counted in the southern region, and, accordingly, the expenses asso-

ciated with them also should be included in that region. While revenue does not ordinarily afford a precise indication of costs, the southern lines' apportionment for the switching and terminal companies on the basis of total transportation revenue is an appropriate and practical method for estimating here the amount of a refinement justified in principle. This adjustment increased the southern lines' proportion of the costs of official-southern traffic by 0.16 percentage point or in revenues about $794,000.

d. Count of cars interchanged, originated, and terminated.—Rail Form A cost applications are based on the count of cars from the Freight Commodity Statistics which, briefly stated, provide that certain cars carrying shipments which are transferred between rail and water carriers, such as lake cargo coal, tidewater coal, and ex-lake ore, will be classed as cars interchanged and that certain other cars carrying shipments transferred between rail and water carriers will be classed as cars originated and terminated. This creates a situation where a car of coal transferred to a ship at an Atlantic port would be classified as interchanged if the shipment is destined to New England, and as terminated if the coal is destined to Europe. Further, coal in official territory going to Canada and transferred from rail to vessel at a Great Lakes port is interchanged, whereas phosphate transferred from rail to vessel at Tampa, Fla., is terminated.

The southern lines contend that for the purpose of determining relative costs incurred by northern and southern lines, it is necessary that cars receiving comparable service be counted in a consistent manner in both territories. The southern lines urge that all of these cars which receive such port service should be classed as originated or terminated because they all are said to receive similar switching service. That a larger proportion of these cars in the North than in the South was classified as interchanged is said to inflate both terminal and inter-

change unit costs more in the North than in the South to the southern lines' disadvantage. To correct this alleged inflation, they examined the information furnished periodically to the Commission for the purpose of reconciling its study of terminations reflected in its Carload Waybill Statistics publication with the Freight Commodity Statistics. They found that 1,803,499 cars in the North and 129,019 cars in the South should be changed from "interchanged" to "originated plus terminated." The number of cars originated and terminated was thereby increased 5.4 percent for eastern district, 8.7 percent for Pocahontas region, and 1.1 percent for the southern region. This had the effect of reducing the costs $2,003,871 in the North and $555,541 in the South, and of changing the South's proportion of total costs from 53.44 percent to 53.67 percent, an increase of 0.23 percentage point.

The northern lines contend that the switching characteristics of the port service between rail and vessel of this traffic are more akin to interchange than to terminal service, that interchange costs vary greatly, and that the information available is inadequate to correctly compute the adjustment. The switching characteristics of this traffic are described by the northern lines as follows:

> That the service at tidewider ports on coal, and the lake ports on coal and ore, is interchange rather than terminal is apparent from the facts with respect to these services. Taking lake cargo coal as an example, the coal trains go to the railroads' lake front
> 59 yards at the ports. Unlike cars which are to be terminated, the lake cargo coal cars are not then moved to various industries in transfer runs and then switched to effect delivery at the consignee's plant. Rather, they are moved to a dumping machine at the railroad's water front yards and there dumped into the lake vessel. It is obvious that this service is much more akin to a movement to an interchange track than to a transfer and switching movement to effect delivery

to a consignee. The fact that the car is not given over to the boat line along with the lading cannot, in itself, mean that the shipment is not interchanged. The interchange of an l.c.l. shipment between railroads is not accompanied by a delivery of the car which carried the shipment; but, nevertheless, it is an interchange. Also, the fact that the interchange is with a boat rather than with a railroad—that the movement is to a dumping machine rather than to an interchange track with another railroad—cannot detract from the essentials of the operation and their significance from a cost standpoint.

The northern lines contend that interchange costs vary greatly and that lake cargo coal, tidewater coal, and ex-lake ore are not in a class by themselves. They state:

> Of course, interchange service may involve high, low, or average expense, just as terminal service may involve high, low, or average expense. For example, the interchange of cars between railroads in New York Harbor necessitates the expense of floating service. So does the interchange of cars between the Pennsylvania and connecting lines at Norfolk. Another illustration of an expensive interchange service of cars is in the case of traffic which formerly moved between interior points in the East and interior points in the Southwest over the so-called break bulk water routes. This traffic even when moving under joint rates (like some of the lake cargo coal traffic) required transfer from car to vessel at the ports.

They also urge that the information furnished to the Commission for purposes of reconciling the waybill study with the Freight Commodity Statistics is inadequate for the purpose of computing the number of cars to be transferred from interchange service to terminal service and that a substantial portion had to be estimated.

There is a great variation from one point to another in the amount of both terminal switching and interchange switching due to the physical layout of the tracks, volume handled, and other causes. Rail Form A gives an equating factor of 1.0 to origin or destination switching and a factor of 0.5 to interchange switching which reflect the relative amount of switching. The northern lines have referred to the similarity of switching at lake ports to interchange switching. Also, because of the large volume of this traffic, it lends itself to multiple-car block switching which is less costly than terminal switching and would justify an equating factor less than one. The reconciliation between the waybill study and the Freight Commodity Statistics had to do only with terminations, and therefore the originations were estimates only. These included the large blocks of traffic received by boat, transferred to car, terminated on rail, and which were counted as interchanged at the port.

This traffic has been counted as interchange traffic for
60 many years. The rates on this traffic are different than the rates on traffic originated or terminated at the same ports. Evidence was introduced to show that the switching characteristics of the port service on this traffic are more akin to interchange than to terminal service. There is great variation from one point to another in the amount and cost of both interchange and terminal service. There is no evidence that the service performed on this traffic is comparable to the average service in originating or terminating traffic in official territory. All things considered, we are of the opinion that the estimate lacks sufficient probative force, that the contentions of northern lines have merit, and that a change in the classification of this traffic for costing purposes in this case is not justified. It has therefore not been included in our restatement of the costs.

e. Car costs.—In the transportation of official-southern traffic, 15 percent moves in refrigerator and tank cars, mainly mileage basis cars, and 85 percent in per diem basis cars. It is the car costs of the per diem cars which

are at issue. The southern respondents contend that the territorial differences in car costs are due to factors unrelated to the traffic in this case. To correct this situation, they urge that average car costs for the United States should be used in both territories. The territorial difference in car costs reflected in Form A for a boxcar with a 28.9-ton load moving 350 miles with one terminal is—

		Percent
Official territory	$16.20	132
Southern region	12.27	100
Difference	3.93 [1]	32

[1] Assuming equal empty return ratios.

The relative size of this difference may be judged by comparison with the total out-of-pocket cost of the same service in the southern region of about $85.

In urging United States average car costs, the southern lines list three reasons in explanation of the variation in car costs between territories, and contend that none of these reasons has any bearing on the relative costs incurred in handling official-southern traffic. As the first reason, they state that the territorial average car cost reflects the composite cost of the car fleet owned by each group of roads and there is a different car fleet in each territory very different from the consist of the cars handling official-southern traffic. It is stated that differences in the car costs produced by Rail Form A as between territories do not measure the differences in the cost of repairing boxcars but rather the difference in the composition of the car fleet. About 82 percent of the car-miles of study traffic (per diem cars) in each territory are handled in boxcars.

Information is adduced as to the percentages of ownership of each type of car in each territory and the percentage of car-miles made by each type of car. We view the per-

centages of ownership as more meaningful since the owning road bears the cost of repairs, depreciation, and return. As to boxcars, the proportion in the North is 36.9 percent and in the South it is 37.9 percent; this difference is too small to be significant. The major differences in ownership are that the North has 7.6 percent points more open hopper cars and the South has 7.0 percentage points more rack cars. These percentages may be said to equalize each other,
61 and, in any event, such cars are used only on a limited basis in the instant traffic movements.

Costs per day or per year for repairs, depreciation, and return are shown to be insignificant as between types of cars. However, utilization is the main differentiating factor in costs between individual types of cars.

The effect of the composition of the car fleet on costs developed in Rail Form A can be measured by its effect on car utilization, as follows:

		Percentage of ownership		*Miles per year of composite car*	
Type of car (1)	*Miles per year* (2)	*Official territory* (3)	*Southern region* (4)	*Official territory* (2) x (3) (5)	*Southern region* (2) x (4) (6)
		Percent	*Percent*		
Box	19,635	36.9	37.9	7,245	7,442
Flat, including rack	12,456	1.8	9.7	224	1,208
Stock	16,953	.7	.6	119	102
Gondola	9,503	17.5	15.2	1,663	1,444
Open hopper	11,827	40.4	32.8	4,778	3,879
Covered hopper	13,816	2.5	3.8	345	525
Other (average)	15,178	.2	0	30	0
		100.0	100.0	14,404	14,600

As indicated above, however, the effect of the composition of the car fleet in each territory, as reflected by the overall utilization, is only slight, 14,404 in official territory as against 14,600 in the South. Any explanation for the dif-

ference of 32 percent in the car costs between the two territories would lie elsewhere.

The second reason advanced by the southern lines on this point is that the territorial average car cost developed in Rail Form A is strongly affected by per diem debits or credits. This, they assert, has a distorting effect because the basis used in computing Rail Form A costs differs from that used in determining per diem rates. The third reason is that in determining the unit car costs by dividing the cost of cars owned by the car-miles operated, the numerator and the denominator do not represent the same cars in any given territory. These two reasons are related and will be discussed together. Under Rail Form A, the cost to the railroads of furnishing freight train cars includes the following items:

(a) owner costs (repairs, depreciation, and return on investment) for all cars owned, including both those serving on line and those serving off line, offset by per diem received for those cars serving off line;

(b) user costs (repairs and inspection) of all cars on line, both owned and foreign;

(c) per diem paid for foreign cars on line;

62 (d) repairs (responsibility of owner) to foreign cars offset by amounts billed; and

(e) overhead costs.

The sum of these costs is divided by the car-miles run on line by both foreign and domestic cars to give a cost per car-mile. Thus, the numerator and denominator are consistent; both represent cars serving on the railroad.

The repairs and maintenance represent actual payments for materials and wages; per diem is a cash payment; depreciation is a portion of money paid in the past to purchase cars and allocated to the present period; and even return on investment, a cost of capital, can be considered as analogous to interest payments on money borrowed to pur-

chase cars. Thus, all these items represent actual outlays of moneys and must be recovered by the railroads if they are to remain financially solvent. The determination and fixing of a rate of per diem which is fair as between all railroads and sections of the country is a difficult and complicated problem into which many considerations enter. However, after the rate is determined it becomes an actual disbursement settled in dollars and cents and properly a part of the costs for each road and territory in the year incurred.

The per diem collected by a road for the use of its cars by others should be used to offset its car costs incurred on the lines of the foreign carriers, for it is assumed that, allowing for exceptions in special situations, the per diem charge generally reimburses owning roads for expenditures in owning and maintaining cars in working order.

All of the items entering into the Rail Form A car costs represent actual expenses, and therefore, any difference in the car costs between the two territories, whether caused by per diem or other items, is not a discrepancy but is a reflection of the actual situation, and this difference (because it is actual) should be considered in the comparison of the relative costs of the two territories.

The southern lines contend that the higher average car cost in the North is a reflection of the average car which is largely hopper and gondola cars, but that the cost per car-mile for box cars is no higher in the North than in the South. This arithmetic is illustrated as follows:

Car costs (car repairs, depreciation, and return)

	Cost per car-mile (cents)		
	Official	*South*	*U.S. average*
Box	3.0	3.0	3.0
Gondola and hopper	6.0	3.0	4.5
Other	4.0	4.0	4.0
Average car	4.3	3.3	3.8

The southern lines explain that open top car costs are higher in the North because of the effect on car costs of per diem debits and credits and the mechanics of Rail
63 Form A wherein the per diem computed on reproduction costs is added to or subtracted from a cost based on original cost. The Clinchfield is cited as an extreme case in which the per diem credits are so great that they create a negative figure for the return on investment portion of the car cost. The southern lines conclude that it is wrong to charge, in effect, to boxcars a higher cost caused by the per diem on open top cars through the aggregation of car costs on all types of cars, and, therefore, they use for both territories the United States average car cost.

In rebuttal the northern lines make the following points: First: Open top cars are not more costly than boxcars. They quote the testimony in another proceeding of a southern lines' witness to the effect that, in his opinion, the cost of maintaining a boxcar is considerably higher than the cost or maintaining an open top car. Contending that the purchase price of a car influences both the return and depreciation elements of car cost, northern lines show that in 1959 the average cost of general service boxcars in the United States was $9,851; that of open hoppers, $8,715; and gondolas, $8,409.

Second: In regard to the effect of utilization on the comparative car-mile costs of open hopper cars, the official territory ownership was 40.4 percent and utilization in car-miles was 40 percent whereas the southern region had an ownership of 32.8 percent and utilization of 23.6 percent.

Third: As to the Clinchfield, the northern lines cite the Pittsburgh & Lake Erie in their group as being in the same situation.

The southern line's arithmetical illustration depends entirely on the assumptions that the car-mile cost of gondola and hopper cars is twice as great in the North as in

the South and twice as great as the boxcar costs. There is no sound evidence to support these assumptions. Indeed, the uncontroverted cost and utilization figures furnished by the northern lines render them highly improbable.

We recognize that per diem charges have been based upon car costs computed on a reproduction basis insofar as depreciation and return on investment of the cars are concerned. This differs from the original cost basis used in Form A car cost computations for owned cars. As explained above, the Form A method necessarily includes per diem in the car costs, and is appropriate in situations where, as here, the issues involve divisions of rates on almost all commodities handled in different types of cars, although mainly boxcars, and between numerous carriers throughout both territories. We distinguish the situation here from that presented in *Louisville & N. R. Co. v. Southern Ry. Co.*, 319 I.C.C. 639, sustained in *Carolina & N. W. Ry. Co. v. United States*, 230 F. Supp. 581 (W.D.N.C. 1964), wherein an adjustment for reproduction costs was made. There the sole commodity at issue was coal (not involved here), only a certain kind of car was used and such equipment was owned exclusively by the originating carrier, the traffic moved intraterritorially over only specified segments of each carrier's lines, and the car costs of the destination carrier consisted solely of the per diem charge. As to the Clinchfield, that carrier is also largely a coal road. Such traffic is not at issue here, and, in any event, that carrier's situation is offset by that of the Pittsburgh & Lake Erie.

There are very real differences in the car costs in each territory and the causes are known. Among these causes are: a difference in utilization of 39.4 car-miles per
64 day in the North and 49.5 car-miles per day in the South; differences in tax and wage rates; and a difference in the relative amount of off-line use of owned cars in all territories. Moreover, there is a greater relative

use in connection with the traffic here at issue of cars owned by official territory railroads than of cars of southern ownership. Eliminating cars of other ownership for purposes of comparison, cars owned by official territory railroads made 54 percent of all car-miles although only 41 percent of those car-miles were run in official territory.

The use of a national average car cost conceals territorial differences in cost which are important in the consideration of divisions between the two involved territories. Accordingly, separate territorial freight train car costs will be used in our restatement.

f. Freight car empty return ratios.—The southern lines take the general position that the history of costs reflects a refinement away from system average costs. Form A departs from overall system average costs by separating line-haul and terminal services, assigning costs on the basis of load per car, and separating tare weight and empty return ratios by type of car. Territorial empty return ratios for all types of cars were broken down into empty return ratios for each of six types of cars in the first 7-day study (August 15, 1948, to July 11, 1949) and for each of 10 types of cars in the second 7-day study[1] (October 22, 1956, to August 18, 1957). Dividing "gondola and hopper" into three types and "flat" into two types of cars is said by the southern lines to be a necessary refinement of the empty return ratios. Further refinement of empty return ratios among the kinds of boxcars and refrigerator cars is, according to the southern lines, consistent with cost finding development and necessary to measure more accurately the costs of the traffic at issue.

The southern traffic study shows that 69.3 percent of the car-miles are incurred by boxcars and 9.7 percent by refrigerator cars. The southern lines changed the empty

1. Cost section statement No. 6-57, "Percent of Empty to Loaded Freight Car-Miles by Class of Equipment and Performance Factors for Way, Through and All Trains Combined."

return ratios from 39 percent in official territory and 33 percent in southern region for all boxcars to 100 percent for auto parts traffic and 30 percent for the remainder of the boxcar traffic in both territories, and the empty return ratios for refrigerator cars in official territory from 90 percent to 75 percent and in southern region from 76 percent to 84 percent. The effect of these adjustments increases the proportion of costs in the South by 0.51 percentage point.

(*1*) *Boxcars.*—The northern lines in applying Rail Form A used empty return ratios based on the second 7-day study of loaded and empty car-miles which produced for each group a single ratio covering all types of boxcars and another ratio covering all ownerships of refrigerator cars. In this category of boxcars are general purpose cars which can be utilized by and are available to all shippers for loading all types of commodities not requiring special type equipment, and boxcars suitable for loading special commodities which, though they may be suited for some type of return load, are in assigned service and thus returned empty, with some exceptions, to the point of loading. Included therein are cars used for transporting auto parts, which are specifically designed to handle such commodities. This 100-percent empty return ratio for specially equipped cars is contrasted by the southern lines with average ratios of less than 40 percent for all boxcars including the assigned cars.

65 The southern lines present the following in support of their adjustment:

(a) A computation showing that if special boxcars have an empty return ratio of 100 percent and general boxcars one of 30 percent, or if special boxcars account for 13 percent of loaded boxcar-miles in the North and 4 percent in the South, the result will be an overall empty ratio of 39 percent in the North and 33 percent in the South, which is what the 7-day study produced.

(b) A showing of the Commission's Transport Statistics of the United States for 1956 as follows:

Boxcars owned

Territory	*Total*	*Special device*	*Percent special device is of total*
Eastern district	267,266	26,779	10.03
Pocahontas region	32,834	1,501	4.57
Eastern plus Pocahontas	300,100	28,280	9.42
Southern region	100,191	4,122	4.11

The southern lines contend that the above indicates that the southern carriers own substantially fewer special device cars than do the eastern or official carriers involved in this proceeding.

(c) The following showing of the relationship in each territory between the amount of traffic commodity class No. 623, Vehicle Parts, N.O.S., and Total Manufactures and Miscellaneous based on carloads originated and terminated and on freight revenue:

VEHICLE PARTS 623—1956

	Eastern district plus Pocahontas region (1)	*South* (2)	*Total (column 1 plus column 2)* (3)	*Percent South of total (column 2 and column 3)* (4)	*Percent eastern district plus Pocahontas region of total (column 1 and column 3)* (5)
	Carloads originated and terminated				
Vehicle parts, N.O.S.	829,934	62,033	891,967	6.95	93.05
Manufactures and miscellaneous	12,669,348	3,787,287	16,486,635	23.01	76.99
Percent vehicle parts	6.55	1.64			
	Freight revenue				
Vehicle parts, N.O.S.	$130,212,468	$19,329,691	$149,542,159	12.93	87.07
Manufactures and miscellaneous	$1,827,508,648	$625,523,731	$2,453,032,379	25.50	74.50
Percent vehicle parts	7.13	3.09			

66 The southern carriers contend that the foregoing demonstrates that they participate to a much more limited extent in vehicle parts traffic than to the official carriers.

(d) The following showing of the empty return ratio of boxcars and the proportion of vehicle parts traffic to all traffic in boxcars for each of the three groups of railroads:

	Boxcars empty return ratio [1]	*Percent vehicle parts 623 to total boxcar traffic* [2]
	Percent	*Percent*
Roads serving Detroit having heavy proportion of vehicle parts to total boxcar traffic [3]	49	14.5
Other official	34	4.2
Total official	39	6.8
Southern region	33	2.6

[1] Second 7-day study.

[2] Percent carloads of vehicle parts 623 handled in boxcars and percent carloads of all traffic handled in boxcars from statement No. TC-3,1956, applied to total carloads handled, vehicle parts and total carloads all traffic, respectively, from Freight Commodity Statistics, Year 1956.

[3] NYC, Wabash, C&O, DTI, and GTW.

(e) A statistical showing of the effect on the empty return ratio from the elimination of vehicle parts traffic. The waybill study does not show for interterritorial traffic the number of car-miles in each territory. Therefore, this missing element was approximated by combining certain items and proportions in the waybill study with originations and terminations and revenues from the Freight Commodity Statistics. The final result after eliminating vehicle parts traffic shows an empty ratio which is 4 percentage points higher in official territory than in southern region.

These five items will be analyzed below:

(a) This is merely a computation showing what the effect would be if certain assumptions are made. By itself,

it does not prove that those conditions actually exist, nor is there other sufficient evidence to this effect.

(b) This shows the percentage ownership of boxcars by railroads in these territorial groups. Cars are interchanged among territories and it is quite probable that cars of eastern ownership travel many car-miles in the western district. It is the car-miles in each territory which affect the empty ratio, and the relative ownership does not necessarily coincide with the relative number of car-miles.

(c) The use of the relationship between the numbers of carloads and the revenues of vehicle parts to total manufactures and miscellaneous group of commodities does not measure the relationship of special boxcars to total boxcars for the reason that many boxcars carried commodities other than manufactures and miscellaneous, and vehicle parts do not all move in special boxcars.

(d) The comparison is based on only three observations and is therefore too limited to be representative. At best, it may be a coincidence or caused by some unknown factor, and is not otherwise supported.

67 (e) The statistical determination of the effect of special cars on the empty return ratio for all boxcars is based on certain assumptions, such as that commodity class No. 623, Vehicle Parts, N.O.S., moves in special cars only and that all special cars have a 100-percent empty return. These assumptions have not been proven. In fact, 12 percent of the vehicle parts move in other than boxcars. This statistical determination is an attempt to show an effect on the empty ratio with mathematical exactness. However, such a degree of accuracy is inappropriate in this particular computation because the individual steps taken to arrive at the answer contain estimates or approximations with a wide margin of error. For example, the percentage distribution of intraterritorial car-miles includes different amounts of car-miles by other than boxcars in each terri-

tory. The equating factors for revenue are also only very rough approximations.

There are undoubtedly instances where specially equipped or directly assigned boxcars have a 100-percent empty return. The record does not indicate, however, whether this is generally prevalent or whether it approaches 50 percent or 100 percent for this class of cars. The five items above tend to show that these cars may have some effect on the empty return ratio, but they do not support a conclusion that any adjustment is warranted here as to the amount of the effect other than that reflected in the averages used.

The southern lines cite the Commission's decision in *Louisville & N. R. Co. v. Akron, C. & Y. R. Co.*, 309 I.C.C. 491, the *Border Point* case, as a precedent for adjusting the empty return ratios because of specially equipped cars. The circumstances were different in that case. Most of the line-haul costs were on only one side of the border. In addition to territorial average costs, 1956 systemwide operating costs were computed separately for the Pennsylvania, the Detroit, Toledo & Ironton, the Louisville & Nashville, and the New York Central. In addition, the Detroit, Toledo & Ironton had 2,596 specially equipped cars for use in transporting automobile parts which generally moved loaded from Detroit to Louisville, and returned empty. This type of car constituted more than half of its owned cars in this area. Moreover, the Louisville & Nashville border point traffic was largely composed of vehicle parts and electric appliances moving to or from Louisville. It was necessary to develop specific data for this dominant traffic. In contrast, the instant proceedings embrace a large and varied body of traffic, incurring line-haul costs on both sides of the border, and the 33,983 cars carrying vehicle parts, commodity No. 623, are not at all dominant but, rather, constitute only 3.5 percent of the total number of cars.

It is claimed that the unbalanced flow of traffic to and from Canada contributes to the high empty return ratio in official territory. A study based on Canadian commodity statistics shows that, excluding automobiles and parts, 468,456 carloads were delivered to Canadian connections and 691,316 were received. If every carload going to Canada could be placed in a car coming therefrom which was unloaded here it would produce the following result:

691,316 southbound loads	
468,456 northbound loads	
222,860 empties	19 percent
1,159,772 total loads	100 percent

68 Thus, under ideal conditions, which rarely obtain, an empty ratio on Canadian traffic of 19 percent might be possible. The figures given as to the imbalance in traffic flow do not indicate that Canadian traffic has a greater empty return ratio than other traffic.

The detail of the southern lines' empty return ratio adjustments follow:

	Official territory	*Southern region*
	Percent	*Percent*
All boxcars	38.93	32.50
Less effect of special device cars	4.27	1.62
General purpose boxcars	34.66	30.88
Less effect of Canadian traffic	2.13	0
Less judgment factor	32.53	30.88
	2.53	0.88
	30.00	30.00

The witness for the southern lines summarized this evidence in the following words:

Bearing in mind that the special device adjustment is merely illustrative and that the use of special device cars for other commodities is of relatively greater importance in the highly industrialized east than in the south it is my conclusion that, as far as North-South traffic is concerned, the empty ratio for box cars is no greater in official territory than in the south. In my judgment a fair ratio for either territory would be 30 percent.

In light of the foregoing, we find that: (1) the adjustment for special device cars of 4.27 percentage points is not adequately supported; at best, it is merely illustrative; (2) that the adjustment for Canadian traffic is in error; and (3) that the last adjustment of 2.53 percentage points is purely an unsupported assumption.

(2) Refrigerator cars.—The second 7-day study developed empty return ratios for eastern district of 90 percent, Pocahontas of 86 percent, and southern region of 76 percent. The southern lines urge that these are not representative of North-South traffic because they include meat traffic, of which very little moves between the North and the South and which has a 98-percent empty return. The southern traffic study shows 80,379 refrigerator cars of which only 1,642 or 2 percent are meat. The waybill study shows that based on originations and terminations (not car-miles, which are not available) fresh meats constitute 19.1 percent of refrigerator car traffic in official territory and 7.2 percent in southern region.

The above percentages are based on a single commodity group, No. 215, Meats, fresh, n.o.s. Generally, a group average is not invalidated because one of the items included in the group is above or below the average. It is normal to have items above offset by those below. For example, the Illinois Central Railroad handles a substantial movement of bananas from New Orleans to destina-
69 tions in official territory. Bananas are transported in refrigerator cars owned or leased by the Illinois

Central and assigned to the movement of bananas. These assigned cars have an empty ratio of 100 percent. In considering whether the cars with 100-percent empty return affect one territory more than another, all such cars must be recognized, not just meat cars. The significance of the banana cars, commodity class No. 51, Bananas, fresh, is that whereas there are proportionately more meat cars in official territory, there are proportionately more banana cars in the southern region. Further, banana cars comprise a much greater proportion of North-South traffic. If all refrigerator cars with a 98- or 100-percent empty return had been considered, the showing would have been entirely different than that for meat cars alone.

The southern lines show that the second 7-day study produced varying results for individual days ranging from 96 percent to 66 percent as the empty return ratio for refrigerator cars in the southern region. The empty and loaded refrigerator car-miles of the principal car owning companies in the southern region obtained from replies to questionnaires sent to the southern roads indicate an empty ratio of 84 percent for all traffic (but not all ownerships) in 1956. This coincides with ratio reported by the Association of American Railroads' Car Service Division on Form CS-57A. This empty ratio of 84 percent is considered more accurate by the southern lines than the results of the 7-day study because it is based on records for the full year and is therefore used in their cost study. However, the southern lines are unwilling to accept the empty return ratios for refrigerator cars in official territory developed in either the 7-day study or the CS-57A reports, and use instead an empty ratio of 75 percent which is the experience of Fruit Growers Express in official territory. Fruit Growers Express handles only 43.3 percent of the North-South refrigerator traffic but the loaded and empty refrigerator car-miles of the other companies were not available to the southern lines. In other words, in determining the ratio of empty return to use in official territory,

the southern lines did not consider the empty return experience of all refrigerator cars of ownerships which handle 56.7 percent of the North-South traffic.

The studies of refrigerator car traffic relied on by the southern lines, like the cost section's 7-day study, cover intraterritorial traffic and traffic from and to other territories and are not confined to North-South traffic. However, unlike the 7-day study, they do not include all traffic and they are not on a comparable basis in both territories.

Although neither party utilized the statistics in the computation of their costs, the southern lines in their exceptions to the recommended report and at oral argument urge that we should use these ratios in our restated costs. The CS-57A statistics cover only private line freight cars and omit railroad owned cars. Thus, it is a complete count of loaded and empty miles for only part of the refrigerator cars. We find that the 7-day study, which is a sample of all of the cars, is more reliable.

For the reasons discussed above, we find that the empty return ratios for both boxcars and refrigerator cars developed by the special studies of the southern lines are not as sound an estimate of the empty return incurred by the official-southern traffic as are the 7-day study territorial empty return ratios. The latter reflect the compilation of actual data reported by the railroads on a
70 comparable basis in each territory under an order of this Commission.

g. Short lines (class II railroads).—The southern lines allege the impropriety of pricing out the services of the short lines (class II railroads) on the basis of territorial average class I railroad costs. They measured in their traffic study the amount of service rendered by short line roads, and, in doing so, adjusted their Form A territorial average costs, which were based on class I railroads, to reflect the level of cost of the short lines. They then ap-

scientific sampling plan, a preliminary sample containing
497 cars in 8 batches was drawn. From this, a
73 sample of 83 cars was taken. A further (and controverted) subsample of 41 cars was then produced. Of these 41 cars, 16 were terminated and 25 were originated; 26 were handled by yard engines and 15 by train engines.

The southern lines made switching studies pursuant to Rail Form F of all cars at each of the points in southern region where a car in the sample had originated or terminated. The switch engine minutes per car for origin or destination switching varied from 3.39 at Huber, Ga., to 72.54 at Gadsden, Ala., with an average of 26.03 minutes for all 41 cars.

The 41-car subsample was itself further divided into 10 subsamples and a "standard error" of 2.2 minutes was computed. It is virtually conceded by all concerned that error due to sampling cannot exceed three standard errors or 6.6 minutes. Thus, if all 967,554 cars had been studied, the average thereof would have been within the range of 26.03 minutes plus or minus 6.6 minutes, or between 19.43 minutes and 32.63 minutes per car. The terminal switching cost for the southern region in the South's cost study of all 967,554 cars is based on the 26.03 minutes so developed.

The southern lines adjusted the official territory costs by applying Pocahontas region switching minutes to bituminous coal for the entire official territory and using special minute per car factors for iron ore and anthracite-to-washers in accordance with a method used by the cost finding section in its periodic publication "Distribution of The Rail Revenue Contribution by Commodity Groups." The minutes per car were thereby reduced for these commodities with a corresponding increase for all other commodities.

This adjustment, which increases the costs in official territory, was approved by the examiners because: (1) it

is based on a method found useful in certain situations involving coal and ore operations; (2) its purpose was to exclude the effect of those operations; (3) the traffic at issue does not include coal; and (4) the adjustment was proposed by the southern lines. However, upon consideration of the exceptions and oral argument, and especially the fact that the adjustment applied to official territory only whereas the southern region also has a large volume of coal traffic, we conclude and find that a fairer basis of cost comparison between the two groups of parties will be attained by deleting this adjustment.

Evidence was introduced to show that volume commodities comprise over 37 percent of the total traffic in official territory. The northern lines point out that if volume commodities exert a depressing effect upon system average switching minutes in the southern region, the presence of volume traffic in the North produces, at the very least, a corresponding influence on the northern lines. They also urge that 13 study points used by the southern lines to illustrate the difference between system average and volume commodity switching minutes were handpicked for the sole purpose of showing that volume commodities do depress the territorial average. Thus, it is asserted that they are extreme instances, not typical or representative. Moreover, 2 of these 13 points are also among those studied for the 41-car sample. Thus, with the two points being common to both studies, the northern lines contend that it is necessarily erroneous to conclude that the principal volume commodity movements affect territorial switching costs to the extent claimed by the southern lines. They also point out that respondents' principal witness in a prior case studied 582 loaded and 591 empty cars of pulpwood, a major volume commodity, and found 14.62 minutes for origin
74 switching and 17.81 minutes for destination switching, which is not far from the system average figures.

See *Reduced Rates on Pulpwood in Southern Territory*, 297 I.C.C. 735, 745.

These three contentions, (1) that volume commodities exist in both territories, (2) that the 13 points were hand-picked and that 2 were common to the points sampled as representative of official-southern traffic, and (3) that pulpwood, a volume commodity, has average switching minutes, are cited by northern lines to show that there is no necessity to make an adjustment for volume commodities. They also urge that a sample of 41 cars is too small to be relied on as representative of almost a million cars of study traffic. They show further that the sample included no cars from Boston, Philadelphia, Detroit, St. Louis, or Buffalo, among other large northern cities, and not a single car of citrus or fresh vegetable traffic.

Of the 967,554 cars of official-southern traffic, 46 percent were southbound and 54 percent were northbound, whereas the 41-car sample showed 39 percent southbound and 61 percent northbound. Thus, the 41-car sample showed 7 percent too many origin studies and 7 percent too few destination studies as compared to the total figure. The 25 cars originated had 24.08 minutes per car and the 16 cars terminated had 29.07 minutes per car. The northern lines point out that although southern lines' operating witnesses have almost uniformly taken the position that it is more burdensome to originate a car in the South than to terminate it, the switching studies of the 41 cars show the opposite.

The 26 cars given yard switching averaged 30.75 minutes and the 15 cars given train switching averaged 17.84 minutes. The original sample of 497 cars contained 59.8 percent given yard switching and 40.2 percent given train switching, whereas of the 41 cars, 63.4 percent were given yard switching and 36.6 percent were given train switching. The northern lines point out that to restore in the same sample the 60-40 relationship of yard to train

switching shown in the more comprehensive sample it is necessary to drop four cars of yard switching from the small sample. If the 4 cars dropped were those with the largest number of switch engine minutes, the average per car for the remaining 37 cars would be 22.30 minutes. If the four cars with the lowest number of switching minutes were dropped the average would be 27.48 minutes.

The northern lines assert that the 41 cars were not selected by subsampling but were later assigned to subsamples. They contend that a distortion of the use of subsamples thereby results throwing doubt on the value of the standard error computed therefrom. They point out that the Form A factors are 17.8 minutes for boxcars and 19.8 minutes for other cars, which is an average of about 19 minutes, and that the principal witness on sampling for southern respondents did not claim any greater reliability for the switching study factor of 26.03 minutes than a range of about 7 minutes, the difference being 19 minutes. Thus, they state that even if the studies were to be taken at face value, there is no justification for the conclusion that the involved traffic, assuming it could be found to be fairly typified by the 41-car sample, "an assumption which offends common sense," is significantly different from average traffic in the South in respect of switching service rendered, since the claimed excess over average minutes and the conceded range of reliability of the study are almost exactly the same.

75 As to the 41 switching studies, 40 were conducted in 1960 and 1 in 1957 whereas the 41 cars were handled during the latter half of 1958 or first half of 1959. Switching minutes were developed for each category of service at all industries in the terminal area. Inasmuch as all cars were included in the divisor in each instance, the minutes attributed to each reflect the average traffic and not necessarily the characteristics of official-southern traffic. No investigation was made to determine whether operations were con-

plied these adjusted unit costs to the service units of the short lines. The resulting increase of the southern lines' proportion of the costs by 0.09 percentage point amounted to approximately $446,000 in revenue. They employed the following procedure in their cost study in order to reflect the level of short-line costs:

1. The total costs of each short line that participated in the official-southern traffic were determined from the 1956 annual reports of each carrier.

2. The costs which were imputed to the operations of each short line by the Rail Form A costs of the class I roads were then aggregated.

3. The ratio of the actual costs in 1. above to the cost imputed by the Rail Form A costs of class I roads in 2. above was computed for each short line.

4. And finally, the ratios thus developed were applied to the territorial Form A costs of official-southern traffic on each class II road.

The actual expenses and traffic volume for the year 1956 as reported by the class II carriers in their annual reports were used in computing these costs.

The northern lines objected to the assumption that compilation of 1956 cars originated and terminated were on the basis of 1955 operations, and that the traffic consist, operating characteristics, and the resulting expenses would be the same for 1956 as for 1955. These assumptions were made because the typical short line report in the year 1956 did not contain as much detailed data as the report for the year 1955.

The southern lines' traffic study showed the number of cars originated or terminated on short lines for the official territory and southern region to be:

	Traffic originated or terminated on other than class I line-haul roads participating in official-southern divisions	
	Number of cars	*Percent of cars*
In official territory	16,697	1.73
In southern territory	55,826	5.77

The northern lines do not question the count of car data regarding short lines on the abstracts underlying the southern lines' traffic study, but observe that there are many class II railroads in official territory which perform only switching or terminal service, whose charges for such service are paid entirely out of eastern line-haul carriers' revenue, and whose participation is not ordinarily shown on the abstracts. The southern lines introduced the following table to illustrate the imputation of class I railroads' costs to the services of these:

71

Costs of short lines in year 1956 imputation of class I roads' costs compared with application of the actual costs of the short lines

Source	*North*	*Percent*	*South*	*Percent*
Territorial average Form A costs	$537,359	100.0	$1,594,486	100.0
Southern lines' study of short-lines cost	509,943	94.9	1,963,632	123.2
Difference	—27,416	—5.1	+369,143	—23.2
Northern lines' study of short-lines' cost	496,545	92.4	1,878,029	117.8
Difference	—40,814	—7.6	+283,543	+17.8
Difference between northern lines' and southern lines' studies	13,398	2.5	85,603	5.4

The above table shows that the imputation of class I road cost to the service of these short lines overstates the costs in the North by $27,416 (southern lines' method) or $40,814 (northern lines' method) and understates the costs in the South by $369,146 (southern lines' method) or $283,543 (northern lines' method).

The southern lines' method reflects the cost level of each short line while retaining the separation between line-haul services (car-miles and ton-miles) and terminal services (cars and tons), whereas the northern lines start with the identical actual carload freight cost for each short line as used by the southern lines but, instead, spread the entire costs of each short line over revenue ton-miles, producing an average cost per revenue ton-mile with no separation of line-haul and terminal services.

In our opinion, and we so find, the southern lines' cost study for short lines is the more acceptable procedure in that it conforms to the principle of separating line-haul and terminal costs set forth in Rail Form A. The southern lines' traffic study more closely reflects the actual level of costs of each participating short line, whereas the northern lines imputes to each short line the cost level of class I railroads. Basically, the class II and the class I railroads should reflect their own respective costs. This adjustment is shown in our restatement of the costs.

h. Adjustment of switching costs to eliminate the effect of volume switching at origin and destination.—The territorial average switching minutes per car at origin or destination, 1956, are as follows:

72

	Official territory		*Southern region*	
	Boxcars	*Other cars*	*Boxcars*	*Other cars*
Cost section study application of Form A	25.9	28.8	17.3	19.2
After the effect of southern respondents' adjustments for "Switching and Terminal Cost" and "Corrected Car Count"	25.4	28.2	17.8	19.8
After adjustment for volume switching	27.65	30.72	26.03	26.03
Volume switching adjustment	2.25	2.52	8.23	6.23
Total amount added to costs by this volume switching adjustment	$1,310,743		$3,648,130	
Change in percentage of costs	44.71–44.45=0.26		55.29–55.55=+0.26	

Some volume commodities frequently move in multiple-car blocks at origin and/or destination with a consequently lower switching cost than for commodities usually handled in one car at a time. The following table indicates the significance of certain volume commodities:

	Number of cars originated or terminated (year 1959)—		*Number of cars official-southern traffic involved in this proceeding*
	On official territory roads	*On southern region roads*	*(as shown in southern lines' traffic study)*
Pulpwood	162,572	1,102,741	564
Sand and gravel	340,072	653,972	2,229
Wet phosphate rock	——	287,892	None
Crushed stone and rock	407,630	813,734	8,372
Iron ore	789,188	113,452	661
Coal	6,186,315	1,915,566	None
Coke	558,823	79,984	2,811
Fluxing stone and dolomite	395,811	3,558	51
Total cars of volume commodities	8,840,511	4,970,899	14,758
Total cars	23,771,003	10,840,187	967,554
Percent cars of volume commodities to total cars of all commodities	*Percent* 37.19	*Percent* 45.86	*Percent* 1.52

The southern lines urge that their territorial average switching costs are depressed by the large proportion of volume commodities in their region to the point that these costs are not representative of the official-southern traffic which includes only a small amount of these commodities. For this reason, they used in their cost study origin or destination switching costs based on a special study in the South and on an adjustment in the territorial costs in the North.

As stated, there were 967,554 cars of official-southern traffic in the year studied. From this figure, pursuant to a

ducted in 1960 in a manner similar to the time the sample cars moved, and no comparison was made of the volume of traffic at the study points between the two periods. For example, at least one car in the sample was picked from an "A" abstract containing 82 similar movements during the period of 1 month, and there necessarily must have been at least 3 or 4 cars per day, which suggests multiple-car block switching. However, no determination was made of this latter aspect which would have required a reduction of the switching minutes claimed on a single-car basis. The northern lines made an examination of the switching studies and found six alleged errors amounting to an overstatement of 63.87 minutes out of 1,067.20 minutes. Four of the errors were disputed by the southern lines and two amounting to 21.73 minutes were conceded.

The northern lines point out that the switching minute adjustment was made on an entirely different basis in the North than in the South and that although the increase in switching minutes in the South was 46 percent for boxcars and 31 percent for other cars it was only about 9 percent for both kinds of cars in the North. Since the justification for, and intent of, the adjustments were to offset the effect of volume commodities on the average, the amount of the adjustments would suggest four or five times as much volume commodity traffic in the South; but such is not the case.

Northern lines also take the position that assuming that comparable methods had been followed in furtherance of the sought purpose of the switching adjustments the net effect of such an adjustment upon relative costs would have been virtually nil. They assert that this would appear to be so because of the similar, and hence at the very least offsetting, consist of the general traffic of northern and southern lines in terms of the respective proportions of volume commodities handled by each.

This offsetting effect can be approximated for official territory by the following computations, the first of which

assumes that volume switching minutes are the same as in the southern region, and the second that volume switching minutes are greater in the same proportion as the territorial average:

76

	Proportion of cars originated or terminated	*Switching minutes per car*	
Southern region:	*Percent*		
All commodities (regional average)	100.00	× 19.2	= 19.2
Other than volume commodities	54.14	× 26.03	= 14.1
Volume commodities (remainder)	45.86		5.1
Volume commodities (5.1 ÷ 45.86 percent)		11.1	
Official territory:			
All commodities (territorial average)	100.00	× 27.3	= 27.3
Volume commodities	37.19	× 11.1	= 4.1
Other than volume commodities (remainder)	62.81		23.2
Other than volume commodities (23.2 ÷ 62.81 percent)		36.9	
Official territory:			
All commodities	100.00	× 27.3	= 27.3
27.3			
Volume commodities (19.2 × 11.1 = 15.8)	37.19	× 15.8	= 5.9
Other than volume commodities	62.81		21.4
Other than volume commodities (21.4 ÷ 62.81 per cent)		34.1	

Assuming the same difference between boxcars and other cars, the switching minutes per car for other than volume commodities in official territory should be:

	All cars	*Boxcars*	*Other cars*
First computation	36.9	34.3	38.1
Second computation	34.1	31.7	35.2
Used in southern lines' cost study		27.65	30.72

The above computations indicate that the adjustment of switching minutes for official territory made by the southern lines is inadequate by from 4 to 7 minutes in comparison with the adjustment they made for their own region, and are therefore rejected.

Territorial average costs are particularly appropriate to the traffic in this case because it is a large and varied body of traffic moving to and coming from terminals in all parts of both territories. In our opinion, and we so find, the depressing effect, if any, of volume switching commodities on the average would affect both territories and, for purposes of comparison, would be largely offsetting.

The switching studies in the South have weaknesses, both in the sample and in the studies themselves. The adjustment in the North was not made on a basis comparable to that in the South, and here, where the relationship of North and South is of prime importance, this is a major defect.

77 For these reasons, we conclude that the contentions of the northern lines are of merit and that Rail Form A territorial average switching costs more accurately measure the relative switching costs on each side of the border of the official-southern traffic than the switching costs computed by the southern lines.

i. Train tonnage adjustment.—The large volume of coal traffic on the Chesapeake & Ohio and Norfolk & Western railroads has a depressing effect on the costs of other traffic because it moves in heavier than average trains. Based on merchandise traffic movements on the Chesapeake & Ohio in trains of 3,200 tons and on the Norfolk & Western in trains of 5,128 tons, the southern lines adjusted the

through train weights used in their cost computations as follows:

	Official territory	*Eastern district*	*Pocahontas region*
Territorial average before adjustment (tons)	3,840	3,434	5,426
After adjustment	3,611	3,434	4,121

This adjustment had the effect of increasing the costs in the North by $867,319 without any change in the costs of the South and resulted in a decrease of the South's proportion of the costs of 0.14 percentage point. This adjustment was necessitated by the proper inclusion of Pocahontas region costs in those of the northern lines and is therefore warranted.

j. Adjustment of constant costs.—The southern lines made two adjustments to constant costs: one, the exclusion of passenger suburban service deficits, and the other, the inclusion in the southern lines' costs of the fully distributed cost deficits on pulpwood and wet phosphate rock which they consider to be related (in transit) to the outbound movement of paper products and dry phosphate rock.

(1) Suburban passenger service deficits.—The southern lines contend that the basic reason justifying the inclusion of passenger service deficits as a part of the cost of providing freight services is that such passenger deficits are almost entirely attributable to the apportioned costs of common facilities which must be incurred in any event to provide freight service. They would include the passenger deficits from intercity service in the constant costs assigned to freight service, but they would exclude the deficits from suburban passenger service for the reason that the suburban service facilities are separate and not used in common with the freight service.

They excluded from the cost of official-southern traffic north of the gateways the amount of $2,830,575, based on

data presented on behalf of eastern territory suburban railroads before the Senate Committee on Interstate and Foreign Commerce in April of 1960 regarding the suburban service of the Boston & Maine, New Haven, New York Central, Delaware, Lackawanna & Western, Central of New Jersey, Erie, Pennsylvania, and Reading railroads. The amount ($377,070) excluded south of the gateways is based on the suburban service deficit of the Illinois Central Railroad.

The northern lines point out that, putting aside entirely the common expenses that are apportioned between freight and passenger service and considering only expenses that are solely related to passenger service, there is a
78 deficit in the southern region whereas in both the eastern district and in official territory the passenger revenues exceed the solely related expenses. Further, in relation to the cost of handling official-southern freight traffic, they contend that there is no difference between that part of the passenger deficit which results from suburban operations and that part which results from through or local passenger trains. They also assert that if the southern lines should not properly be charged with any part of the deficit in handling commuters from "A" to "B" in the East, it would logically follow that the northern lines should not be charged with any part of the deficit in handling passengers from "X" to "Y" in the South.

The southern lines state that the suburban service deficits of the northern roads could be eliminated by the discontinuance of commutation service since the separate facilities maintained solely for suburban service are not used for freight or intercity passenger service. They give the following example: "—Reference to Exhibit J exemplifies the situation which actually exists. It shows track occupancy by various types of trains in the twenty-four hours of a typical week-day of October 1958 on the line of the Pennsylvania Railroad between Overbrook and Bryn Mawr, Penn-

sylvania, which is a portion of one of that company's principal Philadelphia suburban lines. It will be noted that there are four main tracks in this territory. The outside track—No. 1, Eastbound and No. 4, Westbound—are used primarily by suburban trains: while the middle tracks (Nos. 2 and 3) are used primarily for through passenger and freight trains."

It is true that, in the example given, certain track expenses for tracks Nos. 1 and 4 could be saved by abandoning the suburban service and those tracks; however, other costs related to the roadway would continue, such items as land taxes, grading, ditching, culverts, bridges, and signaling systems. Many large passenger terminals are used by both suburban and intercity passengers. In other words, although many individual items of suburban service can be considered solely related, the facilities and service as a whole cannot be considered solely related to suburban service and treated entirely apart from the freight service and intercity passenger service. Because the suburban service deficit includes common costs which must be incurred to provide freight service or intercity passenger service, such costs are properly chargeable to those services to the extent they cannot be recovered from suburban operations, and the deficit from suburban operations should not be excluded from the constant costs. We so find.

(2) Constant cost of transit commodities.—The southern lines included the following amounts in their costs:

Pulpwood	$7,221,986
Wet phosphate rock	615,883
Total	7,837,869

These amounts represent the constant costs not covered by the revenue and deficits sustained by the southern lines in handling, within the South, these commodities into mills which originate South-to-North outbound traffic of paper and paper products and dry phosphate rock.

Both groups have included in their traffic and cost studies the service from point of origin to destination of traffic identified on the interline abstracts as transit traffic.

79 The pulpwood and wet phosphate rock movements are not so identified, and the tariffs for them do not provide for through rates from the points of origin of the raw materials. However, the southern lines claim that a situation, essentially of a transit nature, exists because they maintain rates on the inbound wet phosphate rock and pulpwood which are conditioned upon the outbound movement by rail of the dry phosphate rock and paper products.

The revenue on pulpwood contributes approximately $5 million per year in excess of out-of-pocket costs, whereas the ton and ton-mile method of distribution assigns about $21 million of constant costs to pulpwood. Therefore, say the southern lines, the constant costs in excess of the contribution of pulpwood ($21 million minus $5 million) must be recovered from the high-rated paper and paper products, including southern-official paper traffic. Approximately 54 percent of the paper and paper products originated by the southern lines moves to destinations in official territory, and this traffic produces revenues 36 percent greater than fully distributed costs.

The southern lines urge that they maintain the low rates on the inbound raw materials in order to hold the outbound high-rated paper and dry phosphate rock traffic to rail movement for the benefit of all carriers participating in the haul, and since the northern lines participate in the movement of this high-rated traffic they cannot deny the southern lines divisions which reflect the services performed as an integral part of the joint enterprise.

The northern lines made three principal points in rebuttal:

First: The northern lines can make an even better cost showing on the basis of out-of-pocket costs:

Eastern percentages of total costs on general traffic at average hauls.

Year 1956 Fully distributed 50.7 percent
Out-of-pocket 51.7 percent
Year 1957 Fully distributed 50.9 percent
Out-of-pocket 52.0 percent

Even if fully distributed costs should be completely disregarded the northern lines' case would not suffer, yet the whole basis of the suggested adjustment depends on the use of fully distributed costs which assign the constant expenses on a ton and ton-mile basis.

Second: The wet phosphate rock and pulpwood move wholly within the South, and the northern lines have no participation in their rates, no control over them, and no voice as to their level. These rates on pulpwood "were made on a low basis to attract plants from the North, and now the southern lines want the Commission to require eastern lines to help make up the deficit under constant costs which they incur." The northern lines also point out that another reason for the low level of rates on pulpwood and wet phosphate rock is competition from other modes of transportation, and that any commodity which earns $5 million above out-of-pocket costs is very worthwhile.

Third: The northern lines urge that this adjustment cannot be made by the southern lines in their territory alone but, to be fair, must also be made in the territory of the northern lines with respect to the movement of such raw materials as iron ore and coal and fluxing stone, for example, which go into the manufacture of iron and steel which move from North to South, and as to which there could be no movement without the prior movement of the raw material.

The southern lines justify their adjustment on the basis of an essentially transit relationship on pulpwood and wet phosphate rock. On this point, the northern lines contend that a transit relationship is one that is readily identifiable from the tariff and either exists or does not exist. If an actual transit relationship exists, they assert that the through rates from the initial origin of the raw material via the transit point to the ultimate destination of the finished product would here be in issue if that movement were between the territories involved. In that situation, the through cost would likewise appropriately be considered in fixing divisions. But, they note, no transit is here provided by the appropriate tariffs.

They further point out that the only joint interterritorial rates here before the Commission are those applying on paper and paper products and on dry phosphate rock. They characterize the so-called transit arrangement as, at best, a recognition of the obvious physical fact that the production of finished and semifinished products necessitates an inbound flow of basic materials.

The southern lines' position that losses on pulpwood and wet phosphate rock are incurred in behalf of a joint enterprise (paper and dry phosphate rock traffic), in which the northern lines share, is largely refuted by the evidence that these rates yield revenues profitable to the extent of $5 million a year above out-of-pocket costs.

The transfer to paper products and dry phosphate rock of that portion of the constant costs allocated to pulpwood and wet phosphate rock which the revenue fails to cover is based on a misunderstanding of the nature, significance, and use of constant costs. Each shipment must pay its out-of-pocket costs since they are incurred by and because of that shipment. However, the constant costs, because they are incurred on behalf of the operation as a whole, should

be shared by all traffic. In our judgment, the ton and ton-mile apportionment of constant costs made in the same way in each territory on this large and varied body of traffic is fair to both territories, and the transfer to interterritorial traffic of a part of the constant costs which had been assigned to intraterritorial traffic is not well founded. Stated in another way, we cannot find that for purposes of interterritorial divisions the pulpwood and wet phosphate rates within the South are so specifically and intrinsically related to the rates under consideration that there is a sound basis here for the adjustment made by the southern lines. *Cf. American Sugar Refining Co. v. Ahnapee & W. Ry. Co.*, 322 I.C.C. 717, 720; *Sugar from the West to Central Territory*, 319 I.C.C. 686, 705.

k. Equalization of gateway interchanges.—The cost study submitted by the southern lines does not include an adjustment for equalization of interchange costs at gateway points although their operating witnesses testified that at many of the important gateways the amount of service and the joint yard cost are equalized. However, they did equalize the amount of service performed by each railroad through the equalization of engine-hours operating on each other's rails. It was estimated that if all the cars of North-South traffic, except those interchanged at interior Illinois and Indiana points, were interchanged at equalized gateways, the cost in official territory would be reduced $797,043, and the costs in southern region would be increased a like amount.

81 There are several weaknesses in this estimate. Initially, equalizing the number of engine-hours performed on the other lines' rails does not equalize interchange service because each carrier performs a major part thereof on its own rails. Secondly, although many important gateways are cited, not all are included, and the proportion of cars passing through unequalized gateways is

not shown. Thirdly, the cost of engine time is not equal in the two territories. There is another, and major, criticism of this proposed adjustment. Rail Form A territorial costs produce a cost which is an average for all the service units in the territory, such as interchange handlings. When greater or lesser costs than Form A costs are assigned to particular items, then lesser or greater costs of corresponding amounts must be assigned to the remaining units. Unless this is done, a situation exists where either more dollars are assigned to all the service units than were actually expended, or only part of the dollars incurred are assigned and some are left over and not assigned to anything. It would create a distortion to assign a cost different than average to 880,711 interchange handlings without a corresponding adjustment in the cost of those remaining. As the northern lines explain:

Another substantial objection to the suggested adjustment is that it would be incomplete. If southern lines are assumed to have incurred interchange costs at the gateways at the rate of $4.045 per interchange as compared with their 1956 Form A average of $3.14, that would necessarily mean that their costs for other interchanges would be reduced by $797,043. Conversely, the corresponding adjustment of northern gateway interchange costs would require an *increase* of the same sum in the costs of other interchanges in official territory. But in proposing the making of such adjustment in respect to this item the southern lines did not attempt to show to what extent their costs of the other interchanges on the traffic involved would be *decreased* or to what extent the northern costs of other interchanges would be *increased*. Further, they presented no such data as would permit the completion of such an adjustment.

For the reasons indicated above, we do not accept the proposed adjustment.

Definitions

Northern lines are defined as those assigned to the eastern district and Pocahontas region, except the Norfolk, Franklin and Danville Railway Company, and include the Toledo, Peoria & Western Railroad Company.

Southern lines are defined as those assigned to the southern region, and, in addition, the lines of the St. Louis-San Francisco Railway Company in southern territory and the line of the Norfolk, Franklin and Danville Railway Company west of Suffolk, Va.

ORDER

At a General Session of the INTERSTATE COMMERCE COMMISSION, held at its office in Washington, D. C., on the 3d day of February A. D. 1965.

No. 29885

OFFICIAL-SOUTHERN DIVISIONS
IN THE MATTER OF DIVISIONS OF JOINT RATES BETWEEN OFFICIAL AND SOUTHERN TERRITORIES

No. 29799

AKRON, CANTON & YOUNGSTOWN RAILROAD COMPANY, ET AL.

v.

ABERDEEN & ROCKFISH RAILROAD COMPANY, ET AL.

It appearing, That a full investigation of the matters and things involved in these proceedings has been made, and that the Commission, on the date hereof, has made and filed a report on further hearing containing its findings of fact and conclusions thereon, which said report on further hearing is hereby referred to and made a part hereof:

It is ordered, That the Georgia & Florida Railway Company and the Norfolk, Franklin and Danville Railway Company, be, and they are hereby, made respondents in Docket No. 29885.

It is further ordered, That the complainants, cross-complainants, defendants, and respondents, according as they participate in the transportation, be, and they are hereby, notified and required to establish on or before April 20, 1965, and thereafter to apply, divisions of joint all-rail interstate rates for the transportation of property between points in official territory, on the one hand, and, on the

other, points in southern territory, determined as provided in said report on further hearing.

It is further ordered, That the said complainants, cross-complainants, defendants, and respondents be, and they are hereby, notified and required to cease and desist, on or before April 20, 1965, and thereafter to abstain from asking, demanding, collecting, or receiving divisions of said joint rates upon bases other than those prescribed in said report on further hearing.

It is further ordered, That the order entered herein on January 12, 1953, as amended by order dated May 26, 1953, and the subsequent orders entered herein to the extent such said subsequent orders vacated or modified said order of January 12, 1953, as amended, be, and they are hereby, vacated and set aside as of the date the divisions prescribed in said report on further hearing become effective.

And it is further ordered, That this order shall continue in force until further order of the Commission.

By the Commission.

BERTHA F. ARMES,
Acting Secretary.

449

INTERSTATE COMMERCE COMMISSION

No. 29885 [1]

OFFICIAL-SOUTHERN DIVISIONS

IN THE MATTER OF DIVISIONS OF JOINT RATES BETWEEN OFFICIAL AND SOUTHERN TERRITORIES

Decided May 18, 1965

Upon petition of Norfolk Southern Railway Company, proceedings as they relate to specified traffic of that carrier reopened for reconsideration and findings modified accordingly. In all other respects, upon further consideration and amplification, findings in prior report, 325 I.C.C. 1, prescribing new just, reasonable, and equitable divisions of joint interterritorial rates between official and southern territories affirmed.

Appearances as shown in prior report.

SUPPLEMENTAL REPORT AND ORDER OF THE COMMISSION ON FURTHER CONSIDERATION

FREAS, *Commissioner:*

In the prior report herein [2] at 325 I.C.C. 1, we found, upon further hearing, that the existing divisions of joint interterritorial rates between official and southern territories were unjust, unreasonable, and inequitable. Just, reasonable, and equitable divisions were prescribed. Subsequently, on April 12, 1965, in civil action No. 15454,

1. This report also embraces No. 29799, Akron, Canton & Youngstown Railroad Company, et al. v. Aberdeen & Rockfish Railroad Company, et al.

2. Referred to and made a part hereof.

Aberdeen and Rockfish Railroad Company, et al. v. United States, the United States District Court for the Eastern District of Louisiana, New Orleans Division, the Honorable E. Gordon West, entered an order temporarily restraining our order prescribing the aforesaid divisions from taking effect on April 20, 1965. Such action had the effect of temporarily mooting the request in the petition of the Norfolk Southern Railway Company, filed April 1, 1965, for
450 postponement of the said effective date pending determination of its request for reconsideration of the report and order insofar as it affects "traffic moving between points on Norfolk Southern and points in official territory via the gateway of Norfolk, Virginia."

Since the enactment of section 15(6) as part of the Transportation Act of 1920, it has been our policy in interterritorial divisions cases to employ a group method or system of determining just, reasonable, and equitable divisions. Because of the number of carriers and the numerous rates and divisions involved, the actual necessities of procedure and administration have required the adoption of such a method in order to accomplish the task imposed upon the Commission by Congress. *New England Divisions Case,* 261 U. S. 184, 196-9 (1923). To avoid serious injustice to any carrier, our procedures permit any railroad to be excepted from a group order, in whole or in part, on a proper showing of differing circumstances. Where it is demonstrated by competent and reliable evidence that a carrier's financial or revenue needs situation requires the preservation of its share of the joint rates on the same level as presently existing or at a level different than that to be maintained for the group as a whole, we may provide special individual treatment in order to maintain such carrier as part of the Nation's transportation system without regard to its costs of rendering the service.

On the basis of such a special showing by the Norfolk Southern, we conclude in our prior report that to prescribe

divisions for Norfolk Southern's originated and terminated traffic moving through the Norfolk gateway on the same basis as prescribed for other southern carriers in finding 2 would place that carrier in a deficit position so serious as to impair the rendering of adequate and continuous service to the public. Accordingly, our findings in the prior report, 325 I.C.C. 1 at pages 44, 51-52, sought to retain for the Norfolk Southern a percentage of revenue substantially the same as it presently receives on such traffic. A special scale was prescribed in column 5 of appendix C which increased the column 2 factors applicable to other southern carriers by 108 percent in order to give the Norfolk Southern approximately the same total revenue it now enjoys on shipments originating or terminating on its line and moving via the Norfolk gateway. We constructed column 5 on the basis of the only available evidence of record concerning an average haul formula which the Norfolk Southern urged would produce reasonably reliable results and achieve the end sought.

451 In its petition for reconsideration, however, the Norfolk Southern now asserts that the prorating factors of column 5 fail to preserve its revenue from the traffic in question by a substantial margin estimated to be $106,000 annually ($89,160 from general traffic and $17,699 from perishable traffic). This total amount is computed by expanding to an annual basis the application of the prescribed column 5 factors to waybills of all individual shipments of general traffic moving during the months of March 1958 and November 1959, and for perishable traffic moving during the 1959 season, the latter being admittedly incomplete and preliminary. Although these waybills covering individual shipments constitute the underlying data for the Norfolk Southern's traffic study, they are not of record in these proceedings. Petitioner makes no request to reopen the proceedings for further hearing for the purpose of introducing this evidence in the form of a more detailed study which would provide a more accurate means of con-

structing a special scale of prorating factors to preserve its *status quo.* It merely requests reconsideration and revision of the column 5 scale by the addition of 15 integers to each prorating factor in each mileage block of that scale.

Under the circumstances, it would ordinarily be improper for the Commission to base any supplemental order increasing the prorating factors in column 5 of appendix C on extra record facts. Moreover, the facts now relied upon by the Norfolk Southern are not based upon newly discovered evidence and, as such, fail to meet the appropriate test as specified in *Yourga v. United States,* 191 F. Supp. 373, 376-7 (W. D. Pa. 1961). The Norfolk Southern's petition merely represents a change in theory from that originally urged as a reliable method of constructing a scale of divisional factors which would preserve its *status quo.* Generally, all carriers subject to regulation under the provisions of the Interstate Commerce Act should be admonished against piecemeal trials. *Cf. Mechling Barge Line, Inc. v. United States,* 376 U. S. 375, 383-386 (1964). Ordinarily, any attempt to have the Commission revise its findings in response to a theory different from that originally urged by a party and adopted by the Commission tends to frustrate the administrative process and should not be countenanced in the absence of unusual circumstances. There is, however, such a circumstance present here which requires consideration.

In reply to the Norfolk Southern's petition, the northern lines assert:

> 452 Notwithstanding the insufficiency of the facts alleged in the petition to support the reconsideration or order sought, the Eastern railroads respondent herein, in order to simplify the issues in the said Court action, and to secure the prompt establishment of a uniform, simple, and readily applicable basis of divisions on the Norfolk gateway traffic originated or terminated by the Norfolk Southern, without prej-

udice to their position otherwise, and fully reserving their rights to apply for modification thereof as conditions may warrant, hereby consent to modification of the Commission's report and order of February 3, 1965, so as to increase, by 15 integers, each of the factors contained in Column 5 of Appendix C of the Commission's said report (325 I.C.C. 82).

We consider this consent of the northern lines to be, in effect, an agreement with the Norfolk Southern concerning divisions on the Norfolk gateway traffic under discussion. The question is whether we should modify our findings and the column 5 scale to include an additional 15 integers in each factor thereof in view of the incomplete state of the record. Divisions cases are in the nature of contractual disputes between carriers. Here, as elsewhere in the law, settlements should be encouraged. *Cf.* Administrative Procedure Act, section 5(b). Since the parties themselves are in agreement,[3] we see no reason to object to this course of action. From all that appears, the basis agreed to reflects a reasonable accord. We therefore approve the agrement as just, reasonable, and otherwise equitable. We further find that the northern lines' consent to an increase of each of the prorating factors in column 5 of appendix C by 15 integers warrants modification of that scale at this time to reflect the agreement of the parties concerned. The ends of justice would be better served by incorporating such agreement in our findings which, all parties agree, place the Norfolk Southern's divisions on a systematic basis for the first time by prescribing a modernized scale of divisional factors. As usual, the parties will be permitted to apply for modification thereof as conditions may warrant.

It should be noted, however, that the restraining order issued on April 12, 1965, in the pending court action en-

3. A circumstance rather unusual, unfortunately, in interterritorial divisional proceedings.

joins our prior order from taking effect on April 20, 1965, with respect to all divisional scales prescribed, pending hearing and determination of an application for interlocutory injunction by the three-judge statutory court. Varous protective conditions concerning repayment on the prescribed bases back to April 20, 1965, are offered in the event of either a grant or a denial of the interlocu-
453 tory injunction. Under the circumstances, our order herein prescribing an increase in the prorating factors of the column 5 scale for the Norfolk Southern will be effective from the date therein specified. However, actual settlement on the basis of the new divisions shall be postponed pending decision of the court on the application for interlocutory injunction and, thereafter, shall be governed by the court's order granting or denying said injunction and any protective payback conditions which may be imposed therein.

Insofar as the complaint in the pending court action is concerned, it has been brought to our attention that it alleges, *inter alia*, the following:

> The Commission's report contains no findings which relate to evidence of record the specific cost factors used in the construction of the divisional scales which it prescribed. Plaintiffs are unable to trace these cost factors to evidence in this record. From the record, it can be calculated that the application of the divisional scales prescribed by the Commission would reduce the revenues of the Southern railroads by $8,745,000.

Had this allegation been made by the filing with us of an appropriate petition as is plaintiffs' right, it would have been given full and proper consideration. In any event, we deem it to be in the public interest, and indeed our duty, to make our position and findings as clear and specific as possible insofar as the aforesaid matters are concerned.

Turning first to the allegation that the prior report contains no findings which relate to evidence of record the specific cost factors used in the construction of the divisional scales prescribed, we will amplify our prior discussion at 325 I.C.C. at pages 24-26 and 34-38. Specifically, the appendix hereto demonstrates, in detail, with appropriate references to the record, the manner of the construction of the scales. The fully distributed cost factors used are clearly shown as are the mathematics of their utilization. Reading the aforesaid discussion in light of this appendix, it is clear that the cost scales are based solely on evidence of record and are directly related to the specific cost factors involved. In so finding, we affirm our prior conclusions.

With regard to the asserted reduction in the revenue of the southern railroads by $8,745,000, the prior report indicated a difference of $7,948,004 as a reduction for the southern lines and as a gain for the northern lines. 325 I.C.C. at page 50. Our prior figure represented an overall estimate relating and applying the percentage of costs to the total revenue involved. To the extent that the
454 higher figure now urged by southern lines may reflect a more detailed picture when related to past individual movements, it does not warrant a change in our findings. The scales prescribed still reflect the restated costs of record and, for the reasons indicated in the prior report, can properly serve here as a guide for the determination of just, reasonable, and equitable divisions. *Cf. Louisville & N. R. Co. v. Southern Ry. Co.*, 319 I.C.C. 639, 657-658, sustained in *Carolina & N. W. Ry. Co. v. United States*, 230 F. Supp. 581 (W.D. N.C. 1964), affirmed *per curiam* by the Supreme Court on April 26, 1965, 33 L.W. 3349.

In rejecting the old scale of divisional factors, we found numerous deficiencies therein.[4] Those deficiencies

4. See, e.g., 325 I.C.C. at page 37.

were viewed in light of our conclusion that an adjustment is required to compensate the respective groups of carriers according to their expenditures in the joint effort of handling the interterritorial traffic in question. No one deficiency was found controlling. In so holding, we also rejected arguments that equal factor divisions should be maintained. 325 I.C.C. at page 27. To the extent the present divisions did not meet the foregoing test, they were found unjust, unreasonable, and inequitable. 325 I.C.C. at page 50. In our judgment, all other factors of section 15(6) being substantially equal, the divisional scales prescribed on the basis of restated cost proportions will produce divisions which we consider fair and equitable as between the parties. No other basis has been shown to be appropriate here. In any event, except for the Norfolk Southern, no carrier at any time has satisfactorily demonstrated a special situation which required special and separate treatment. Accordingly, considering the scales prescribed in light of the traffic and cost studies referred to in our prior report, and the record as a whole, we find nothing revenue-wise or in any other respect which would warrant a change in our findings as to railroads in either territory, individually or as groups. We affirm our prior findings and conclusions as warranted by the record.

COMMISSIONER MURPHY, dissenting in part:

I am in accord with the majority's findings that the basis agreed to between the official lines and the Norfolk Southern is reasonable and may be approved. I do not agree, however, that the record contains evidence of specific cost factors which would support the construction of the divisional scales prescribed in the prior report. In this regard, I adhere to my separate dissenting-in-part expression in that report.

COMMISSIONER TUGGLE did not participate.

It is ordered, That insofar as the prior report, 325 I.C.C. 1, involved traffic moving between points on the Norfolk Southern and points in official territory via the gateway of Norfolk, Va., the instant proceedings be, and they are hereby, reopened for reconsideration on the present record, and the effective date of the order herein, dated February 3, 1965, and served March 2, 1965, having been temporarily restrained by the United States District Court for the Eastern District of Louisiana, New Orleans Division, on April 12, 1965, in civil action No. 15454, Aberdeen and Rockfish R.R. Co., et al. *v.* United States, et al., be, and it is hereby, vacated and set aside insofar as said order requires prescription of scales of prorating factors applicable to said traffic.

It is further ordered, That the complainants, cross-complainants, defendants, and respondents, according as they participate in the transportation, be, and they are hereby, notified and required to establish on or before July 30, 1965, and thereafter to apply, divisions of joint all-rail interstate rates for the transportation of property on traffic originating or terminating on the lines of the Norfolk Southern Railway Company, and moving to or from points in official territory, via Norfolk, Va., determined as provided in the supplemental report on further consideration issued contemporaneously herewith and made a part hereof. Actual settlement on the basis of the new divisions shall be, and it is hereby, postponed pending decision of the three-judge statutory court on the pending application for interlocutory injunction, and thereafter shall be governed by and subject to the court's order granting or denying said in-

junction and any protective payback conditions which may be imposed therein.

It is further ordered, That our prior report and order herein, dated February 3, 1965, and served March 2, 1965, except as modified and amplified in said supplemental report on further consideration be, and it is hereby, affirmed in all respects and together with this order, subject to the above-mentioned restraining order of the court, shall continue in force until further order of the Commission.

By the Commission.

BERTHA F. ARMES,
Acting Secretary.

APPENDIX D

A. Section 1(4) of the Interstate Commerce Act, 49 U.S.C. § 1(4), provides in pertinent part:

> It shall be the duty of every such common carrier establishing through routes . . . in case of joint rates, fares, or charges, to establish just, reasonable, and equitable divisions thereof, which shall not unduly prefer or prejudice any of such participating carriers.

Section 15(6) of the Interstate Commerce Act, 49 U.S.C. § 15(6), provides:

> (6) Whenever, after full hearing upon complaint or upon its own initiative, the Commission is of opinion that the divisions of joint rates, fares, or charges, applicable to the transportation of passengers or property, are or will be unjust, unreasonable, inequitable, or unduly preferential or prejudicial as between the carriers parties thereto (whether agreed upon by such carriers, or any of them, or otherwise established), the Commission shall by order prescribe the just, reasonable, and equitable divisions thereof to be received by the several carriers, and in cases where the joint rate, fare, or charge was established pursuant to a finding or order of the Commission and the divisions thereof are found by it to have been unjust, unreasonable, or inequitable, or unduly preferential or prejudicial, the Commission may also by order determine what (for the period subsequent to the filing of the complaint or petition or the making of the order of investigation) would have been the just, reasonable, and equitable divisions thereof to be received by the several carriers, and require adjustment to be made in accordance therewith. In so prescribing and determining the divisions of joint rates, fares and charges, the Commission shall give due consideration, among other things, to the efficiency with which the carriers

concerned are operated, the amount of revenue required to pay their respective operating expenses, taxes, and a fair return on their railway property held for and used in the service of transportation, and the importance to the public of the transportation services of such carriers; and also whether any particular participating carrier is an originating, intermediate, or delivering line, and any other fact or circumstance which would ordinarily, without regard to the mileage haul, entitle one carrier to a greater or less proportion than another carrier of the joint rate, fare or charge.

B. Section 8(b) of the Administrative Procedure Act, formerly 5 U. S. C. § 1007(b) and now revised and codified as 5 U. S. C. § 557(c), (80 Stat. 387), provides:

(c) Before a recommended, initial, or tentative decision, or a decision on agency review of the decision of subordinate employees, the parties are entitled to a reasonable opportunity to submit for the consideration of the employees participating in the decisions—

(1) proposed findings and conclusions; or

(2) exceptions to the decisions or recommended decisions of subordinate employees or to tentative agency decisions; and

(3) supporting reasons for the exceptions or proposed findings or conclusions.

The record shall show the ruling on each finding, conclusion, or exception presented. All decisions, including initial, recommended, and tentative decisions, are a part of the record and shall include a statement of—

(A) findings and conclusions, and the reasons or basis therefor, on all the material issues of fact, law, or discretion presented on the record; and

(B) the appropriate rule, order, sanction, relief, or denial thereof.

Section 10(e) of the Administrative Procedure Act, formerly 5 U. S. C. § 1009(e), and now revised and codified as 5 U. S. C. § 706 (80 Stat. 393), provides:

> To the extent necessary to decision and when presented, the reviewing court shall decide all relevant questions of law, interpret constitutional and statutory provisions, and determine the meaning or applicability of the terms of an agency action. The reviewing court shall—
>
> (1) compel agency action unlawfully withheld or unreasonably delayed; and
>
> (2) hold unlawful and set aside agency action, findings, and conclusions found to be—
>
> (A) arbitrary, capricious, an abuse of discretion, or otherwise not in accordance with law;
>
> (B) contrary to constitutional right, power, privilege, or immunity;
>
> (C) in excess of statutory jurisdiction, authority, or limitations, or short of statutry right;
>
> (D) without observance of procedure required by law;
>
> (E) unsupported by substantial evidence in a case subject to sections 556 and 557 of this title or otherwise reviewed on the record of an agency hearing provided by statute; or
>
> (F) unwarranted by the facts to the extent that the facts are subject to trial de novo by the reviewing court.
>
> In making the foregoing determinations, the court shall review the whole record or those parts of it cited by a party, and due account shall be taken of the rule of prejudicial error.

JURISDICTION

The judgment of the three-judge district court was entered on August 22, 1967.[3] The notice of appeal was filed on October 23, 1967.[4] The jurisdiction of this Court is invoked under 28 U.S.C. 1253 and 2101(b). *Chicago and N.W. Ry. Co.* v. *Atchison, T. & S.F. Ry. Co.*, 387 U.S. 326, and *Baltimore & Ohio R. Co.* v. *United States*, 298 U.S. 349.

QUESTION PRESENTED

A petition filed with the Interstate Commerce Commission under Section 15(6) of the Interstate Commerce Act (49 U.S.C. 15(6)) sought modification of Commission-prescribed divisions for apportioning the revenues received from the interterritorial transportation of North-South freight under joint rates. After considering data and upon making findings relating to each of the Section 15(6) criteria, the Commission found the existing divisions inequitable and prescribed new divisions in proportion to the relative costs of the two groups of carriers in handling the interterritorial traffic at issue. The cost figures used by the Commission were basically derived from Rail

---

[3] Although the district court's judgment is dated August 8, 1967, only Circuit Judge Wisdom signed it on that date—the other judges (West and Hunter) separately signing it on later and different dates at different places prior to its entry on August 22, 1967; this is reflected by the clerk's filing stamp (see B. & O. J. S. App. 33a).

[4] Since the sixtieth day after entry of judgment was October 21, 1967, a Saturday, filing of the notice of appeal in the district court on the following Monday, October 23, 1967, was timely. See Rule 6(a), F.R.Civ.P.; *Union National Bank* v. *Lamb*, 337 U.S. 38, 40–41. Also Saturday is a legal holiday in New Orleans (La. Rev. Stat. Ch. 2, § 55.

Form A,[5] which produces average unit costs for territorial freight service, although the Commission made certain adjustments to Rail Form A costs to reflect more accurately the costs of the particular traffic involved. The district court, in rejecting adjusted Rail Form A costs as a proper yardstick for this purpose, held that the Commission was required to base its computations on more refined cost data. The question presented is whether, in ascertaining the relative costs of service in an interterritorial divisions case, the Commission may rely on Rail Form A data as to territorial average costs, adjusted to reflect more accurately the costs of the particular traffic involved, or is required to develop more refined cost data.

[5] Rail Form A, first developed in 1939, is the basic formula almost universally recognized and used by the transportation industry and the Commission as an acceptable and reliable method of ascertaining and comparing relative costs of rail service in all types of rate proceedings involving a large and varied body of traffic. See *New York* v. *United States*, 331 U.S. 284, 315–318. Generally, the expenses of carriers assigned to geographical areas are first broken down into groups and are translated into territorial average unit costs of performing each of the kinds of services involved in moving specific shipments or in furnishing a given amount of service in each territory. The territorial figures achieved reflect the average unit costs for carload freight service under a wide range of operating conditions within each territory. Adjustments are contemplated to fit any peculiar characteristics of particular shipments for individual as well as groups of railroads. When the average unit costs are multiplied by the number of work units of each of the services found to be employed in moving the specific shipment or furnishing the given amount of service in the territory, the cost figures thus produced will be the substantial equivalent of specific costs of the particular traffic in question. Costs are placed into two classes—(1) out-of-pocket or variable expenses which vary directly with the kind

(footnote continued)

STATUTES INVOLVED

Section 1(4) of the Interstate Commerce Act (49 U.S.C. 1(4)), and Sections 8(b) and 10(e) of the Administrative Procedure Act (5 U.S.C. (Supp. II, 1965–1966) 557(c) and 706) are set forth in Appendix D to the Jurisdictional Statement filed by the Baltimore & Ohio R. Co., *et al.* in the companion appeal.

Primarily involved is Section 15(6) of the Interstate Commerce Act (49 U.S.C. 15(6)), which provides:

> Whenever * * * the Commission is of opinion that the divisions of joint rates, fares, or charges, applicable to the transportation of passengers or property, are or will be unjust, unreasonable, inequitable, or unduly preferential * * * the Commission shall by order prescribe the just, reasonable and equitable divisions thereof to be received by the several carriers * * *. In so prescribing and determining the divisions of joint rates, fares and charges, the Commission shall give due consideration, among other things, to the efficiency with which the carriers concerned are operated, the amount of revenue required to pay their respective operating expenses, taxes, and a fair return on their railway property held for and used in the service of transportation, and the importance to the public of the transportation services of

---

of traffic handled; and (2) constant or fixed costs not capable of assignment to particular kinds of traffic which normally must be borne by various types of traffic in proportion to the ability of each to pay. The sum of the out-of-pocket costs plus a *pro rata* distribution of the constant or fixed costs is referred to as "fully distributed costs".

such carriers; and also whether any particular participating carrier is an originating, intermediate, or delivering line, and any other fact or circumstance which would ordinarily, without regard to the mileage haul, entitle one carrier to a greater or less proportion than another carrier of the joint rate, fare, or charge.

STATEMENT

1. INTRODUCTION

This appeal concerns the imposition by a district court of certain novel standards for the Interstate Commerce Commission to follow in exercising its Section 15(6) authority to prescribe just, reasonable and equitable divisions of joint rates. The case arises out of the Commission's 1965 order prescribing new divisions of the revenues derived from interterritorial freight traffic moving under joint rates between points in the Northern and Southern[6] sections of the eastern part of the country. The rates subjected to the Commission's order cover all commodities, with a few exceptions, and produce approximately $496 million in revenues annually. The shift in revenues which would result from the new divisions is approximately $8 million a year, which amounts to an overall reduction of approximately three percent of the revenues of the Southern lines from the traffic involved (325 I.C.C. at 50, 453–454).

[6] As here used, the North embraces Official Territory, which lies generally east of Lake Michigan, Chicago, Peoria, and Cairo, Illinois, and St. Louis, Missouri, and north of the Ohio River and Norfolk, Virginia; the South embraces Southern Territory, which lies south of Official Territory and east of the Mississippi River.

2 PROCEEDINGS BEFORE THE COMMISSION

In 1953, in *Official-Southern Divisions*, 287 I.C.C. 497, the Commission prescribed divisions, on the basis of equal-mileage factors, for apportioning the North-South freight revenues. That determination was based on a finding that, in computing costs of service under Rail Form A standards, "the safest assumption for the future * * * [is] that neither contesting group will have an appreciably lower basis of operating costs than the other * * *" (287 I.C.C. at 526).

In 1956, the Northern roads petitioned for a general reopening and rehearing, and for modification of the divisions previously prescribed, on the ground, among others, that the Northern lines' costs had proved to be substantially higher than those of the Southern roads. Upon completion of the reopened proceeding in 1965, the Commission found that the existing divisions were in violation of Section 15(6) in that they allocated to the Southern lines a greater share of the revenues from the joint rates than that to which they were entitled (325 I.C.C. at 50). Considering each of the Section 15(6) criteria, the Commission found all of the relevant factors, except for costs, to be substantially equal,[7] but concluded that

[7] It was found that both groups are being operated efficiently and neither group should be considered as more or less efficient than the other (325 I.C.C. at 18); that there are no differences in importance to the public attributable to the services of the two groups (325 I.C.C. at 28), and that neither group has greater revenue needs than the other (325 I.C.C. at 49).

computations under restated Rail Form A cost standards established a decisive difference in the relative costs of rendering the service involved.

More specifically, the Commission pointed out (325 I.C.C. at 18–19, 24) that both groups of carriers had tried and submitted their cases on the basis of fully distriuted costs computed under Rail Form A, although the Southern lines had presented twelve adjustments to Rail Form A costs which, they asserted, would improve the accuracy of the figures so derived. The Northern lines introduced other detailed data, in considerable bulk, establishing the validity of the Rail Form A costs as a proper standard of measurement and the impropriety of the Southern lines' proposed adjustments. Disputes over the applicability of Rail Form A costs and the various adjustments occupied a large part of the administrative record. However, the only essential differences between the parties related to the degree to which Rail Form A territorial average costs should be modified to fit the specific traffic, and to the meaning and significance of the Southern lines' suggested adjustments. In a comprehensive analysis rejecting seven of the Southern lines' adjustments as unsound or based on unsupported and inapplicable facts or assumptions, the Commission concluded that the restated Rail Form A costs which it used, based on the Southern lines' cost and traffic studies except as to the rejected adjustments, "more reliably", "accurately", and "adequately reflect the

costs which are attributable to the traffic at issue" (325 I.C.C. at 25–26, 48).[8]

Noting that in the sample year selected by the Southern lines "the northern lines received 44.64 percent of the revenue while incurring 46.35318 percent of the fully distributed costs," the Commission determined that "[i]t is clear that an adjustment in the divisions is required to compensate the respective groups according to their expenditures in the joint effort of handling this interterritorial traffic" (325 I.C.C. at 50).[9] "To the extent that the present divisions do not meet this test," the Commission stated, "they are unjust, unreasonable, and inequitable" (*ibid.*). Accordingly, the Commission prescribed new divisions in the form of divisional mileage scales (*id.* at 82) which "are based on the fully distributed costs and divide the

[8] Consideration of such cost data lead the Commission to conclude that its "restatement of the costs, which are reasonably accurate and reliable for purposes of determining the relative contribution by the groups on a cost-of-service basis, shows that the cost level in 1956, the year both groups used in the final cost analysis, is somewhat higher in the North than in the South for like services. A consideration of all factors indicates that this situation will most likely continue in the immediate future" (325 I.C.C. at 48).

[9] In rejecting the contentions of the Southern Governors' Conference that uniform divisions based on equal-mileage factors should be continued, the Commission pointed out that "an adherence to uniformity as such, without a careful evaluation of the statutory criteria and the evidence of record, can hardly result in the fixing of just, reasonable, and equitable shares" (325 I.C.C. at 27). Application of the revised divisions would result, the Commission stated, in a 3.59-percent increase in the revenues of the Northern roads, and a corresponding 2.908-percent decrease in the revenues of the Southern lines (325 I.C.C. at 50).

revenue in the same proportion to those costs" (*id.* at 50), finding that "the results achieved through the application of the * * * scales here prescribed will for the future be just, reasonable, and equitable * * *" (*id.* at 51).[10]

3. PROCEEDINGS IN THE DISTRICT COURT

In March 1965, the Southern roads brought suit before a three-judge district court to enjoin enforcement of and to set aside the Commission's order establishing the new divisions. The court held that the Commission's restated Rail Form A costs, based on territorial costs of all freight service, were not a proper yardstick for measuring the costs of the particular traffic in a divisions case. In the court's view, the Commission was required "to take affirmative action to require the development of an adequate record as to the actual costs of handling the specific traffic at issue" (B. & O. J.S. App. 30a). The district court, accordingly, set aside the Commission's order as not supported by substantial evidence and reasoned findings within the meaning of Sections 8(b) and 10(e) of the Administrative Procedure Act, and remanded the case for further proceedings consistent with its opinion.[11]

---

[10] See also 325 I.C.C. at 453–454, where, in its supplemental report, the Commission reaffirmed its conclusions, that revised divisions were required and that the cost data used provided an adequate evidentiary basis for the newly-prescribed divisional scales.

[11] However, the court granted a stay of judgment pending appeal (B. & O. J.S. App. 35a). Accordingly, the new divisions are in effect subject to conditions requiring a financial settle-

(footnote continued)

THE QUESTION PRESENTED IS SUBSTANTIAL

This appeal raises important issues concerning the administration of Section 15(6) of the Interstate Commerce Act, under which the Commission is charged with assuring that revenues from joint rates are fairly and equitably divided among the participating carriers. Despite language to the contrary in its opinion, the district court in effect held that the Commission may not compute the relative costs of handling particular traffic in an interterritorial divisions case on the basis of Rail Form A territorial average costs. In so holding the district court rejected a procedure previously approved by this Court and one which the carriers here had followed before the Commission—that of presenting data and providing analysis on the basis of Rail Form A computations, adjusted in certain respects to reflect more accurately the relative costs of handling the specific traffic at issue. In disapproving this established procedure, and in imposing on the Commission the burden of conducting special cost studies, the district court has significantly impaired the Commission's ability to resolve this or any subsequent divisions case of similar magnitude and to administer Section 15(6) effectively. Plenary consideration by this Court is thus warranted.

1. The distict court erred in holding that, in a divisions case involving virtually all traffic between two widespread territories, the Commission is required to develop more refined data reflecting the exact costs of

---

ment among the carriers back to the date the Commission's order was permitted by the court to go into effect (April 20, 1965), if the judgment is affirmed on appeal.

the particular service and cannot accept, as a standard of measurement, computations produced through use of Rail Form A territorial average costs as appropriately adjusted.[12]

Years ago this Court sustained the integrity of the Rail Form A formula (*New York* v. *United States,* 331 U.S. 284), and has consistently approved the application of restated Rail Form A costs as a proper standard for measuring costs of service in divisions cases involving a large and varied body of interterritorial traffic handled by over 300 railroads (*Chicago & N.W. Ry. Co.* v. *Atchison, T. & S.F. Ry. Co.,* 387 U.S. 326), as well as a single commodity handled by two railroads intraterritorially (*Carolina & N.W. Ry. Co.* v. *United States,* 234 F. Supp. 114, affirmed, 380 U.S. 526). In addition, the Rail Form A formula is only one of a number of similar approaches developed by the Commission for determination of the costs of service of the various kinds of common carriers subject to its regulation. Rejection by the district court of Rail Form A cost figures necessarily raises doubt as to the validity of other similar formulas as well.

Whether a cost study is adequate or should have been refined or supplemented by additional data has long been recognized as a question of fact which is

[12] While the Commission's order was in terms ultimately set aside for lack of substantial evidence and adequate findings, the district court reached that conclusion only after rejecting the Commission's specific findings as to the adequacy of restated Rail Form A costs because these findings did not comply with the court's view of the proper standard of cost measurement to be applied (see, *e.g.*, B. & O. J.S. App. 11a, 25a, 29a).

within the special competence and discretion of the Commission. *E.g., Illinois Commerce Comm'n* v. *United States,* 292 U.S. 474, 481, 484. Here the parties requested that the fully distributed costs of service be utilized, and the Commission merely adhered to the recognized practice of restating Rail Form A territorial average costs to produce a reasonable reflection of the expenses incurred in handling the particular North-South traffic in question.[18]

Indeed, the use of Rail Form A cost figures, in ascertaining relative fully distributed costs in a large interterritorial divisions case such as this, is compelled as a practical matter. Rail Form A data is readily available, and does not include the biases which special cost studies conducted by the contesting parties might understandably reflect. Allocation of an appropriate part of some overhead or constant cost items to the particular traffic is plainly proper, and,

[18] The costing procedures or methods used here in adjusting the Southern lines' studies (325 I.C.C. at 24–25) are the same as those which the Commission employed with the unanimous approval of this Court just last Term in *Chicago & N.W. Ry. Co.* v. *Atchison, T., & S.F. Ry. Co.*, 387 U.S. at 351, 354, except that the costs here were computed on a fully distributed basis. In the *Chicago & N.W. Ry. Co.* case the Commission found significant the smallness of the percentage-point difference between two cost showings—one based on a study made in great detail of the particular service rendered, and the other involving a straight Rail Form A application. It concluded that "one substantiates the other, and supports the view that, for a large and varied body of traffic as here at issue, territorial average costs will be the substantial equivalent of specific costs". (321 I.C.C. at 49–50). In this case, a similar comparison of two such studies establishes that the percentage-point difference is almost infinitesimal (see 325 I.C.C. at 25–26).

if appropriate, Rail Form A cost figures can be restated or adjusted so as to exclude those constant cost items which should not be taken into acount. As to each item the question is essentially one of practical and informed judgment. In its report the Commission here pointed out that "[t]erritorial average costs are particularly appropriate to the traffic in this case because it is a large and varied body of traffic moving to and coming from terminals in all parts of both territories" (325 I.C.C. at 96). Yet, the district court substituted its own view for that of the body charged by Congress with the duty of effectuating the public interest in the existence of "divisions that colloquially may be said to be fair" (*Baltimore & Ohio R. Co.* v. *United States,* 298 U.S. 349, 357–360).

The district court was quite correct in stating that here the Commission prescribed new divisions on the basis of the relative costs of service in handling the interterritoral traffic involved, and that the Commission concluded that neither group of carriers had shown its revenue needs to be greater than those of the other. But that hardly leads to the conclusion that the restated Rail Form A costs data used by the Commission was inadequate. Here the Commission compared the relative costs of the respective groups in providing the service at issue by using fully distributed costs adjusted in certain respects to reflect the costs of the particular traffic more accurately. What the Southern roads complained about—and persuaded the district court to accept—was that, in their view, the Commission had not made additional adjustments to the cost data which they had suggested. In that

respect, both the Southern lines and the district court seriously misconceive the Commission's function under Section 15(6).

Congress, in enacting Section 15(6), never intended for the Commission, whether in cases grounded on a comparison of costs of service or a consideration of other factors as well, simply to perform essentially ministerial tasks in calculating how joint freight rates should be divided. Rather, the Commission's duty is to effectuate "the public interest in maintaining all essential parts of the transportation system" (325 I.C.C. at 49). Here, in rejecting the Northern lines' argument "that their revenue needs are greater since the Southern lines' average rates of return are somewhat higher," the Commission specifically pointed out that its "prescription of divisions based on relative costs includes allowance for overhead and return, and in our judgment reflects a due proportion of the burden of maintaining the financial integrity and credit of the carriers involved" (*ibid.*).[14] Thus, in determin-

[14] Indeed, this Court has approved the Commission's use in divisions cases of cost evidence which reflects a due or fair proportion of the overall burden of doing business. *Baltimore & Ohio R.R. Co.* v. *United States*, 298 U.S. 349, 360, 378 (see 325 I.C.C. at 49). That the language of Section 15(6)—"property held for and used in the service of transportation"—is broad enough to support consideration of all railroad property—and thus fully distributed costs—was recognized in the *Baltimore & Ohio R.R. Co.* case, where the Court stated (298 U.S. at 360): "It requires no discussion to demonstrate that § 15(6) authorizes the Commission to take into account and give due weight to revenues from all transportation service, the operating expenses and taxes chargeable to the same and the amounts available as compensation for the use of all carrier property. And unquestionably the paragraph also em-

(footnote continued)

ing the adequacy of the cost data and the propriety of using fully distributed costs, as appropriately adjusted, the Commission was acting in consonance with the statutory duty imposed upon it by Congress. The significance of that congressional authorization, and the wide latitude of discretion which necessarily accompanies it, was disregarded by the district court in substituting its judgment for that of the Commission with regard to the sufficiency of the cost evidence on which its determination was based.

Nor is the district court's suggested distinction (B. & O. J.S. App. 25a–26a) of this Court's decision of last Term in *Chicago & N.W. Ry. Co.* v. *Atchison, T. & S.F. R. Co.*, 387 U.S. 326, apposite (see note 13, *supra*). There, although the lower court had not dealt directly with the cost issues, this Court found the "attacks on the legal invalidity of the Commission's findings on costs * * * so insubstantial that no useful purpose would be served by further proceedings * * *" (*id.* at 356). In the instant case, like in *Chicago & N.W. Ry. Co.*, "[t]he presentation and discussion of evidence on cost issues constituted a dominant part of the lengthy administrative hearings, and the issues were fully explored before the Commission," and "[i]ts factual findings and treatment of accounting problems concerned matters relating entirely to the special and complex peculiarities of the railroad industry" (*ibid.*). Here, like there, "the Commission's

---

powers the Commission to take into account the revenues, expenses, taxes and returns attributable to the service covered by the divisions under consideration."

disposition of these matters is sufficient to show that its conclusions had reasoned foundation and were within the area of its expert judgment" (*ibid.*). It follows, then, that the district court failed to accord sufficient weight to the Commission's resolution of such matters in the instant case. Indeed, under that court's holding, little if anything is left to informed expertise and practical judgment of the administrative body in this regard. Such a result was not intended by Congress when it conferred sweeping authority on the Commission, in Section 15(6), to ensure the fairness of divisions in the public interest.[15]

It was never contemplated by Congress that costs of service in divisons cases be ascertained with exact and irrefutable mathematical precision.[16] Indeed, it is rather illusory to assume that the exact costs allocable to particular traffic can be definitively ascertained. In point of fact, any particular shipment's actual cost is necessarily an apportionment of the various expenses incurred in providing and maintaining facilities and in

---

[15] Nor can enactment of the Administrative Procedure Act be viewed as having restricted the scope of the Commission's authority under Section 15(6), or as having overruled or qualified this Court's past decisions upholding that authority (see *Chicago & N.W. Ry. Co.* v. *Atchison, T., & S.F. Ry. Co.*, 387 U.S. at 342).

[16] Mathematical precision is, of course, technically impossible since empirical judgments are essential to the distribution of overhead. *New York* v. *United States*, 331 U.S. 284 at 324, 328; *Baltimore & Ohio R.R. Co.* v. *United States*, 298 U.S. 349 at 378. When conclusions are based on cost, the entire cost must be taken into account, *i.e.*, "the outlays that exclusively pertain to a given class of traffic must be assigned to that class, and the other expenses must be fairly apportioned." *Northern Pacific R.R. Co.* v. *North Dakota*, 236 U.S. 585, 597.

conducting rail operations generally. Here the contesting groups of carriers recognized the necessity of using the Rail Form A territorial average formula for measuring costs of service; the only difference between the parties involved the degree to which such costs should be modified to fit the specific traffic at issue. In view of its conclusion that, as restated with some adjustments, the Rail Form A cost data submitted was of such quality, credibility and accuracy so as to persuade it that such data adequately and reliably reflected the costs of handling the North-South traffic at issue, there was no need for the Commission to have embarked upon an independent investigation to determine whether the parties might be overlooking or concealing some relevant evidence. See *Chicago & N.W. Ry. Co.* v. *Atchison, T., & S.F. Ry. Co.*, 387 U.S. at 343. Under the circumstances, it can hardly be said that the Commission violated any statutory duty or abused its discretion in failing to have undertaken the development of more refined cost data.[17] Cf. *Brotherhood of Maintenance of Way Em-*

[17] Indeed, it is clear that only limited use could be made of the more refined cost data required by the district court. First, the Commission could decide that Rail Form A computations are not adequate to measure the costs of handling North-South traffic because the characteristics of the services performed in handling that traffic are so different from average traffic as to require special treatment (see *Boston & M. R.R. Co.* v. *United States*, 208 F. Supp. 661, 674-5 (D.C. Mass., 1962), affirmed 371 U.S. 26). But this possibility was provided for by Commission procedure and the contrary was shown. A second possible use would be to demonstrate that the Rail Form A territorial data with respect to individual services was so extreme as to distort the costs of handling North-South traffic. Here again, how-

(footnote continued)

ployees v. *United States*, 221 F. Supp. 19, 28 (E.D. Mich.), affirmed, 375 U.S. 216; *Florida East Coast Ry. Co.* v. *United States*, 259 F. Supp. 993, 1013–1014 (M.D. Fla.), affirmed, 386 U.S. 8. And, despite the Southern lines' assertion that the Northern roads had failed to carry their burden of showing that the existing divisions were unjust and should be revised (see B. & O. J.S. App. 12a), what the Commission actually concluded—as the district court acknowledged—was that "the Northern lines established a prima facie case that Rail Form A costs properly measure the cost of the specific traffic" (*id.* at 19a), and that the Southern roads had not overcome this *prima facie* case insofar as their suggested but rejected adjustments were concerned.

In sum, the district court's holding that the restated Rail Form A cost figures were improperly utilized by the Commission is erroneous and conflicts with established practice under decisions of this Court. It is of great importance to the administration of the Commission's Section 15(6) duty to effectively super-

---

ever, the Commission allowed for such a showing. Thus, the Southern lines contended, for example, that empty-return ratio on auto parts cars should be adjusted. The Commission considered, but rejected, such allegations (325 I.C.C. at 69). Accordingly, the only new purpose to be served by refined cost data would be to challenge the propriety of the Rail Form A cost formula—either to require more accuracy or to restrict consideration to only those costs directly pertaining to the traffic in question. Moreover, this effort to achieve a theoretically perfect formula for ascertaining relative costs of particular traffic without allowances for overhead and return conflicts with the broad purposes underlying Section 15(6)—even in a case such as this where relative costs of service was the criterion on which the adjustment was grounded.

vise the fairness of divisions on interterritorial traffic that the judgment below be reversed.[18]

2. Although the district court placed major emphasis on the Commission's use of Rail Form A figures, it cited three cost items—solely related costs of suburban passenger service, switching costs, and empty-return ratios of box cars—as "important separate issues" of "greater significance as illustrations of the more pervasive error" in using Rail Form A as a standard for measuring the relative costs of particular traffic in a divisions case. We submit the court erred again in rejecting the Commission's computations with respect to these cost items on the ground that they were unsupported by reasoned findings and substantial evidence within the meaning of Sections 8(b) and 10(e) of the Administrative Procedure Act.[19]

The Commission adequately took into account in this case the questions whether expenses solely related to suburban passenger service should be excluded from the fully distributed costs and whether Rail Form A switching costs and empty-return ratios should

[18] In a concluding paragraph of its opinion, the district court stated that the cost data used by the Commission, in addition to the other infirmities which it had found, "[w]ith the passage of each year * * * becomes more and more vulnerable to the charge of staleness," so that a reopening of the proceeding by the Commission to obtain more current data "well might be warranted" (B. & O. J.S. App. 32a). Considering the time-consuming nature of complex, interterritorial divisions cases such as this one, however, the court's suggestion in this regard might result in the Commission's never being able to decide such cases on the basis of sufficiently recent data—thus negating its authority under Section 15(6).

[19] 5 U.S.C. 557(c)(A) and 706(2)(E).

be refined to reflect more accurately the costs of the North-South traffic involved. With respect to the latter items, the Commission made comprehensive findings rejecting the Southern lines' proposed adjustments because they were based on unsupported theoretical computations and factual assumptions and contained a variety of weaknesses, both in the sample used and in the studies themselves (325 I.C.C. at 64–68, 69–70, 71–77).[20] Here the Commission had before it an abundance of evidence, typical in character and ample in quantity, which established that the services performed in handling the interterritorial traffic shared the same facilities in common with other traffic and that the North-South traffic involved is average traffic, influenced by and in turn influencing other traffic.

With respect to suburban passenger deficits, the Commission first referred to the Southern lines' single example of solely related costs and found that "although many individual items of suburban service can be considered solely related, the facilities and service as a whole cannot be considered solely related

[20] For example, as to switching cost studies, the Southern lines made reference to only 41 out of 967,554 cars. As to empty-return ratios, the Commission applied empty-return ratios from a seven-day study developed from supervised data all railroads are required to furnish by Commission order, which produced ratios of 39 percent in the North and 33 percent in the South. This data included auto parts' cars. The Southern Lines proposed to assign an assumed 100-percent empty-return ratio for auto parts' cars and an assumed 30-percent ratio for all other box car traffic. The Commission found the assumptions on which the proposed adjustments were based erroneous and unsupported (325 I.C.C. at 68).

* * * and treated entirely apart from freight service and intercity passenger service" (325 I.C.C. at 78). The Commission then went on to conclude that (*ibid.*):

> Because the suburban service deficit includes common costs which must be incurred to provide freight service and intercity service, such costs are properly chargable to those services to the extent they cannot be recovered from suburban operations, and the deficit from suburban operations should not be excluded from the constant costs.[21]

Indeed, the Commission's approach in this regard is consistent with the established practice, specifically approved by this Court, of fixing freight rates on the basis of including passenger deficits as part of freight service costs. See *King* v. *United States*, 344 U.S. 254, 261, 267; *Chicago, M., St. P & P. R.R. Co.* v. *Illinois*, 355 U.S. 300, 307; *Public Service Comm'n of Utah* v. *United States*, 356 U.S. 421, 426. And here, the passenger deficits were unquestionably included in fixing

[21] In point of fact, the Southern lines supported inclusion of passenger deficits in the cost figures to be used in assaying the propriety of the existing divisions. However, they sought to have the Commission draw a distinction between intercity and suburban passenger deficits, since it was desirable, from their point of view, to have the intercity passenger deficits of the Southern roads included. The Commission found it unjustifiable, as a practical matter, to make such a distinction. The district court, however, overturned the Commission on this question, since it viewed intercity deficits as sufficiently related to the common facilities which must be maintained to provide freight service (B. & O. J.S. App. 20a), but, ignoring the Commission's express findings to the contrary, chose to regard suburban deficits quite differently.

the level of, and in granting general increases in, the joint freight rates on North-South traffic. See *Increased Freight Rates, 1948,* 276 I.C.C. 9, 32–39; *Increased Freight Rates E. W. & S. Territories, 1956,* 300 I.C.C. 633, 641–647, 657–658; *Railroad Passenger Train Deficit,* 306 I.C.C. 417, 477–479; and S. Rep. No. 445, 87th Cong., 1st Sess., p. 285.

Thus, after making the basic determination that passenger deficits should be included in the fully distributed costs, the Commission apportioned a share of the entire Northern and Southern lines' passenger deficits to the costs of the North-South service involved, in the same proportion that that particular traffic bears to the total traffic in each territory.[22] The district court rejected the method employed by the Commission, stating flatly that the Administrative Procedure Act requires findings on "the critical

[22] The formula employed by the Commission provides equal recognition and treatment of passenger deficits on each side of the border since it includes intercity and suburban deficits in the North and the South as well as local passenger service deficits in the South. Thus, contrary to the district court's view (B. & O. J.S. App. 20a–21a), this is not a case where the Commission has given controlling weight to passenger deficits and has required carriers in one part of the country to subsidize passenger operations elsewhere. Upon Southern lines insistence the Commission included passenger deficits within fully distributed costs. But as to anything beyond that it specifically found (325 I.C.C. at 49) that nothing "presented here offers a concrete basis on which to find that either group is entitled to a share of the joint rates larger than accruing under the divisions hereinafter prescribed on the basis of relative costs [which] includes allowances for overhead and return, and in our judgment reflects a due proportion of the burden of maintaining the financial integrity and credit of the carriers involved."

issue * * * [of] how much of the railroads' cost of commuter service was in fact common with the cost of freight service and how much was solely related to commuter service" (B. & O. J.S. App. 21a),[23] and concluded that the Commission failed to make adequate findings in this regard. However, a meaningful comparison of the relationship of fully distributed costs can only be made on the basis of including all passenger deficits. These deficits represent money lost to the respective railroads by reason of the fact that the Interstate Commerce Act requires the continued rendition of necessary passenger services. Such losses must be recovered from profitable freight traffic if the railroads are to remain solvent and continue to operate in conformity with the congressional objectives enunciated in the National Transportation Policy (49 U.S.C. preceding Section 1). Here the district court's decision would unduly restrict the Commission's ability to carry out the will of Congress

[23] At several places in its opinion, the district court referred to the fact that the Commission itself had noted that some costs of providing suburban service could be considered as solely related to that kind of service (B. & O. J.S. App. 20a–21a, 31a). In light of what it regarded as "a concession that many commuter facilities are solely related to that service and have nothing whatsoever to do with the cost of handling the North-South traffic or any other freight traffic" (*id.* at 21), the court found the Commission's treatment of suburban passenger deficits inconsistent and unsupportable. That some costs of providing suburban service might be considered as solely related, however, hardly leads to the conclusion that all such costs can or should be so regarded or that the Commission acted improperly in not excluding some of these costs here. Many costs of inter-city passenger service are also solely related thereto, e.g. stations, cars, train operation etc., and the Commission included these.

by prohibiting the dividing of joint rates in conformity with the factors which went into their composition. In this respect as well, therefore, the decision below would seriously interfere with the Commission's effective administration of Section 15(6).[24]

CONCLUSION

The district court has erected a rigid formula for ascertaining relative costs of service which will impair

[24] Several paragraphs of the district court's opinion discuss in quixotic fashion the question of "inherent territorial disadvantages" (B. & O. J.S. App. 16a–19a). As the court pointed out, it was strenuously urged that "as a matter of law the Northern railroads cannot have an increase [in divisions] in the absence of inherent territorial disadvantages" (*id.* at 19a). Stating that it could not determine whether the Commission had resolved this issue, the district court concluded that, if it had, its determination suffered from a lack of findings and substantial evidence, and that, if it had not, it had failed to resolve a material issue. Thus, the court stated that the case was being decided on other grounds but that the Commission "should decide and dispose of this contention in accordance with the Administrative Procedure Act" upon remand (*ibid.*). As the Commission pointed out, "In essence, however, other factors being equal, cost differences generally are the product of, and reflect, the inherent advantages and disadvantages that go to make up the respective overall transportation conditions in the two territories" (325 I.C.C. at 28). Continuing, the Commission further stated, "Indeed, the continued maintenance of divisions which, all other things being equal, do not reflect the relative costs of service would not suggest justice between the parties" (*ibid.*). Thus, the Commission simply determined that, in a divisions case where the carriers were found to be efficient and the fairness of existing divisions and the need for revised divisions was assessed on the basis of relative costs of service, it was appropriate to conclude that cost differences reflect inherent territorial disadvantages, insofar as that consideration is relevant under Section 15(6).

the Commission's Section 15(6) power to prescribe fair divisions. In substituting its own view as to what constitutes the proper yardstick for measuring relative costs, the district court departed from prior decisions of this Court and past Commission practice, and misconceived not only the requirements of Section 15(6) but also its own function as a reviewing tribunal. See *United States* v. *Pierce Auto Freight Lines,* 327 U.S. 515, 535–536. This appeal thus presents a substantial question in the administration of the Interstate Commerce Act and probable jurisdiction should be noted.

Respectfully submitted.

v.
ABERDEEN AND ROCKFISH RAILROAD COMPANY, *et al.*, *Appellees*.
No. 938

ON APPEAL FROM THE UNITED STATES DISTRICT COURT FOR THE EASTERN DISTRICT OF LOUISIANA

MOTION TO AFFIRM

Appellee Southern railroads, listed in Appendix A hereto, move pursuant to Rule 16 of the Revised Rules of this Court that the judgment of the district court be affirmed on the ground that the judgment below is so clearly correct that plenary review by this Court is not warranted.

QUESTION PRESENTED

The Interstate Commerce Commission entered an order which abandoned the previously-established equal treatment of the North and the South in dividing the revenues from

freight traffic moving between those territories and substituted a new basis of divisions substantially inflating the Northern share of the joint revenues and correspondingly reducing the share of the Southern railroads. The question presented to this Court is whether the district court properly set aside this order and remanded the cause to the Commission on the ground that the order violated Sections 8(b) and 10(e) of the Administrative Procedure Act in that it was supported neither by reasoned findings nor substantial evidence in the record.

STATEMENT

Prior to the Commission's decision in this case, divisions of joint rates on North-South traffic were made by use of an equal-factor scale so that railroads in Northern and Southern territories received equal compensation for the same amount of service performed.[1] This equal basis of divisions had been in effect since 1953 when the Commission prescribed uniform divisional scales for use in dividing revenues on North-South freight traffic. *Official-Southern Divisions,* 287 I.C.C. 497, 523, 546-547 (1953). The establishment of equal divisions came shortly after the Commission's historic decision in *Class Rates Investigation, 1939,* 262 I.C.C. 447 (1945), affirmed by this Court in *New York* v. *United States,* 331 U.S. 284 (1947), which determined that the higher rate levels at that time applicable to the movement of rail freight throughout Southern territory constituted an unlawful discrimination against the South, and replaced the discriminatory structure with a uniform rate structure applicable throughout the United States east of the Rocky Mountains.

---

[1] Thus, on a shipment travelling 300 miles in both Northern and Southern territories, the Northern and Southern railroads each received 50% of the joint rate (287 I.C.C. at 547, 552).

The Northern railroads thereafter petitioned the Commission for an inflation in the divisional scale for the North. Their claim for preferential treatment was based exclusively upon allegedly higher costs, as shown by the "Rail Form A" cost formula. The Southern railroads pointed out that the relevant costs were not territorial average costs, which are the product of the Rail Form A formula, but rather the costs incurred in handling North-South traffic—the traffic which produced the joint rates being divided.[2] They presented evidence showing that territorial averages do not measure the costs of performing the various services which go into the transportation of North-South freight traffic. They showed that for most items, such as running trains, maintaining roadway, and the like, Northern and Southern average costs were equal, and that a relatively few factors, such as higher territorial "interchange" costs, car costs, "switching" costs, "empty return ratios," and suburban commuter deficits, were responsible for producing the claimed higher costs in the North. The issue thus presented was whether these relatively few "inflating" territorial average factors were, in fact, related to North-South traffic, or whether on the other hand, the unadjusted territorial averages misstated the costs of North-South traffic.

The Commission held that Section 15(6) criteria such as "revenue need" and "public importance" were substantially

---

[2] The relevant traffic, i.e., the North-South traffic which produces the revenues to be divided, yields only 6.0% of the total freight revenue of the Northern railroads, and only 21.4% of the freight revenues of the Southern railroads (Verified Statement No. 36, Ex. 5). Where, as here, the relevant traffic comprises only about 6% of the total traffic, it is necessary to distinguish between (1) territorial average costs developed for *all* traffic, and (2) the costs of North-South traffic, which the Commission found to be the controlling test in this case.

equal, and that divisions of joint rates should reflect the relative costs of handling North-South traffic (325 I.C.C. at 26, 50, 56). However, the Commission actually used unadjusted territorial averages to compute the costs of the controverted services involved in transporting North-South freight. On the basis of these averages, which were higher in the North than in the South, the Commission abandoned the divisional equality between the two territories and prescribed new divisions substantially inflating the share of the Northern railroads at the expense of the Southern railroads. For example, under the newly-prescribed divisions, for a shipment moving 300 miles in both Northern and Southern territories, the Northern divisional factor was 241, whereas the Southern factor was 206 (325 I.C.C. at 82). This constitutes a 17 per cent inflation in favor of the Northern railroads—an inflation which becomes much greater (up to 45 per cent) at the shorter hauls and somewhat less at the longer hauls (*ibid.*).

The Southern railroads filed this action in the District Court for the Eastern District of Louisiana to set aside that part of the Commission's order prescribing the inflation in the divisions of the Northen railroads. The Southern Governors' Conference and the Southeastern Association of Railroad and Utilities Commissioners filed an intervening complaint.

The three-judge district court (Circuit Judge Wisdom and District Judges West and Hunter) set aside the Commissioner's order and remanded the cause to the Commission for further proceedings on the ground that the Commission erred "in prescribing divisions on the basis of the average cost of all traffic for this series of important elements of cost which are higher in the North for reasons that have not been shown to have any relation to the North-South freight traffic here at issue" (B&O J.S. App. A, p. 24a). The district court held that in a case such as this,

where "the outcome of factual issues is bound to cut deeply into economic relations on such a scale and when the result involves a departure from an equal division formula previously adopted," the Commission must satisfy the requirements of the Administrative Procedure Act that there be substantial evidence supporting findings with respect to the several critically important cost elements that accounted for the entire inflation awarded to the North (B&O J.S. App. A, p. 31a). The Northern railroads (B&O et al.) and the Interstate Commerce Commission appealed from the district court's judgment.[3] The United States, the statutory defendant, did not join in the appeals.

NO SUBSTANTIAL QUESTION IS PRESENTED BECAUSE THE DISTRICT COURT'S ACTION IN SETTING ASIDE THE COMMISSION'S ORDER FOR VIOLATIONS OF SECTIONS 8(b) AND 10(e) OF THE ADMINISTRATIVE PROCEDURE ACT WAS CLEARLY CORRECT.

I. The fundamental question presented to the district court was whether the Commission's use of the costs of one category of traffic (unadjusted territorial average costs) to measure the costs of a different category (the costs of

---

[3] 28 U.S.C.A. § 2101, provides that the time within which to appeal an adverse judgment to the Supreme Court begins with the entry of that judgment. Commission counsel contend that the judgment of the district court was entered on August 22, 1967 (ICC J.S. p. 2) so that the Commission's notice of appeal was timely filed within the sixty-day time limit. However, the date of entry was August 8, 1967—the date appearing on the face of the decree (B&O J.S. App. B, p. 34a). The district court stated in its "Order Staying Decree," which was also dated August 8, 1967, that the Decree itself was "signed, dated, *and entered* concurrently herein on this date" *(id.* pp. 35a-36a) (emphasis added).

North-South traffic at issue) had any foundation in findings supported by substantial evidence. The absence of any such foundation was the basis on which the district court set aside the Commission's orders.

Yet counsel for the Commission and the Northern railroads would make it appear that the district court's decision contained principles much more far-reaching and ominous. They say that the district court imposed "novel standards" on the Commission (ICC J.S. p. 5), and that it invaded the Commission's authority in holding that the Commission "was obligated as a matter of law to develop more refined cost data described by the District Court as the 'actual costs of handling the specific traffic at issue'" (B&O J.S. p. 4). They also interpret the district court's decision as a "rejection by the district court of Rail Form A cost figures . . ." and as a holding that the Commission "cannot accept, as a standard of measurement, computations produced through use of Rail Form A territorial average costs as appropriately adjusted" (ICC J.S. p. 11). Finally, they contend that the district court overstepped the bounds of appropriate judicial review and left "little if anything . . . to informed expertise and practical judgment of the administrative body" (ICC J.S. p. 16; see also B&O J.S. pp. 21-22).

The "horribles" paraded in the Jurisdictional Statements of appellants are entirely imaginary, for they have no basis in the decision of the district court. The district court imposed no "novel standards" on the Commission. It was the Commission itself, not the district court, which held that the controlling factor in the determination of equitable divisions on North-South traffic should be the relative costs of the Northern and Southern railroads with respect to that particular traffic—not their relative costs on all

traffic in both territories (325 I.C.C. at 26, 50, 56).[4] The court below held, as it was obliged to do as a matter of law (p. 18, *infra*), that the Commission having selected the standard upon which the case was to be decided, the adequacy of the Commission's findings and evidence must be tested in the light of that standard (B&O J.S. App. A, p. 25a).

Nothing in the decision of the district court precludes the Commission from relying on Rail Form A costs "as appropriately adjusted" (see ICC J.S. p. 11). Nor does anything in that decision justify the Commission's concern that the integrity of Rail Form A is under attack, or its fear that other cost formulas have been tainted by the suspicion of invalidity (*ibid.*).[5] The district court recognized explicity that:

---

[4] The Commission repeatedly and unequivocally stated its standard as "the relative costs of the parties reflecting their respective operations as to this traffic" (325 I.C.C. at 50), "the costs which are attributable to the traffic at issue" (326 I.C.C. at 26), and "the purpose is to measure the cost of services performed under the line-haul rates to be divided" (325 I.C.C. at 56). Yet the Northern railroads persistently and erroneously attribute the establishment of this standard to the district court (e.g., B&O J.S. pp. 16, 21, 9).

[5] Thus, the elaborate justification of Rail Form A offered by the Northern railroads (B&O J.S. pp. 13-16) only justifies that which is not in dispute. In the *Class Rate Investigation*, relied upon by the Northern railroads, "the intent of the cost study was to reflect territorial average operating conditions . . ." (262 I.C.C. at 588). This Court's decision in *New York* v. *United States*, 331 U.S. 284, 309 (1947) upheld the Commission's class rate action as intended to affect the rate levels on all traffic. As a result, that case can be cited as authority for the use of Rail Form A territorial averages to measure territorial average costs, a proposition we have nowhere disputed; but it is no authority for using Rail Form A, without adjustment or supporting evidence, to measure a 6% segment of those total costs.

> ". . . the Rail Form A cost formula was devised for the express purpose of measuring territorial average costs and has been widely used as an acceptable means of comparing relative transportation costs. It represents a comprehensive study entitled to full weight when the issue is one that it was designed to cover." (B&O J.S. p. 24a.)

However, when the Commission has adopted as its standard the costs of handling North-South traffic, unadjusted territorial averages are not enough, by themselves. Appellants are seeking to use unadjusted territorial averages, which are admittedly higher in the North than in the South, to measure the controverted and important elements of the costs of North-South traffic, without *any* evidence that the costs of the former measure the costs of the latter. However, as the district court stated:

> "[Territorial average costs] cannot appropriately be accepted *without further evidence for mechanical application to particular segments of traffic* in a divisions case. The 'many minute calculations' contained in Rail Form A were used to measure the overall average costs and certainly produce a misleading appearance of exactitude when applied mechanically to measure a specific cost of a specific body of traffic such as that involved here. Evidence of overall territorial averages surely can and should be considered, but as to specific important cost items the Commission should *not wholly and exclusively* rely on such averages. *United States* v. *Abilene and Southern R.R. Co.*, 265 U.S. 274; *Atchison, Topeka and Santa Fe Ry. Co.* v. *United States*, 225 F. Supp. 584.[6] The Commission stated its exclusive standard to be the relevant cost of handling the specific

[6] In that case, the District Court for the District of Colorado (per Judge Doyle) set aside orders of the Commission in a divisions case between the North and part of the Midwest for failure to comply with the requirements of the Administrative Procedure Act (225 F. Supp. at 606-607). Neither the Commission nor the United States appealed.

> freight traffic to which the divisions apply. We are persuaded that the order is not based on substantial evidence nor supported by reasoned findings within the meaning of Sections 8(b) and 10(e) of the Administrative Procedure Act because the use of territorial averages accounting for the Northern inflation has not been supported with findings of evidence relating any such inflation to the North-South freight traffic." (B&O J.S. pp. 24a-25a; emphasis added)

In referring to "specific important cost items" as to which the Commission relied upon Rail Form A without adjustment, the district court was well aware that the entire inflation in the Northern territorial averages stems from a few services as to which the averages are higher in the North than the South (B&O J.S. App. A, p. 11a). Freight transportation service is a combination of numerous different elements.[7] As to most services involved in hauling freight, such as operating trains and maintaining tracks and stations, the costs of the Northern and Southern railroads are the same. The overall Northern territorial average cost inflation is attributable to a few higher Northern service costs, such as car costs, the cost of commuter operations, the ratio of empty-to-loaded cars, the costs of interchanging and switching the cars (Verified Statement No. 39, pp. 62-63). Indeed, even now Commission counsel do not challenge the holding below that these several cost items are responsible for the entire Northern inflation.[8]

---

[7] Rail Form A territorial costs are, as Commission counsel concede, broken down into the costs "of performing each of the kinds of service involved in that transportation" (ICC J.S. p. 3).

[8] The Northern railroads refer to Northern wage levels, which they say are higher than those in the South (B&O J.S. p. 22 n. 12). The cost of labor was not one of the elements of Rail Form A costs relied upon by the Commission to show a generally higher Northern cost level. Nor could the Commission have relied upon labor costs, because higher wages in the North, which are only 2 per cent higher

Because the Commission granted an inflation to the North under the standard of costs related to North-South traffic, and because the higher Northern territorial averages actually used by the Commission are higher only because of a few elements of costs, it is especially incumbent upon Commission counsel to state the reasons and point to the evidence in the record which justifies the use of unadjusted territorial average costs with respect to these critical services.[9] No such evidence is identified; there are only the averages themselves.

Since North-South traffic constitutes only 6% of all Northern traffic, it is arbitrary to assume without evidence that the average costs of 100% of Northern traffic would measure the costs of 6% of that traffic, as it would be arbitrary to assume that every 6% segment of the traffic would fairly represent the entire traffic. To say that samples must be based on evidence showing that they are

---

than in the South and which occur in the "executive and professional" categories (Tr. R. 2629-31; Verified Statement No. 80, Ex. F-1, F-2), are offset by the far greater traffic density on the lines of the Northern railroads than is enjoyed on the lines of the railroads operating in the South (Verified Statement No. 36, Ex. 1, p. 21). Whatever the factors affecting the levels of these costs in the several territories their net effect is that the costs *per unit* of traffic are not higher in the North except for the several critical elements referred to in the text.

[9] Commission counsel have a curious way of putting the question. They say several times that the question is whether the Commission may rely on territorial averages "as appropriately adjusted" (ICC J.S. p. 11; see also pp. 3, 13, 17). The difficulty is that, with respect to costs of performing the particular services in North-South traffic which account for the Northern territorial inflation, the Commission did *not* rely on averages which were adjusted in *any* way, much less "appropriately adjusted." The Commission relied instead on unadjusted averages—with no evidence that these averages measured the cost of North-South traffic which the Commission found to be the decisive standard.

representative is not to say that samples may not be used.[10] By the same token, to require that averages must be supported by evidence indicating that they are fairly representative of the costs on a narrow segment of traffic is a far cry from holding that averages may not be used. Yet that is all that the district court required here: "[T]his formula was designed to measure the cost of handling all the traffic in two or more territories, and cannot appropriately be accepted *without further evidence* for mechanical application to particular segments of traffic in a divisions case" (B&O J.S. App. A, p. 24a) (emphasis supplied).

Where is the evidence to support the use of unadjusted average Rail Form A costs to measure the critical cost factors? There is no such evidence.[11] There is only the unsup-

---

[10] The Commission itself has subsequently held, in *Increased Rates within Southwest, and Between Colo. & Wyoming and Southwest*, 326 I.C.C. 216, 236-237 (1966), that "if selected carriers are used as a basis for a showing of revenue needs for all respondents, competent testimony must be produced to establish that they are typical of the group as a whole. . . . Facts, and not unsupported conclusions or opinions of interested witnesses, are required for such a finding."

[11] The Northern railroads now refer to evidence which they say shows "that territorial costs properly show the cost of performing the service on the North-South traffic (V.S. 8)" (B&O J.S. pp. 14-15). The Verified Statement referred to is a "train utilization study" which was not even cited by the Commission and which had nothing to do with the service costs responsible for the Northern inflation; it dealt with the costs of operating trains—costs which do not account for the inflation granted to the North. With respect to the cost elements that do account for that inflation, the witness who introduced the "train utilization study" conceded that he knew nothing about empty return ratios (Tr. R. 499); and a study of freight trains obviously had no bearing on the costs of commuter service or the other elements accounting for the inflation.

By relying on the "train utilization study," appellants in effect admit that unadjusted averages, by themselves, are insufficient to

ported conclusion that territorial average costs are appropriate to the traffic in this case because "it is a large and varied body of traffic" (ICC J.S. p. 13; B&O J.S. p. 23). However, this statement was made in connection with a single proposed adjustment, having to do with switching costs (325 IC.C. at 76). It does not alter the uncontroverted fact that North-South traffic constitutes only 6% of the total Northern traffic. Furthermore, the varied nature of this traffic has nothing to do with the fact that by relying on territorial average costs the Commission included deficits arising out of Northern commuter operations unrelated in *any* way to North-South traffic. Nor does it lend any support to the Commission's use of territorial average empty return ratios 10% higher in the North than the South even though the Northern average is inflated by the unusually high empty return ratios of special box cars which are used to a much greater extent in the North than in connection with the North-South traffic—such as the specially-designed auto parts cars in service in the Detroit area (325 I.C.C. at 64, 54). Similarly, it is completely unrelated to the Commission's use of 58% higher Northern costs of interchanging cars at the territorial gateway (325 I.C.C. at 37, 456)—an inflation unjustifiable where the costs are incurred by the Northern and Southern railroads in handling the *same* cars at the *same* points.

The Northern railroads cite *Chicago & N.W.R. Co.* v. *A.T. & S.F. R. Co.*, 387 U.S. 326 (1967), as authority for the proposition that the cost studies used in divisions cases

---

show the costs of North-South traffic. Yet appellants are unable to point to any evidence which even purports to relate to North-South freight traffic the average costs for those elements which account for the entire inflation given to the Northern railroads. This Court has held that use by the Commission of general formulas and unsifted averages cannot take the place of findings and evidence. *I.C.C.* v. *Mechling*, 330 U.S. 567, 581-583 (1947).

can be "predicated upon Form A territorial averages" (B&O J.S. p. 19), and Commission counsel argue to the same effect (ICC J.S. p. 15). But no party here contends that Rail Form A cannot provide the framework for analysis. The critical point here is that neither the Northern railroads nor the Commission counsel can cite this Court's decision in that case to support the abandonment of territorial equality in divisions without substantial supporting evidence. In *Chicago & N.W. R. Co.*, the Commission's order reduced a divisional inflation favoring the Mountain-Pacific lines (387 U.S. at 331-332, 336-337), whereas in this case the Commission's order *created* the Northern inflation which is now under attack; also, the alignment of the parties is reversed since in this case it is the victims—not the beneficiaries of the inflation—who attack the order. The district court in this case gave full consideration to, and carefully distinguished the *Chicago & N.W. R. Co.* case (B&O J.S. App. A, pp. 25a-26a).

Finally, it is argued that matters of cost are questions of fact "within the special competence and discretion of the Commission" (ICC J.S. p. 12), and that the district court's decision reduces the Commission's function to "ministerial tasks" of performing calculations (ICC J.S. p. 14; see also B&O J.S. pp. 21-22). The Commission fears that "little if anything is left to informed expertise and practical judgment" (ICC J.S. p. 16). But the decision below in no way invades the Commission's special province. The court below explicitly recognized the special responsibility of the Commission:

> "We start, of course, from the premise that on the subject of transport economics, the Commission's judgment is entitled to great weight. The appraisal of cost figures is itself a task for experts and, unlike a problem in mathematics, it cannot be precisely right or wrong." (B&O J.S. App. A, p. 24a)

The district court understood that: "As to the sufficiency of the evidence to support the order, it is *not* the proper function of this Court to substitute its judgment or to weigh evidence" (*ibid.* p. 26a) (emphasis supplied). Its decision thus represents no more than an application of the requirements set forth in the Administrative Procedure Act, and enforced by this Court in *Burlington Truck Lines* v. *United States*, 371 U.S. 156, 168 (1962):

> "[The Commission] must make findings that support its decision, and those findings must be supported by substantial evidence. *Interstate Commerce Comm'n* v. *J-T Transport Co.*, 368 U.S. 81, 93; *United States* v. *Carolina Carriers Corp.*, 315 U.S. 475, 488-489; *United States* v. *Chicago, M., St. P.R. Co.*, 294 U.S. 499, 511."

What counsel for the Commission are now asking is an end to any effective judicial review of its decisions in matters where costs are of central significance. Appellants are contending, essentially, that the requirements of the Administrative Procedure Act do not operate with respect to the Commission in prescribing divisions. But they are unable to cite any case which would relieve the Commission of its obligations under the Act to support its action with findings based upon substantial evidence.[12]

---

[12] The Northern railroads rely heavily on the pre-Administrative Procedure Act decision in *Illinois Commerce Commission* v. *United States*, 292 U.S. 474 (1934) (B&O J.S. pp. 21-22, 25), even though that case had nothing whatsoever to do with the requirement of adequate findings or substantial evidence. It involved a Commission order directing "the removal of unjust discrimination against interstate commerce, resulting from disparity of the intrastate and interstate switching rates of interstate rate carriers in the Chicago Switching District" (292 U.S. at 476), based on a specific cost study of switching movements in Chicago. That case would be analogous to the present case only if the cost study actually relied upon to measure Chicago switching costs had been developed from the costs of all switching movements throughout the entire State of Illinois, or perhaps the entire Official Territory.

The district court below inquired whether there was any rational basis or any evidence to support the use of unadjusted territorial averages in place of the costs of several particular services involved in North-South traffic. It could find none. Although it was the district court's task to decide in the first instance if the requirements of the Administrative Procedure Act had been met, and despite the holding below that there was no substantial evidence to support the Commission's use of unadjusted territorial averages to measure the particular cost factors which account for the entire inflation given the North, appellants do not even suggest that this Court should actually review the evidence in the record to determine if the lower court was in error. They ask that this Court reverse the decision below, but they do not refer to any part of the record where such evidence can be found. Indeed, Commission counsel now attempt to defend its orders with the theory that the district court should not have inquired into the basis for the Commission's reliance on Rail Form A averages. This kind of defense is wholly incompatible with the obligations imposed on both the Commission and reviewing courts by the Administrative Procedure Act. *Burlington Truck Lines* v. *United States,* 371 U.S. 156, 167-168 (1962); *Mississippi River Fuel Corp.* v. *F.P.C.,* 163 F.2d 433, 439 (D.C. Cir. 1947); *Government of Guam* v. *Federal Maritime Commission,* 365 F.2d 515 (D.C. Cir. 1966).

II. As to the seven cost elements of North-South freight transportation which account for the entire Northern cost inflation, the Commission used unadjusted Rail Form A territorial average costs to measure the costs of North-South traffic. The district court found that inclusion of one such cost—suburban passenger deficits—as part of the cost of North-South traffic through reliance on territorial averages was "typical of the overall approach of the Commission" (B&O J.S. App. A, p. 20a).

The territorial average costs used by the Commission include deficits attributable to both intercity passenger service and suburban commuter service. The Commission held that deficits attributable to passenger service should be assessed as a part of the cost of freight service where there are common costs, and no party disputes this finding. Common costs include the costs of maintaining track and bridges and the like where passenger and freight trains use the same facilities. Consequently, if passenger service is unable to bear its full share of the burden of facilities which must be maintained to handle freight trains, the burden may properly be assigned to freight service.

The same cannot be said of many commuter facilities. The operation of suburban commuter trains requires equipment and facilities which have no relation at all to freight service. Many of the tracks are different, as are the terminals and yards. The Commission recognized this when it expressly found that "many individual items of suburban service can be considered solely related . . . to suburban service" (325 I.C.C. at 78). The Commission itself thus found that many of the costs incurred in providing suburban commuter service were completely unrelated to any freight traffic, much less North-South freight traffic. Yet, through the use of Rail Form A unadjusted averages, the deficits arising out of all Northern commuter operations—including those completely unrelated to freight traffic—were included in the Northern average costs which the Commission applied to North-South traffic.

The district court recognized the inconsistency in the Commission's finding that many aspects of commuter operations are totally unrelated to North-South freight traffic, and its simultaneous inclusion of deficits arising from those unrelated commuter operations as a part of the costs of North-South freight traffic. There is no rational support

for the inclusion of such deficits as a part of the relevant costs which, by the Commission's own test, are the costs of the North-South freight traffic. Thus, under the Commission's own findings the pertinent question was what part of the North's total suburban operation was related, by virtue of common facilities, to North-South freight traffic. The Commission's finding, quoted by appellants (ICC J.S. p. 21) justifies attributing a portion of *common* costs to freight traffic costs. But that finding provides no justification whatever for attributing to North-South freight traffic any costs that are solely related to commuter service and thus have no relation to North-South freight traffic. As the court below held (B&O J.S. App. A, p. 21a):

> "The critical issue on this cost item was to determine how much of the railroad's cost of commuter service was in fact common with the cost of freight service and how much was solely related to commuter service. But, in accordance with its general approach to these issues the Commission, by adopting Rail Form A, inflated the Northern railroads' freight costs by the entire commuter deficit of those railroads, without regard to the plain conflict between this action and its own finding that 'many individual items of suburban service can be considered solely related . . . to suburban service.'"

The district court thus held that the Commission's result was arbitrary and unsupported by evidence, and set aside the order, which would have placed the burden of Northern commuter deficits, unrelated to North-South freight traffic, on the Southern economy, its railroads and its people, through an inflation in the Northern divisions.

The present attempts of counsel for the Commission and the Northern railroads to bridge the gap between the costs of North-South freight traffic held by the Commission to be controlling and the costs actually used violate the

rule in *S.E.C.* v. *Chenery Corp.*, 332 U.S. 194 (1947).[13] Commission counsel now argue that because commuter deficits may be taken into account in determining rates, they should also be taken into account in making divisions of those rates (ICC J.S. p. 21). This theory was not advanced by the railroads in the proceedings before the Commission and did not constitute any part of the basis upon which the Commission decided the case. On the contrary, the Northern railroads took the position that "a change in divisions is not dependent on a change in rate levels," and admitted that the North sought "*disproportionate* divisions of a uniform structure of rates."[14]

As the Northern railroads recognized before the Commission, rate levels are no higher in the North than in the South. Rate levels have been the same since the Commission proceedings in which equal class rates were upheld by this Court in *New York* v. *United States*, 331 U.S. 284 (1947). The Northern railroads, having lost their preference in the form of lower rates, now seek to regain that preference in the form of inflated divisions.

This Court has recently recognized the difference between the issues involved in rate cases and those in divi-

---

[13] "(A) simple but fundamental rule of administrative law . . . is . . . that a reviewing court, in dealing with a determination or judgment which an administrative agency alone is authorized to make, must judge the propriety of such action solely by the grounds invoked by the agency. If those grounds are inadequate or improper the court is powerless to affirm the administrative action." (332 U.S. at 196). See also *Burlington Truck Lines* v. *United States*, 371 U.S. 156, 168-169 (1962); and *N.L.R.B.* v. *Metropolitan Life Ins. Co.*, 380 U.S. 438, 443-444 (1965).

[14] Reply of Eastern Railroads to the Exceptions of Southern Governors' Conference, et al., dated November 30, 1963, p. 18 (emphasis in original).

sions cases.[15] As a result, the cases cited by appellants (ICC J.S. p. 21; B&O J.S. p. 28), such as *King* v. *United States*, 344 U.S. 254 (1952), with respect to the determination of rate levels only emphasize the violation of the rule in *Chenery, supra*.[16]

Finally, Commission counsel argue that since deficits represent "money lost," and since such losses must be recovered "if the railroads are to remain solvent," the Commission must consider these deficits in determining divisions (ICC J.S. p. 23). This argument rests on a theory of the general revenue needs of the Northern railroads,[17] and

---

[15] This Court's decision in *Chicago & N.W.R. Co.*, relied upon below (B&O J.S. App. A, p. 22a), fully supports the decision of the district court (387 U.S. at 350):

> "[W]hile the Commission has sometimes acted to offset passenger deficits in freight rate cases, the issues are quite different when, in a divisions case it is argued that carriers in one part of the country should subsidize the passenger operations of carriers elsewhere."

[16] *King* v. *United States*, 344 U.S. 254, (1952), involved the prescription of rates—not divisions. And this Court recognized that the *King* case had nothing to do with facilities "solely related" to passenger service: "In Florida, however, the discontinuance of railroad passenger service would not permit the discontinuance of high-speed tracks and equipment because of the need for fast freight schedules to transport perishable fruits and vegetables from Florida" (344 U.S. at 265).

[17] The Jurisdictional Statement of the Northern railroads also makes it clear that they are concerned with "revenue needs" rather than the "costs of North-South traffic"; they refer again to their argument, which the district court rejected, that the costs of commuter deficits should be "treated as overhead, or constant costs, the allocation of which is required *because of the need for revenue* from the freight service to continue operations" (B&O J.S. p. 27) (emphasis supplied).

King v. *United States*, 344 U.S. 254 (1952), cited by the Northern railroads (B&O J.S. p. 28), had to do with whether higher freight rates were justified by revenue needs (344 U.S. at 267-268); it had nothing to do with the costs of any category of traffic.

in effect admits that the deficits arising from commuter services are unrelated to the relative costs of North-South traffic. The revenue needs question was considered by the Commission, which determined that there was no difference in the revenue needs of the railroads of the two territories (325 I.C.C. at 49):

> "Accordingly, we see no justification at this time for adding any special increment favoring one group of carriers over the other. We find that no affirmative reasons appear in this record which would warrant any adjustment of the divisions in question over and above the relative costs of service, either on the grounds of *greater revenue need* or otherwise." (emphasis added)[18]

It was argued before the district court, as it is now argued here, that the Commission charged the entire Northern suburban commuter deficit to freight traffic "as a matter of policy, and that is that there is a need for that revenue to continue operations." (B&O J.S. App. A, p. 21a) The district court rejected the argument as follows (B&O J.S. App. A, p. 21a):

> "The complete answer to this contention is that the Commission did no such thing. The revenue need issue was hotly contested before the Commission, each group contending that its needs were greater—the Northern railroads, on the basis of lower rates of return; the Southern railroads, on the basis of their growing service responsibilities to an expanding economy. The Commission rejected both contentions. . . ."

---

[18] Having admitted that they are relying on "revenue needs," the Northern railroads argue that the district court ignored the Commission's finding permitting the allocation of "overhead" to relative costs. (B&O J.S. p. 27). But the passage they cite (325 I.C.C. at 49) refers only to overhead costs which are related to the costs of North-South freight traffic. The next two sentences of the Commission's report expressly reject the revenue needs argument.

Thus, the resurrection of the revenue needs question at this time is a clear violation of the *Chenery* rule, and amounts to a concession that the Commission's treatment of commuter deficits cannot be defended on the basis adopted by the Commission itself.

The district court cited switching costs and empty-return ratios as two other illustrations of the Commission's error in relying, without evidence, on unadjusted territorial average costs (B&O J.S. App. A, pp. 22a-23a). The district court held that the Commission's reliance on these averages was not supported by findings based upon substantial evidence in the record (B&O J.S. App. A, pp. 22a-24a, 31a). Commission counsel would brush these objections aside, not by pointing to evidence in the record to show that the averages do in fact measure the costs of North-South traffic, but by criticizing the Southern studies for a "variety of weaknesses" (ICC J.S. p. 20). But the court below was not passing on the strength or weakness of the Southern railroads' cost adjustments; it simply held that there was no evidence to support the use of higher costs in the North with respect to these cost elements (B&O J.S. App. A, pp. 30a-31a).[19]

Commission counsel object to the district court's references to the Commission's powers to obtain cost evidence, arguing that there was no need for the Commission to act because the unadjusted territorial averages, in their view, adequately measured the costs of handling North-South traffic (ICC J.S. p. 17). However, Commission counsel

---

[19] The district court found that (B&O J.S. App. A, pp. 19a-20a): "The Commission did not assume any responsibility for the development of a more adequate record, and in several instances held that the absence of comparable evidence in the record itself [i.e. evidence as to Northern costs comparable to that presented by the Southern railroads as to their own costs] prevented adjustments in territorial averages."

can hardly object to the holding below that the Commission has ample power to obtain relevant evidence.

The point of the district court's conclusion is that the Commission's finding of higher costs in the North was not supported by evidence (B&O J.S. App. A, p. 29a). The burden was on the North to produce such evidence; but even where the North did not present adequate data, the Commission had ample power to require its production. The court below simply held that, the necessary evidence not having been obtained by any means, the inflation in Northern divisions was unsupported and unjustified.[20]

---

[20] The Northern railroads also suggest that the district court erred in failing to reserve jurisdiction to enter further orders thought to be "proper" (B&O J.S. p. 32). However, they never asked the court below to reserve jurisdiction. Moreover, they agreed in the court below to re-settle all revenues accruing during this litigation in accordance with the pre-existing basis of divisions, in the event the Commission's orders were set aside. Such a refund simply reflects the inflation to which they have not shown they are entitled.

As to the loss of the inflation in future years, the Northern railroads say the Commission should have reserved jurisdiction because "the Court below found nothing to warrant any inference, that development of the more refined costs it deemed essential would at all warrant lower divisions for Northern lines than those prescribed in the orders under review. . . ." (B&O J.S. p. 32). On the one hand they attack the court below for second-guessing the Commission—which it did not do; on the other hand they suggest that the district court made a mistake in not speculating about what divisions *might* be warranted upon remand.

Furthermore, even after complying with their agreement to repay the difference between the prescribed divisions and the pre-existing divisions, the Northern railroads will still be the beneficiaries of a terminal factor in the pre-existing divisional scale which the Commission found to be excessive in the amount of $7,426,000 annually—an amount which, in the almost three years since the Commission's decision, has amounted to over $22 million (325

CONCLUSION

The district court has properly applied the standards of the Administrative Procedure Act to the Commission's orders at issue in this case. It has emphasized—not undermined—the Commission's responsibilities. The district court, in remanding the cause to the Commission, has not restricted the Commission in its use of Rail Form A costs or any other factor so long as their application under the standard adopted by the Commission is supported by evidence.[21] No new limits or standards have been imposed on the Commission's discretion. There is only the requirement that its orders be based upon findings which are supported by evidence.

This case has been remanded to the Commission for further proceedings consistent with the requirements of the Administrative Procedure Act. The United States, which is charged by statute with the responsibility for defending orders of the Commission, has not appealed this disposition of the case.

I.C.C. at 37, B&O J.S. App. A, p. 5a). The district court concluded that the Commission's order was not severable, and set aside the correction of the excessive terminal factor at the same time it set aside the Northern inflation (B&O J.S. App. A, p. 6a).

[21] Contrary to the interpretation of the Northern railroads the district court did not hold that the Commission must "start all over again" (B&O J.S. p. 31). On the contrary, while observing that evidence was becoming more and more vulnerable to the charge of staleness, the court specifically stated that its observation did *not* "indicate that it would necessarily be an abuse of discretion for the Commission not to re-open the investigation to receive later operating figures. . . ." (B&O J.S. App. A, p. 23a).

Accordingly, the judgment of the district court should be affirmed without further argument.

Attorneys for Appellees Southern Governors' Conference and Southeastern Association of Railroad and Utilities Commissioners

January, 1968

Hence, the Court rejected the suggestion that the advantages of the North were a justification for discrimination against the South, and it ordered that discrimination removed by putting into effect a uniform class rate structure. This was finally done in 1952, and for the first time in this century, the South enjoyed a position of equality with the North with respect to the cost of rail transportation.

Although the decision in *New York* v. *United States* had made it clear that the South was entitled to this position of equality, the Northern interests refused to accept equality with the South. Having failed to convince the Court that the North was entitled to lower rates because of "natural advantages," these interests decided to pursue their aim of obtaining a preference for the North through precisely the opposite strategy — by seeking inflated divisions from North-South freight traffic to offset claimed Northern *disadvantages*.

During the period following the affirmance of the Commission's order in the *Class Rates* case and prior to the issuance of the orders of the Commission which are the subject of this litigation, revenues from North-South freight traffic were divided on an equal-factor basis — that is, both the Northern and the Southern railroads received a share of the revenues from that traffic based directly upon the amount of service they performed in handling it. This equal-factor basis of divisions was prescribed by the Commission itself to implement the principle of uniformity announced in the *Class Rates* case. *Official-Southern Divisions*, 287 I.C.C. 497, 533, 577-578 (1953). Under this basis, each group of railroads received an identical share of the joint rate on any shipment involving an equal haul in each territory. Where one group of railroads performed more service than the other, that

group received a larger share of the revenues, but the difference in divisions was directly related to the amount of service performed.

In 1956, however, only four years after the uniform class rate structure was put into effect, the Northern railroads filed a complaint before the Interstate Commerce Commission claiming that they are entitled to *more* than an equal share of the North-South freight revenues based upon the amount of service they perform because the costs of performing rail service are higher in the North than they are in the South. They asked the Commission to prescribe a basis of divisions with inflated Northern factors which would have accorded them 35 percent more than the Southern railroads for each unit of rail service performed.

As representatives of the interests of the people of the South, the Southern Governors' Conference and the Southeastern Association of Railroad and Utilities Commissioners intervened in the proceedings before the Commission. However, our participation in these proceedings was not designed to secure any special favor for the Southern public or for the Southern railroads. Quite the contrary, we took the position that the principle of uniformity requires that all sections of the country be treated *equally* — that, except where justified by the most imperative of special circumstances, each section should support its own transportation system.

The Northern railroads' complaint seeking an inflation in their divisions on the basis of claimed higher Northern costs raised two distinct groups of issues, each aspect of which was thoroughly contested in the proceedings before the Commission. The first group of issues to which most of the evidence and argument of the Southern railroads was directed, was whether costs on North-South freight traffic are actually higher in the North, as the

ON APPEAL FROM THE UNITED STATES DISTRICT COURT FOR THE EASTERN DISTRICT OF LOUISIANA, NEW ORLEANS DIVISION

MOTION TO AFFIRM

The Southern Governors' Conference and the Southeastern Association of Railroad and Utilities Commissioners, plaintiffs in the proceedings below and appellees in this Court, respectfully move that the judgment of the United States District Court for the Eastern District of Louisiana be affirmed.

QUESTIONS PRESENTED

1. Whether the district court invaded the province of the Interstate Commerce Commission in setting aside orders of the Commission prescribing inflated divisions for the Northern railroads on the ground that such orders were based upon cost conclusions that were not supported by reasoned findings and substantial evidence as required by the Administrative Procedure Act?

2. Whether the Commission acted lawfully in prescribing an inflation in the divisions of the Northern railroads on the basis of Rail Form A territorial average costs, without either findings or evidence to support the conclusion that such costs are the product of and reflect inherent territorial disadvantages from which the North suffers as compared to the South?

3. Whether the Commission can lawfully impose the burden of the higher transportation costs of one section of the country upon another section, even if such costs reflect inherent differences between the two sections, without finding that the section being subsidized cannot support its own transportation system and that the section being called upon for such subsidy can afford to provide it without undue harm to its economy?

STATEMENT

Twenty-one years ago, this Court handed down its historic decision in *New York* v. *United States*, 331 U.S. 284 (1947), upholding an order of the Interstate Commerce Commission which struck down as unlawfully discriminatory the basic railroad class rate structure that had impeded the growth of the South since before the turn of the century. Prior to that case, railroad rates had

consistently been higher in the South than in the North, and Southern shippers had been compelled to pay substantially higher charges to reach Northern markets than Northern shippers were paying to reach Southern markets, even where the distances involved were identical. The purported justification for this rate discrimination, which both the Commission and this Court rejected, was that the North has "natural advantages" over other sections of the country — such as a heavier "concentration of population" and "the preponderance of the nation's total natural resource of energy supply" — which made it "the logical location" for many industries (331 U.S. at 314). Because of these "natural advantages," it was contended that the North is entitled to lower rates than the South for the same amount and kind of rail service.

In rejecting this proffered justification for a discriminatory class rate structure, this Court acknowledged that the North did indeed enjoy certain immense advantages over other sections of the country. But it agreed with the Commission that these advantages were as much an effect of, as a cause for, the discriminatory rate structure (331 U.S. at 315):

> " . . . It is sufficient at this point to say that the record makes out a strong case for the inference that natural disadvantages alone are not responsible for the retarded development of the South and the West, that the discriminatory rate structure has also played a part. How much a part cannot be determined, for every effect is the result of many factors. But the inference of prejudice from the discriminatory rate structure is irresistible. If this discriminatory rate structure is not justified by territorial conditions, then its continued maintenance preserves not the natural advantages of one region but man-made trade barriers which have been imposed upon the country. . . ."

Northern railroads asserted, for the same amount and kind of rail service. The Southern railroads sought to show that the claim of higher Northern costs was based entirely upon *territorial average costs* that did not measure the costs of performing rail services of the same amount and kind in both territories, which, of course, is the only relevant comparison since North-South freight traffic is, by definition, the same traffic in both territories. We joined in and supported the position of the Southern railroads on this issue.

The second, and by far the most important group of issues from the standpoint of these appellees, related to the question of whether, even assuming the Northern railroads' claim of higher costs to be valid, the Commission should prescribe an inflated basis of divisions to offset such costs. Our position was that the Commission should not force the railroads, and hence, indirectly the public, of one section of the country to subsidize the transportation system of another section, without some showing of special circumstances that would justify and require shifting the burden of one section to another.

On February 3, 1965, and May 18, 1965, the Commission issued its orders in this case. The Commission did not give the Northern railroads the full 35 percent inflation which they requested; however, the orders involved here inflate the Northern railroads' divisions so that they receive, on the average, 17 percent more than the Southern railroads for the same amount and kind of service. These court proceedings were instituted to review the lawfulness of the Commission's prescription of this inflation.

The district court proceedings revolved principally about the question of whether the Commission's reports lawfully resolved the issues which had been presented to it. In granting the Northern railroads' request for an in-

flated basis of divisions, the Commission had discussed at length the contention that territorial average costs did not measure the costs of handling North-South freight traffic. But it had rejected that contention largely on the ground that there was no choice but to use territorial average costs, since no other cost data were available to it which had been prepared on a comparable basis in both territories. Moreover, the Commission had virtually ignored our contention that the North's divisions should not be inflated even if their costs of handling North-South traffic were somewhat higher than the South's. On this point, the Commission had said that "an adherence to uniformity as such, without a careful evaluation of the statutory criteria and the evidence of record" would not be proper (325 I.C.C. at 27). But the Commission had nowhere attempted to evaluate the evidence and arguments which we advanced to support a continuation of the principle of uniformity.

The district court found legal defects in the Commission's treatment of both these aspects of the case. It first pointed out that the Commission's use of territorial average costs was not supported by reasoned findings or substantial evidence as required by the Administrative Procedure Act (B. & O. J.S. App. 25a). The district court then went on to observe that the Commission had failed to follow similar statutory requirements in dealing with our contention that bare differences in cost, even if properly found to exist, should not automatically be reflected in interterritorial divisions (B.&O. J.S. App. 18a). Accordingly, the district court's opinion provides that "upon remand, the Commission should decide and dispose of this contention in accordance with the Administrative Procedure Act" (B. & O. J.S. App. 19a).

NO SUBSTANTIAL ISSUE IS PRESENTED FOR PLENARY CONSIDERATION BY THIS COURT.

The basic issue presented by these appeals is whether the district court was correct in holding that the Commission could not prescribe a basis of divisions on North-South freight traffic which would compel the South to subsidize the Northern railroads without supporting that action with reasoned findings supported by substantial evidence.

In dealing with this issue, it is important to keep in mind the fact that the action of the Commission in prescribing such an inflated basis of divisions is as novel as it is far-reaching. Indeed, the South is the only section of the country which has been called upon to support the transportation system of another section. The equal-factor divisions prescribed for application between the North and Southwest in *Official—Southwestern Divisions*, 287 I.C.C. 533 (1953), have never been challenged and are still in effect. The Commission also prescribed equal-factor divisions for application between the North and the Midwest in *Official—Western Trunk Lines Divisions*, 316 I.C.C. 351 (1962), and although the particular scale prescribed in that case was set aside as improperly constructed (*Atchison, Topeka & Santa Fe Ry. Co. v. United States*, 225 F.Supp. 584 (1965), it has since been replaced with another equal-factor scale by mutual agreement (see agreement attached to Joint Petition to Dismiss in Docket No. 34515, dated March 25, 1966), which agreement was formally approved by order of the Commission dated April 8, 1966.

The only inflated basis of interterritorial divisions now in effect other than the one at issue in this case was prescribed in the *Transcontinental Divisions* case for application between Mountain-Pacific territory and the Midwest where different rate levels are also in effect (*Akron,*

Canton & Youngstown R. Co., et al v. Atchison, Topeka & Santa Fe Ry. Co., et al., 321 I.C.C. 17 (1963)).[1] Since the inflation in the transcontinental divisions of the Mountain-Pacific railroads is specifically based upon and justified by higher rates in that territory, that inflation amounts to nothing more than an arrangement whereby the Mountain-Pacific railroads can retain the higher rates paid by the people of that territory — a fact which the Commission itself recognized and relied upon in prescribing the inflation (321 I.C.C. at 77). Hence, the South is the only section of the country being forced to subsidize the railroads of another section through inflated divisions unrelated to higher rates in effect in that section.

In setting aside the Commission's orders in this case, the district court did not reach the ultimate question of whether there are limits upon the statutory power of the Commission to force one section of the country to support another. However, the district court did quite properly take note of the fact that this would be the effect of the orders here. This Court should also keep this fact in the forefront of its consideration of this case, for the issue here is not simply whether the Commission has lawfully divided a sum of money between two groups of railroads, but, rather, whether it has made findings based upon substantial evidence, to justify orders which introduce the wholly unprecedented concept that the railroads of one section of the country should be supported by the people of another section. We submit that the correct resolution

[1] This was the order which was upheld by this Court in *Chicago & North Western Ry. Co.* v. *Atchison, Topeka & Santa Fe Ry. Co.* 387 U.S. 326 (1967). The divisions prescribed by the Commission between the North and Mountain-Pacific territory in that case, which were not brought before this Court, were based upon point-to-point percentages making it difficult to relate service performed to the divisions prescribed. However, the Northern railroads themselves have subsequently described these divisions as roughly equivalent to the equal-factor divisions in effect between the North and the South prior to the orders involved in this case.

of this issue is so clear that this case does not warrant plenary consideration.

I. THE DISTRICT COURT CORRECTLY SET ASIDE THE COMMISSION'S COST FINDINGS AS ARBITRARY AND UNSUPPORTED BY SUBSTANTIAL EVIDENCE.

The main contention of both of the Jurisdictional Statements filed in this case is that the district court somehow invaded the province of the Interstate Commerce Commission and made that agency's performance of its task more difficult by holding that the Commission had acted arbitrarily and without the support of substantial evidence in using Rail Form A territorial average costs as equivalent to the costs of handling North-South freight traffic on several critical cost issues. Neither of the appellants actually seeks to demonstrate that there was substantial evidence to support the Commission's action, and neither suggests that this Court should itself review the record to determine whether such evidence exists. Instead, they seek a holding that the Commission was entitled to do what it did without regard to what was or was not in the record. We shall show that this contention is without merit; but, before doing so, the whole issue of cost measurement must be put in perspective.

The single most important fact about Rail Form A average costs is that these average costs tend to vary directly with the degree of industrialization in the areas served by the railroads for which costs are being computed — that is, the greater the degree of industrialization in any area, the higher the Rail Form A average costs of the railroads serving that area. The reason for this correlation between Rail Form A average costs and the degree of industrialization in an area is that, with few exceptions, it costs considerably more to handle manu-

factured goods than to handle raw materials. Special equipment must be used to handle many manufactured articles — equipment which is more expensive, which usually requires greater maintenance, and which almost invariably has a much higher than average empty return ratio because it is not suitable for any return haul. Raw materials, on the other hand, usually move in the least expensive equipment in multi-carload quantities which permit a considerable saving in switching expense per car. Moreover, a high degree of industrialization in an area also often forces the railroad serving that area to perform other expensive services, such as commuter passenger service, which increase the Rail Form A average costs of railroads serving the more industrialized areas.

The railroads serving the Northeastern portion of the United States handle far more manufactured traffic than any other group of railroads in the country. The concentration of basic industry, such as iron and steel, in the Northeast is well known. But the dominance of that section of the country is even greater with respect to the manufacture of durable consumer goods, such as automobiles. Nearly all of the automobile parts used throughout the country are manufactured in the North. Hence there is a very heavy movement of this important traffic both within the North and between the North and other sections of the country in which the Southern railroads do not participate. The South, on the other hand, is a deficit area with respect to most manufactured goods, so the movement of such goods within the South without the participation of the Northern railroads is much more limited.

The result of this substantial difference in the degree of industrialization and, therefore, in the amount of manufactured traffic moving, in the North and in the South is that the Rail Form A average costs of the Northern railroads are the highest of any railroads in the coun-

try and the average costs of the railroads serving the South are the lowest. (The Western railroads, serving an area less industrialized than the Northeast but more industrialized than the South, show average rail costs precisely in line with that degree of industrialization.) The following table graphically depicts this situation: [2]

	Per Capita Value Added by Manufacture (1956)	*Rail Form A Territorial Average Costs (1956)*
Official Territory	229	122
Western Territory	118	115
Southern Territory	100	100

This table shows a clear correlation between the degree of industrialization of an area and the Rail Form A average costs of the railroads that serve it. Of course, the correlation is not a perfect one, since other factors also influence Rail Form A average costs. In the North, for example, the inflating influence of manufactured traffic is partially offset by the greater amounts of coal traffic handled by the Northern railroads, since coal is one of the cheapest commodities to handle. And in the West, the inflating influence of manufactured traffic is only one of several factors (such as the necessity for crossing mountain ranges) which contribute to the higher cost level of those railroads. However, in each case, it is clear that the degree of industrialization of any section of the country is an important factor influencing the level of the Rail Form A average costs of its railroads.

Since the level of Rail Form A average costs is influenced so greatly by the degree of industrialization of the area served, such average costs do not precisely measure either the actual costs to a single railroad of carrying a single commodity or the relative costs of two

[2] Table based upon data set forth in V.S. No. 15, Exs. 1 and 5 and costs constructed from the Commission's Statement 2-58, which was used by the Commission here (see B.&O. J.S. App. 67a). The indexes were constructed by treating Southern figures as 100 and calculating percentage deviations for the North and the West.

groups of railroads in carrying the same commodity or commodities. No commodity will have cost characteristics precisely identical to the theoretical average commodity, even in a single territory; nor will the Rail Form A averages for any two groups of railroads be based upon the same amount and kind of service in both territories. Consequently, in any case in which the critical issue is the cost of service in handling a particular commodity or the relative cost of service in handling the same commodity in two territories, Rail Form A average costs do not necessarily measure the costs of the shipments at issue.

In this case, of course, the cost issue before the Commission was the relative costs of the Northern and Southern railroads in handling North-South freight traffic — a defined body of traffic which by definition consists of the same carloads of freight in both territories. Since about one-half of this traffic originates in the industrial North, it contains a higher percentage of the more costly to handle manufactured goods which predominate in that territory than the average traffic handled by the Southern railroads. On the other hand, since roughly one-half of the North-South traffic originates in the South, it is also true that such traffic contains a higher percentage of cheaper to handle raw materials than the average traffic handled by the Northern railroads.

Notwithstanding these obvious differences between North-South traffic and territorial average traffic in the North and the South, the Northern railroads sought to rely upon the unadjusted Rail Form A averages for those two territories as measuring the costs of North-South traffic and justifying an inflation in their divisions. The Southern railroads resisted this theory and sought to show that Rail Form A average costs reflect substantial differences in the kinds of service being performed in the

two territories. Where the service in the two territories is the same, as it is on North-South traffic which is the same traffic moving in both territories, the Southern railroads contended that the costs of the Northern railroads were no higher than Southern costs. And in support of this conclusion, the Southern railroads showed a number of instances in which the higher Rail Form A averages were the product of differences in the kinds of service performed in the two territories, such as the inclusion in the averages of commuter passenger deficits, the distortion of the Northern territorial average empty return ratios caused by the heavy movement of automobile parts in the North, the distortion in their own switching costs caused by heavy intraterritorial movements of raw materials in bulk, and so on.

The district court specifically relied upon these differences between North-South freight traffic and territorial average traffic in the North and South in setting aside the Commission's orders, pointing out that under the Commission's own standard, it could not ignore these differences and rely exclusively upon averages (B.&O. J.S. App. 25a):

> "Evidence of overall territorial averages surely can and should be considered, but as to specific important cost items the Commission should not wholly and exclusively rely on such averages. *United States v. Abilene and Southern R.R. Co.* 265 U.S. 274; *Atchison, Topeka and Santa Fe Ry. Co. v. United States*, 225 F. Supp. 584. The Commission stated its exclusive standard to be the relevant cost of handling the specific freight traffic to which the divisions apply. We are persuaded that the order is not based on substantial evidence nor supported by reasoned findings within the meaning of Sections 8(b) and 10 (e) of the Administrative Procedure Act because the use of territorial averages accounting for the Northern inflation has not been supported with find-

ings of evidence relating any such inflation to the North-South freight traffic."

When the issues now sought to be presented by the appellants in this case are considered against this background, it is apparent that the Commission's action in prescribing an inflation in the divisions of the Northern railroads based exclusively upon unadjusted Rail Form A averages is vitiated by serious legal defects and that the district court was eminently correct in setting that action aside. The dispute between the Northern and the Southern railroads brought directly into issue the accuracy of Rail Form A averages as a measure of the relative costs of the two groups of railroads in handling North-South traffic. Hence, the Commission had a plain duty to resolve that issue; but this was a duty which the Commission completely failed to perform. After making some minor adjustments in the Rail Form A averages, the Commission proceeded to reject each and every one of the Southern railroads' principal cost adjustments, not on the basis of any evidence that Rail Form A did accurately measure the relative costs with respect to the particular factor involved, but largely because no other data were available showing costs on a comparable basis in both territories,[3] or because the Southern railroads were unable to show the precise extent to which the Rail Form A averages distorted a particular cost factor.[4] The Commission thus simply *assumed* that Rail Form A averages

[3] For instances in which the evidence of the Southern railroads was rejected for a lack of "comparable" data for the North, see 325 I.C.C. at 69 (refrigerator car empty return ratios); 325 I.C.C. at 76 (switching costs); 325 I.C.C. at 60 (count of cars interchanged). See also 325 I.C.C. at 66, where the Commission reached a similar result due to an absence of "adequate" data (box car empty return ratios).

[4] The Commission relied upon this kind of consideration in rejecting the Southern railroads' adjustment of border interchange costs as an "estimate" (325 I.C.C. at 81) and insisting upon use of the territorial averages, which were 58% higher in the North, despite undisputed evidence that these averages were not applicable, simply because a precise showing of actual border interchange costs had not been made.

measure the costs of handling North-South freight traffic without making any findings on the material issues raised to challenge that assumption and without evidence to show that such averages were applicable. In setting this action aside, the district court did nothing more than it was absolutely required to do by the Administrative Procedure Act.

Section 8(b) of the Administrative Procedure Act provides that the Commission's decisions must "include a statement of (1) findings and conclusions, as well as the reasons or basis therefor, upon all the material issues of fact, law, or discretion presented on the record . . ." (5 U.S.C. § 557(c)). Section 10(e) of that Act provides that Commission action shall be held unlawful and set aside where its findings are "unsupported by substantial evidence" and where found to be "arbitrary, capricious, and abuse of discretion, or otherwise not in accordance with law" (5 U.S.C. § 706). This Court has repeatedly held that these requirements are to be strictly enforced. *Burlington Truck Lines, Inc.* v. *United States*, 371 U.S. 156 (1962); *Gilbertville Trucking Co.* v. *United States*, 371 U.S. 115, 130 (1962).

Although both appellants contend otherwise, the district court's decision enforcing these provisions of the Administrative Procedure Act will in no way impair the ability of the Commission to administer the Interstate Commerce Act. The Commission does not use, and could not rationally use, Rail Form A average costs as the automatic cost formula to resolve all of the cost issues which come before it. Quite the contrary, as appellants themselves admit (B.&O. J.S., p. 13), from the very inception of the Rail Form A cost formula, the Commission has recognized that "The ascertainment of the costs of transporting a particular commodity over a single railroad or group of roads, for instance, obviously requires more re-

finement in procedure . . .". (*Class Rate Investigation, 1939*, 262 I.C.C. 447, 693 (1945)). Hence, the Commission can and does adjust Rail Form A average costs in most of the cases in which a precise determination of cost of service is a vital issue.

Midwest Emery Freight System, Inc. v. *Baltimore & R. Co.*, 321 I.C.C. 637 (1964), is an excellent example of the typical approach of the Commission. In the *Midwest Emery* case, the Commission made numerous cost adjustments to determine the costs of the particular traffic involved in that case, including a radical adjustment in the empty return ratio (from the territorial average of 79 percent to 13.7 percent) on the basis of a special study submitted by the railroads of their actual experience in handling that traffic (321 I.C.C. at 650). In making this adjustment, the Commission specifically repudiated the claim that Rail Form A territorial averages automatically produce "reasonably accurate criteria of the ratio of the empty to the loaded movement of the cars utilized by the defendants in the instant service" (*ibid.*).

The Commission has repeatedly used the same approach in cases where the issue was the cost of handling a single commodity, including a number of divisions cases involving adjustments of the very cost factors which the Commission refused to adjust here. In *Louisville & Nashville R. Co.* v. *Southern Ry. Co.* 319 I.C.C. 639 (1963), for example, a case involving the divisions of coal rates, the Commission made a substantial adjustment of Rail Form A averages with respect to car costs. And in *Illinois Central R. Co. v. Great Northern R. Co.*, I.C.C. (decided August 7, 1967), involving divisions of calcined alumina rates, the Commission prescribed divisions based upon costs reflecting several adjustments, including an adjustment to give effect to the fact that the traffic at issue required "less than average engine minutes per car in origin and destination switching."

The only cases in which the Commission has intimated that Rail Form A average costs might constitute an acceptable measure of controverted costs are the relatively rare cases involving territory-wide rates or divisions. And even in this limited kind of case, the Commission has never gone so far as to hold that Rail Form A averages can be accepted automatically without supporting evidence showing their applicability to the traffic at issue. Hence, in virtually every one of the territory-wide cases, the Commission has made some adjustment in the averages, even while stating that because a wide and varied body of traffic was involved, it may not have had to go beyond Rail Form A averages to obtain a workable measure of the actual costs of the traffic involved. Indeed, the Commission recognized the principle that adjustments must be made in Rail Form A averages in this case, for it did make some such adjustments. Thus, with respect even to territory-wide cases, Commission counsel's contention that Rail Form A averages constitute an automatically applicable measure of the costs of particular traffic (I.C.C. J.S. p. 12, note 13) is contrary to what the Commission itself has been doing and what it did in this very case. In view of this established practice of the Commission, it is apparent that the approach now urged for territory-wide cases by Commission counsel is as unnecessary to the administration of the Interstate Commerce Act as it is unsound.[5]

---

[5] Although it is true that North-South traffic has widespread origins and destinations throughout both of these territories and, consequently, uses most of the rail facilities in the two territories, it does not follow at all that the average costs of all traffic handled by the Northern and Southern railroads is equivalent to their costs in handling North-South traffic. In the first place, it is plain that some rail facilities which affect the overall territorial averages have no bearing at all upon the costs of handling North-South freight traffic; the many items which the Commission itself acknowledged as being solely related to the Northern suburban passenger deficit are a clear example of this kind of facility. More importantly, even though North-South traffic uses most of the

Certainly, there is no conceptual difference between finding the actual costs of a wide and varied body of traffic and finding the actual costs of handling a particular commodity. The Commission, therefore, plainly could have used the same cost approach here that it used in *Midwest Emery, Louisville & Nashville and Illinois Central.* Nor would this approach have placed an undue burden upon the Commission. Although this case involves a much larger volume of traffic than was involved in any of those cases, the cost issues raised here are actually no broader or more difficult. The only difference is that in those cases the Commission resolved the cost issues on the basis of the evidence of record and here it ignored the evidence and accepted unsupported averages.

All three of those cases, of course, involved a situation in which the railroads voluntarily came forward with data as to their specific costs in handling particular traffic. But this fact cannot conceivably be regarded as distinguishing the present case, for in *Interstate Commerce Commission* v. *New York, New Haven & Hartford R. Co.*, 372 U.S. 744 (1963), this Court expressly held that carriers have a duty to bring forward such information (372 U.S. at 760, note 12):

> "Of course, when such an issue is raised, each carrier should bring forward the data relating to its own costs that are required for the resolution of the issue."

---

facilities in the North and the South, expensive facilities as well as cheap ones, it cannot be assumed that this use of facilities occurs in the same proportion with respect to North-South traffic that it occurs with respect to the average of all traffic. Plainly, the single most important determining factor in the territorial average costs of a group of railroads is the degree to which it must use expensive facilities, (such as special purpose box cars) or perform expensive services (such as switching cars in single-car lots), and just as plainly there need be no connection between the degree to which this need arises on average traffic and on any particular segment of traffic, regardless of how widespread the origins and destinations of that traffic may be.

Hence, it is irrelevant whether carriers volunteer specific cost data; if they do not, the Commission has ample authority to require it. And the Commission has exercised that authority on numerous occasions by requiring the parties to produce special data on the traffic involved to permit a more precise determination of costs.

In *Boston and Maine R. Co.* v. *United States*, 162 F. Supp. 289 (D. Mass. 1958), for example, the court set aside a Commission order for failure to resolve cost issues in the determination of freight car rentals where the Commission possessed ample power "to turn the matter over to its accounting staff for investigation." On appeal by other parties, the Commission declined to defend its action and advised the Supreme Court of its readiness to "proceed in accordance with the terms of the remand" (358 U.S. 68, 71 (1958)). The Commission thereupon required the submission of adequate and comparable data from all railroads (Orders in I.C.C. Docket Nos. 31358 and 33145, *Railroad Freight Car per Diem Charges*).

We recognize, of course, that the mere fact that the Commission has been following this procedure voluntarily does not necessarily mean that it can be compelled to do so. But the many cases in which the Commission has adjusted cost averages on the basis of evidence and required evidence to make specific cost findings certainly show that Commission counsel are groping when they claim that such an approach to cost issues is unworkable. Plainly it is not. There can be no real doubt, therefore, that the Commission could have adopted such an approach here, rather than let this important case be determined by averages that have no real relation to its issues.

We submit that the district court was entirely correct in holding that, under the circumstances of this case, the Commission was required to compel the submission of adequate and comparable data, for nothing less would

satisfy the long-established principle that an administrative agency has an affirmative duty to see that a record is made which is adequate to permit it to assess and determine all of the public interest issues which arise out of the proceedings before it. Cf. *Udall v. FPC*, 387 U.S. 428 (1967). Commission counsel seek to make it appear that the district court went beyond this principle and required the Commission to embark "upon an independent investigation to determine whether the parties might be overlooking or concealing some relevant evidence" (I.C.C. J.S. p. 17). However, the district court held no such thing, but, instead, made it clear that the Commission was free to decide for itself how it would discharge its responsibility "to require the development of adequate and comparable cost data" (B.&O. J.S. App. 29a).

The Commission is well aware that this process need involve no independent effort on the part of its staff. In other proceedings, where the Commission has found the record to be inadequate, it has recognized this fact. Thus, in *Increased LTL, AQ and TL Rates To, From and Between New England Territory*, I.C.C. Docket No. 34454, where the Commission did not consider the data based on the various cost studies to be probative of the cost picture for New England carriers for New England operations, the Commission issued a series of special orders requiring that the carriers produce the data which it desired. When they failed to do so, the Commission denied them the rate increase which they sought (329 I.C.C. 244 (1966)). The Commission has thus demonstrated that it has ample power to discharge its responsibility to make certain that all relevant facts are disclosed in the record upon which it is to act.

There is nothing whatever inconsistent with this view of the Commission's responsibility in dealing with the issues of relative cost of service in any of this Court's

prior decisions. Certainly, neither *New York* v. *United States,* 331 U.S. 284 (1947) nor *Chicago & North Western Ry. Co.* v. *Atchison, Topeka & Santa Fe Ry. Co.,* 387 U.S. 326 (1967), relied upon by Commission counsel (I.C.C. J.S. p. 11), supports the view that Rail Form A average costs may be used to support a finding as to the costs of any particular body of traffic without independent evidence that such averages are actually applicable.

In *New York* v. *United States,* the issue before the Commission was much broader than the costs of any particular body of traffic, since the whole basic class rate structure was involved, and the principal claim of discrimination in that case was not in the handling of a particular body of traffic that had moved but in the fact that the higher class rates in the South had *prevented* traffic from moving (331 U.S. at 307-308). Hence, the issue in that case was not the costs of a particular body of traffic but the general rail costs of the territories involved, for which Rail Form A averages are much more suitable. To be sure, the averages still should have been adjusted to rule out any distorting effect of different traffic consists in the two territories, but this Court expressly found these effects had been eliminated (331 U.S. at 317). This finding clearly distinguishes the present case from *New York* v. *United States,* for it means that in that case, the record did affirmatively show that average costs were appropriate for the purpose for which they were used.

The *Chicago & North Western* case involved a precisely similar situation, for there too the Court found and expressly relied upon independent evidence in the record supporting the applicability of the Rail Form A averages to the traffic at issue. The cost issues in *Chicago & North Western* related to the Commission's use of territorial average empty return ratios and maintenance of

way and structures expense. As to the former, this Court expressly pointed out that the "Midwestern carriers . . . had come forward with specific empty-return data" (387 U.S. at 355). As to the latter, the Court upheld the Commission's finding against an attack based upon the contention that the Commission had relied upon erroneous factual premises. The Court itself reviewed the record and necessarily found the factual premises not to be erroneous (387 U.S. at 355-356).

The approach used by this Court in reviewing the record in *New York* v. *United States* and in *Chicago & North Western* is precisely the approach used by the district court here. The Commission's action in each case has been judged on the basis of the facts in the particular record upon which it was based. This approach imposes no unusual burden upon the Commission, for it requires only that the Commission comply with the Administrative Procedure Act and support its action with reasoned findings based upon substantial evidence.[6] And the existence of this kind of judicial review vindicates, rather than impugns, the integrity of the Rail Form A cost formula, despite Commission counsel's efforts to make it appear otherwise (I.C.C. J.S. pp. 10-13), for without such review, the formula might become a weapon to subvert the very principle which it was created to serve.

[6] Commission counsel are clearly wrong when they urge that there is more fairness in cost determinations based upon Rail Form A average costs than there would be in determinations based upon special studies, simply because "Rail Form A data is readily available, and does not include the biases which special studies conducted by the contesting parties might understandably reflect" (I.C.C. J.S. p. 12). The fact is, of course, that Rail Form A itself has substantial biases against any under-industrialized section. If the Commission can use Rail Form A averages to inflate the divisions of railroads of one section of the country without any evidence that they apply to the traffic involved, the more highly industrialized sections of the country are certain to gain a substantial advantage over the South. We think that this fact alone is enough to require the Commission to decide these cases on the basis of the evidence of record.

That, of course, is precisely what would have happened here, but for the decision of the district court. The Commission's Cost Section was created and Rail Form A devised at the urging of these very appellees to destroy the myth that the North was entitled to preferential class rates. Rail Form A was properly applied in that case and accomplished that purpose. But now the Commission would permit the formula to destroy the very good which it made possible by accepting an uncritical application of the averages produced by the formula to a situation in which such averages have no factual basis. Rail Form A was never intended to have such application.

II. THE COMMISSION COMMITTED REPEATED VIOLATIONS OF THE ADMINISTRATIVE PROCEDURE ACT IN DEALING WITH THE QUESTION OF WHETHER THE CLAIMED HIGHER NORTHERN RAIL COSTS ARE THE PRODUCT OF INHERENT TERRITORIAL DISADVANTAGES.

Since the cost of handling North-South freight traffic was not properly shown to be any higher in the North than in the South, the district court was clearly correct in setting aside the inflation prescribed in the Northern railroads' divisions on the sole basis of such unsupported cost conclusions. However, the correctness of the district court's judgment does not depend upon this aspect of its opinion. For even if the costs of the Northern railroads had been shown to be somewhat higher than those of the Southern railroads, neither the evidence of record nor any findings in the Commission's report support the Commission's action in prescribing divisions based upon such higher costs.

If it is assumed that the Northern railroads actually do experience higher costs for like service in handling North-South freight traffic, there are at least three pos-

sible reasons that might explain these higher costs. They are:

(1) That for reasons of greater efficiency, the Southern railroads are able to perform rail service cheaper than the Northern railroads under substantially identical conditions in the two territories;

(2) That differences in economic conditions in the two territories, specifically higher wage and tax levels unrelated to any difference in levels of productivity in the North, make costs higher in the North even though the two groups of railroads are equally efficient, and even though all other conditions affecting transportation costs in the two territories are substantially identical; and,

(3) That there are inherent differences in transportation conditions in the two territories that make the costs of rail service higher in the North without regard to the relative efficiency of the two groups of railroads, or to the economic conditions prevailing in either territory at any particular moment.

Throughout the proceedings before the Interstate Commerce Commission, these appellees have taken the position that the only cost differences that should be reflected in interterritorial divisions are those in the third category above—that is, cost differences related to inherent differences in transportation conditions.

Section 15(6) of the Interstate Commerce Act (49 U.S.C. §15(6)) does not authorize the Commission to prescribe divisions based upon relative cost of service without regard to the reasons underlying cost differences or the consequences of prescribing divisions based upon such differences. Although the section clearly permits the Commission to consider costs, it also specifically directs the Commission's attention "to the efficiency with which the carriers concerned are operated" and to "the im-

portance to the public of the transportation services of such carriers." Thus, in any case in which inflated divisions are sought on the basis of claimed higher costs, the plain duty of the Commission under Section 15(6) is to consider the reasons for such higher costs and the consequences to the public of basing divisions upon such costs.

We recognize, of course, that Section 15(6) does not say that the Commission may never prescribe divisions based upon costs that are inflated by inefficiency or divisions that would have an adverse impact upon the economy of one section of the country. However, the plain purpose of the section is to limit the situations in which that can be done to those involving a showing of special circumstances and to require the Commission carefully to consider and explain the consequences of such action. Here, the record contains no showing which even attempts to justify inflated divisions based upon cost differences in the first category above — that is, those growing out of differing levels of efficiency. Consequently, we contended before the Commission that it must examine any cost differences found to exist and determine whether such differences were the product of differing levels of efficiency. Similarly, we contended that, on the record in this case, the "importance to the public" criterion of Section 15(6) is inconsistent with the prescription of inflated divisions based upon cost differences in the second category above — that is, those growing out of different economic conditions in two sections of the country — since such an inflation could only perpetuate the difference in economic conditions upon which it was based. In this connection, we relied upon the decision of this Court in *New York* v. *United States*. As the Court said in that case, if a discrimination "is not justified by territorial conditions, then its continued maintenance preserves not the natural advantages of one region but man-made trade barriers which have been imposed upon the country" (331 U.S. at 315).

It is now substantially undisputed that the Commission did not lawfully dispose of the issues raised by our contention that the claimed higher Northern costs were not the product of inherent territorial disadvantages. The Commission simply assumed these issues away, saying, "other factors being equal, cost differences generally are the product of and reflect, the inherent advantages and disadvantages that go to make up the respective overall transportation conditions in the two territories" (325 I.C.C. at 27).

In setting aside the Commission's orders, the district court pointed out that this portion of the Commission's report was so vague that the parties could not even agree as to what the Commission had held. It then went on to observe (B. & O. J.S. App. 18a-19a):

> "Surely, the Commission report should be so phrased that there be no room for such a dispute as this. We have read the language carefully and we have some hesitation in saying which interpretation is correct. The question of whether a showing of inherent disadvantages is prerequisite to an increase in territorial divisions is, at least in the first instance, a question for the Commission. If, as petitioners read the report, the Commission has held that such a showing is necessary, then this Court need only consider whether in view of such a test, the requirements of reasoned findings and substantial evidence of Sections 8(b) and 10(e) of the Administrative Procedure Act have been met. If, on the other hand, as defendants contend, the Commission has made no holding on the question of inherent disadvantages, the Court must consider whether the Commission's failure to resolve the material issue raised with respect to that question can be reconciled with the express requirement of Section 8(b). We are considering not a restriction upon the statutory powers of the Commission to make divisions, but whether the Commission followed requirements of the Administrative Procedure Act. The Administrative Pro-

cedure Act requires findings on material issues of law. *N.L.R.B. v. Hearst Publications*, 322 U.S. 111 (1944). If, as plaintiffs assert, the Commission has held that a showing of inherent disadvantages is a pre-requisite to an increase in territorial divisions, then the Commission's conclusion (that higher Northern costs reflect inherent territorial disadvantages) is subject to attack because there are no findings as to what these inherent territorial disadvantages consisted of."

The district court's holding is clearly correct. The Commission had a plain duty, arising both from the issues presented to it by the parties and from the provisions of Section 15(6), to determine whether the cost differences which it found to exist were the product of inherent territorial differences between the North and the South. The Commission's perfunctory assumption that all cost differences reflect inherent territorial differences hardly satisfied that duty. Indeed, although counsel for the Commission seek to take some advantage of this assumption here (I.C.C. J.S. p.24, note 24), the district court was told, as its opinion points out (B. & O. J.S. App. 18a), "that the Commission made no finding on this question at all and were simply commenting on Interveners' contention." [7]

Moreover, as the district court found, the Commission did not make the findings necessary to support the conclusion that the North suffers from inherent disadvantages. The Commission did not find that all other factors that affect costs other than inherent territorial differences are in fact equal. Quite the contrary, it implicitly recognized that there are major inefficiencies in the Northern

---

[7] Commission counsel's characterization of the district court's discussion of this issue as "quixotic" is neither accurate nor fair. The district court responded quite directly and succinctly to the issues presented in the briefs filed before it. In order to make it appear otherwise, Commission counsel have now changed their position and seek to obscure the plain representations made to the district court (Compare Brief of I.C.C. before the district court, pp. 79-80, with I.C.C. J.S., p. 24, note 24).

railroad system in the form of overcapacity that had to be and were being eliminated. And the Commission made no finding at all as to the relative economic conditions in the two territories, even though the Northern railroads pointed to such differences as the major reason for their claimed higher costs. This treatment of the question of whether the claimed higher Northern costs are the product of inherent territorial disadvantages clearly failed to satisfy the requirements of either Section 15(6) or the Administrative Procedure Act.

In the first place, the Commission's conclusion improperly ignored the undisputed evidence of record that the Northern costs of record were substantially higher than they need be, or will be in the very near future, because of overcapacity in the Northern rail system. The Northern railroads have in effect admitted that their rail system suffers from overcapacity to a greater extent than that of any other part of the country. In a series of important control and merger applications, they have repeatedly urged the Commission to allow them to effect major consolidations which would permit elimination of many duplicate facilities and produce vast savings. See, e.g., *Chesapeake & Ohio R. Co. — Control — Baltimore & Ohio R. Co.*, 317 I.C.C. 261 (1962); *Norfolk & Western Ry. Co. and New York C. & St. L. R. Co. — Merger*, 324 I.C.C. 1 (1964); *Pennsylvania R. Co. — Merger — New York Central R. Co.*, 327 I.C.C. 475 (1966); *Norfolk & Western Ry. Co. — Merger — Chesapeake & Ohio R. Co.*, I.C.C. Finance Docket No. 23832, now pending. These applications, aimed to bring about a complete realignment of the Northern railroads into two systems, have each been expressly predicated upon the view that maintenance of the existing rail system in the North would be wasteful in view of permanent changes that have rendered large parts of this system virtually useless.

The existence of substantial overcapacity in the Northern railroad system was recognized in the *Penn-Central Merger* case (*Pennsylvania R. Co.—Merger—New York Central R. Co.*, 327 I.C.C. 475 (1966)), where the Commission relied explicitly upon Northern railroad overcapacity as a ground for approving that merger (327 I.C.C. at 512):

> "The Eastern District has, at this time, an oversupply of rail facilities inasmuch as the total volume of rail traffic in the district does not adequately support the existing railroad plant regardless of how the traffic may be apportioned or diverted from one railroad to another." [8]

---

[8] The examiners' Recommended Report in the *Penn-Central Merger* case was even more explicit in its recognition of the cause of the Northern railroads' problems (*Proposed Merger of Pennsylvania and New York Central Railroads*, (F.D. 21989, p. 198)):

> "We believe that one of the primary explanations for this trend [the massive decline of rail traffic in the North] lies in the changing structure and location of industry in the Eastern District and the nation as a whole or the 'industrial mix'. Historically, the Eastern District has been noted for its heavy industry, and the fact that it has supplied the nation with steel and other basic items which have previously moved by rail from Pittsburgh and other eastern industrial points to the western, northern and southern extremities of the nation. The growth of major population centers throughout the nation, however, which are able to support the necessary high fixed investment of heavy industry has caused a certain degree of 'decentralization' of industry. This, in many instances, has eliminated, or at least restricted, eastern producers from such markets and thereby curtailed the use of rail service to some undocumented extent.
>
> "Of equal and possibly of more importance, areas such as New England have lost a substantial portion of heavy industry which has been replaced to a major extent by light industrial production such as electronics and electronic components. As light industry generally requires less transportation for its output as well as lower material per employee, such manufacturing is not the best source of rail traffic."

In its decision the Commission expressly embraced these findings and made them its own, ordering this part of the Examiners' report "bound in printed form in the permanent series of Interstate Commerce Commission reports" (327 I.C.C. at 481).

In upholding the Penn-Central merger and permitting its prompt consummation, this Court also pointed to and relied upon this purpose of the merger to bring about "the rationalization and elimination of some of the dual facilities and services in various areas and in various respects." *Penn-Central and N & W Inclusion Cases*, — U.S. — (decided January 15, 1968).

Largely as a result of the elimination of overcapacity, the Commission found that effectuation of the Penn-Central merger would eventually result in savings in excess of $80 million a year (327 I.C.C. at 501). The Norfolk & Western-Nickel Plate-Wabash merger was found to produce savings of $29 million a year (324 I.C.C. at 80). The C&O - B&O control arrangement was found to produce savings of $44 million a year, with the possibility of substantial additional savings when those two roads are eventually merged (317 I.C.C. at 277). The N&W - C&O merger would produce further savings of $36 million a year, with the possibility of still further savings in the amount of $12 million a year from the inclusion of other railroads.

The record in this case was closed prior to the approval of any of these consolidations, and it does not therefore reflect the elimination either of the overcapacity that has already been achieved through mergers that have since been consummated or any of the other overcapacity currently being considered by the Commission in other Northern merger proceedings.[9] However, the record does

[9] In view of this fact, the district court was clearly correct in suggesting that, upon remand, a reopening of the record for additional evidence "might well be warranted" (B.&O. J.S. App. 32a). The court did not hold that the staleness of the record was a ground for setting aside the Commission's orders, but only that, since the case must go back anyway, the record ought to be brought up to date to reflect the significant changes that have occurred. Commission counsel's contention that this suggestion "might result in the Commission's never being able to decide such cases on the basis of sufficiently recent data" (I.C.C. J.S., p. 19, note 18) only emphasizes the unsupported extremes to which counsel have gone in an effort to substance to this appeal.

reflect the existence of overcapacity in the North, and these appellees repeatedly urged the Commission to take this overcapacity into account in determining the reasons for any higher rail costs which it might find to exist in the North.

The Commission brushed the entire problem of Northern overcapacity aside because it found that *some* overcapacity exists in the Southern rail system, and because the savings to be realized from mergers were not immediately available, saying (325 I.C.C. at 17-18):

> "It is true the savings expected from proposed mergers and consolidations are not reflected in the cost studies of record. However, the southern lines themselves have noted that mergers are now going forward in all territories, including the South. If and when such proposed mergers are ultimately approved and finally consummated in both groups the savings produced thereby will be *then* reflected in the respective unit costs" (emphasis supplied).

This reasoning totally misses the point insofar as the question of whether the claimed higher Northern rail costs are the product of inherent territorial disadvantages. The existence of overcapacity in the railroad system of the North produces higher transportation costs in that territory, and this is flatly inconsistent with the Commission's conclusion that any higher costs found to exist are automatically attributable to inherent disadvantages in transportation conditions. This is so regardless of *when* the savings possible from the elimination of such overcapacity are to be realized. The critical fact is that a vast potential for savings exists and that this potential is much greater in the North than in the South. This fact alone is sufficient to undercut any conclusion that the Northern railroads' present problems are due to inherent disadvantages.

The failure of the Commission to give effect to its

own recognition that the Northern railroads' costs are inflated by substantial overcapacity renders its actions unlawful under both the Administrative Procedure Act and Section 15(6) of the Interstate Commerce Act. This failure left the Commission's action without the support of reasoned findings based upon substantial evidence as required by the former Act and without any effective consideration of the statutory criterion of relative efficiency as specified in Section 15(6). Moreover, the Commission's arbitrary action in disregarding Northern railroad overcapacity leaves the South in a position where it must support this kind of inefficiency. The very existence of a right to inflated revenues based upon overcapacity will tend to discourage its elimination. Thus, to that extent, the South will be forced to get along with less of a railroad system than it needs in order that the North may preserve more than it can economically use. The Commission's reports contain no answer to the critical questions posed by reliance upon costs inflated by overcapacity: Why should the North, as a railroad rate territory, be entitled to maintain, partly at the expense of the South, a rail transportation system for more extensive than that which the South can afford to support for itself? Why should the South be forced to subsidize the uneconomic consequences of attempting to maintain facilities that are partly unneeded in the North? And why should the people of the entire country be deprived of the benefits that flow from a unified national economy unhampered by artificial barriers that prevent the most efficient allocation of transportation resources?

The Commission's insistence upon treating the claimed higher Northern costs as reflecting inherent territorial disadvantages without even considering these questions was clearly arbitrary. But the arbitrary character of the Commission's treatment of the question of whether the claimed higher Northern rail costs are

the product of inherent territorial disadvantages extended beyond even this patently improper refusal to give effect to its own findings with respect to overcapacity. The Commission also refused to give effect to the fact that the Northern railroads themselves attributed their claimed higher costs, not to inherent territorial disadvantages in the North, but to different economic conditions prevailing in that section of the country.

Throughout these proceedings, the Northern railroads have stressed the higher wage and tax levels in the North as the reason for their claims of higher cost of service. Indeed, the same contention is advanced in the Northern railroads' Jurisdictional Statement here (B. & O. J.S., p. 22, note 12). Assuming this to be so, how is it possible to square higher costs caused by higher wage and tax levels with the Commission's conclusion that such higher costs "are the product of and reflect" inherent territorial disadvantages?

Differences in wages and tax levels are significant in rail costs only if the higher wages and taxes in the North are not offset by correspondingly greater productivity for capital and workers in the North. The record indicates that Northern wages and taxes are offset here by the substantially greater traffic density of the Northern railroads (V.S. No. 36, Ex. 1, p. 21). But even if this is not the case, the necessary effect of the prescribed inflation in the Northern railroads divisions is to force the South to subsidize higher wages and taxes for the North. We submit that such a subsidy is clearly inconsistent with the public interest.

If there is one thing clear from this Court's decision in *New York* v. *United States*, it is that differences in wage and tax levels not related to differing levels of productivity are not to be used as a justification for imposing administrative regulations that perpetuate differences be-

tween two sections of the country. Such regulations would constitute a classic trade barrier and relegate the less prosperous sections of the country to a permanently subordinate position. The higher Northern costs claimed here cannot therefore properly be regarded as the product of the inherent territorial disadvantage under the Northern railroads' own theory as to the reason for such higher costs.

In *New York* v. *United States,* the Interstate Commerce Commission found that there were no inherent differences in rail transportation conditions in the North and South, and this Court reached the same conclusion itself on the basis of a review of the record in that case (331 U. S. at 315). In departing from this conclusion here, on the basis of a record which contains no new evidence on this subject, and where no party even contended that such inherent territorial differences exist, the Commission has clearly acted arbitrarily. The district court's judgment requiring that, on remand, this matter be determined in accordance with reasoned findings based upon substantial evidence is therefore correct and should be sustained.

III. THE COMMISSION'S ACTION IN PRESCRIBING AN INFLATION IN THE NORTHERN RAILROADS' DIVISIONS VIOLATES THE ADMINISTRATIVE PROCEDURE ACT EVEN IF ITS CONCLUSION THAT THE NORTH SUFFERS FROM INHERENT TERRITORIAL DISADVANTAGES IS CORRECT.

The orders involved in this case are also unlawful under the Administrative Procedure Act on the further ground that the Commission failed to make findings which would justify the imposition of the burden of inherent Northern disadvantages upon the South, even if its conclusion that such disadvantages exist is accepted. As pointed out above, these appellees contended through-

out these proceedings that the burden of any inherent disadvantages found to exist in the North should be borne by the North, through higher Northern rates, rather than by the South, through inflated Northern divisions of uniform rates. When the Commission's examiners ignored this contention, we took specific exception to this aspect of their recommended report (Southern Governors' Exc. pp. 44-55). Thus, our Exception No. 4 took issue with the examiners' recommendation of an inflation for the Northern railroads on the ground that, as recommended by the examiners, "such an inflation would amount to an imposition of a part of the Northern transportation burden upon the Southern public without any finding that the North is incapable of supporting its own transportation system" (Southern Governors' Exc. pp. 44-45). Despite this specific exception, the Commission adopted the same tactic used by its examiners and simply ignored both our exception and the basic problem to which it was directed. *There is not a single word in the Commission's report which was directed to, or in any way responds to, our exception.*

The failure of the Commission to consider or even to attempt to explain why the North should not be compelled to support its own transportation system is an especially important legal defect in its orders here. Prior to this case, the Commission's own decisions had uniformly followed a principal of primary local responsibility, as originally announced in *New England Divisions*, 126 I.C.C. 579, 599 (1927). There the Commission said:

> "The dangers in (the) . . . assumption that deficiencies in local earnings must inevitably be made up on interchange business at the expense of connecting lines are obvious. Communities and the roads which serve them might too readily arrive at the conclusion that they are 'unable' to increase local rates and, in disregard of the principle of self-help, unduly rely upon others to carry this burden."

On the basis of this principle of primary local responsibility and the numerous cases which followed and applied it, we asked the Commission to adhere to the same principle here, or at least to explain to us why it could not do so. When the Commission did neither, but simply ignored the whole matter, it effectively attempted to change its whole approach to divisions cases without any explanation at all. The district court was plainly correct in holding that this was improper under this Court's decision in *Secretary of Agriculture* v. *United States*, 347 U.S. 645 (1949). As the court below pointed out (B. & O. J.S. App. 27a):

> ". . . for many years prior to this case the Commission has consistently followed the view that the primary responsibility for meeting the cost and revenue needs of the railroads of any territory lies with the people and the industry of that territory. *New England Divisions*, 126 I.C.C. 579, 599 (1927); *Divisions of Rates, Official and Southern Territories*, 234 I.C.C. 175, 190 (1939); *Official-Southern Divisions*, 287 I.C.C. 497, 523 (1953); *Akron, Canton & Youngstown R. Co.* v. *Atchison, T. & S.F. Ry. Co.*, 321 I.C.C. 17, 51 (1963). In this very case, prior to re-opening, the Commission held that the primary division of revenues accruing from this traffic were to be made on an equal-factor scale. We recognize that the Commission is not perpetually bound by their 1953 holding, but we do believe that the Commission has special responsibilities in a case of this magnitude when it departs from its prior finding (*Sec'y of Agriculture* v. *United States*, 347 U.S. 645."

This holding of the district court is clearly correct. Section 8(b) of the Administrative Procedure Act plainly condemns the action of the Commission in at least two separate respects. First, Section 8(b) requires that the Commission rule upon each exception presented to it:

> "Prior to each recommended, initial, or tentative decision, or decision upon agency review of the decision of subordinate officers the parties shall be

> afforded a reasonable opportunity to submit for the consideration of the officers participating in such decisions . . . (2) exceptions to the decisions or recommended decisions of subordinate officers or to tentative agency decisions. . . . *The record shall show the ruling upon each such . . . exception presented.*" (Emphasis supplied) (5 U.S.C. §1007(b))

The Commission was thus under a plain duty to make a ruling upon our Exception No. 4 and this it failed to do.[10] Secondly, Section 8(b) requires that the Commission support its action with reasoned findings. There is nothing which faintly resembles such findings in the reports here.

Furthermore, the Commission's action cannot stand under Section 10(e) of the Administrative Procedure Act, for there is absolutely no evidence in the record in this case to support the Commission's decision to compel the South to subsidize the rail transportation system of the North. Instead, the record in this case affirmatively shows that the South is in no position to assume a part of the burden of supporting the Northern railroads. The Commission's preoccupation with "Economic Trends" reflected in percentage of growth (325 I.C.C. at 12-16) seems to have closed its eyes completely to the fact that the South is still by far the poorest section of the entire country, measured by almost any economic indicator that one might choose, and that the North is by far the richest. Indeed, despite the phenomenal growth that has occurred in the South since the removal of the discriminatory class rates, our position relative to that of the North has changed very little.

---

[10] The view expressed by the courts is buttressed by the statement made by Representative Walter, as sponsor of the bill, when he explained the Administrative Procedure Act to the House of Representatives:

> "The record must show the official rulings of the agency upon each such finding, conclusion, or exception presented . . ." (92 Cong. Rec. 5653 (1946)).

The situation as it existed under the old class rate structure was summarized by this Court in its opinion in *New York* v. *United States* (331 U.S. at 310-313). There the Court first pointed out that as of 1939, "the great advance in the industrialization of Official Territory over the other territories need not be labored, for it is obvious," an observation the Court supported with the following data (331 U.S. at 310):

Territory	*Land Area 1940*	*Gainful Workers 1930*	*Value of Manufactured Products 1939*	*Value added by Manufacture, 1939*
Official	13.5	51.1	67.8	71.4
Southern	13.3	16.8	10.0	9.4
Western Trunk Line	20.9	13.5	9.9	8.7
Southwestern	14.2	9.3	4.5	3.3
Mountain Pacific	38.1	9.3	7.8	7.2
Total	100.0	100.0	100.0	100.0

The Court went on to show, again by a table setting forth the significant data, that the situation as of 1939 was no temporary phenomenon and, indeed, was getting worse when measured in absolute terms (331 U.S. at 311):

	Actual increase in total gainful workers 1910 to 1930	*Actual increase in value of products in all industries from 1909 to 1939*	*Actual increase in value added by manufacture in all manufacturing industries from 1909 to 1939*
Official	6,230,273	$23,561,190,000	$11,284,350,000
Southern	652,755	4,229,396,000	1,662,336,000
Western Trunk Line	904,986	3,117,079,000	1,284,798,000
Southwestern	1,011,151	1,942,378,000	580,388,000
Mountain-Pacific	1,863,419	3,320,930,000	1,341,785,000

The Court also discussed the significance of economic trends within the country in the following terms (331-313):

"The value added by manufacture in all industries from 1849 to 1939 is shown for all territories by the chart on the following page.

"From this chart it is apparent that Official Territory has maintained its commanding lead in spite of recent marked increases elsewhere, especially in the South. Similarly, for the period 1929 to 1939 the number of wage earners in manufacturing industries in the entire country decreased 11 per cent; in official territory, 12 per cent; while in the South there was an increase of 5 per cent. For the same period, values of manufactured products increased 1 per cent in the South, while they decreased 21 per cent for the entire country and 25 per cent in Official Territory. From 1930 to 1940, the number of gainfully occupied workers in manufacturing in Official Territory decreased from 70.5 per cent to 69.4 per cent of the nation's total, while in the South there was an increase from 10 per cent to 11.9 per cent. A number of manufacturing activities have increased more rapidly in the South than in Official Territory, though the reverse has been true in other industries. But in spite of the growth in industrial activities in the South and West (which appellants stress heavily), the percentage comparisons are not particularly revealing because of the great disparity between the bases on which they are computed.

"The fact remains that economic development in the South and West has lagged and still lags behind Official Territory. In 1940 the average annual dollar income per person employed in Official Territory was $1,988; in Southern $940; in Southwestern $1,177; in Western Trunk-Line $1,411. Official has 69 per cent of all workers engaged in manufacturing in the United States and 29 per cent of all workers in extractive industries. It has, for example, a high concentration in the manufacture of

steel and copper products, though less than 4 per cent of the iron ore reserves, and no reserves of metallic copper. The South and West furnish raw materials to Official and buy finished products back. They are also dependent to a great extent on the markets for their products in Official which has over 48 per cent of the population of the country, 76 per cent of the national market for industrial machinery and raw materials, 64 per cent for all goods and sources (sic), 62 per cent for consumer luxuries, and 53 per cent for consumer necessities."

The changes in this situation shown in this record do not even begin to bring about an equalization between the North and the South of the conditions described above. The 849 per cent increases shown in "Value Added by Manufacture" in the South between the year 1935 and 1956 (V.S. No. 15, Ex. No. 5) actually gives the South only 11.7 per cent of the "Value Added by Manufacture" in the country as a whole. This can be compared to the 9.4 per cent recited by the Court for the South in 1939 and the 71.4 per cent figure recited for North in the same year. The per capita statistics set out in the record (V.S. No. 15, Ex. No. 11) are to the same effect. In every category shown, the South still lags far behind the rest of the country in wealth as well as in its level of economic activity.

The Commission's orders in this case would effectively nullify the gains realized by the South as a result of the establishment of the principle of uniformity in *New York v. United States*. Although the orders here operate *directly* only upon the revenues of the railroads and not upon rates, an inflation in the Northern railroads' divisions on North-South freight traffic will inevitably have an impact not merely upon the Southern railroads' revenues but also upon the transportation system and, consequently the whole economy of the South. Because the earnings of the Southern railroads have consistently been

found by the Commission to be inadequate,[11] any action which would further reduce those rates of return for the benefit of the Northern railroads would necessarily result either in a diminution of rail services in the South, or in an increase in the rates which Southern shippers must pay for such services, or both.

It is obvious that the Southern railroads cannot spend money for maintenance and expansion of their services unless they have the money to spend. Consequently, if the Southern railroads have no excess revenues to spend for this purpose in their current earnings, a substantial decrease in those earnings would inevitably have an impact upon the railroads' operations.

The only alternative to a substantial diminution in the quality of rail service available to the people of the South would be a substantial increase in rates. Any substantial rate increase would obviously put these shippers at an even more serious disadvantage in their efforts to compete with shippers located closer to the center of population.

The extent of this unfairness becomes even more ap-

---

[11] The Commission has consistently stated in its own proceedings that the rates of return of the Southern railroads are inadequate. In *Increased Freight Rates, 1951*, 284 I.C.C. 589, 612 (1952) the Commission found rates of return of these railroads to be substandard, even though they were then substantially higher than they have been in recent years, saying:

> "Judged by any standard shown of record, the rates of return earned or prospectively to be earned by the railroads by the districts and regions specified in our former reports in this case, are substandard."

And only last year, in *Increased Freight Rates, 1967*, 329 I.C.C. 854 (1967), the Commission reiterated this finding (329 I.C.C. at 872) in holding that the Southern railroads were entitled to another general freight increase designed to generate the revenues necessary to permit them to maintain their current level of service.

parent when it is realized that the Northern railroads' primary duty is to serve the competitors of Southern industry. It is common knowledge that most of the buying power of the country is concentrated in the North and that, notwithstanding the substantial geographical disadvantage which must be overcome, industries located in other parts of the country must seek to reach that market. The Commission itself recognized this situation in its report in the *Class Rates* proceeding (262 I.C.C. at 696):

> "Official territory is the greatest consuming territory in the country, and is the market that nearly all manufacturers desire to reach, particularly where they have a surplus of their products to sell. In shipping to official territory, manufacturers in the other territories not only have the disadvantage of location, but are subjected to an additional burden in those instances where they must pay class rates on a much higher level than their competitors in official territory. This situation reacts to the disadvantage of manufacturers in the other territories, and to the advantage of those in Official Territory, tends to restrict the growth and expansion of the manufacturers in the other territories, and to some extent, to prevent the establishment of new manufacturing plants in those territories."

Moreover, the alternative of a rate increase is particularly ominous here since revenues lost to the Northern railroads through their inflated divisions might be made up, in part at least, from an increase in intrastate rates within the South — rates which are of vital importance both to the growth of an independent Southern economy and in their effect upon the overall ability of Southern shippers to compete in the markets of the North. Over the protest of some of the appellees (see e.g. *King* v. *United States*, 344 U.S. 254), the Commission has successfully asserted the power under Section 13 of the

Interstate Commerce Act to take into account the entire financial condition of the railroads, rather than restricting itself to those aspects related to intrastate commerce, in passing upon the adequacy of intrastate rates.[12] Under this rule, any loss of revenues in this interterritorial divisions case may later be used by the Commission as a basis for compelling intrastate rate increases. Hence, in future Section 13 proceedings the very rates of return which the Commission has here depressed to meet the burden of claimed higher transportation costs in the North may have to be augmented by increases in intrastate rates.

The basic unfairness of imposing the burden of higher Northern transportation costs upon the South is apparent where the economy of the South is demonstrably and dramatically weaker than that of the North, as the record here unquestionably shows that of the South to be. The inevitable effect of any divisional structure that accords higher divisions to the Northern railroads would be to improve the rail transportation system of the North at the expense of the Southern public, for any transfer of divisional revenues to meet the needs of

---

[12] The Commission has repeatedly utilized Section 13 orders based upon this theory as a source of additional revenues for the Southern railroads. Indeed, as a result of such proceedings or the threat of such proceedings, intrastate rate increases have been effected in each one of the States represented here during the period covered by the rate of return date set out above. See, e.g., *Louisiana Intrastate Rates and Charges*, 284 I.C.C. 467 (1952); *Alabama Intrastate Express Rates and Charges*, 288 I.C.C. 423 (1953); *Mississippi Intrastate Freight Rates and Charges*, 291 I.C.C. 39 (1953); *Louisiana Intrastate Freight Rates and Charges*, 291 I.C.C. 279 (1954); *North Carolina Intrastate Freight Rates and Charges*, 293 I.C.C. 541 (1954); *Tennessee Intrastate Freight Rates and Charges*, 294 I.C.C. 633 (1955); *South Carolina Intrastate Freight Rates and Charges*, 296 I.C.C. 159 (1955); *Alabama Intrastate Rates and Charges on Coal, Lumber, and Scrap Iron*, 297 I.C.C. 241 (1955); *Louisiana Intrastate Passenger Fares*, 305 I.C.C. 137 (1958); *Louisiana Intrastate Freight Rates and Charges*, 306 I.C.C. 301 (1959).

the Northern railroads could not fail to have an adverse impact upon rail transportation in the South, either through increased freight rates or through a diminution in the availability of rail services, facilities and equipment, or both. Consequently, a transfer of divisional revenues to the Northern railroads would bear heavily upon the Southern public regardless of the reasons that might be offered to support it.

The record shows that the Southern people are fighting a long uphill struggle in their efforts to raise their standard of living to that already enjoyed in other parts of the country. In such a situation the South cannot properly be expected to make a disproportionate contribution to the maintenance of the rail system in the North. The South has many needs of its own which must be met, and we are striving mightily to meet them despite the handicap of a still woefully inadequate industrial base. There is simply nothing whatever in the record to justify a further shackling of the efforts of our people by requiring them to subsidize the rail transportation system of the North.

The undisputed facts show no basis for the Commission's action in imposing the burden of the allegedly higher Northern transportation costs upon the Southern people. That action is therefore unlawful and should be set aside under Section 10(e) of the Administrative Procedure Act.

CONCLUSION

When the claims being pressed by the Northern railroads in this case are considered against the background of the historical context out of which they arose, it is plain that what is involved here is simply another effort to keep the South in a permanent position of economic inferiority. Whether the fashionable justification is in-

herent Northern *disadvantages,* as here, or inherent Northern *advantages,* as in the *Class Rates* case, and whether Northern rail costs are argued to be higher than those in the South or lower, the result is always the same. Thurman Arnold summed it up almost thirty years ago in a speech delivered August 22, 1941 at Hot Springs, Arkansas:

> "The industrial East has been the Mother Country. The South and West have been the colonies. The colonies have furnished the Mother Country with raw material. The Mother Country has been exploiting the colonies by selling them manufactured necessities at artificially controlled prices . . . How this all happened is a complicated process. Big business has treated the West and South primarily as a source of raw materials, not as a place to manufacture and sell finished products at competitive prices.
>
> "This is the age-old principle of colonial empires. It is dictated by the necessity of keeping up dividends in the Mother Country against cheaper local competition in the colonies. The methods of maintaining control of industrial markets in the South and West are based on the power of tightly organized cartels to control supply, transportation and distribution in such a way as to put new competing enterprise in the colonies under a continuing handicap."

In refusing to permit the Interstate Commerce Commission to promote this kind of policy without reasoned findings based upon substantial evidence as required by the Administrative Procedure Act, the district court has done nothing more than to guarantee the South the minimal protections of the law against this threat. The rightful province of the Commission has in no sense been invaded, for the Commission is still free to decide the case as it sees fit so long as it observes legal requirements.

For the foregoing reasons, the judgment of the United States District Court for the Eastern District of Louisiana should be affirmed.

Respectfully submitted,

Supreme Court of the United States

OCTOBER TERM, 1967.

No. 925.

THE BALTIMORE AND OHIO RAILROAD COMPANY, ET AL.,

Appellants,

v.

ABERDEEN AND ROCKFISH RAILROAD COMPANY, ET AL.,

Appellees.

ON APPEAL FROM THE UNITED STATES DISTRICT COURT FOR THE EASTERN DISTRICT OF LOUISIANA.

APPELLANTS' BRIEF OPPOSING MOTIONS TO AFFIRM.

REPLY TO THE MOTION OF SOUTHERN RAILROADS, APPELLEES.

At the outset, the action of the court below should be placed in its proper perspective. As pointed out in Appellants' Jurisdictional Statement, to develop the relative service costs of their respective territories in handling this traffic, both sides utilized the territorial Rail Form A costs. The Southern lines then modified those costs to include 12 adjustments. The Commission accepted five of those adjustments and rejected the others. It made a definitive analysis of each adjustment and it concluded that the

Form A average costs with the adjustments accepted reliably reflected the costs of the North-South traffic. The District Court reversed the Commission, disagreeing with that body's findings concerning the weight and significance to be accorded the cost evidence.

The District Court's action is in the teeth of this Court's recent decision in *Chicago & N. W. Ry. Co. v. Atchison, T. & S. F. Ry. Co.*, 387 U.S. 326, 87 S. Ct. 1585 (1967) where, in discussing a similar attack on the cost issues the Court said:

> "The presentation and discussion of evidence on cost issues constituted a dominant part of the lengthy administrative hearings, and the issues were thoroughly explored and contested before the Commission. Its factual findings and treatment of accounting problems concerned matters relating entirely to the special and complex peculiarities of the railroad industry. Our previous description of the Commission's disposition of these matters is sufficient to show that its conclusions had reasoned foundation and were within the area of its expert judgment. Baltimore & O. R. Co. v. United States, 298 U.S. 349, 359; New York v. United States, 331 U.S. 284, 328, 335, 349."

The above language is entirely apposite here. So is the holding in *Baltimore & O. R. Co. v. United States*, 298 U.S. 349 (1936) that "The Commission alone is authorized to decide upon weight of evidence or significance of facts" (p. 359).

Contrary to the contentions of the Appellees, the decision below rests upon grounds which if accepted are, to use Appellees' own words, "far-reaching and ominous" (Motion, p. 6). This affirmatively appears both from the opinion of the court below and from the arguments with which Appellees attempt to justify it.

In a decisive passage in its opinion, on which Appellees heavily rely, the court below held that territorial average costs "cannot appropriately be accepted without further evidence for mechanical application to particular segments of traffic in a divisions case." (J.S. 24a). As we shall show below, the Commission's order does not rest upon any "mechanical application" of Form A costs and its reliance upon those costs as to the particular segment of traffic involved was supported by substantial evidence. It is clear that the District Court weighed the evidence *de novo* and substituted its own inferences or conclusions for those drawn by the Commission. If its decision is allowed to stand it will serve as a precedent for continued interference with the Commission's determination of cost accounting problems.[1]

I. The Southern lines say that Appellants seek to use "unadjusted territorial average costs" (Motion, 5) without any evidence that they measure the cost of controverted elements of the North-South traffic, and they quote from the opinion below that territorial average costs cannot be

---

1. After stating that this case has been remanded to the Commission for further proceedings consistent with the requirements of the Administrative Procedure Act, Southern railroads say on page 23 of their motion: "The United States, which is charged by statute with the responsibility for defending orders of the Commission, has not appealed this disposition of the case." At page 5, Southern roads again bring this matter to the attention of the Court. In the court below the United States urged that the order of the Commission should be sustained. Lest the Court be misled into believing that the United States has changed its position and now agrees with the decision below, Appellants desire to state that they have been informed by the Attorney General that the reason that the Department of Justice did not file a Jurisdictional Statement was that it could make no special contribution to the defense of the order involved and that the order could be adequately defended by counsel for the Interstate Commerce Commission.

accepted "without further evidence for mechanical application to particular segments of traffic" (Motion, 8).

The fact that the Commission adopted five of the adjustments tendered by Southern lines, and the exhaustive analysis of these and the remaining controverted adjustments (taking up 26 pages of an appendix to its report) indicate how far removed its action was from a "mechanical application" of the Form A territorial costs.

There is abundant evidence to support the use of the Form A costs as adjusted by the Commission. At the outset, the order of investigation itself involved all traffic (except, by common consent, coal and coke) between all stations in the whole of Official Territory and all stations in the whole of Southern Territory and over all the railroads of each territory. It was truly a case involving territory-wide traffic between the North and the South. The record showed the North-South traffic of Northern and Southern lines combined to constitute 10% of their combined traffic (V.S. 36, Ex. 5). This contrasted with much smaller portions of total traffic in other cases in which the use of territorial averages had been approved, such as *Class Rate Investigation, 1939,* 262 I.C.C. 447 (1945), affirmed, *New York v. United States,* 331 U.S. 284 (1947), wherein the traffic moving under the rates involved constituted only 4.1% of the total traffic of the railroads (262 I.C.C. at 479).[2]

The record also establishes that the interterritorial traffic involved is an inseparable part of the whole and possesses no transportation characteristics which are distinguishable from those of traffic generally, and that the method of railroad operation is such that the use of average

2. Appellees seek to escape the force of this comparison by suggesting that the Commission was concerned in the *Class Rate* case with finding territorial average costs of all traffic. As this Court pointed out, however, the orders involved "affect class rates and class rates alone" and that ". . . this proceeding pertains only to class rates, which move but a small percentage of the traffic"; 331 U.S. at 330 and 343.

territorial costs was appropriate to the traffic involved in this case (V.S. 8).[3] This evidence showed, *inter alia*, that in a test week North-South traffic moved in 45% of all the trains operated by the Eastern lines, and the witness concluded that it would be found, over a longer period, that every train operated by an Eastern line would participate in the transportation of Southern traffic. "The obvious conclusion to be drawn is that Southern traffic shares in the same service provided on traffic generally within Official Territory and is not restricted to any particular trains or categories of service" (V.S. 8, p. 9).

The evidence also shows that the Southern lines basically used the Form A territorial costs and that some 89.45% of the total North-South costs attributed by them to the traffic involved were unadjusted Form A territorial averages (V.S. 40, 40A). That the territorial costs were representative as to the North-South traffic was strongly indicated by that fact.

Again, the record contains comprehensive evidence by Northern lines with respect to each element of cost as to which Southern lines sought to adjust the Form A costs (E.g., V.S. 73, 76, 77 & 80, §§ A-J; Part printed in the Joint Appendix at pp. 609-617, 623-661, see J.S. 3, N. 3).

The evidence also shows that Southern lines have employed Form A territorial average unit costs as appropriate to measure transportation costs of far less scope than that involved in the present case (V.S. 80, Sec. H; J.A. 656-660). Sufficient examples of such use by Southern lines were supplied to illustrate how such territorial costs are used by Southern lines "as a matter of established practice month in and month out before the Commission" (J.A. 656).

---

3. Southern lines characterized this evidence as a "train utilization study" (Motion, 11, footnote 11). This evidence was much broader in scope, showing how railroad facilities and services are planned and operated so as to transport all freight in a similar manner irrespective of ultimate point of origin or destination.

With the foregoing evidence before it, and after a detailed consideration of each of the cost adjustments sought by the Southern lines, the expert body concluded that, with the adjustments adopted, the Form A costs were adequate and reasonably accurate and reliable to reflect the costs attributable to the traffic at issue. All of these facts having been before the Commission, it cannot be said that its conclusion lacked support in substantial evidence. The contrary holding of the District Court can only mean that it disagreed with the Commission's appraisal of the significance of these facts. The Commission accepted them as showing that the Form A costs are reliable for use here, as to the traffic involved; the District Court held that greater refinement was necessary. That, however, was not its function.

As to findings, if the adjusted Form A costs used by the Commission are representative of the North-South traffic, as the Commission found, then the higher costs relate to that traffic. These are the costs to the railroads involved of performing their transportation services. They do not pay one scale of wages (their largest item of expense) on North-South traffic and another and different scale on other business. They handle North-South traffic along with all other, an indiscriminate part of the whole. Passenger deficits—here considered upon Southern lines' insistence—are not incurred for any freight traffic, but are spread over all, as part of the constant or overhead expense, for both Northern and Southern lines. The Commission's findings that the costs were reasonably accurate and reliable for determining the cost to the railroads on the traffic involved, plus the 26 pages of cost analysis and conclusions on disputed cost items were all the cost findings that were required of the Commission.

On p. 9 of their Motion, Southern lines say that the lower court was "well aware" that the entire "inflation" in the Northern lines' territorial averages stems from a few services as to which the averages are higher in the North than in the South. Any such "awareness" could derive only from Southern lines' assertions to that effect. The Interstate Commerce Commission made no such finding. Necessarily, the higher Northern costs are the result of the whole complex of conditions under which they operate and the whole complex of conditions under which the Southern lines operate. See *New York v. United States*, *supra*, at pp. 348-349.[4]

Southern lines say (7) that nothing in the decision of the District Court precludes the Commission from relying on Rail Form A as appropriately adjusted, or justifies the concern that the integrity of Rail Form A and other cost formulas is under attack.

In support of this statement, those lines argue that the District Court recognized explicitly that Rail Form A was "devised for the express purpose of measuring territorial average cost and has been widely used as an acceptable means of comparing relative transportation costs" and that it is entitled to full weight when the issue is one "that it is designed to cover." This statement actually shows

4. Southern lines attempt to overcome the important fact that Northern lines' wage levels are higher than theirs by several representations which, upon plenary consideration, Northern lines would show to be inaccurate. It may here be noted that these Appellees state (Footnote, pp. 9 and 10) that Northern lines' higher wages occur in the "executive and professional categories . . ." The evidence shows that they apply in other categories as well (e.g., maintenance of way and structures and maintenance of equipment, V.S. 80, Ex. F-2, pp. 1 and 2, and V.S. 80, F-3, pp. 1 and 2; J.A. 644-8 and 651-2), and also that the "executive and professional" category includes such employees as clerks, stenographers, accountants, elevator operators, patrolmen and watchmen, freight claim agents, janitors, etc. (V.S. 80, Ex. F-2, p. 1; J.A. 646-647).

that the court would severely circumscribe the use of the formula. Upon plenary consideration, Appellants would show that the lower court was mistaken in its conception of the purpose of the formula and in ascribing to it so limited a use.

Moreover under the lower court's decision, it is the reviewing court which would decide whether the formula figures were "appropriately adjusted." Here they were adjusted by the Interstate Commerce Commission and the resulting figures were considered by that body as reliably representing the cost of the North-South traffic. If the District Court can substitute its judgment for that of the Commission and require special studies for greater refinement, the value of the Commission's cost formulas will manifestly be seriously impaired and, moreover, complex questions relating to transportation costs will be decided by the many District Courts which have jurisdiction to review orders of the Commission, rather than by the body which Congress has charged with the administration of the National Transportation Policy and the regulation of carriers subject to its control.

On p. 13 of their motion, the Southern railroads make some comments respecting this case as compared with *Chicago & N.W. R. Co. v. A.T.&S.F. R. Co.*, 387 U.S. 326 (1967). Their purported distinction of that from the instant case is no distinction at all. And it is of the utmost significance that they in no way deny that in that case, as here, although the basis of the Commission's action was the relative costs of the parties reflecting their respective operations as to the traffic involved, the Commission relied almost exclusively upon the Form A average costs of handling all traffic in these territories in reaching its conclusions. No reference whatever is made by the Appellees to that fact or to the statement (quoted in our Jurisdictional

Statement, p. 20) by their co-Appellees, the Southern Governors' Conference, et al., that ". . . there, as here, virtually every objection to reliance upon such territorial averages was brushed aside without either findings or evidence to support such action." In that very recent case this Court held that the evidence, the same kind as is involved in the case at bar, was sufficient to support the inter-territorial divisions order involved. And the Appellees in no way challenge that fact.

II. The remainder of the Motion to Affirm is concerned largely with Southern lines' argument concerning passenger deficits. On the whole, those arguments are clearly met in the Jurisdictional Statement (pp. 25-30). There remains little that warrants comment at this time.

It is argued on p. 16 of the motion that only the deficits attributable to common costs may be assigned to the freight service where the deficit results from commutation operations; yet under the commission's decision the Appellees would have the entire deficit—that resulting from both common and solely related costs—assigned to freight services where the deficit results from intercity passenger service. The Appellees state (16) that the operation of commuter trains requires equipment and facilities which have no relation to freight service, citing, *inter alia,* terminals and yards. But it is just as clear that intercity passenger service requires "equipment and facilities which have no relation at all to freight service." It requires *inter alia,* passenger locomotives, passenger cars, coach yards and passenger terminals. Yet, in the one case (commuter service) the deficit resulting from the expenses pertaining to these "solely related" facilities would be excluded, while in the other case (intercity service) it would remain included. The injustice of adopting this selective approach, which would be so beneficial to Southern lines, is manifest.

In the first paragraph on p. 18 of the motion, it is stated that Commission counsel now argue that because commuter deficits may be taken into account in determining rates, they should also be taken into account in making divisions of those rates, and Appellees go on to state that this theory was not advanced by the railroads in the proceedings before the Commission and that the Northern roads there took the position that a change in divisions is not dependent on a change in rate levels. It was Northern lines' initial position before the Commission that passenger deficits should be completely excluded and only freight costs considered (Jurisdictional Statement, 25), but that if the Commission did consider passenger deficits it should consider all of them and not only those which were of greatest significance to the Southern lines. It is of obvious relevance to the consideration of such deficits in prescribing divisions that they are considered in prescribing rates, and reference to that fact in no way changes the grounds of the Commission's decision. The statement attributed to Northern railroads that a change in divisions is not dependent upon a change in rate levels had nothing to do with the matter of passenger deficits. It related to the entirely different question as to whether a change in class rates must entail a change in divisions, which obviously it need not.

It is stated in the middle paragraph on p. 18 of the motion that rate levels are no higher in the North than in the South and that they have been the same since the *Class Rate* case which was upheld in *New York v. United States,* 331 U.S. 284 (1947). Without saying so, the Southern lines are here referring only to class rates. It is true that the class rates are the same in both territories. These rates move only about 1% of all carload tonnage in the Eastern United States. *Eastern Central Motor Carriers Asso. v.*

B. & O. R. Co., 314 I.C.C. 5, 17 (1961). The rate levels upon which the great volume of the traffic actually moves have become higher in the North than those in the South. *Official-Southern Divisions*, 287 I.C.C. 497, 523 (1953). *Increased Freight Rates, E.W. and S. Territories, 1956*, 300 I.C.C. 633, 689 (1957).

In footnote 15 on p. 19 of their Motion, Appellees quote from *C.&N.W.* to the effect that the issues are different when, in a divisions case, it is argued that carriers in one part of the country should subsidize passenger operations elsewhere. Appellants showed in their Jurisdictional Statement that the consideration given passenger deficits by the Commission had the effect of increasing Southern lines' divisions over what they would have been otherwise, that it was at the insistence of those lines that the Commission included passenger deficits at all, and that the inclusion of passenger deficits may be said to have resulted in Northern lines subsidizing Southern lines. No answer was made to that argument.[5]

5. In Footnote 16 on p. 19, of their Motion, the Appellees assert that this Court recognized that *King v. U.S.*, 344 U.S. 254, had "nothing to do" with the facilities "solely related" to passenger service, and they then quote a single sentence from that decision in support of the assertion. A reading of the case will show that the Court did not limit the Commission's consideration of passenger deficits to those which resulted from common costs. Indeed, it said that if the passenger service cannot bear "its direct costs and its share of the joint costs" the Commission has felt it necessary to take the passenger deficit into account in fixing freight rates; 344 U.S. at 261. The Commission's action in doing so was approved. The Commission's theory with respect to considering passenger deficits in determining freight rates is set forth in detail in *Increased Freight Rates, 1948*, 276 I.C.C. 9, pp. 32-39.

REPLY TO THE MOTION OF APPELLEES, SOUTHERN GOVERNOR'S CONFERENCE, ET AL.

This motion contains so large a number of misleading statements that it cannot be dealt with adequately in a brief which must be prepared with the dispatch now required.

The "Statement" in the Southern Governors' motion (pp. 2-3), while recognizing that the Commission's order in *Class Rate Investigation, 1939, supra,* related only to the "class rate structure", proceeds to state that:

> "Prior to that case, railroad rates had consistently been higher in the South than in the North and Southern shippers had been compelled to pay substantially higher charges to reach Northern markets than Northern shippers were paying to reach Southern markets, even where the distances involved were identical."

That this broad generalization is not even substantially correct will be apparent from the Commission's report in the case cited at pages 593-600, and 601-607. See also the comparisons of the average interterritorial rate levels in 1957, 1958, and 1959 here of record, which show substantially lower rate levels on northbound than on southbound traffic (V.S. 75, p. 3; J.A. 619).

Particularly objectionable is the Southern Governors' erroneous and irresponsible statement at page 4 to the effect that the "Northern interests", having failed to convince this Court that the North was entitled to lower rates because of natural advantages, "refused to accept" the equality with the South upheld in *New York v. United States, supra,* and "decided to pursue their aim of obtain-

ing a preference for the North . . . by seeking inflated divisions from North-South freight traffic . . ."[6]

Since it was only *Northern lines* that sought rehearing in the Commission's proceeding which resulted in the divisions order under review, Southern Governors' indiscriminate use of the term "Northern interests", as to both rate structure and divisions, clearly charges that Northern lines resisted the prescription of uniform class rates, that they refused to accept the equality ordered, and that their effort to secure divisions reflecting relative costs of service was pursuant to a deliberate purpose of "obtaining preference for the North". Nothing could be further from the truth than these charges.

The Northern lines accepted the Commission's decision in the *Class Rate* case. They did not intervene, or otherwise participate, in "the suits by or on behalf of northern and New England States and western railroads to set aside these orders, . . ."[7]

That Appellees should here descend to the level of charging Northern lines—in seeking to obtain divisions reflecting their higher costs—to be motivated by a purpose "to keep the South in a permanent position of economic inferiority", contrary to their statutory duties under the Act, and without a shred of evidence to support such charges, is a cogent commentary on the complete lack of merit in their contentions.

Again, Southern Governors' motion (p. 6) states that "the Commission's orders inflate the Northern railroads' divisions so that they receive, on the average, 17 percent more than the Southern railroads for the same amount and kind of service." The stipulation of the parties embodied in Paragraph 3(4) of the pretrial order states:

---

6. An equally offensive and wholly erroneous accusation appears at page 18 of the Motion of Southern railroads.

7. The quoted language is from *New York v. United States*, 331 U.S. at 288.

"Overall, the divisions and revenues of the Southern railroads are reduced approximately 3%. Many divisions of Northern railroads were reduced by the Commission's order." (J.A. 3)

Appellants will endeavor to deal in summary fashion with the principal points set forth in this motion:

1. As to the Need for Findings That Higher Costs Result From Inherent Disadvantages.

Section 15(6) of the Interstate Commerce Act, which empowers the Commission to prescribe divisions and requires that it give due consideration to specified elements along with all other pertinent facts, imposes no such restriction upon the Commission's use of relative costs as these Appellees ask the Court to impose. And no judicial construction of Section 15(6) supports their construction.

The Appellees are incorrect in assuming that the Commission must find that higher costs reflect inherent disadvantages before giving effect to them. The Commission said: "Relying on *New York v. United States,* 331 U.S. 284, 315 (1947), the interveners also take the position that natural disadvantages must be found in the North before we may increase the divisions of the northern railroads." (J.S. 70a) This, of course, was a statement of the Appellees' contention. The Commission answered it by stating, in essence, that other factors being equal, cost differences are the product of, and reflect, the inherent advantages and disadvantages that go to make up the respective overall transportation conditions in the two territories.[8]

8. The Commission then cited *Louisville & N. R. Co. v. Southern Ry. Co.,* 319 I.C.C. 639, at pages 646-47. At the cited pages, the Commission, consistent with its conclusion here, said, after describing contentions concerning operating conditions:

"While an appraisal of the evidence regarding physical operations indicates that both the complainant and the defendant operate in

The factor of special importance here, of course, is efficiency of operation. And the Commission found that both groups of carriers are being operated efficiently and that neither group should be considered as more or less efficient than the other (J.S. 58a).

Moreover, Appellees' reliance on *New York v. United States* on this point is misplaced. There the Court reviewed a decision of the Commission which ordered that class rates over a large part of the country be equalized. The Commission's orders were designed to eliminate regional discriminations in class rates and involved only rate discrimination. Divisions were not in issue. The Commission's authority to reach such regional discrimination was based upon § 3(1) of the Interstate Commerce Act, 49 U.S.C.A. § 3(1), which, *inter alia,* condemns discrimination between regions, districts or territories. There had been a wide disparity in the level of the class rates in the territories involved. The Commission was required by § 3(1) of the act to remove that disparity unless it could find that the differences in class rate levels were justified by transportation conditions pertaining to such rates in the several territories. It is significant that the Commission, in order to determine this fact relied primarily on cost evidence. As the Court noted, at pages 315-316:

> "The Commission found that conditions peculiar to the respective territories did not justify the differences in the territorial class-rate structures. In reach-

---

mountainous terrain, there is no need to determine whether such transportation conditions are more favorable or onerous to one than to the other. The nature of the physical transportation circumstances is concededly reflected in the cost of operations. In this respect, the cost data hereinafter discussed form a sounder basis for a determination of the issue raised than any conclusions to be drawn from the numerous factual statements regarding operating conditions."

This decision was affirmed at 380 U.S. 526.

ing that conclusion it first inquired whether the differences in the costs of furnishing the railroad service in the several rate territories justified the existing differences in the levels and patterns of the class rate scales."

Thus, the case of *New York v. United States* actually stands for the proposition that costs are a fair, if not the primary means, of determining differences in territorial conditions. The fact that the Commission and this Court considered cost of service extremely important in determining territorial conditions affecting transportation is further apparent from pages 348-9 of the Court's decision:

> "Revenue needs, like costs of rendering the transportation service, are germane to the question whether differences in territorial rate structures are justified by territorial conditions. They are amongst the standards written into § 15a; they reflect the totality of conditions under which the carriers in the respective territories operate."

The Commission's findings under the heading "Importance to the Public" (J.S. 69a-70a), and its above-quoted finding regarding efficiency of operation were all the findings it was required to make with respect to this contention of these Appellees.

2. That the Commission May Not Impose the Burden of Higher Costs of One Section of the Country on Another, Even if They Result From Inherent Territorial Disadvantages.

On page 9 of their motion, these Appellees infer that the Commission introduced "the wholly unprecedented concept that the railroads of one section of the country should be supported by the people of another section." The Com-

mission did no such thing. Its decision rests on the completely reasonable basis of fixing divisions with relation to relative costs. Divisions, of course, are a matter between railroads, and a change therein does not change the rates paid by shippers. And in paying the rates involved, the shippers are simply paying for services rendered by the railroads, both Northern and Southern. In no sense is there involved a situation in which the railroads of one section are supported or subsidized by the people of another.

No "principal of primary local responsibility" such as these Appellees suggest has governed the prescription of divisions in the North-South cases or otherwise. The authority of the Commission to prescribe disparate divisions of interterritorial rates for the carrier groups concerned, when found by it to be just, reasonable, and equitable, is settled beyond question. *New England Divisions Case,* 261 U.S. 184 (1923), and *Baltimore & O. R. Co. v. United States,* 298 U.S. 349, 370 (1936).

Indeed, in some of the past North-South divisions cases the Commission prescribed divisional factors which, on Florida citrus, were as much as 85% higher, mile for mile, for the Southern lines than for the Northern lines and on traffic in general, 25% higher for Southern than for Northern lines. *Atlantic Coast Line R. Co. v. Arcade & A. R. Corp.,* 194 I.C.C. 729, 761-2 (1933), and *Divisions of Rates, Official and Southern Territories,* 234 I.C.C. 175, 192 (1939). In the first of these cases Commissioner Eastman's dissent pointed out that ". . . the majority are obliged to lean heavily on . . . the fact that while both sets of lines are bad off financially, the southern lines appear to be worse off than the northern." (762) The Commission's order was sustained in *Baltimore & O. R. Co. v. United States,* 298 U.S. 349 (1936). In neither of these instances was the Com-

mission's order regarded as compelling Official territory or its people to subsidize the carriers of the South.

The statement of the lower court in the instant proceeding, which is quoted on p. 37 of these Appellees' Motion, to the effect that the Commission is not perpetually bound by their 1953 holding, which prescribed an equal factor scale, but that the Commission has "special responsibilities in a case of this magnitude when it departs from its prior finding," completely overlooks the change in controlling facts, i.e., that whereas the Commission believed when prescribing equal factors that the costs of both groups of lines were and would remain equal, the evidence in this case shows that those of Northern lines proved to be higher when the record in the present case was made.

That no further findings with respect to this point were required of the Commission is clear. *N.L.R.B. v. Wichita Television Corporation*, 277 F.2d 579, 585; *Minneapolis & St. Louis R. Co. v. U.S.*, 361 U.S. 173, 193-4 (1959).

3. That Uniform Divisions Were Prescribed to Implement the Principle of Uniformity.

At p. 4 of their Motion, Southern Governors state:

> "This equal-factor basis of divisions was prescribed by the Commission itself to implement the principle of uniformity announced in the *Class Rate* case. *Official-Southern Divisions*, 287 I.C.C. 497, 533, 577-578 (1953)."

No reference to this subject appears at the pages cited by Appellees; in fact some of the pages do not even pertain to that case. While the Commission referred to the *Class Rate* scale in deciding upon the contour of the divisional scale prescribed in 1953, its report makes clear that in fixing the level of the divisions as between the Northern and

Southern groups it was guided by all the evidence of record, and particularly the cost evidence. This is made clear by its conclusions on pp. 524-527 of the report, and especially by the statements on p. 526 relating to the Commission's judgment that it considered it to be the safest assumption for the future that neither group would have a lower basis of operating costs than the other and that there are no other relevant circumstances of sufficient importance to justify higher divisional factors for one group than the other. This language clearly indicates that except for the Commission's finding that certain items of expense of Northern lines might be regarded as transient it would have prescribed divisions higher for Northern lines than for Southern on the basis of the cost evidence.

4. That "The Single Most Important Fact About Rail Form A Average Costs Is that These Average Costs Tend to Vary Directly With the Degree of Industrialization in the Areas Served by the Railroads for Which Costs Are Being Computed . . ."

This idea, for which Appellees cite no evidence, and as to which there is none, is basic to a large part of Appellee's argument. The record does show that as the South became more industrialized with relation to the North than it had been in the past, the transportation costs of the Southern railroads became relatively lower than those of the Northern railroads. The relatively greater increase in industrialization in the South in recent years is set forth in the Commission's report under "Economic Trends" (J. S. 50a-52a). The relation of Northern to Southern freight service costs is shown in the table appearing at J.S. 61a. This shows that at 500 miles, for example, the Official Territory costs were 11% higher than the Southern costs in 1948 and 20% higher than Southern costs in 1956 and 1957.

This shows that no reliance can be placed upon the Appellees' dictum that "the greater the degree of industrialization in any area, the higher the Rail Form A average costs of the railroads serving that area." (Motion, p. 10)

5. That the Commission Rejected Southern Lines' Adjustments Largely Because No Other Data Were Available Showing Costs on a Comparable Basis in Both Territories.

This is incorrect. In Footnote 3 on page 15 of the Motion, Appellees refer to what they call "instances" in which Southern railroads' evidence was rejected for lack of "comparable" data for the North, and they refer to empty return ratios, switching, and count of cars. A reference to the Commission's report will show that each of these proposed cost adjustments was rejected by the Commission for reasons independent of the existence or non-existence of comparable data for Northern lines. As to some of the items, the Commission referred to the absence of comparable data. But other reasons for rejecting the proposed adjustments were stated by the Commission in Appendix B to its report.

6. That the Form A Costs Used in Certain Recent Division Cases Were Adjusted.

On page 17 of their Motion to Affirm, these Appellees state that the Commission adjusts Rail Form A average costs in most of the cases in which "a precise determination of costs of service is a vital issue". As examples of such cases, they cite *Louisville & Nashville R. Co. v. Southern Ry. Co.*, 319 I.C.C. 639 (1963) and *Illinois Central R. Co. v. Great Northern R. Co.*, I.C.C. No. 34699 (unreported. Recommended report and order of Oct. 27, 1966 adopted,

with inconsequential changes on July 31, 1967). As to the first of these two divisions cases, they state that the Commission made a substantial adjustment of Rail Form A averages with respect to car costs. This reference to but one adjustment is in contrast with the fact that the Commission made five adjustments in the present case. And the Court will remember that the L&N case dealt with only one commodity moving between limited points on only two railroads, in contrast with the vast scope of the present case. Also in connection with that case, it is interesting to note that while there the Commission adjusted Rail Form A averages with respect to "car costs", in the present case, the Southern lines suggested, as a substitute for the Form A car costs of the Northern and Southern railroads, the car costs of all the railroads in the United States, on all the traffic of the country (J.S. 114a).

The second case, *Illinois Central v. Great Northern,* also involved a single commodity moving between points on only two railroads and the adjustment cited by the Appellees was again only one, "to give effect to the fact that the traffic at issue required 'less than average engine minutes per car in origin and destination switching' ". In the present case, the Commission found that "territorial average costs are particularly appropriate to the traffic in this case because it is a large and varied body of traffic moving to and coming from terminals in all parts of both territories." It also found that the special switching studies in the South "have weaknesses, both in the sample and in the studies themselves" (J.S. 140a).

7. That the Chicago & North Western Case Was One in Which the Court Found Independent Evidence in the Record Supporting the Applicability of the Rail Form A Averages to the Traffic at Issue.

This statement (on page 22 of the Motion) should be contrasted with the statement by these same Intervenors in their brief as *amici curiae* in *Chicago & North Western,* which is quoted in Appellants' Jurisdictional Statement at pages 19-20.

8. That the Northern Railroads Suffer From Overcapacity to a Greater Extent Than the Southern Railroads.

This statement (e.g., on p. 29 of their Motion) has no support in the evidence whatever. The claims of Northern lines' alleged overcapacity are founded primarily upon generalizations concerning merger activity in the North. However, there is like merger activity in the South. The Commission has approved the mergers of the Central of Georgia and the Southern Railway, and of the Seaboard Airline and the Atlantic Coast Line, the latter, of course, being already in control of the Louisville & Nashville. A proposal for the merger of the Illinois Central and the Gulf, Mobile & Ohio is now going forward.

The Commission stated (J.S. 58a) that "... the southern lines themselves have noted that mergers are now going forward in all territories, including the South. If and when such proposed mergers are ultimately approved and finally consummated in both groups the savings produced thereby will be then reflected in the respective unit costs. The economies hoped to be effected thereby and the savings expected are not ascertainable for future operation to the degree required for any specific adjustment here of the cost studies of record."

9. That the Commission's Orders Would Nullify the Gains Realized by the South and Cause Rate Increases Within the South.

The suggestion that the Commission's decision in the present case would result either in a substantial diminution in the quality of rail service within the South or a "substantial increase in rates", and all the speculative consequences thereof which are alleged in the Motion, are hollow in the extreme. The Commission's estimate of the amount of the revenue reduction to the Southern lines as a result of the order here under review ($7,948,000.00, J.S. 99a) is only 62/100 of 1% of the freight revenue of the Southern lines ($1,280,900,000.00, J.A. 516) for the year in which the Commission's calculations were made (1956). After an appropriate adjustment for income taxes, therefore, it would appear that the reduced revenue might be somewhere in the neighborhood of 4/10 of 1% of the gross freight revenue of Southern lines. It is difficult to understand, therefore, how Appellees could be envisaging "a substantial increase in rates" as a consequence of this divisions order. The Commission considered these Appellees' contentions and found that the prescribed divisions "can result in no unlawful injury to the South" (265 I.C.C. at 27-28; 69a-70a).

IN THE EVENT OF REMAND THE PRESCRIBED DIVISIONS SHOULD BE PERMITTED TO CONTINUE IN EFFECT SUBJECT TO READJUSTMENT AS NECESSARY TO PROTECT ALL PARTIES.

In footnote 20 at page 22 of their motion to affirm, the Southern lines suggest that Northern lines, not having specifically asked the Court below to retain jurisdiction to require equitable resettlements in the event of a further order of the Commission upon remand, should for that

reason be denied that relief here. As an offset to the revenue losses Northern lines would thereby suffer from an unprotected remand, Southern lines suggest that under the pre-existing equal-factor divisions the Northern lines would still have the benefit of a terminal factor "which the Commission found to be excessive in the amount of $7,426,000 annually . . ." But this conclusion assumes the correctness of Southern lines' contention that the Commission upon rehearing separately found that the divisional scale it prescribed in 1953 "was invalid because of an excessive terminal element of 37 integers in the initial mileage block", a contention which the Court below specifically rejected (5a-6a).[9]

It is entirely possible that if the Commission should be required to give further consideration to this matter, such further consideration would result in the prescription for Northern lines of similar or substantially similar divisions to those here involved. But the Commission would lack authority under Section 15(6) to make a new divisions order retroactive so as to protect Northern lines for the large revenue losses they would suffer for the period from April 20, 1965, until a new order could become effective for the future following the remand proceeding.

It is respectfully submitted that this Court, in the event of remand to the Commission for further findings, should, therefore, employ the procedure it adopted in *Sec'y of Agriculture v. United States,* 347 U.S. 645 (1954), in which it vacated the District Court's order and remanded the cause to the Commission for more explicit findings, but without invalidating the Commission's order or enjoining its enforcement, thus leaving the unloading charges fixed

9. At page 34, Southern Governors' Motion suggests that the higher wages and taxes in the North are offset by its greater traffic density. But this assumption is not soundly based. *Divisions of Freight Rates,* 148 I.C.C. 457, 473.

by the Commission's order in effect pending completion of the remand proceedings. Such a procedure here would protect the interests of all parties by assuring the application of such divisions as the Commission might ultimately prescribe to all traffic moving subsequent to April 20, 1965.

CONCLUSION.

The Commission's decision of February 3, 1965 was the culmination of almost six years of an administrative process designed to assure equitable divisions for both the Northern and Southern lines. Appellees would have these six years of labor which the parties and the Commission devoted to this case nullified without full consideration by this Court, by the affirmance of a decision, the central fact of which is that the lower court substituted its judgment for that of the Commission on the complex administrative question of transportation costs. The authority of a court to decide such questions has been repeatedly denied by this Court, and as recently as in 1967 in *Chicago & N.W. R. Co., supra.*

The importance of this case to Northern lines cannot be overstressed. The affirmance sought would force them to begin all over again with administrative proceedings that would doubtless consume additional years, with no opportunity to preserve the increases awarded them in 1965. It would require the payment by them of over $25 million to the Southern lines and the loss of some $8 million annually until the issuance of a new order by the Commission. In view of these facts and of the important questions presented in the Jurisdictional Statements, it is respectfully submitted that the summary affirmance sought by the Appellees should be denied and the case set down for plenary consideration by this Court.

IN THE

Supreme Court of the United States

OCTOBER TERM 1967

THE BALTIMORE AND OHIO RAILROAD COMPANY, ET AL.,

Appellants

v.

ABERDEEN AND ROCKFISH RAILROAD COMPANY, ET AL.,

Appellees

ON APPEAL FROM THE UNITED STATES DISTRICT COURT FOR THE EASTERN DISTRICT OF LOUISIANA, NEW ORLEANS DIVISION

BRIEF FOR APPELLANTS

OPINIONS BELOW

The opinion of the District Court (A. 325) is reported at 270 F. Supp. 695. The initial report of the Interstate Commerce Commission (A. 18) and its supplemental report (A. 176) are published at 325 I.C.C. 1 and 325 I.C.C. 449, respectively.

JURISDICTION

The final decree of the District Court was entered on August 22, 1967 (A. 357). These Appellants filed their notice of appeal in the District Court on October 2, 1967 (A. 5, 367). On March 4, 1968 this Court noted probable jurisdiction and consolidated this appeal and the appeal of the Interstate Commerce Commission (No. 938) from the same judgment (390 U.S. 940). The jurisdiction of this Court rests on 28 U.S.C. §§ 1253 and 2101(b). *New England Divisions Case,* 261 U.S. 184 (1923); *Baltimore & O. R. Co. v. United States,* 298 U.S. 349 (1936); *Chicago & N.W. R. Co. v. A., T. & S. F. R. Co.,* 387 U.S. 326 (1967).

STATUTES INVOLVED

Sections 1(4) and 15(6) of the Interstate Commerce Act (49 U.S.C. §§ 1(4) and 15(6)) and Sections 8(b) and 10(e) of the Administrative Procedure Act (5 U.S.C. §§ 557(c) and 706) are set forth in Appendix A of this brief.

Section 15(6) of the Interstate Commerce Act, which implements a general duty imposed upon common carriers by railroad in Section 1(4) of the Act, provides as follows:

> "Whenever, after full hearing upon complaint or upon its own initiative, the Commission is of opinion that the divisions of joint rates, fares, or charges, applicable to the transportation of passengers or property, are or will be unjust, unreasonable, inequitable, or unduly preferential or prejudicial as between the carriers parties thereto (whether agreed upon by such carriers, or any of them, or otherwise established), the Commission shall by order prescribe the just, reasonable, and equitable divisions thereof to be received by the several carriers. • • •. In so prescribing and

determining the divisions of joint rates, fares and charges, the Commission shall give due consideration, among other things, to the efficiency with which the carriers concerned are operated, the amount of revenue required to pay their respective operating expenses, taxes, and a fair return on their railway property held for and used in the service of transportation, and the importance to the public of the transportation services of such carriers; and also whether any particular participating carrier is an originating, intermediate, or delivering line, and any other fact or circumstance which would ordinarily, without regard to the mileage haul, entitle one carrier to a greater or less proportion than another carrier of the joint rate, fare or charge."

QUESTIONS PRESENTED

The District Court set aside orders (herein termed "order") entered by the Interstate Commerce Commission in proceedings held pursuant to Section 15(6) of the Interstate Commerce Act. The order found existing divisions of joint railroad rates for the carriage of all freight (other than coal and coke and certain trailer-on-flatcar traffic, excluded by the parties) between Official Territory and Southern Territory, to be unjust, unreasonable, and inequitable and prescribed new divisions which the Commission found would be just, reasonable, and equitable for the future.[1] Over 200 railroads, respondents in the principal proceeding, were involved, but the case was tried by the parties and decided by the Commission as a controversy between two contending groups of rail carriers—Eastern (or Northern) railroads and Southern railroads. Having found all other elements requiring consideration to be in balance as between the two groups, the Commission prescribed the new divisons with reference to the relative costs of the services involved to the Northern and Southern lines. The District Court set aside the said order and remanded the cause to the Commission for further proceedings.

The questions presented are these:

1. Whether the District Court disregarded established standards of judicial review by rejecting as insufficiently

1. Official Territory is comprised of the area lying generally east of the Mississippi River and north of the Ohio River, and certain points in Virginia. Southern Territory lies generally east of the Mississippi River and south of Official Territory.

A joint rate is one that extends over the lines of two or more carriers, and is established by the participating carriers either by agreement or pursuant to an order of the Commission. *St. Louis Southwestern Ry. Co. v. United States*, 245 U.S. 136, 139-140, note 2; *Chicago & N.W. Ry. Co. v. A., T. & S. F. Ry. Co.*, 387 U.S. 326, 331. The joint rate paid by the shipper is divided among the participating carriers, and the shares of the rate received by them are known as "divisions." *St. Louis Southwestern Ry. Co. v. United States, supra; New England Divisions Case*, 261 U.S. 184, 187.

refined the relative costs that the Commission found, on substantial evidence, to be adequate and reasonably accurate and reliable for the purpose of establishing new divisions, and by holding that the Commission was obligated as a matter of law to develop more refined cost data described by the District Court as the "actual cost of handling the specific traffic at issue."

2. Whether when the Commission, for the purpose of prescribing just, reasonable and equitable divisions of joint rates, makes findings of relative costs on a fully-distributed basis and includes therein a pro rata share of passenger service deficits, it is required as a matter of law in determining such relative costs to consider only passenger expenses which would remain to be borne by freight service if passenger operations were discontinued, and whether there was any error prejudicial to the Southern railroads in the Commission's treatment of passenger service deficits.

3. Whether the District Court improperly equated such overhead costs as are an integral part of fully-distributed costs with general revenue needs and as a consequence erred in holding that the Commission having adopted a relative cost basis for determining fair divisions, acted without findings and substantial evidence in relying upon relative costs which reflected an appropriate proportion of the deficits from all passenger operations including suburban service.

4. Whether the District Court erred in remanding the cause to the Commission without retaining jurisdiction to require equitable resettlements of revenues received by the parties from interterritorial freight rates in the event of a further order of the Commission on remand.

STATEMENT

I. Proceedings Before the Commission.

The Appellants are the railroads which operate in Official Territory, here called Northern lines. They intervened as defendants in the action brought by the Southern lines to set aside an order of the Interstate Commerce Commission which prescribed just and reasonable divisions of freight rates having application on virtually all freight moving between the North and the South. The Southern lines, Appellees here and Plaintiffs in the Court below, are joined in their attack on the validity of the Commission's order by the Southeastern Association of Railroad and Utilities Commissioners and the Southern Governors' Conference (herein collectively termed "the Conferences").

Twenty-one years ago, on July 17, 1947, the Northern lines began their efforts before the Interstate Commerce Commission to obtain divisions of the freight rates applying between Official and Southern territories which would give recognition to relative costs of service. On that date Northern lines filed a petition for further hearing in I.C.C. Docket No. 24160, *Divisions of Rates, Official and Southern Territories*, 234 I.C.C. 175 (1939). There the Commission had prescribed divisional factors for Southern lines that were 25% higher on general traffic, and from 31% to 72% higher on Florida vegetables than the factors prescribed for the Northern lines; and in *Atlantic Coast Line R. Co. v. Arcade & A.R. Corp.*, 194 I.C.C. 729 (1933), 198 I.C.C. 375 (1934), the Commission had prescribed divisions of rates on Florida citrus fruit which were from 47% to 85% higher for Southern than for Northern lines.

In consequence of the petition of July 17, 1947 the Commission instituted the investigation in which—seventeen years later and after an initial major decision—the order here under review was entered. The proceeding is

entitled *Official-Southern Divisions*, I.C.C. Docket No. 29885. In its original decision (287 I.C.C. 497, January 12, 1953), the Commission concluded that if it were to give controlling weight to the 1946 and 1948 Rail Form A cost studies of the Northern lines the relatively higher divisions sought by those lines would have been justified. But it did not accept them at face value because it believed that certain important items of expense in the years involved might reasonably be regarded as transient. Upon appraisal of the Form A cost data for the years studied and the facts of record it considered it to be the safest assumption for the future that neither group of railroads would have an appreciably lower basis of operating costs than the other, and that no other relevant circumstances of importance justified higher divisional factors for one group than the other (p. 526).

Accordingly, the divisional scale prescribed in the 1953 decision accorded the Southern and Northern lines equal divisions for equal mileage hauls north and south of the dividing points.

In 1959 the case was reopened by the Commission upon petition of the Northern lines for modification of the 1953 order to give recognition, principally, to Northern lines' higher costs of service, which the experience of the intervening years had confirmed.

In the period from September 1959 to February 1961 evidence was taken in the form of verified statements and exhibits, with oral hearings for cross-examination. Eighty verified statements were received, many of them voluminous. There were thirty exhibits independent of the verified statements, and the hearings for cross-examination produced approximately 2700 pages of testimony. All of this evidence made up what the Court below called "this massive record" (A. 348). Lengthy briefs were filed by the parties, and then followed the report of the two Hearing Examiners recommending divisional factors for Northern lines higher than those for Southern lines. Exceptions to the report and replies thereto were filed by both groups

of parties and the case was argued orally before the Commission.

In its decision, dated February 3, 1965, the Commission found the Northern lines' cost of performing the service involved to be relatively higher than that of the Southern lines (A. 78). It found other factors to be substantially equal, and predicated its ultimate conclusion upon its determination of the relative costs of performing the service. Hence it prescribed divisional scales which are higher for equal distances for Northern lines than for the Southern lines to the extent that the Northern lines' costs were found to be higher.

Ten of the eleven Commissioners joined in the Commission's report and one dissented, in part. The dissenting Commissioner agreed that the Northern lines should have higher divisions than Southern lines, but he objected to the amount of the increase awarded (A. 86). It is stipulated by the parties that overall the divisions and revenues of the Southern lines from the traffic involved were reduced approximately 3% (A. 200-201). While generally the divisions of Northern lines were increased, the difference in the construction of the new scales as compared with the old resulted in the reduction of many divisions of Northern lines, with corresponding increases in the divisions of Southern lines (A. 201).

II. Review of Commission's Findings.

The report now before the Court shows that the case was considered thoroughly by the Commission. The details of the findings will be reserved for such discussion as may be required in connection with particular points, but a brief summary of the report would seem desirable at this point.

Beginning at A. 25 the Commission described the traffic studies submitted by the parties, studies which are designed to show the characteristics of the traffic which moves under the rates to be divided. It is the traffic study which fur-

nishes the data (such as type of equipment, weight thereof, tons, ton-miles, cars, car-miles, number of interchanges, etc.) to which unit costs are applied. The Commission agreed with a high appraisal which Southern lines put on their own traffic study [2] (A. 24-25), and it used that study in its determination of the relative service costs (A. 48).

After finding that the evidence contained typical and ample representations of the roads involved, covering typical movements for a normal annual period, and that the detailing of the divisions on particular traffic, reflecting the rates involved, permits an appropriate consideration of individual carriers, the Commission went on to review economic trends (A. 31-35). The facts found with respect to economic trends and rates of return appeared to indicate a

---

2. The Southern lines' characterization of their traffic study from p. 187 of their brief before the Commission is as follows:

> "The Southern lines' traffic study accurately measures the transportation characteristics of the precise traffic against which the Docket 29885 equal factor divisions were prescribed to apply, and against which any prescribed change in those divisions would hereafter apply. The Southern lines' traffic study, presented by Witness W. W. Wolford, provides the most current data available with respect to the normal annual movement of Official-Southern traffic and supplies all the traffic data required for the Commission's determination of just, reasonable and equitable divisions.
>
> "The utilization of modern data processing equipment and techniques has permitted the Southern lines to develop the most complete information pertaining to the movement of Official-Southern traffic ever presented to the Commission. This information shows the services performed and revenue received by each carrier participating in the movement of the precise traffic at issue. It measures the participation of Class I and Class II railroads individually and as groups, in each territory, and shows the relative importance of Official-Southern revenues and ton-miles to the railroad groups and individual carriers (V.S. 36, Exs. 4 and 5). The distribution of revenue by mileage blocks north and south of the gateways is shown (V.S. 11, Ex. 2). [A. 600-712] Other information provided by the Southern lines' traffic study includes the volume and consist of Official-Southern traffic, average hauls, distribution by gateways, states of origin and destination, and similar information (V.S. 11 and V.S. 11A)."

greater revenue need on the part of Northern than of Southern lines. But the Commission found no warrant for adjustment of the divisions from those based upon the relative costs of service (A. 78-79).[3]

The Commission next found that both groups are being operated efficiently (A. 37-39) and then reviewed the subject of relative cost of service. It began this discussion by quoting the statement made when prescribing the then existing divisions (those prescribed in the 1953 report) that:

> "'. . . it is to be the safest assumption for the future upon the facts before us that neither contesting group will have an appreciably lower basis of operating costs than the other, . . .'" (A. 39).

The Commission stated, with reference to the case now on appeal, that the basic formula used by both Southern and Northern lines was Rail Form A, a formula devised by the Commission's Cost Finding Section and entitled "Formula for Use in Determining Rail Freight Service Costs." It first considered the Northern lines' contention that the costs north of the dividing points should be ascertained on the basis of the costs of the Eastern District roads alone, rather than including with those costs those of the railroads of the Pocahontas Region. Had this point been resolved in favor of Northern lines, the prescribed divisions would have been substantially higher than those fixed by the Commission (A. 47). But the Commission decided the issue in favor of the Southern lines (A. 42).

At (A. 46) the Commission noted that:

> "The southern lines urge that it is settled law that relative service costs are the decisive measure in determining just and reasonable divisions . . ."

---

3. In fixing higher divisions for Southern lines in the earlier cases, the Commission had relied heavily upon their then greater revenue needs. See, *e.g., Baltimore & O. R. Co. v. U.S.*, 298 U.S. 349, 361 (1936).

The basic unit costs used by both Northern and Southern lines were shown to be the Form A average costs for Southern and official territories for the year 1956, with Southern lines advocating 12 adjustments therein. Each of these adjustments was analyzed in great detail in Appendix B to the Commission's report, wherein the Commission accepted five of Southern lines' adjustments and rejected the others (A. 87-129). In the following table from the report (A. 48-50), the Commission set forth its restatement of the costs:

"

Restated Costs

All traffic	*Official territory*	*Southern region*
Revenue as settled	$221,430,341	$274,656,425
Percent	44.64	55.36
Fully distributed costs—unadjusted	169,617,543	194,306,309
Percent	46.61	53.39
Adjustments:		
Exclude platform costs	—2,254,075	—453,673
Way and thru train separation	—2,283,259	—3,595,230
Switching and terminal Companies	—163,473	+1,039,610
Include short line (class II railroads) costs	—37,725	+529,347
Train tonnage—Pocahontas region	+867,319	0
Total adjustment (net)	—3,871,213	—2,479,946
Fully distributed costs—adjusted	$165,746,330	$191,826,363
Percent	46.35318	53.64682

"

Thus the Commission's restatement of the costs showed that whereas the lines north of the dividing points received 44.64% of the revenue on the traffic involved, they incurred over 46.35% of the cost of performing the service. The great extent to which the evidence that produced these results was evidence of the Southern lines was noted by the Commission (A. 48):

> "Our restatement is based on official territory (eastern district plus Pocahontas region) costs north of the breakpoints, for reasons previously discussed, [the "alternative urged by the southern lines,"; A. 42] and is at the fully distributed level,[4] as advocated by both groups, on all traffic. Apart from the adjustments rejected in appendix B, our restatement is based on the southern lines' cost computation, as applied to their traffic studies, which, we find, more reliably and accurately reflect the movement of the traffic in question."

After reviewing contentions of the Conferences, the Commission found that there were no differences in the importance to the public as between the contending groups of railroads (A. 50-51).

The Commission next discussed a major issue, which related to the points over which the rates should be divided. In its first 1953 decision the Commission had found that the divisions should apply to and from actual points of interchange between Northern and Southern lines rather than at so-called territorial borders. On petition of Southern lines urging that this conclusion would cause a loss of $6 million annually to them the Commission reinstated the territorial boundaries as the dividing points, 289 I.C.C. 4, 7-8. In the present case the Northern lines strongly urged that the dividing points should be at the actual points of interchange; but the Commission concluded this major issue

4. "As found appropriate in *Louisville & N. R. Co. v. Southern Ry. Co.*, 319 I.C.C. 639, 660, sustained in *Carolina & N. W. Ry. Co. v. United States*, 230 F. Supp. 581 (W.D.N.C. 1964)."

against them (A. 52-56). It likewise decided in favor of Southern lines the issue as to whether or not a 15% minimum division which had been applied in the past should be continued (A. 64).

Beginning at A. 75, the Commission set forth its general discussion and conclusions. It stated that both on the basis of precedent and the position of the parties in the present litigation, relative service costs constitute a prime factor in determining the fair and equitable share of joint revenue to be received by the carriers involved. At A. 78 it stated:

> "Our restatement of the costs, which are reasonably accurate and reliable for purposes of determining the relative contribution by the groups on a cost-of-service basis, shows that the cost level in 1956, the year both groups used in the final cost analysis, is somewhat higher in the North than in the South for like services. A consideration of all factors indicates that this situation will most likely continue in the immediate future."

The Commission then pointed out that both groups of carriers also relied upon revenue needs in claiming that they should have a greater share of the joint revenue than accorded by the present divisions. At A. 78 the Commission stated that in every divisions case evidence relating to revenue need is material because Section 15(6) of the Interstate Commerce Act requires that due consideration be given, among other things, "to the amount of revenue required to pay their respective operating expenses, taxes, and a fair return on their railway property held for and used in the service of transportation." Then it stated, at A. 78, that:

> "We are thereby authorized 'to take into account and give due weight to revenues from all transportation service, the operating expenses and taxes chargeable to the same and the amounts available as compensation for the use of all carrier property,' as well as 'the reve-

nues, expenses, taxes and returns attributable to the service covered by the divisions under consideration.' *Baltimore & O. R. Co. v. United States,* 298 U.S. 349, 360, 370 (1936). We are free to give such evidence the weight which the particular circumstances appear to justify.''

Immediately thereafter the Commission stated that in this case it had considered evidence relating to the cost and other factors ''concerning the public interest in maintaining all essential parts of the transportation system.'' It found (A. 79) that no factor offered a concrete basis on which to find that either group is entitled to a share of the joint rates larger than that which would result from divisions prescribed on the basis of relative costs. It stated that:

''. . . our prescription of divisions based on relative costs includes allowances for overhead and return, and in our judgment reflects a due proportion of the burden of maintaining the financial integrity and credit of the carriers involved. *Cf. New England Divisions,* 66 I.C.C. 196, 199.'' (A. 79)

At A. 79, the Commission concluded:

''. . . weighing the cost evidence of record in the same balance and similarly considering it, without particular solicitude, we are of the opinion and find that it affords a reasonable basis for the exercise of a practical judgment. Stated in another manner, everything else being substantially equal, the relative costs of the parties reflecting their respective operations as to this traffic can properly serve here as a guide for the determination of just, reasonable, and equitable divisions. *Cf. Louisville & N. R. Co. v. Southern Ry. Co.,* 319 I.C.C. 639, at pages 657-658.[5]

5. Affd., *Carolina & Northwestern Ry. Co. v. U.S.,* 234 F. Supp. 112 (W.D., N.C., 1964); Aff'd 380 U.S. 526.

Since the evidence in the test year showed that the Northern lines received 44.64% of the revenue and incurred over 46.35% of the costs, the Commission found it:

> ". . . clear that an adjustment in the divisions is required to compensate the respective groups according to their expenditures in the joint effort of handling this interterritorial traffic. To the extent that the present divisions do not meet this test, they are unjust, unreasonable, and inequitable." (A. 80)

The Southern lines had asked the Commission to prescribe scales of divisional factors based upon costs, using the method adopted in *Louisville & Nashville R. Co. v. Southern Ry. Co.*, 319 I.C.C. 639, and they pointed out that, to the extent that the Examiners were found to be correct in their rejection of specific aspects of the Southern lines' cost evidence, the cost evidence as thus modified would provide the basis for constructing the divisional scales (Southern lines' exceptions, A. 1361-1363). The Commission agreed; and after accepting five of Southern lines' proposed adjustments and rejecting others, it prescribed the new divisions on the basis of Southern lines' cost evidence as thus modified, citing *Louisville & Nashville* (A. 48-49, 63, 79-80).[6]

The Commission found that based on Southern lines' traffic study for 1956 the prescribed scales would increase Northern lines' revenue divisions by $7,948,004, and decrease Southern lines' divisions correspondingly (A. 80). The formal ultimate findings condemning the present divisions as unjust, unreasonable, and inequitable, and prescribing just, reasonable, and equitable divisions for the future appear at A. 81-83.

---

6. Because of a special situation, the Commission deviated from the prescribed scales to give a more favorable basis to the Norfolk Southern Railroad, a Southern line, and upon petition of that line it gave it an even more favorable basis in the supplemental report on further consideration (A. 176). Otherwise, the conclusions in the February 3, 1965 report were affirmed in the supplemental report, which was dated May 18, 1965.

III. Proceedings in the Court Below.

On March 31, 1965, the Southern lines filed suit in the United States District Court for the Eastern District of Louisiana, New Orleans Division, praying that the order of the Commission prescribing the new divisions be enjoined and set aside. Contemporaneously, plaintiffs filed an application for an interlocutory injunction and, if needed, a temporary restraining order. This resulted in the granting of a temporary restraining order, but following hearing before the three judges on plaintiffs' application for interlocutory injunction, the temporary restraining order was dissolved and the application for interlocutory injunction was denied subject to conditions for refunding the money involved to Southern lines in the event they should be successful in permanently setting the order aside. As a consequence the newly prescribed divisions became applicable as of April 20, 1965, the effective date of the Commission's order (A. 131-132).

The District Court disregarded the findings of the Commission concerning the adequacy, reasonable accuracy and reliability of the data on the relative costs of handling the traffic involved on which the Commission had relied and held such data insufficiently refined to support the Commission's order, and for this reason it found the order to lack the support of substantial evidence and adequate findings. It held that the Commission was obligated to develop, or to require the parties to develop, more refined cost data described by the Court as the "actual costs of handling the specific traffic at issue." (A. 354) It decreed that the Commission's order be set aside and that the cause be remanded to the Commission for further proceedings.

In its opinion, the court below—with apparent lack of appreciation of the years of work necessary to prepare traffic and cost studies of the completeness of those here of record, to say nothing of the more refined cost data envisioned by it—suggested (without purporting to require)

that a new traffic study as well as a new study of costs which would meet the views of the court as to the "actual costs" of handling the specific traffic might well be warranted (A. 356).

Under the protective conditions attached to the District Court's denial of an interlocutory injunction, which are carried forward by its order staying decree (A. 169-171, 359), Northern lines would be obligated, in the event the Commission's order is permanently set aside, to resettle their accounts with Southern lines on all shipments made on and after April 20, 1965, with interest. As of April 20, 1968, this represented a principal amount of some $25,000,000 to be paid Southern lines by Northern lines.

SUMMARY OF ARGUMENT.

I.

The Southern lines contended before the Commission that relative service costs are the decisive measure in determining just and reasonable divisions. They urged the Commission to determine such costs on the basis of the territorial costs for Official and Southern territories, respectively, as developed by the Commission's Cost Finding Section's Rail Form A formula as modified by 12 adjustments which they proposed.

After a comprehensive examination and discussion of each of the proposed adjustments, the Commission adopted 5 of them and rejected the remaining 7. The unit costs as thus derived from the Southern lines' evidence were applied by the Commission to the Southern lines' traffic study, which they said accurately measured the transportation characteristics of the precise traffic involved.

The Commission found that the costs as thus restated by it are "reasonably accurate and reliable for purposes of determining the relative contribution by the groups on a cost-of-service basis . . ." (A. 78).

The Southern lines asked the Commission to base the divisions to be prescribed on their cost evidence as modified to the extent that any of their proposed adjustments were rejected. The Commission did precisely that.

Upon suit by Southern lines, the District Court held that the costs upon which the Commission acted should have been more refined and that the Commission was obliged to require the development of what the Court described as the actual costs of handling the specific traffic at issue, rather than to rely on territorial average costs.

The District Court thus substituted its judgment for that of the Commission on the purely administrative and complex factual question as to the representative character

of the cost evidence. In so doing, it acted contrary to numerous decisions of this Court with respect to the judicial review of cost evidence, e.g., *Illinois Commerce Commission v. United States,* 292 U.S. 474, 481 (1934); *New York v. United States,* 331 U.S. 284, 328, 331, 335 and note 33 (1947); *Chicago & N.W. R. Co. v. A., T. & S.F. R. Co.,* 387 U.S. 326, 356 (1967).

If allowed to stand, the Court's decision would seriously interfere with the Commission's use of cost formulae widely employed by the Commission and parties appearing before it in daily practice. The District Court's decision also rests on an assumption as to the function of the reviewing court which, if applied generally, would mean that the technical problems involved in determining transportation costs would not be determined uniformly by the expert judgment of the agency charged with the administration of the National Transportation Policy, but by the varied views of the numerous District Courts which have jurisdiction to review Commission orders.

Finally the decision of the court below requires a cash payment of $25 million, plus interest, by the railroads in the northeastern part of the country, which include some of the most necessitous carriers of the nation, to the Southern lines, and an immediate reduction in Northern lines' divisions to the extent of approximately $8 million a year, at least until the Commission could undertake a new investigation in a futile search for "actual costs," which would consume additional years of litigation.

II.

The action and conclusions of the District Court are directly contrary to this Court's recent decision in *Chicago & N.W. Ry. Co. v. A., T. & S.F. Ry. Co., supra,* which involved an I.C.C. order prescribing divisions of joint rates between Mid-western and Transcontinental (far-western) railroads. Indeed, the cases are so similar that Appellees, the Southern Governors' Conference, et al. (which have

been allied with the Southern railroads throughout this litigation) filed a brief as *amici curiae* in *Chicago & N.W. R. Co.* and stated that the Commission's cost findings in the case here on appeal reflect the same approach used by the Commission in the *Chicago & N.W.* case, and that there, as here, although the asserted basis of the Commission's action was the relative cost of performing the service involved "the Commission relied almost exclusively upon the average costs of handling all traffic in these territories in reaching its conclusions." And there, as here, virtually every objection to reliance upon such territorial averages was brushed aside without either findings or evidence to support such action."

This Court held in *Chicago & N.W. R. Co., supra,* that the Commission's "factual findings and treatment of accounting problems concerned matters relating entirely to the special and complex peculiarities of the railroad industry" and that the Commission's conclusions "had reasoned foundation and were within the area of its expert judgment" (p. 356).

The present phase of the litigation over divisions on north-south traffic has been before the Commission and the Courts for about 11½ years, and the initial phase thereof began about 21 years ago. This Court's reference, in *Chicago & N.W. R. Co., supra,* at 356, to the long time which elapsed from the time the complaints in that case were first filed and its indication of the necessity of bringing the litigation to an end (p. 356) are applicable with equal force in the present case.

III.

The District Court enunciated its difference of opinion with the Commission as to the significance of the cost evidence in terms of lack of substantial evidence and findings. There is abundant evidence, reviewed hereinafter, to show that the use of territorial unit costs (with such modifications as the Commission allowed) as applied to

a traffic study showing with precision transportation characteristics of the traffic involved was justified in this case, which deals with all traffic, other than coal and coke and certain trailer-on-flatcar traffic between every station in Official territory and every station in Southern territory over all Northern and all Southern railroads.

Moreover, the insistence of the Court below that the Commission determine the "actual costs" of "the specific traffic" sets up a standard that is illusory and impractical. Of necessity, the cost of any shipment or category of shipments represents an apportionment of expenses incurred in providing and maintaining facilities and conducting operations. The practical impossibility of securing "actual costs" as to any category of traffic was recognized in *New York v. United States,* 331 U.S. 284, 328, 335 and note 33.

IV.

In their opening cost evidence, the Northern lines excluded the entire amount of the deficit from passenger operations incurred by the Northern and Southern railroads, respectively. Southern lines objected to this and contended that Northern lines' study of the cost of the service involved was defective in computing constant costs without consideration of passenger deficits.

Although the inclusion of passenger deficits was to Southern lines' advantage, Northern lines did not object to such inclusion, but did object to Southern lines' contention that the Commission should cull out of the passenger deficits that part thereof which is attributable to commutation service, of which there is relatively little in the South. Southern lines contended that the commutation service is almost entirely rendered on facilities that are not used in the rendition of any service other than commutation but that intercity passenger service almost entirely uses facilities that are used also for freight and that, on this basis, the deficit incurred in the performance of commutation

service should be excluded but the remaining passenger deficit included, in computing the cost of the North-South freight service.

The Commission found that while some elements of the cost of rendering commutation service are incurred solely in connection with that service the facilities on the whole could not be considered solely related to suburban service and treated entirely apart from freight and intercity passenger service. It concluded that the suburban deficits should not be excluded from the constant costs and it included a pro rata portion of the entire passenger deficit for both Northern and Southern lines, basing its figures upon the cost evidence submitted by Southern lines before the exclusion of suburban deficits.

The Court below found that the Commission erred in including suburban deficits because it said there was neither findings nor evidence to relate such deficits to the Commission's standard for decision, i.e., the relative cost of performing the North-South freight service involved. The fact is, of course, that it is in the very nature of overhead, or constant costs, that they are not incurred in the performance of the service to which they are apportioned. *New York v. United States,* 331 U.S. 284, 316 (1947). But the District Court dismissed the Northern lines' point that these costs are treated as overhead, or constant costs, the allocation of which is required because of the need for revenue from freight service to continue passenger operations. It said that the Commission did not so treat them since it rejected contentions of both groups of railroads for divisions over and above the cost of service on the ground of revenue needs.

The District Court plainly erred in this holding. The Commission stated that its prescription of divisions based upon relative costs included allowances for overhead and return thus reflecting a due proportion of the burden of maintaining the financial integrity and credit of the carriers and that accordingly it found no justification for add-

ing "any special increment" favoring one group of carriers over the other. Included in the allowance for overhead, of course, were the passenger deficit figures for Northern and Southern lines.

The Court's holding that the Commission could consider only those expenses of performing commutation service which are common to freight and passenger has no basis in the decisions of the Commission or of this Court. *Increased Freight Rates, 1948,* 276 I.C.C. 9, 32-39 (1949); *King v. United States,* 344 U.S. 254, 260 (1952).

It is important to note that the Northern lines' entire passenger revenues exceeded the expenses that are solely related to the performance of passenger service as a whole and that they experienced a deficit on passenger operations only when a portion of the expenses that are common to freight and passenger was assigned to the passenger service, but that the Southern lines' passenger revenues are exceeded by the costs solely related to the performance of passenger service alone. In the calculation of the cost of the North-South freight service, therefore, the net result of the Commission's action was to allocate to the Southern lines a deficiency of solely related passenger expenses under passenger revenue as well as the additional deficit resulting from the allocation of common expenses to the passenger service, while the passenger deficit included for the Northern lines resulted from the apportionment of common expenses alone. Overall, therefore, the lower Court's view that it was proper to apportion to the freight service involved only that part of the passenger deficit which resulted from the allocation of common expenses was actually met as to Northern lines but not as to the Southern lines.

The District Court quoted from this Court's decision in *Chicago & N.W. R. Co., supra,* to the effect that while the Commission has sometimes offset passenger deficits in freight rate cases, the issues are different when, in a divisions case, it is argued that carriers in one part of the country should subsidize the passenger operations of car-

riers elsewhere, but that in the light of the fact that the passenger deficits were of negligible relevance to the Commission's decision there were no errors that would justify setting aside the order there involved.

Had the Commission not considered passenger deficits, the Northern lines' divisions would have been relatively greater than those prescribed for them by the Commission. The inclusion of passenger deficits, therefore, may be said to have resulted in Northern lines subsidizing Southern lines. There clearly was no error prejudicial to the Southern lines in the Commission's consideration of passenger deficits. As to those lines it was of "negligible relevance" (C. & N.W., pp. 350-351) except that its consideration gave them more than a million dollars annually above that which they would have obtained if passenger deficits had not been included in the constant costs.

ARGUMENT.

1. The Decision of the District Court Exceeds the Bounds of Permissible Judicial Review.

After a comprehensive review of the evidence (A. 49-50, 87-129) the Commission found that Southern lines' evidence of territorial unit costs, with the adjustments adopted by the Commission, "adequately reflect the costs attributable to the traffic at issue" (A. 49-50) and are "reasonably accurate and reliable for the purposes of determining the relative contribution by the groups on a cost-of-service basis . . . ." (A. 78). The District Court, however, substituted its judgment for that of the Commission and declared that the costs relied upon were not sufficiently refined to sustain the order prescribing the divisions. The Court stated this conclusion in terms of lack of substantial evidence and of findings, but this asserted deficiency relates only to the difference between the Court's views and those of the Commission as to the adequacy of the costs used.

In so deciding, the Court below acted directly contrary to pronouncements of this Court with respect to the judicial review of cost evidence. Typical of this is *Illinois Commerce Commission v. United States*, 292 U.S. 474, 481 (1934):

> "Whether or not the cost study was representative, whether the study should have been more refined, and whether it should have been supplemented as appellants desired, are questions of fact, the determination of which is within the competence of the Commission. The Commission reached its conclusion after full hearing and thorough consideration of all questions presented. As the record affords a sufficient basis for the Commission's determination, it is not subject to review in the courts . . . ."

See also *B. & O. R. Co. v. United States,* 298 U.S. 349, 359 (1936) involving a divisions order, and *New York v. United States,* 331 U.S. 284, at 328, 331, 335, and note 33 (1947), where this Court was considering the Commission's initial reliance on Form A costs in *Class Rate Investigation, 1939,* 262 I.C.C. 447 (1945).

This rule was recently invoked in an opinion of this Court dealing with divisions of freight rates. In *Chicago & N.W. R. Co. v. A., T. & S.F. R. Co.,* 387 U.S. 326 (1967), it was stated (356):

> "The presentation and discussion of evidence on cost issues constituted a dominant part of the lengthy administrative hearings, and the issues were thoroughly explored and contested before the Commission. Its factual findings and treatment of accounting problems concerned matters relating entirely to the special and complex peculiarities of the railroad industry. Our previous description of the Commission's disposition of these matters is sufficient to show that its conclusions had reasoned foundation and were within the area of its expert judgment. *B.&O. R. Co. v. United States,* 298 U.S. 349, 359; *New York v. United States,* 331 U.S. 284, 328, 335, 349."[7]

Indeed, the facts with relation to the cost evidence in that case and in the present case are so alike that the decision therein constitutes a precedent of unusual significance for the disposition of the present appeals.

2. The Decision Below Misconstrues and Is Inconsistent With This Court's Recent Decision in Chicago & N.W. R. Co.

It is particularly surprising that the District Court decided as it did when it had the benefit of this Court's decision in *Chicago & N.W. R. Co. v. A., T.&S.F. R. Co.,*

7. *Chicago & N.W.* was cited and followed on this point in *Permian Basin Area Rate Cases,* No. 90, et al. October Term 1967 (U.S.) (Vol. 36 Law Week, No. 42, p. 4358, May 1, 1968).

387 U.S. 326 (1967) which was handed down only about one month before the decision of the District Court here on appeal and which held that cost evidence, admittedly substantially the same as that upon which the Commission acted in the present case, was sufficient to sustain the order there involved and within the area of the Commission's expert discretion. Indeed, the District Court could have decided this case by simply citing *Chicago & N.W.*

That the District Court misapplied and misconstrued the decision in *Chicago & N.W. R. Co.* would seem beyond dispute. There, in sustaining an order by which the Commission prescribed interterritorial divisions between Midwestern and Mountain-Pacific railroads, this Court considered and rejected contentions similar to those successfully advanced, through the same principal counsel, by Southern lines in the present proceeding. The District Court in the present case referred to *Chicago & N.W. R. Co.*, and stated that:

> "There, the Commission based its cost findings on a special cost study and analysis prepared by the Mountain-Pacific carriers and made certain adjustments which it considered more accurately reflected the true costs of the traffic involved. These adjustments (3) were derived from Rail Form A. The Supreme Court held that the attack on the legal validity of these adjustments to costs were unsubstantial. Here, of course, the entire inflation is pegged on relative costs derived from Rail Form A." (A. 349-350)

Thus, the District Court construed *Chicago & N.W. R. Co.* as involving Form A costs only to the extent of three adjustments. The fact is that there, as here, the basic cost study upon which the Commission relied was predicated upon Form A territorial averages, with certain adjustments advocated by Appellees (Mountain-Pacific lines) being allowed by the Commission and others rejected. This is clear

from the Commission's decision which was sustained in that case. *Akron, C.&Y.R. Co. v. Atchison, T.&S.F. R. Co.*, 321 I.C.C. 17, 29-53; 322 I.C.C. 491, 492-499. Indeed, the Commission concluded in that case that ". . . for a large and varied body of traffic as here at issue, territorial average costs will be the substantial equivalent of specific costs" (322 I.C.C. at 50). The cost study prepared by the Mountain Pacific carriers to which the Court referred in *Chicago & N.W. R. Co.* at p. 352 was basically the Form A territorial averages with adjustments, just as the Southern lines' cost evidence in the present case consisted of the Form A territorial average costs, with adjustments. In that case (as pointed out on pp. 352-356) and in the present case the Commission allowed some of the adjustments and rejected others.

The cost issues in *Chicago & N.W. R. Co.* and those involved here are indeed so similar in character that the intervenors in the instant case—Southern Governors' Conference and Southeastern Association of Railroad and Utilities Commissioners—obtained leave to file a brief as *amici curiae* in the appeal in *Chicago & N.W. R. Co.* in order to present to this Court their contention that the cost issues in that case should not be decided by the Supreme Court, lest such a decision govern the decision of the District Court in the instant case. They stated in their *amici* brief of April 5, 1967, to this Court:

> "However, the Commission's cost findings in the *Official-Southern* case reflect the very same approach that it used in the *Transcontinental* case. There, as here, although the asserted basis of its action was 'the relative costs of the parties reflecting their respective operations as to this traffic' (325 I.C.C. at 50; see also 325 I.C.C. at 26, 56), the Commission relied almost exclusively upon the average costs of handling all traffic in these territories in reaching its conclusions. And there, as here, virtually every objection to reliance upon such territorial averages was brushed aside

without either findings or evidence to support such action." (pp. 2-3)

Likewise, the Mountain-Pacific lines in their memorandum of August 16, 1967, in support of a motion to the California District Court to clarify a passage in its decision (which was reversed in *C.&N.W.*) relating to the cost issues, stated, at page 14:

> "The decision in the *Official-Southern Divisions* case is especially relevant here since that case, like this one, involved the use by the Commission of Rail Form A territorial averages to measure the actual costs of handling particular traffic."

It is clear, therefore, that the basic cost evidence upon which the Commission relied in *C.&N.W.*—and not just a few adjustments therein—was made up of territorial unit costs based upon Rail Form A, and that the District Court in the present case misconstrued *C.&N.W.* in its attempted distinction thereof. In contrast to the District Court's substitution of its judgment for that of the Commission on the representative nature of those costs and the need for greater refinement, the Supreme Court in *C.&N.W.* applied the usual rule of judicial review by accepting the Commission's judgment on accounting problems which the Court said "concerned matters relating entirely to the special and complex peculiarities of the railroad industry." (387 U.S. 326, 356).

After holding in *Chicago & N.W. R. Co.* that these cost matters were within the area of the Commission's expert judgment, this Court pointed out that:

> "Thirteen years have elapsed since the complaints in this case were first filed. The appellees' attacks on the legal validity of the Commission's findings on cost are so insubstantial that no useful purpose would be served by further proceedings in the District Court. We conclude that there was no legal infirmity in the Commission's cost findings."

The initial phase of the present case began on July 17, 1947, almost 21 years ago, and the reopening of the case which inaugurated the present phase of the same litigation began with Northern lines' petition of November 2, 1956, about 11½ years ago. The lapse of time to which the Court adverted in *Chicago & N.W. R. Co.*, therefore, is a consideration which applies with at least as much force in the present case. It is respectfully submitted that the Court should conclude, as it did in *Chicago & N.W.*, that the cost findings were in the area of the Commission's expert judgment and without legal infirmity and it should finally bring this litigation to an end.[8]

3. The Commission's Order Is Sustained by Substantial Evidence and Adequate Findings.

In their motion to affirm, the Southern lines argued that Appellants seek to use "unadjusted territorial average costs" (Motion, 5) without any evidence that they measure the cost of controverted elements of the North-South traffic, and they quote from the opinion below that territorial average costs cannot be accepted "without further evidence for mechanical application to particular segments of traffic" (Motion, 8).

The fact that the Commission adopted five of the adjustments tendered by Southern lines, and the exhaustive analysis of these and the remaining controverted adjustments (taking up 26 pages of an appendix to its report) indicate how far removed its action was from a "mechanical application" of the Form A territorial costs.

8: Referring to the lapse of almost eight years from the time at which the administrative proceedings began, this Court in the recent decision in *Permian Basin Area Rate Cases*, No. 90, et al., October Term 1967 (—— U.S. ——) (Vol. 36 Law Week, No. 42, p. 4358, May 1, 1968) also pointed out that very extended additional proceedings would doubtless be necessary to review questions relating, *inter alia*, to cost determinations and, following *C. & N.W.*, held that the factual findings and accounting problems concerned administrative matters, that no useful purpose would be served by further proceedings in the court of appeals, and that there was no legal infirmity in the Commission's findings (Law Week, p. 4358-9, May 1, 1968).

There is abundant evidence to support the use of the Form A costs as adjusted by the Commission. It should first be noted that, as the Commission stated in *Class Rate Investigation, 1939,* 262 I.C.C. 447 (1945), at p. 693:

> "There are different degrees of refinement in costs depending upon the purposes for which the costs are intended. The ascertainment of the costs of transporting a particular commodity over a single railroad or a group of roads, for instance, obviously requires more refinement in procedure than the calculation of relative costs for transporting all traffic, or important and well-defined segments of traffic, by territorial groups of carriers."

This case involved "the relative costs for transporting . . . important and well-defined segments of traffic, by territorial groups of carriers." The order of investigation itself put in issue the divisions of rates on all traffic (except, by common consent, coal and coke) between all stations in the whole of Official Territory and all stations in the whole of Southern Territory and over all the railroads of each territory. It was truly a case involving territory-wide traffic between the North and the South. The record showed that the North-South traffic of Northern and Southern lines constituted 10% of their combined traffic (V.S. 36; Ex. 5) (A. 796). This contrasted with much smaller portions of total traffic in other cases in which the use of territorial averages had been approved, such as *Class Rate Investigation, 1939, supra,* wherein the traffic moving under the rates involved constituted only 4.1% of the total traffic of the railroads (262 I.C.C. at 479).[9] The *Class Rate* decision was affirmed

9. Appellees have sought to escape the force of this comparison by suggesting that the Commission was concerned in the *Class Rate* case with finding territorial average costs of all traffic. As this Court pointed out, however, the orders involved "affect class rates and class rates alone" and that ". . . this proceeding pertains only to class rates, which move but a small percentage of the traffic"; 331 U.S. at 330 and 343.

in *New York v. United States*, 331 U.S. 284 (1947) after due consideration of the data based upon Form A territorial costs and the conclusions of the Commission with respect thereto (315-332).

The record also establishes that the interterritorial traffic involved is an inseparable part of the whole and possesses no transportation characteristics which are distinguishable from those of traffic generally, and that the method of railroad operation is such that the use of average territorial costs was appropriate to the traffic involved in this case (V.S. 8; A. 575). This evidence showed, *inter alia*, that in a test week North-South traffic moved in 45% of all the trains operated by the Eastern lines, and the witness concluded that it would be found, over a longer period, that every train operated by an Eastern line would participate in the transportation of Southern traffic. "The obvious conclusion to be drawn is that Southern traffic shares in the same service provided on traffic generally within Official Territory and is not restricted to any particular trains or categories of service" (V.S. 8, p. 9; A. 547).

The Southern lines themselves used the Form A territorial costs as the basis for their own cost study. In fact, approximately 89.45% of the total North-South costs attributed by the Southern lines to the traffic involved were unadjusted Form A territorial averages (computed from V.S. 40, 40A; A. 867, 875). This fact strongly suggests that the Form A average territorial costs were representative for the North-South traffic and that the adjustments proposed by the Southern lines were simply *ad hoc* restatements that were the result of the exigencies of their litigating position rather than of any genuine infirmity in territorial average costs.

The evidence also shows that Southern lines have employed Form A territorial average unit costs as appropriate to determine the cost of transportation of far narrower scope than that involved in the present case (V.S. 80, Sec. H; A. 953-957). Sufficient examples were supplied to illus-

trate how such territorial costs are used by Southern lines "as a matter of established practice month in and month out before the Commission" (A. 953).[10]

Again, the record contains comprehensive evidence to support the Commission's conclusions with respect to the seven adjustments which had been sought by the Southern lines and rejected by the Commission (e.g., V.S. 73, 76 and 80; A. 893-904, 911-931, 933-974).

After a detailed consideration of each of the cost adjustments sought by the Southern lines, the expert body concluded that, with the adjustments adopted, the Form A costs were adequate and reasonably accurate and reliable to reflect the costs attributable to the traffic at issue. All of these facts having been before the Commission, it cannot be said that its conclusion lacked support in substantial evidence. The contrary holding of the District Court can only mean that it disagreed with the Commission's appraisal of the significance of these facts. The Commission accepted them as showing that the Form A costs are reliable for use here; the District Court held that greater refinement was necessary. That was not its function.

Moreover, the insistence of the Court below (A. 354) that the Commission determine the "actual costs" of

10. Indeed, one of the principal Southern lines, the Illinois Central, employed such costs (with minor adjustments) in a current divisions case, *Illinois Central R. Co. v. Great Northern Ry. Co.*, I.C.C. No. 34699 (unreported, recommended report and order of October 27, 1966 adopted, with inconsequential changes, by Division 2 of the Commission on July 31, 1967). There it was stated that the defendant criticized the Illinois Central's use of Rail Form A as not tending to disclose the cost of handling the traffic in issue because, it urged, the formula is designed to portray broad, territorial costs. The case involved but one commodity. The Illinois Central was sustained. It was stated in the report that costs determined in a similar manner have been relied upon in other divisions cases involving a single commodity, citing a case involving two other prominent Southern railroads—each of which relied upon Form A costs with certain adjustments—(*Louisville & N. R. Co. v. Southern Ry. Co.*, 319 I.C.C. 639, sustained in *Carolina & Northwestern Ry. Co. v. United States*, 234 F. Supp. 112 (W.D., N.C. 1964), affd, per curiam, 380 U.S. 526 (1965)).

"the specific traffic" involved sets up a standard that is illusory and impractical. Any given category of shipments uses terminals in common with other shipments, is handled by the same switching crews, moves over track and in trains maintained and operated for all traffic and in cars and by locomotives that are repaired in central shops. Of necessity, any shipment's cost is an apportionment of expenses incurred in providing and maintaining facilities and conducting operations.[11]

For many years before the establishment of the Cost Finding Section of the Commission and the development of Rail Form A the Commission had great difficulty in obtaining reliable costs for use both in divisions cases and other proceedings under the Interstate Commerce Act.[12]

---

11. The practical impossibility of securing "actual rail costs" is recognized in *New York v. United States,* 331 U.S. 284, 328, 335, and note 33.

12. Thus, in *Divisions of Freight Rates,* 148 I.C.C. 457 (1928) the Commission stated (p. 477): "The greatest obstacle in securing a satisfactory record has been the difficulty of determining relative costs of service as far as the traffic in question is concerned." In the initial report in the instant proceeding, *Official-Southern Divisions,* 287 I.C.C. 497, at pages 506-507 (1953), the Commission, referring to a previous report in No. 24160, *Divisions of Rates, Official and Southern Territories,* 234 I.C.C. 175 (1939) stated:

"At page 188 of the 1939 report we said:

> 'Some of the speculation and controversy necessarily arising in considering averages of this kind could be avoided if it were possible to separate terminal and line-haul elements of expense by some satisfactory method. The two contending groups agree that no such method has yet been determined, but in their statistical evidence they have presented some exhibits in which separations of this kind have been made more or less arbitrarily for purposes of illustration.'

"Shortly afterward we established a cost finding section which is now a part of our Bureau of Accounts and Cost Fnding, having as one of its objects the development of improved methods for determining transportation costs. After exhaustive investigation that section constructed what has come to be known as Rail Form A, a formula for determining railroad freight

At that time the Commission was to some degree at the mercy of litigants who made showings of costs on diverse bases always designed to support the particular position the litigants might then be taking.

The purpose of the organization of the Cost Finding Section and the development of Rail Form A was to arm the Commission with methods and directions for determining costs that were reasonably designed in accordance with generally uniform standards, and not simply contrived for some *ad hoc* litigating purpose.

The decision below threatens to impair these widely accepted methods that the Commission has independently developed for the determination of costs and to throw the subject back to the partisan presentations by the litigants.

This is not to say that the formula should not permit of necessary adjustments in appropriate cases. But it is the Commission, rather than the District Court, that should make the determination whether the adjustment is proper and appropriate to the case. It is that body which has the staff and the background of knowledge and experience necessary to make the judgments involved on adjustments proffered by litigants who have much to gain by their adoption.

Form A classifies the expenses of the railroads and reduces them to a unit basis by dividing the various classes of expenses by appropriate statistics, such as cars originated, tons, ton-miles, etc. This produces a cost per ton for some services, and costs per car-mile, per ton-mile or for other service units for other services, depending upon which unit is most appropriate. These unit costs are then applied to the units of service involved in the particular traffic, here the North-South traffic, which units are ascertained by making a traffic study. This application of the unit costs to the number of service units involved results in the appor-

---

service costs, including a separation of the line-haul and terminal elements and a differentiation in respect of load and tare weights per car. The basic formula is described in *Class Rate Investigation, 1939*, 262 I.C.C. 447, 571-88."

tionment of the railroads' unit costs to the exact units of service involved in the case at hand.

The basic principle of the Rail Form A formula is perhaps best described at page 81 of Senate Document No. 63, 78th Cong., 1st Sess., under the title "Rail Freight Service Cost Studies in the Various Rate Territories of the United States," (as taken from the statement of Dr. Ford K. Edwards, the Commission's head cost analyst and its chief witness in No. 28300, *Class Rate Investigation, 1939*, 262 I.C.C. 447, 571 and footnote 78):

> "The cost study is fundamentally based on the principle that the performance of transportation service requires the production of a number of homogeneous service units, such as gross ton-miles, car-miles, consignments billed, cars given an interchange switch, etc. The unit cost for such units are based solely on those expenses which vary directly with the performance of the unit in question. Expenses which were unaffected by the performance of service units, i.e., the constant or indirect costs, are set apart for a separate treatment. The cost study determines the quantity of service units of each kind consumed in rendering the service. This is based on the length of haul, net weight of load, tare weight of car, percent of empty return and whether carload or less than carload. The number of service units thus accumulated are then priced out at the territorial average unit cost per service unit. The aggregate of the costs thus determined constitutes the total out-of-pocket or assignable cost. The fact that unlike commodities are handled does not affect the accumulation of the quantities of homogeneous service units that are consumed in the rendition of the service. A gross ton-mile is a gross ton-mile whether it is made up of fertilizer, logs, cotton, or electric refrigerators. A car interchanged is a car interchanged regardless of whether it is furniture or coal. Hence, it cannot be said that the averages are produced by wholly unlike things

as the comparisons in cost are fundamentally limited to a comparison of the quantities of like service units. In short, the costs are a yardstick of the quantities of homogeneous service units required of the carriers in performing transportation services on various classes of equipment, various weights of loads with various percents of empty return, and various lengths of haul. The cost study is a measure of the relative work performed by the carriers in performing a given amount of transportation service. It evaluates in cents per hundredweight the influence of the transportation conditions insofar as they affect the cost of performing the service."

The costs developed under this formula were considered at length by this Court in *New York v. United States,* 331 U.S. 284, 315-340.

A particularly damaging aspect of the District Court's decision, obviously growing out of its unfamiliarity with matters of common carrier costs and administrative requirements, is the substantial extent to which the principle of its holding would cripple the ability of the Commission to administer the Interstate Commerce Act in proceedings in which cost data are customarily presented. The Court below has held that Form A territorial unit costs, as modified by the adoption of five adjustments advocated by Southern lines, did not constitute substantial evidence of the cost of the service involved in this case, which deals with transportation of virtually all commodities, over all railroads, between every station in the North and every station in the South.

This holding leaves nothing to the discretion of the administrative body. The Court below thus holds as a matter of law that territorial unit costs applied to the specific service units of a particular traffic cannot be accepted by the Commission, without further evidence, in arriving at its "opinon" (49 U.S.C., § 15(6)) that existing divisions are unreasonable and that the divisions prescribed

will be fair and equitable. But since the instant record contains such further evidence (A. 541-582) which the Court below noted (A. 343, n. 12) but disregarded, and since it likewise disregarded the adjustments of the Form A costs which Southern lines proposed and the Commission accepted and incorporated into the unit costs it employed and relied upon, the holding becomes a virtually absolute condemnation of the use or acceptance of relative costs for particular traffic—albeit important segments of traffic by territorial groups of carriers—based largely on the application of regional unit costs to the service units of such specific traffic. This holding is central to the court's decision.

In terms the opinion of the court below on this point refers to "a divisions case" (A. 348), but the principle announced is broad enough to relate to other types of issues before the Commission and to other types of carriers. Thus, the Rail Form A formula is but one of the formulas developed by the Commission's Cost Section for the determination of costs of common carriers subject to its regulation; others including Highway Form B and Barge Form C. The Cost Section has prepared numerous studies of regional cost data for both rail and motor common carriers.[13] The wide use and acceptance of these studies is indicated by the Commission in its Annual Report to the Congress for 1961, at page 153, and in that for 1967, at page 108.

Were the decision of the Court below to stand as to the legal inadequacy of rail costs ascertained by the application of territorial unit costs to the specific service units of the vast interterritorial traffic here involved, the same principle would apply with greater force where the particular traffic was of lesser volume and scope. It would also condemn the use of the system average costs of a single carrier as applied to particular traffic movements over that line although (contrary to the assumption of the District Court, which regarded Form A as being designed to develop territorial

13. See, for example, I.C.C. Annual Reports: 1949, p. 76; 1950, pp. 71-72; 1955, pp. 71-72; 1957, p. 107.

costs only) this is a use made of the Form A formula regularly before the Commission. The District Court's decision would also apply to the use of costs developed by the Commission's Cost Section for other types of carriers in determining costs of their particular traffic. The limitations that would thus be imposed upon the use of Form A either as applied to regional figures or the system figures of individual carriers is a limitation which would seriously hamper the Commission in the administration of the Interstate Commerce Act and the parties who appear before it. And in doing so it would put for nought the long established rule that "the Commission alone is authorized to decide upon weight of evidence or significance of facts." *B.&O. R. Co. v. U.S.*, 298 U.S. 349, 359 (1936).

4. A Review of the Individual Cost Adjustments Considered in the Lower Court's Opinion Shows That It Went Far Beyond the Permissible Limits of Court Review and That the Commission's Conclusions Regarding Them Were Supported by Findings and Substantial Evidence.

Extended discussion of each of the cost adjustments proffered by the Southern lines and rejected by the Commission is here unnecessary. But an indication of the serious error into which the District Court fell in failing to follow such precedents as *Illinois Commerce Commission v. United States, supra,* may be gained by reference to several of those proposed adjustments which were specifically the subject of the Court's findings.[14]

14. The District Court stated (A. 335) that it is uncontroverted that most elements of costs are no higher on Northern than on Southern railroads and that (A. 343) seven items account for the "entire inflation" of Northern costs over those of Southern lines. In fact, these statements were controverted (Brief for Intervening Defendant Railroads, p. 50, fn. 9). They are shown to be erroneous, for example, by the evidence showing higher wages on Northern than on Southern lines. Wages constitute the largest item of railroad expense. If Northern lines had the same wage levels as Southern lines, their total wage costs in 1956 would have been almost $58,000,000 less than they actually were (V.S. 80, Sec. F; A. 938-939).

The first which may be noticed is the Court's finding that the Commission's use of territorial averages for switching costs "rather than the specific costs" incurred with respect to North-South traffic, is not supported by reasoned findings or substantial evidence (A. 355). The adjustment of switching costs proposed by Southern lines purportedly was made to eliminate the effect of volume switching, i.e., the switching of multiple cars in a single unit, it being the Southern lines' contention that they had relatively more such cars moving within the South than the Northern lines had moving within the North, and that consequently the effect thereof should be excluded in determining the switching minutes (and, therefore, cost) applicable to the interterritorial traffic involved.

The Commission found that: "Territorial average costs are particularly appropriate to the traffic in this case because it is a large and varied body of the traffic moving to and coming from terminals in all parts of both territories" (A. 121), that the depressing effect of the switching of volume movements would be largely offsetting as between the two territories (A. 121), that the Southern lines' studies of switching within the South had weaknesses, both in the sample and in the studies themselves (A. 121) [15] and that Southern lines' switching adjustment within the North was not made on a basis comparable to that which they used within the South (A. 121). For these reasons the Commission concluded that Rail Form A territorial average switching costs measure the relative switching costs of the Official-Southern traffic more accurately than the switching costs computed by the Southern lines (A. 121).

---

15. The evidence offered by the Southern lines with respect to switching within the South was based on a study of but 41 cars, out of a total North-South movement of 967,000 cars. The Southern lines' sampling expert declined to characterize the 41 car sample as representative (A. 999-1000). Moreover, the sample did not consist only of North-South traffic, and there were other defects in the study (A. 113-122).

The presence of "reasoned findings" and of substantial evidence in support of the Commission's conclusions concerning the Southern lines' proposed switching adjustment and the use of territorial average costs is clear (A. 113-121). The District Court's conclusion to the contrary is based purely upon the substitution of its judgment for that of the Commission on the question of whether the territorial switching minutes are representative for use here or whether they should be more refined (A. 347-349).

The Southern lines' adjustment for empty return ratios on boxcars was also specially mentioned by the District Court as illustrative of what the Court called the Commission's general approach (A. 346). Without discussing the Commission's analysis of this complex matter or making any review of the evidence, the Court quoted from the opinion of the single dissenting Commissioner (who agreed that Northern lines should have an increase in divisions, but not as much as the Commission allowed), and announced, as a conclusion of law, that the use of territorial average empty return ratios rather than the "actual empty return ratios for the North-South traffic in issue" was unsupported by reasoned findings and not based upon substantial evidence (A. 355).

The Commission discussed the empty return ratio adjustment fully (A. 101-110). The proposed adjustment with respect to boxcars was made by Southern lines in three steps. The Commission found, with respect to the first step, that the adjustment was "not adequately supported" and was, at best, "merely illustrative", that the adjustment for the second step "is in error" and that the third adjustment was "purely an unsupported assumption" (A. 108). Its conclusion was that ". . . the empty return ratios for both boxcars and refrigerator cars developed by the special studies of the southern lines are not as sound an estimate of the empty return incurred by the official-southern traffic as are the 7-day study territorial empty return ratios. The latter reflect the compilation of actual

data reported by the railroads on a comparable basis in each territory under an order of this Commission."[16]

It is manifest that the Commission made reasoned findings in support of the empty ratios which it used.

The third adjustment to which the District Court specifically adverted was that regarding deficits from commutation service. This will be discussed below (*infra*, p. 44 ff.).

It is interesting to note that in the case before the Commission, when it came to their proposed adjustment of car costs, the Southern lines abruptly departed from the position which they had emphatically maintained, namely, that the costs should be more refined than territorial averages in order to bring them closer to the North-South traffic involved in the proceeding. As to car costs, they advocated the use of the average car costs for all railroads in the United States in substitution for the territorial car costs of the Northern and Southern railroads. After making extensive findings (A. 94-101) the Commission rejected this proposed adjustment (A. 100-101).[17]

While the Court below did not separately discuss the remaining adjustments made by Southern lines which the Commission rejected, the Commission made all necessary reasoned findings supporting its rejection of them: namely, (1) count of cars interchanged, originated, and terminated (A. 91-94); (2) constant cost of transit commodities (A. 124-128); and (3) equalization of gateway interchanges (A. 128-129).

From the foregoing it will be seen again that the District Court simply disagreed with the Commission on the question of whether the territorial unit costs, as restated

16. A substantially similar conclusion of the Commission in connection with its rejection of a proposed adjustment of empty return ratios was noted and sustained by this Court in *Chicago & N.W. R. Co., supra*, at 352-353, 355.

17. The use of Form A territorial car service costs and the rejection of adjusted car costs was sustained by this Court in *Chicago & N.W. R. Co., supra*, (at 354).

by the Commission, were representative for use as a guide for the determination of the relative contribution by the respective groups of carriers in the transportation of North-South traffic.

The Court, in Conclusion No. 3 (A. 354) found that the Commission took no independent action to require "the development of more refined cost data" (A. 335), and it concluded that the Commission has a duty to use its powers to obtain cost evidence where such evidence is necessary to assure an adequate record (A. 354). The Commission, to whom is committed the duty of decision on this matter, found the cost evidence upon which it acted to be adequate, reasonably accurate, and reliable for purposes of determining the relative contribution by the groups on a cost-of-service basis (A. 49-50, 78). This conclusion was sustained by substantial evidence; the Commission had no duty to require the development of other evidence to supplant that which it found satisfactory. Such a duty could not be created by the lower court's substituting its judgment for that of the Commission as to the necessary degree of refinement in the cost evidence. *Illinois Commerce Commission v. United States, supra.*[18]

18. In Conclusion No. 7 (A. 355) the Court stated that the "typical evidence rule" requires evidence typical in character and ample in quantity with respect to the divisions and services performed under the particular rate being divided, and that the Commission must consider evidence of actual services performed on the particular traffic involved. By Southern lines own representation (see footnote 2 on p. 9, *supra*) in which the Commission concurred, the evidence on which the Commission acted accurately measured the transportation characteristics of the percise traffic involved. The Commission did not disregard the typical evidence rule, but found the evidence to be representative (A. 31). The District Court made its own appraisal of the evidence and disregarded the inferences and conclusions that the Commission drew from the facts. In those circumstances the District Court's invocation of the phrase "typical evidence rule" cannot obscure the fact that the Court simply substituted its own opinions on the weight and significance of the evidence for those of the Commission. This is not permissible under the established rules of judicial review.

5. There Was No Error in the Commission's Treatment of Passenger Service Deficits.

As is almost universally true on American railroads, the passenger revenues of the Northern and Southern lines are less than the expenses attributable to their passenger service. The excess of the expenses over the revenues is called the passenger deficit. The fully-distributed costs under Rail Form A include, in addition to the out-of-pocket costs (which latter are represented by 80% of the operating expenses, rents and taxes, plus a return of 4% after Federal income taxes on half of the value of the road property and the total value of the equipment) the remaining 20% of the operating expenses, rents and taxes, the passenger and less-than-carload operating deficits and a 4% return, after Federal income taxes, on the remaining half of the road property. These amounts that are necessary to bring out-of-pocket costs up to a fully-distributed cost level are distributed to the traffic in question on a pro rata ton and ton-mile basis. "In effect, the fully-distributed costs as thus computed, consist of the out-of-pocket costs plus an allowance which closely approximates the weighted average contribution per net ton-mile made by all traffic to the constant costs or overhead burden." [19]

In their initial evidence before the Commission, the Northern lines excluded passenger deficits of both Northern and Southern railroads from their fully distributed cost computations. But in their brief before the Commission (118; A. 1052-1053), the Southern lines stated:

"The Northern lines' fully distributed cost applications do not include passenger and less-carload

19. pp. 3, 4, *Rail Carload Cost Scales by Territories,* Interstate Commerce Commission, Bureau of Accounts, Cost Finding and Valuation, Statement No. 2-58. This was the statement used by the Southern lines in computing cost of service upon which, as adjusted, the Commission relied (A. 48). See also, *New York v. United States,* 331 U.S. 284, 315-332.

deficits or the return on property devoted to such services (V.S. 3, p. 8; Tr. R. 769-70), whereas the Cost Finding Section's applications of fully distributed costs include passenger and less-carload deficits, with an allowance for a 4 percent return on the property devoted to those services (V.S. 40, p. 12)."

Southern lines continued, at p. 120 of their brief (A. 1053):

"Accordingly, the Northern lines' study is defective in computing constant costs without consideration of passenger deficits, contrary to the practice of the Cost Finding Section."

Thus, it was the Southern lines that introduced the matter of including the passenger deficits in the costs to be considered in this case. They regarded these deficits as an essential element of the constant—or overhead—costs.[20]

Although the inclusion of passenger deficits was to the advantage of Southern lines, the position of the Northern lines was that while they had no objection to the allocation

---

20. The record does not show the exact difference that would result from the elimination of the total passenger deficit figures that were allocated to the costs of the Northern and Southern lines respectively. The basic source of the cost data used by Southern lines is I.C.C. Bureau of Accounts, Cost Finding and Valuation Statement No. 2-58 (A. 48). On page 6 of that statement the passenger service deficits, including return, were shown to be the following percentages of the carload fully-distributed cost: Eastern District 11%, Pocahontas Region 6%, Southern Region 12%.

Official Territory is made up of the Eastern District plus the Pocahontas Region. Necessarily, therefore, the percentage for Official Territory would be less than 11%. However, the application of even the 11% figure to the total Official Territory costs shown by Southern lines (V.S. 40, Ex. B, p. 3, corrected) and the 12% figure to the Southern costs shown on that page would change the percentages of total costs North of the gateways from 46.61% to 46.89%, and South of the gateways from 53.39% to 53.11%. This increase North of the gateways of slightly over one-quarter of 1% would, if it were reflected in the cost scales, increase Northern lines' share of the North-South revenues ($496,086,766, A. 48) by slightly over $1,389,000 annually.

of passenger deficits as part of the constant costs of performing the service involved, they did object to the selective approach advanced by the Southern lines under which Northern lines' deficits from suburban operation would be excluded, while all of the Southern passenger deficits (except the suburban deficit of the Illinois Central) would be included in ascertaining the relative costs to the two groups of carriers of performing the North-South service involved. Northern lines thought it arbitrary and unfair for Southern lines to propose a deviation from the Commission's formula and practice to the end that the Southern lines' costs would reflect their deficit from performing passenger service between points in the South, while the costs of Northern lines would be stripped of that portion of their passenger deficit which results from their performing part of their passenger service.[21] In the suburban service, the Northern lines are operating trains in which the passengers are, for the most part, traveling between their homes and places of employment. The trains operated by the Southern lines are occupied by passengers who may be traveling for different purposes than the commuters in the North. But that fact is obviously without significance. In both cases a passenger service is being operated. In both situations the railroads are obliged by law to operate. In both situations a loss is incurred. In both situations there is a need for freight to make a contribution against the loss in order to continue the operation.[22]

---

21. The court below (A. 344) said that "through the use of average costs", passenger deficits were included in the cost computations. It was not through the use of average costs that such deficits were included, but through the insistence of Southern lines that they be added, along with other overheads.

22. As this Court stated with reference to deficit passenger trains operated by the Southern Railway, "The problems raised by the discontinuance of trains Nos. 7 and 8 cannot be resolved alone by reference to appellee's loss in their operation but depend more upon the predominantly local factor of public need for the service rendered." *Alabama Comm'n. v. Southern R. Co.*, 341 U.S. 341.

The Interstate Commerce Commission's policy of taking passenger deficits into consideration in fixing freight rates was thoroughly reviewed in *Increased Freight Rates, 1948,* 276 I.C.C. 9, at 32-39. The lawfulness of the Commission's giving this consideration to passenger deficits was approved in *King v. United States,* 344 U.S. 254 (1952). That decision resulted from a proceeding instituted before the Interstate Commerce Commission by the principal Southern railroads, seeking to require an increase in Florida intrastate freight rates commensurate with that granted on interstate rates in *Increased Freight Rates, 1948, supra,* on the ground that the state rates discriminated against interstate commerce. The relief sought was granted by the Interstate Commerce Commission, and upon review this Court quoted as follows from the Commission's decision (261):

> ". . . if passenger service inevitably and inescapably cannot bear its direct costs and its share of joint or indirect costs, we have felt compelled in a general rate case to take the passenger deficit into account in adjustment of freight rates and charges. Both the freight and passenger services are essential, and revenue losses or deficits on the one necessarily must be compensated by earnings on the other if the carriers are to continue operations."

After referring to the fact that § 15a(2) of the Interstate Commerce Act (49 U.S.C. § 15a(2)) and the National Transportation Policy (preceding 49 U.S.C. § 1) direct the Commission to consider, among other things, the need of revenue to sustain efficient and adequate service, the Court concluded (p. 267) that there is no reason why the Commission may not give weight to passenger deficits in prescribing the intrastate freight rates in Florida, as it does in prescribing interstate freight rates for the southern territory.[23]

23. See also *Chicago, M. St. P. & P. R. Co. v. Illinois, et al.,* 355 U.S. 300, 307 (1958), and *Public Service Comm. of Utah v. U.S.,* 356 U.S. 421, 426 (1958).

In the proceeding here under review the Commission included a pro rata portion of the entire passenger deficit of the Northern and Southern lines, basing its figures upon the cost evidence submitted by the Southern lines before the exclusion of suburban deficits by them.

Upon oral argument in the Court below, the Southern lines admitted that they did not challenge the Commission's power to include suburban deficits and that they did not attack the Commission's consideration of such deficits from the standpoint of "policy" and, indeed, they admitted that deficits from suburban service might be considered, but only, they said, to the extent that they result from the apportionment of common costs (A. 242, 245).

The District Court found that the Commission erred in including suburban deficits because, it said, there was neither finding nor evidence "rationalizing the conclusion that suburban passenger deficits reflecting costs not common to freight service but 'solely related' to suburban passenger service can or should be treated as cost of North-South freight traffic," the Commission's standard for decision (A. 346, 354-355). The fact is, of course, that it is in the very nature of overhead, or constant, costs that they are not incurred in the performance of the service to which they are apportioned. *New York v. United States*, 331 U.S. 284, 316 (1947). But the District Court dismissed the Northern lines' point that these costs are treated as overhead costs, the allocation of which is required because of the need of revenue from the freight service to continue passenger operations. It said that the Commission did not so treat them, it having rejected contentions of both Southern and Northern groups for divisions over and above the cost of service on the ground of revenue needs (A. 345).

The Court plainly erred in this holding. Each group had contended before the Commission that in fixing the divisions the Commission should include an additive—over and above divisional shares based upon fully-distributed costs—for their general revenue needs. In rejecting these

contentions, the Commission made this finding, which was ignored by the District Court:

> "However, our prescription of divisions based on relative costs includes allowances for overhead and return, and in our judgment reflects a due proportion of the burden of maintaining the financial integrity and credit of the carriers involved. *Cf. New England Divisions*, 66 I.C.C. 196, 199. Accordingly, we see no justification at this time for adding any special increment favoring one group of carriers over the other." (A. 79).

The failure of the court to take note of that finding and to understand that by their very nature constant costs are not directly related to particular traffic led it to decide, erroneously, that there was no finding rationalizing the conclusion that the suburban deficits reflecting some costs not common to freight service but solely related to suburban service, should be treated "as cost of North-South freight traffic" (A. 346).

It should also be noted that the District Court's apparent theory (A. 344) that the Commission could consider only the deficit resulting from the apportionment of common expenses has no basis in the decisions of the Commission or of this Court.[24] In the Commission's leading case on the subject of passenger deficits, *Increased Freight Rates, 1948, supra,* there was no mention of any such theory. Moreover, the passenger deficit considered by the Commis-

24. The lower court said that it is "generally agreed" that intercity passenger deficits should be considered as a part of the cost of providing freight service because such deficits are usually the product of costs allocated to passenger operations from common facilities which must be maintained to provide freight service (A. 344). That statement on this complex matter is the court's, not that of the Commission. Indeed, in *Railroad Passenger Train Deficit,* 306 I.C.C. 417 (1959), the Commission considered contentions that passenger deficit figures are fictitious because of alleged shortcomings in its accounting rules and it found that evidence indicating the contrary "is of major significance and serves as a warning that common costs cannot be lightly dismissed" (pp. 415, 426).

sion in fixing the level of freight rates is the entire passenger deficit. The Commission considers overall rates of return from all operations (see, for example, *Increased Freight Rates, 1948, supra,* at pp. 18-24), and the increase in operating expenses due to wage, price and tax increases attributable to all services (see, *e.g., Increased Freight Rates, 1948, supra,* at pp. 20-24, and *Increased Freight Rates, E.W. and S. Territories, 1956,* 300 I.C.C. 633, at 641-647, 657-8).

In *King* there was likewise no mention of any limitation that the Commission might consider only so much of passenger deficits as result from the apportionment of common costs. In its opinion therein, the Court set forth a long quotation from the Commission's report, the essence of which was that if the passenger service cannot bear "its direct costs and its share of joint costs" (p. 261) the Commission has felt compelled to take the passenger deficit into account in fixing the freight rates and that:

> "Both the freight and passenger services are essential, and revenue losses or deficits on the one necessarily must be compensated by earnings on the other if the carriers are to continue operations. Both may be subjected to reasonable rates and charges to produce the fair aggregate return, even though thereby a higher rate of return may be exacted from the one than from the other." (344 U.S. 261-2) [25]

The Court then referred to the statutory provisions which direct the Commission to consider the need, in the public interest, of adequate and efficient transportation service and the need of revenues sufficient to sustain such ser-

25. The Court observed on page 262 that the Commission's change of policy from non-inclusion to inclusion of passenger deficits in fixing freight rates was the "inevitable consequence of steadily increasing passenger operating costs," together with the growth of competition from automobiles. Obviously these increasing passenger operating costs were real costs and not such costs as Southern lines' witness referred to as a mere matter of "terminology" (V.S. 14, p. 13; A. 713).

vice. It found that the statute leaves no ground for a claim that the Commission may not give weight to passenger deficits "in prescribing *interstate* freight rates to meet overall revenue needs." (Emphasis by the Court) With that, the Court's consideration of the power of the Commission to give weight to passenger deficits in prescribing interstate freight rates was ended. And it had not so much as mentioned any such theory as Appellees advanced in this case, i.e., that the justification for considering deficits is that they result from common costs.

The Court then considered whether the Commission may give weight to passenger deficits when prescribing intrastate freight rates under Section 13(4), which prohibits discrimination against interstate commerce. The Court took notice of the Commission's observation that there was no justification for a difference in treatment as between the Florida intrastate freight traffic and interstate traffic, and that the passenger deficit matter "would become even more serious for interstate shippers if this burden were imposed entirely upon them . . ." (p. 265).

In comparing the interstate and intrastate situations, the Court observed, at page 265, that:

> "In Florida, moreover, the discontinuance of railroad passenger service would not permit the discontinuance of high-speed tracks and equipment because of the need for fast freight schedules to transport perishable fruits and vegetables from Florida."

The Southern lines seem to suggest (Motion to Affirm, p. 19, fn. 16) that the entire case turned on that sentence. That it did not, and that Southern lines' suggestion is superficial in the extreme, will be evident from the most casual reading of the opinion. The sentence is immediately followed by the Court's statement that:

> "The Commission dealt with the freight and passenger revenues and properties of the Florida roads as a whole when determining the need for increases in interstate

freight rates. Nothing has been demonstrated which would demand different treatment of these properties in relation to the intrastate activities."

The Court concluded, at page 267, that:

". . . . there is no reason why the Commission may not give weight to passenger deficits in prescribing the intrastate freight rates in Florida, as it does in prescribing interstate freight rates for the southern territory."[26]

It was doubtless the Southern lines' realization that the *King* decision does not restrict the Commission's power to consider passenger deficits to those resulting from the apportionment of common expenses that induced them to concede in the lower court that they do not rest their suburban deficit point on any question of the Commission's power (A. 242, 245).

It should next be noted that the Commission found against Southern lines on a basic factual premise of their suburban deficit point. They had argued that this deficit could be eliminated by the discontinuance of commutation service, on the premise that suburban facilities are maintained solely for such service and are not used for freight or intercity passenger service (A. 123). After considering this contention, the Commission determined that although

---

26. This Court has cited with approval its holding in *King* in at least two subsequent decisions; *Chicago, M., St. P. & P. R. Co. v. Illinois*, 355 U.S. 300 (1958), and *Public Service Comm. of Utah v. U. S.*, 356 U.S. 421, 426 (1958). In the former, the Court said, at p. 307:

"Passenger deficits have become chronic in the railroad industry and it has become necessary to make up these deficits from more remunerative services. The I.C.C. has recognized this practical reality of today's railroading and has changed its rate-fixing policy so that if interstate passenger service inevitably and inescapably cannot bear its direct cost and its share of joint or indirect costs, the I.C.C. feels compelled in a general rate case to take the passenger deficit into account in the adjustment of interstate freight rates and charges."

many individual items of suburban service can be considered solely related to that service the facilities and service as a whole cannot be considered solely related to suburban service and treated entirely apart from the freight service and intercity passenger service. It concluded, therefore, that suburban deficits should not be excluded from the constant costs (A. 124). The District Court held that the Commission was required "to determine how much of the railroads' cost of commuter service was in fact common with the cost of freight service and how much was solely related to commuter service." (A. 345) But having found that the commuter service and facilities "considered as a whole" could not be regarded as solely related to suburban service it was reasonable for the Commission to treat the costs as it did, that is, in exactly the same manner as it treated the costs of all other passenger services.[27] Clearly, it was within the Commission's administrative competence to do so.

It is important to note that (unlike the Southern lines, whose passenger revenue was less than their expenses that are solely related to passenger service) Northern lines' passenger revenues exceeded the expenses that are solely related to the performance of passenger service as a whole and that they had a deficit only when a portion of the common expenses was assigned to the passenger service (A. 123). In the calculation of the cost of the North-South service, therefore, the net result of the Commission's action was to allocate to the Southern lines a pro rata share of a deficiency of solely related passenger expenses under passenger revenue as well as the additional deficit resulting from the allocation of common expenses to the passenger service, while the passenger deficit included for the Northern lines resulted from the apportionment of common expenses alone. Overall, therefore, the lower court's view

27. Intercity passenger service requires equipment and facilities which have no relation to freight service. It requires *inter alia*, passenger locomotives, passenger cars, coach yards and passenger terminals.

(that it was proper to apportion to the freight service only that part of the passenger deficit which resulted from the allocation of common expenses) was actually met as to the Northern lines but not as to the Southern lines.

The District Court (A. 346) quoted from this Court's decision in *Chicago & N.W. R. Co. v. A.,T.&S.F. R. Co., supra,* to the effect that while the Commission has sometimes offset passenger deficits in freight rate cases, the issues are different when, in a divisions case, it is argued that carriers in one part of the country should subsidize the passenger operations of carriers elsewhere, that if the Commission were to give controlling weight to passenger deficits in a divisions case, it might be appropriate to take more evidence on the matter and discuss it in greater depth than the Commission did in that case, but that in the light of the fact that there the passenger deficits were of negligible relevance to the Commission's decision, there were no errors that would justify setting aside the order there involved.

Controlling weight was not given to the matter of passenger deficits in the present case. Upon the insistence of the Southern lines an allocable share of the deficits was included in determining costs but the Commission essentially gave both groups of roads equal treatment. Moreover all that the Court said in *Chicago & N.W.* was that, where controlling weight is given to passenger deficits in a divisions case, it might be appropriate to take more evidence on the issue and discuss it in greater depth than the Commission did in that case (387 U.S. at 350). Here there was no issue between the parties as to whether passenger deficits should be considered. The only issue was on the validity of Southern lines' request that part of the deficit should be excluded from consideration. The Commission declined to make this adjustment. Unlike the *Chicago & N.W.* situation, there was no claim here of "unfair procedural surprise" (387 U.S. at 349). The parties introduced all the evidence they desired and, after adequate

discussion in its report, the Commission declined to eliminate the suburban portion of the passenger deficits.

Finally, if there was any subsidization of one group of lines by the other it would have to be said that the Northern lines, who are not complaining about the matter, subsidized the Southern lines whose divisional shares were made greater by the inclusion of passenger deficits in determining service costs.

From the foregoing, it will be seen that there was neither error nor prejudice to the Southern lines in the Commission's consideration of passenger deficits.

6. In the Event of Remand the Prescribed Divisions Should Be Permitted to Continue in Effect Subject to Readjustments as Necessary to Protect All Parties.

That the Commission's order is valid and should not be disturbed on judicial review is evident both on the face of the Commission's report and in the light of precedent, particularly the very recent decision in *Chicago & N.W. Ry. Co.* Appellants believe it likely, therefore, that the Commission's order will be sustained. As indicated above, however, if the order should be permanently set aside, Appellants would be required to refund more than $25 million, plus interest, and the former divisions would be reinstated at an annual cost of about $8 million to Northern lines until the Commission could again prescribe new divisions. Northern lines must, therefore, proceed with great caution, and suggest that in the unlikely event there should be a remand the prescribed divisions should be permitted to continue in effect subject to possible readjustment following the remand proceedings.

In the *C.&N.W.* case this Court referred to the fact that thirteen years had elapsed since the complaints which gave rise to that litigation were first filed and it then held that the attacks on the Commission's cost findings were so insubstantial that no useful purpose would be served by further proceedings in the District Court. It is about

twenty-one years since Northern lines began this proceeding, and approximately eleven years since they petitioned for its reopening on November 2, 1956. In contrast to the concern of the Supreme Court regarding the time consumed in the disposition of *C.&N.W.* (and see *Illinois C.R. Co. v. Norfolk and W.R. Co.*, 385 U.S. 57, 75 (1966) and *Consolo v. Federal Maritime Comm'n.*, 383 U.S. 607, 621 (1966)) the District Court here concluded its decision not only by ordering the case back to the Commission for the development of the "actual costs of handling the specific traffic at issue" (A. 354) but it suggested that the evidence upon which the Commission acted had become stale and that the reception of new evidence was in order (A. 356).

Under § 15(6) the Commission is without authority to prescribe divisions retroactively except in circumstances not here present. *Brimstone R.R. Co. v. United States*, 276 U.S. 104, 117-123 (1928); *United States v. Baltimore & Ohio R. Co.*, 284 U.S. 195 (1931). Accordingly, such further order prescribing divisions as the Commission might enter following a remand would of itself have force only prospectively from its effective date. Thus, whether or not the Commission's new order made any change in its original prescription, it would lack power to protect these Appellants for the entire period of years from April 20, 1965 to the effective date of its new order. Since there is nothing of record to suggest, and the Court below found nothing to warrant any inference, that development of the more refined costs it deemed essential would at all warrant lower divisions for Northern lines than those prescribed in the order under review, an additional loss to Northern lines, at the rate of some $8 million per annum for all years prior to the effectiveness of a new Commission order, may reasonably be assumed.

Thus it is entirely possible that if the Commission were required to give further consideration to this matter, the result would be the prescription for Northern lines of similar or substantially similar divisions to those here involved. But, as stated, the Commission would lack au-

thority to make a new divisions order retroactive so as to protect Northern lines for the large revenue losses they would suffer for the period April 20, 1965 until a new order could become effective for the future, following the remand proceeding.

It is respectfully submitted that this Court, in the event of remand to the Commission for further findings, should, therefore, employ the procedure it adopted in *Sec'y. of Agriculture v. United States,* 347 U.S. 645 (1954), in which it vacated the District Court's order and remanded the cause to the Commission for further administrative proceedings, but without invalidating the Commission's order or enjoining its enforcement, thus leaving the unloading charges fixed by the Commission's order in effect pending completion of the remand proceedings. A similar procedure here, in the event of remand, would protect the interests of all parties by assuring the application of such divisions as the Commission might ultimately prescribe to all traffic moving subsequent to April 20, 1965.

As an alternative to this procedure this Court, in the event of a remand to the Commission, could direct the lower court to retain jurisdiction to make an equitable resettlement of the divisions in the event that upon remand the Commission in a valid order prescribed new divisions for the Northern lines more favorable than the old divisions. Since this would involve the resettlement of accounts by the payment of some $25 million plus interest by Northern lines to the Southern lines and the use for a number of years (until the Commission could complete further proceedings and issue a new order) of the old divisions which the Commission had found unlawful, and thereafter, assuming the issuance of a valid order by the Commission, the retransfer of the moneys—plus additional moneys attributable to later shipments—to the Northern lines, this alternative would not seem to be as desirable as that of permitting the present divisions to remain in effect subject to an equitable resettlement of revenues upon the completion of the remand proceedings.

7. The Contentions of the Southern Governors' Conference, et al. Are Without Merit.

The Southern Governors' Conference and the Southeastern Association of Railroad and Utility Commissioners, hereinafter called "the Conferences," contend that even if it be conceded that the Northern costs were relatively higher than the Southern on the specific traffic involved, the Commission could not lawfully reflect them in higher divisions north of the gateways without first finding that such higher costs were the result of what the Conferences referred to as "inherent territorial disadvantages."[28] This restriction, or test, which they incorrectly charged the Commission with having adopted, has no basis in Section 15(6) or in any judicial construction thereof.

The District Court, while emphasizing that it was remanding the case to the Commission for other reasons, stated that upon remand the Commission should decide and dispose of this contention in accordance with the Administrative Procedure Act (A. 341-343), by which it apparently meant that the finding of the Commission with respect to the contention should be stated with greater clarity.

The Commission said, with respect to this argument, "Relying on *New York v. United States,* 331 U.S. 284, 315 (1947), the interveners also take the positon that natural disadvantages must be found in the North before we may increase the divisions of the northern railroads." (A. 51) This, of course, was a statement of the Appellees' contention. The Commission answered it by stating: "In essence, however, other factors being equal, cost differences gen-

28. While the Conferences do not attempt to define or describe what they would include within the scope of "inherent territorial disadvantages," it would appear that they would exclude virtually everything that might affect relative costs except physical or natural conditons such as topography, grades and curves, climatic conditions, etc.

erally are the product of, and reflect, the inherent advantages and disadvantages that go to make up the respective overall transportation conditions in the two territories."[29]

This contention of the Conferences would forbid the Commission to act upon cost evidence until that body, through a process reversing the development of the costs, had investigated the causes of such higher costs and found that they stemmed from nothing but "inherent territorial disadvantages," a standard of obviously uncertain scope. Thus, having "marched up the hill" at the expenditure of much time, effort and money to produce the requisite Form A costs, the Commission in effect would have to "march down again" by making a tremendous factual inquiry into the causes of the higher costs. The Commission would thereby lose a great deal of the value and usefulness of Form A costs and be required to observe an illogical, wasteful and time-consuming procedure.

The justification offered the lower Court by the Conferences for judicial adoption of their contention concerning "inherent territorial disadvantages" was that other-

---

29. The Commission then cited *Louisville & N. R. Co. v. Southern Ry. Co.*, 319 I.C.C. 639, at pages 646-47. At the cited pages, the Commission, consistent with its conclusion here, said, after describing contentions concerning operating conditions:

> "While an appraisal of the evidence regarding physical operations indicates that both the complainant and the defendant operate in mountainous terrain, there is no need to determine whether such transportation conditions are more favorable or onerous to one than to the other. The nature of the physical transportation circumstances is concededly reflected in the cost of operations. In this respect, the cost data hereinafter discussed form a sounder basis for a determination of the issue raised than any conclusions to be drawn from the numerous factual statements regarding operating conditions."

This decision was upheld in *Carolina & Northwestern Ry. Co. v. United States*, 234 F. Supp. 112; affirmed, 380 U.S. 526. Similar recognition that costs "reflect the totality of conditions under which the carriers in the respective territories operate" is found in this Court's decision in *New York v. United States*, at pp. 348-9.

wise the Commission might give undue weight to higher costs which were higher because of conditions such as inefficient operation. But there is no need for providing any such restriction on the Commission's authority to prescribe divisions. Section 15(6) as enacted by Congress already provides protection against the use of relative costs affected by inefficiency of operations. Thus, at the outset of the list of matters required to be considered, the provision requires that the Commission "shall give due consideration, among other things, to the efficiency with which the carriers concerned are operated. * * *"

In this case the Commission has quite specifically given full attention to "efficiency of operation" (A. 37-39), and has definitely found (A. 39):

> "We find upon this record that northern lines' cost of service is not shown to be affected by purported waste or inefficiency. More affirmatively, we find that both groups are being operated efficiently and that neither group should be considered as more or less efficient than the other."

The Conferences presented argument concerning the possible future effects of mergers authorized or proposed. In this connection it may be noted that subsequent to the closing of the record before the Commission, the respondent Southern railroads, supported by the Conferences, sought further hearing for the purpose of submitting evidence concerning the effect of proposed combinations and consolidations of rail carriers in Official Territory upon operating costs and revenue needs of said carriers. In its order of December 27, 1962, denying said petition (A. 1157) the Commission concluded as follows:

> "*It further appearing,* That such combinations and consolidations are involved in pending proceedings before the Commission, in some of which the hearings have not been concluded, and that it cannot properly

be assumed at this time that all of the combinations and consolidations will be approved and consummated, as proposed;

"*It further appearing,* That even if all or some of the combinations and consolidations are approved and consummated, the effect thereof on operating costs and revenue needs of the carriers involved will not be ascertainable within a brief period after consummation;

"*And it further appearing,* That reopening these proceedings for further hearing would result in unjustified delay in the disposition thereof; therefore

"*It is ordered;* That said petition be, and it is hereby, denied, for the reason that sufficient grounds have not been presented to warrant granting the action sought."

The Commission's findings under the heading "importance to the Public" (A. 50-51) and its above-quoted findings regarding efficiency of operation were all the findings that it was required to make with respect to this contention of the Conferences. *Minneapolis & St. Louis R. Co. v. U.S.*, 361 U.S. 173, 193-4; *Chicago & N.W. R. Co. v. A., T. & S.F. R. Co., supra,* at 358.

In the Conclusion of its opinion (A. 355) the District Court used an expression to the effect that the prescribed divisions are "bound to cut deeply into economic relations . . ." This, apparently, has reference to the contention of the Conferences that the Commission's decision in the present case would result either in a substantial diminution in the quality of the rail service within the South or a substantial increase in freight rates.[30] The revenue reduc-

30. It should be noted in this connection that in some of the past North-South divisions cases the Commission prescribed divisional factors which, on Florida citrus, were as much as 85% higher, mile for mile, for the Southern lines than for the Northern lines and on

tion of Southern lines as a result of the order under review ($7,948,000, A. 80) is only 62/100 of 1% of the freight revenue of the Southern lines ($1,280,900,000, A. 776) for the year in which the Commission's calculations were made (1956). After an appropriate adjustment for income taxes, therefore, it would appear that the reduced revenue might be somewhere in the neighborhood of 1/10 of 1% of the gross freight revenue of Southern lines. Manifestly, therefore, these alleged apprehensions of the Conferences regarding a substantial increase in rates or a diminution of the service as a consequence of this divisions order are wholly without substance. The Commission considered the contentions of these Appellees and found that the prescribed divisions "can result in no unlawful injury to the south." (A. 51)

In their original brief to the Commission of June 17, 1961, at page 5, the Conferences stated:

> "The destruction of the equal factor divisional scales sought in this proceeding by the Northern railroads ultimately threatens the destruction of the uniform class rate scales which the South fought so hard to secure."

This concern of these Appellees is without foundation. Rates and divisions affect different relationships, are regulated under different statutory provisions, and are subject,

---

traffic in general, 25% higher for Southern than for Northern lines. *Atlantic Coast Line R. Co. v. Arcade & A.R. Corp.*, 194 I.C.C. 729, 761-2 (1933), and *Divisions of Rates, Official and Southern Territories*, 234 I.C.C. 175, 192 (1939). In the next decision, *Official-Southern Divisions*, 287 I.C.C. 497, the Commission equalized the factors and in the order under review, the Commission fixed higher divisional factors for the Northern lines than for the Southern. Contrary to the District Court's impression, there is clearly nothing novel about one group of lines having proportionately higher divisions than the other on North-South traffic. It is of the essence of the administrative function that the Congressional standards for Commission action under Section 15(6) may require it to change its orders from time to time in accordance with the facts which, upon investigation, it finds.

in their prescription, to different considerations. Rates involve shipper-carrier relations; divisions affect only inter-carrier relationships. Rates are regulated under portions of Sections 1, 2, 3, and 4 of the Act, while divisions are regulated under Section 15(6). Since enactment of the latter provision in 1920, it has been recognized as a provision made by the Congress whereby, in appropriate cases, the Commission could order disparate divisions out of rates which might be uniform in character or in measure of increase. *New England Divisions Case,* 261 U.S. 184, 191 (1923). In prescribing uniform *class* rates east of the Rocky Mountains in *Class Rate Investigation, 1939,* 262 I.C.C. 447 (1945), the Commission at pages 693-694 discussed the bearing of costs upon rates in part as follows:

> "Discretion and flexibility of judgment within reasonable limits have always attended the use of costs in the making of rates. Costs alone do not determine the maximum limits of rates. Neither do they control the contours of rate scales or fix the relations between rates or between rate scales. Other factors along with costs must be considesed and given due weight in these aspects of rate making. * * * [31]
>
> "Moreover, it has long been recognized that it is unwise from the standpoint of both shippers and carriers to attempt to reflect in any rate schedule or rate structure all the minute and unsubstantial variations in the costs of service that occur on different divisions or segments of the same railroad or between individual railroads or groups of railroads. The tendency has been, rather, to deal with average costs in such manner as to avoid needless rate variations and to permit the freest possible movement of traffic."

---

31. Quoted by this Court in *New York v. United States,* 331 U.S. 284, 328, which sustained the Commission's order therein.

With reference to the Conferences' contentions concerning the prescription of differing divisions based upon relative costs, and the relation thereto to future rate levels, it is important to note that to the exent that there would be any difference in rates because of cost differences, the differences would be in favor of the Southern shippers. If higher costs are to be reflected in higher rates, it is Official Territory which would have the higher rates since the costs of the Official Territory railroads are higher. Thus the situation would be exactly the reverse of what it was when Southern transportation costs were higher and Southern shippers were required to pay higher rates than their Northern competitors.[32]

Finally, the insistence of the Conferences upon adherence to uniformity in divisions regardless of the change in basic facts which now show higher costs on the part of Northern lines than of Southern is quite at variance with the decisions of this Court as to the necessity of flexibility and adaptability on the part of administrative bodies. See, e.g., *American Trucking v. A., T. & S.F. R. Co.*, 387 U.S. 397, 416 (1967).

Referring to the contention of Southern interveners that the public interest required uniformity in these divisions, the Commission concluded (A. 50-51):

> "We recognize that the public interest must be considered and the importance to the public of the transportation services of the railroads is not a sectional concept. We are required under the act to preserve an adequate national system of transportation, and must therefore consider the public interest of all concerned. Such a consideration, however, does not by any means require a uniformity of divisions, nor can we find an

32. In fact, in the post-war general freight rate increase cases the Commission has several times granted increases which are higher within the North than within the South, or between the South and the North. See, for example, *Increased Freight Rates, E. W. and S. Territories, 1956*, 300 I.C.C. 633, 689 (1957).

affirmative virtue in it on this record. Cf. *Western Trunkline Case,* 225 F. Supp. at page 604. Moreover, as pointed out in *New England Divisions Case,* 261 U.S. 184, 191 (1923), section 15(6) was designed to help the weak 'by preventing needed revenue from passing to prosperous connections.' Thus, an adherence to uniformity as such, without a careful evaluation of the statutory criteria and the evidence of record, can hardly result in the fixing of just, reasonable, and equitable shares."

CONCLUSION

For the foregoing reasons, it is respectfully submitted that the judgment of the District Court should be reversed and the cause remanded to that court with instructions to dismiss the complaints.

APPENDIX A.

Statutes Involved.

A. Section 1(4) of the Interstate Commerce Act, 49 U.S.C. § 1(4), provides in pertinent part:

> It shall be the duty of every such common carrier establishing through routes . . . in case of joint rates, fares, or charges, to establish just, reasonable, and equitable divisions thereof, which shall not unduly prefer or prejudice any of such participating carriers.

Section 15(6) of the Interstate Commerce Act, 49 U.S.C. § 15(6), provides:

> (6) Whenever, after full hearing upon complaint or upon its own initiative, the Commission is of opinion that the divisions of joint rates, fares, or charges, applicable to the transportation of passengers or property, are or will be unjust, unreasonable, inequitable, or unduly preferential or prejudicial as between the carriers parties thereto (whether agreed upon by such carriers, or any of them, or otherwise established), the Commission shall by order prescribe the just, reasonable, and equitable divisions thereof to be received by the several carriers, and in cases where the joint rate, fare, or charge was established pursuant to a finding or order of the Commission and the divisions thereof are found by it to have been unjust, unreasonable, or inequitable, or unduly preferential or prejudicial, the Commission may also by order determine what (for the period subsequent to the filing of the complaint

or petition or the making of the order of investigation) would have been the just, reasonable, and equitable divisions thereof to be received by the several carriers, and require adjustment to be made in accordance therewith. In so prescribing and determining the divisions of joint rates, fares and charges, the Commission shall give due consideration, among other things, to the efficiency with which the carriers concerned are operated, the amount of revenue required to pay their respective operating expenses, taxes, and a fair return on their railway property held for and used in the service of transportation, and the importance to the public of the transportation services of such carriers; and also whether any particular participating carrier is an originating, intermediate, or delivering line, and any other fact or circumstance which would ordinarily, without regard to the mileage haul, entitle one carrier to a greater or less proportion than another carrier of the joint rate, fare or charge.

B. Section 8(b) of the Administrative Procedure Act, formerly 5 U. S. C. § 1007(b) and now revised and codified as 5 U. S. C. § 557(c), (80 Stat. 387), provides:

(c) Before a recommended, initial, or tentative decision, or a decision on agency review of the decision of subordinate employees, the parties are entitled to a reasonable opportunity to submit for the consideration of the employees participating in the decisions—

(1) proposed findings and conclusions; or

(2) exceptions to the decisions or recommended decisions of subordinate employees or to tentative agency decisions; and

(3) supporting reasons for the exceptions or proposed findings or conclusions.

The record shall show the ruling on each finding, conclusion, or exception presented. All decisions, including initial, recommended, and tentative decisions, are a part of the record and shall include a statement of—

(A) findings and conclusions, and the reasons or basis therefor, on all the material issues of fact, law, or discretion presented on the record; and

(B) the appropriate rule, order, sanction, relief, or denial thereof.

Section 10(e) of the Administrative Procedure Act, formerly 5 U. S. C. § 1009(e), and now revised and codified as 5 U. S. C. § 706 (80 Stat. 393), provides:

To the extent necessary to decision and when presented, the reviewing court shall decide all relevant questions of law, interpret constitutional and statutory provisions, and determine the meaning or applicability of the terms of an agency action. The reviewing court shall—

(1) compel agency action unlawfully withheld or unreasonably delayed; and

(2) hold unlawful and set aside agency action, findings, and conclusions found to be—

(A) arbitrary, capricious, an abuse of discretion, or otherwise not in accordance with law;

(B) contrary to constitutional right, power, privilege, or immunity;

(C) in excess of statutory jurisdiction, authority, or limitations, or short of statutory right;

(D) without observance of procedure required by law;

(E) unsupported by substantial evidence in a case subject to sections 556 and 557 of this title or otherwise reviewed on the record of an agency hearing provided by statute; or

(F) unwarranted by the facts to the extent that the facts are subject to trial de novo by the reviewing court.

In making the foregoing determinations, the court shall review the whole record or those parts of it cited by a party, and due account shall be taken of the rule of prejudicial error.

INTERSTATE COMMERCE COMMISSION, APPELLANT

v.

ABERDEEN & ROCKFISH R. CO., ET AL., APPELLEES

On Appeal from the United States District Court for the Eastern District of Louisiana, New Orleans Division

---

BRIEF FOR THE INTERSTATE COMMERCE COMMISSION

OPINIONS BELOW

The opinion of the district court (A. 325-356) is reported at 270 F. Supp. 695. The reports of the Interstate Commerce Commission (A. 18-132; 176-186) are published at 325 I.C.C. 1 and 325 I.C.C. 449.

JURISDICTION

The judgment of the three-judge court was entered on August 22, 1967 (A. 357). The notice of appeal

was filed on October 23, 1967 (A. 5, 371). Jurisdiction to review the district court's decision is conferred by 28 U.S.C. 1253 and 2101(b). *Chicago and N.W. Ry. Co.* v. *Atchison, T. & S.F. Ry. Co.*, 387 U.S. 326; *Baltimore & O. R. Co.* v. *United States*, 298 U.S. 349. Probable jurisdiction was noted on March 4, 1968 (390 U.S. 940), and this appeal was consolidated with the appeal from the same judgment in *The Baltimore and Ohio R.R. Co.* v. *Aberdeen & Rockfish R.R. Co.*, No. 925, this Term.

QUESTION PRESENTED

A petition filed with the Interstate Commerce Commission under Section 15(6) of the Interstate Commerce Act [49 U.S.C. 15(6)] sought modification of Commission-prescribed divisions of joint rates applying over the lines of more than 200 railroads for the interterritorial transportation of virtually all North-South freight.[1] After considering evidence and upon making findings relating to each of the Section 15(6) criteria, the Commission concluded that the existing divisions were unjust, unreasonable and inequitable and it prescribed new divisions in proportion to the relative costs of the two groups of carriers in handling the traffic at issue.[2] The cost figures used by

---

[1] Except coal, certain trailer-on-flatcar traffic, and border point traffic embraced in another proceeding entitled Docket No. 32055 (A. 86).

[2] The Commission prescribed a special basis of divisions for the Norfolk Southern Railroad covering traffic originated or terminated on its line when that railroad demonstrated that its circumstances and conditions were sufficiently unlike

the Commission were derived from Rail Form A, which produces average unit costs for territorial freight service, although the Commission made certain adjustments to reflect more accurately the costs of the particular traffic involved. In rejecting adjusted Rail Form A costs as a proper yardstick for this purpose, the district court held that the Commission was required to base its computations on more refined cost data.

The question presented is whether, in ascertaining the relative costs of service in an interterritorial divisions case, the Commission may rely on Rail Form A data as to territorial average costs, adjusted to more accurately reflect the costs of the particular traffic involved, or is required to develop more refined cost data.

STATUTES INVOLVED

Section 1(4) of the Interstate Commerce Act [49 U.S.C. 1(4)], and Sections 8(b) and 10(e) of the Administrative Procedure Act [5 U.S.C. 557(c) and 706] are set forth in Appendix A to appellants' brief in the companion case, No. 925, this Term.

Primarily involved is Section 15(6) of the Interstate Commerce Act [49 U.S.C. 15(6)], which provides, in pertinent part:

> Whenever * * * the Commission is of opinion that the divisions of joint rates, fares, or charges applicable to the transportation of passengers or

---

those of the other Southern carriers as to merit individual treatment. The special divisions for the Norfolk Southern are not in issue.

property, are or will be unjust, unreasonable, inequitable, or unduly preferential * * * the Commission shall by order prescribe the just, reasonable and equitable divisions thereof to be received by the several carriers * * *. In so prescribing and determining the divisions of joint rates, fares and charges, the Commission shall give due consideration, among other things, to the efficiency with which the carriers concerned are operated, the amount of revenue required to pay their respective operating expenses, taxes, and a fair return on their railway property held for and used in the service of transportation, and the importance to the public of the transportation services of such carriers; and also whether any particular participating carrier is an originating, intermediate, or delivering line, and any other fact or circumstance which would ordinarily, without regard to the mileage haul, entitle one carrier to a greater or less proportion than another carrier of the joint rate, fare, or charge.

STATEMENT

1. INTRODUCTION

This appeal involves the district court's imposition of novel cost standards for the Commission to follow in exercising its Section 15(6) authority to prescribe just, reasonable and equitable divisions of joint rates.[3]

---

[3] A joint rate is established when two or more carriers publish a single charge for their joint carriage of freight from an origin point on one line to a destination on another. The proportion of a joint rate received by each of the carriers as its share of the revenue received for the joint service is commonly known as a "division."

The case arises out of the Commission's 1965 order prescribing new divisions of the revenues derived from the transportation of interterritorial freight traffic moving under joint rates between all points in the Northern and Southern [4] sections of the eastern part of the United States.

2. PROCEEDINGS BEFORE THE COMMISSION

The Commission's order here under review modified the divisions of North-South freight revenues it had previously prescribed in *Official-Southern Divisions*, 287 I.C.C. 497 (1953). In its 1953 order, the Commission based its prescription of equal-mileage factor divisions [5] upon a finding that, in computing relative costs of service for the groups of carriers concerned under Rail Form A standards, "the safest assumption for the future * * * [is] that neither contesting group will have an appreciably lower basis of operating costs than the other, and that there are no other relevant circumstances which are of sufficient importance to justify higher divisional factors for one group than

---

[4] The North embraces Official Territory, which lies generally east of Lake Michigan, Chicago, Peoria, and Cairo, Illinois, and St. Louis, Missouri, and north of the Ohio River and Norfolk, Virginia. The South embraces Southern Territory, which lies south of Official Territory and east of the Mississippi River.

[5] These equal-factor divisions provided equal compensation for the same amount of service performed by the Northern and Southern railroads. Thus, for shipments moving 500 miles in each territory, the Northern and Southern railroads would each receive 50% of the joint rate (287 I.C.C. at 547, 552).

the other" (287 I.C.C. at 526). Upon Northern lines' petition for rehearing and modification alleging, among other things, that Northern lines' costs were now substantially higher than those of the Southern roads, the Commission reopened the proceedings for further hearing. (A. 20, 377-384, 414-415).

During the lengthy hearings that followed, both groups of carriers introduced evidence which sought to demonstrate the unfairness of the existing divisions and that each group was entitled to a larger share of the joint rates than previously received. The Commission considered 80 verified statements containing direct testimony and numerous attached exhibits, 30 additional exhibits introduced at the hearings and over 2700 pages of testimony on cross-examination.[6] Upon completion of the administrative proceeding in 1965, the Commission found that the existing divisions were in violation of Section 15(6) in that they allocated to the Northern lines a lesser share of the revenues from the joint rates than would be warranted by their share of the expenditures in providing the joint service (A. 79-80).

The Commission reached this conclusion after considering and making findings as to each of the criteria specified for "due consideration" in Section 15(6), as

---

[6] Evidence considered by the Commission included detailed traffic studies based on actual movements (A. 25-31); the carriers' revenue shares received under the then existing divisions in a representative year (A. 29, 46-48); economic trends (A. 31); operating and revenue trends (A. 33-37); efficiency of operations (A. 37-39); elaborate cost studies based on Rail Form A (A. 39-50); and extensive data on various cost factors (A. 87-130).

applied to each of the two contendings groups of railroads. It found all of the relevant factors, except for costs, to be substantially equal,[7] but concluded that computations under Rail Form A cost standards, which it adjusted and restated to more accurately reflect North-South traffic, established a decisive difference in the relative costs of rendering the service involved.

More specifically, both groups of carriers tried and submitted their cases on the basis of fully distributed costs computed under Rail Form A, although the Southern lines presented twelve adjustments which, they asserted, would improve the accuracy of the Rail Form A figures so derived for the traffic involved (A. 40, 46-47). The Northern lines introduced other detailed data establishing the validity of Rail Form A costs as a proper standard of measurement and the impropriety of the Southern lines' proposed adjustments. The disputes over applicability of Rail Form A costs and the various proposed adjustments occupied a large part of the administrative record. However, as the Commission pointed out (A. 46-48), the only essential difference between the carrier groups related to the degree to which Rail Form A territorial unit costs of all traffic should be modified to fit the

---

[7] The Commission found that both groups of carriers are being operated efficiently and neither group should be considered as more or less efficient than the other (A. 39); that there are no differences in importance to the public attributable to the services of the two groups (A. 51); and that no adjustment over and above divisions based upon costs was warranted for either group on the grounds of greater revenue needs or otherwise (A. 79).

specific work units of the traffic at issue, and to the meaning and significance of the Southern lines' suggested adjustments.

In a comprehensive analysis accepting five and rejecting seven of the Southern lines' adjustments as unsound or based on unsupported and inapplicable facts or assumptions, the Commission concluded that its restated Rail Form A costs, which were based on Southern lines' cost and traffic studies except as to the rejected adjustments, "more reliably," "accurately," and "adequately reflect the costs which are attributable to the traffic at issue" (A. 48-49, 77-78, 87-129). Upon consideration of such cost data, the Commission concluded that its "restatement of the costs, which are reasonably accurate and reliable for purposes of determining the relative contribution by the groups on a cost-of-service basis, shows that the cost level in 1956, the year both groups used in the final cost analysis, is somewhat higher in the North than in the South for like services. A consideration of all factors indicates that this situation will most likely continue in the immediate future" (A. 78).

Noting that in the sample year selected by the Southern lines "the Northern lines received 44.64 percent of the revenue while incurring 46.35318 percent of the fully distributed costs," the Commission determined that "[i]t is clear that an adjustment in the divisions is required to compensate the respective groups according to their expenditures in the joint effort of handling this interterritorial traffic. To the extent that the present divisions do not meet this test," the Commission concluded, "they are unjust,

unreasonable and inequitable" (A. 80). Accordingly, the Commission prescribed new divisions in the form of scales of divisional factors (A. 130) which "are based on the fully distributed costs and divide the revenues in the same proportion to those costs" [8] (A. 80), finding that "the results achieved through application of the divisional mileage scales here prescribed will for the future be just, reasonable, and equitable * * *" (A. 80).[9]

Under the newly prescribed scale of divisional factors, tables of integers arranged by mileage blocks (in 50 mile increments) are used to compute percentages for dividing the joint rates [10] which produce approxi-

[8] Southern lines requested the prescription of divisional scales based on costs urging that "[t]o the extent, if at all, the Examiners are found to be correct in their rejection of specific aspects of the Southern lines' cost evidence * * *, the cost evidence, as thus modified, would provide the basis for constructing the divisional scales" (A. 1361-1363). In agreeing with the Southern lines, the Commission prescribed new divisions on that basis.

[9] In its Supplemental Report, the Commission reaffirmed its conclusions that revised divisions were required and that the cost data of record it used provided an adequate evidentiary basis for the newly prescribed divisional scales (A. 181-183).

[10] Scales of divisional factors are tools for accomplishing the division of revenues by the use of common fractions to calculate percentages which are then used to divide the revenue from a given shipment of freight. For example, if the haul for an originating Northern line were 300 miles and the haul for the terminating Southern line were 500 miles, the scales selected by the Commission prescribe 241 integers for the originating Northern road and 321 integers for the terminating Southern road (A. 130). The sum of these factors is 562. Reduced to percentages, the Northern road would re-

mately $496 million in revenues annually. The shift in revenues which would result from the new divisions is approximately $8 million a year. This amounts to an overall increase in the revenues of the Northern lines from the traffic involved of 3.5 percent and a reduction in Southern lines' revenues of approximately 3 percent (A. 80, 181-182).

3. PROCEEDINGS BEFORE THE DISTRICT COURT

In March 1965, the Southern lines brought the instant suit before a three-judge district court in the Eastern District of Louisiana to enjoin the enforcement of and to set aside the Commission's order establishing the new divisions.[11] The Northern railroads intervened as defendants and joined the United States and the Commission in defending the order. In denying Southern lines' application for interlocutory injunction, the district court dissolved a previously issued temporary restraining order and permitted the newly prescribed divisions to become applicable on April 20, 1965, subject to conditions requiring a refund of the increases to the Southern lines if they were successful in setting aside the order.

---

ceive $\frac{241}{562}$ or 43% of the joint rate and the Southern road would receive $\frac{321}{562}$ or 57%.

[11] The Southern Governors' Conference and the Southeastern Association of Railroad and Utilities Commissioners intervened on behalf of the Southern carriers in the Commission proceedings and in the three-judge court judicial review action.

After oral argument, the district court concluded that the Commission's restated Rail Form A costs, although based on adjustments of territorial costs of all freight service to reflect North-South service, were not a proper yardstick for measuring the costs of the particular traffic in a divisions case. In the Court's view, the Commission was required "* * * to take affirmative action to require the development of an adequate record as to the actual costs of handling the specific traffic at issue" (A. 354). Accordingly, the district court set aside the Commission's order as not supported by substantial evidence and reasoned findings within the meaning of Sections 8(b) and 10(e) of the Administrative Procedure Act [5 U.S.C. 557(c) and 706], and remanded the case for further proceedings consistent with its opinion. Pending appeal, however, the court stayed its judgment and permitted the new divisions to remain in effect, subject to the same pay back conditions imposed in its denial of a preliminary injunction which require a financial settlement among the carriers back to the effective date of the Commission order (April 20, 1965), should its judgment be affirmed on appeal (A. 359).

SUMMARY OF ARGUMENT

I. Under Section 15(6) of the Interstate Commerce Act, Congress has imposed upon the Interstate Commerce Commission the duty to assure just, reasonable, and equitable divisions of joint rates as between connecting carriers. Exercising this authority, after consideration of evidence and upon making findings relating to each of the Section 15(6) criteria, the

Commission prescribed new divisions of the joint rates on interterritorial North-South freight traffic in proportion to the relative costs of handling that traffic. The cost figures used were derived from Rail Form A, which produces average unit costs of all territorial service, although the Commission made certain adjustments to reflect more accurately the costs of the particular traffic in question. The district court held, however, that restated Rail Form A costs were not a proper yardstick for this purpose and that the Commission was required to develop more refined data to reflect the actual costs of the particular traffic.

When contesting groups of carriers in a divisions case recognize the necessity of basing their costs of service on computations derived by applying Rail Form A territorial unit costs of all traffic to the specific work units incurred in handling the traffic involved in the contested divisions and one group sought —but failed to prove—that certain proposed adjustments were required to compensate for peculiar characteristics of the particular traffic, this Court has expressly declined to invade the province of the Commission and has approved Rail Form A computations as a proper standard of cost measurement. *Chicago & N.W. Ry. Co.* v. *Atchison, T. & S.F. Ry. Co.*, 387 U.S. 326.

Divisions cases are essentially pragmatic in nature. Congress has accorded the Commission in Section 15(6) a considerable amount of discretion to carry out its basic responsibility of prescribing "just, reasonable, and equitable" divisions. In determining

the adequacy of the cost data in the instant case, the Commission was acting in consonance with the statutory duty imposed upon it by Congress. In substituting its own view as to the adequacy of the cost evidence, the district court simply failed to give sufficient weight to the Commission's resolution of such matters, leaving little if anything to informed expertise and practical judgment. Such a result was never intended when, in Section 15(6), Congress conferred sweeping authority upon the Commission to effectuate the public interest in the existence of "divisions that colloquially may be said to be fair." *Baltimore & O. R. Co.* v. *United States*, 298 U.S. 349, 357-360.

The use of Rail Form A data is compelled as a practical matter since it is readily available and is not subject to biases which special studies conducted by the parties might understandably reflect. Moreover, it was never contemplated by Congress that costs of service in divisions cases be ascertained with exact mathematical precision—a technically impossible task since empirical judgments are essential. *New York* v. *United States*, 331 U.S. 284, 324-328. Indeed, it is rather illusory to assume that the exact costs of any particular traffic can be definitively ascertained since costs of particular shipments are necessarily an apportionment of the various expenses incurred in providing and maintaining facilities necessary to conduct rail operations generally. Where particular traffic uses physical facilities and employees' services in common with other traffic, and has been shown to have no distinguishing characteristics, the application of Rail Form A costs is plainly proper.

Nothing in the language of Section 15(6) expressly or impliedly prohibits the comparison of cost by applying Rail Form A territorial unit costs to the work units incurred in transporting a large and varied body of all traffic moving between two territories and handled by all railroads in each territory. The decision below conflicts with the established practice approved by decisions of this Court, substitutes the reviewing court's preference concerning the adequacy of cost evidence and constitutes an unwarranted incursion into the administrative domain. *S.E.C.* v. *New England Electric System*, 390 U.S. 207, 211. Since the Commission's procedures permitted all refinements to Rail Form A territorial unit costs which were necessary to reasonably reflect the cost of the particular traffic in question, the requirement of more refined cost data imposed by the court below would not only serve no useful regulatory purpose, but would seriously impair the Commission's ability to exercise in a practical manner its authority to adjust divisions.

II. The attempt of the Southern lines to rewrite the lower court's holding, so as to require rejection of the Commission's order for lack of evidence to support the use of Rail Form A costs to measure the cost items involved in their rejected adjustments, fails. Moreover, their more limited argument that the Commission's findings are inadequate and not supported by substantial evidence is itself without merit.

Southern lines were proponents of a different result from that urged by the Northern lines and had a

burden to maintain under Section 7(c) of the Administrative Procedure Act, 5 U.S.C. 556(d). As the district court acknowledged, however, the Commission in effect found that Southern lines failed to overcome Northern Lines' *prima facie* case of the applicability of Rail Form A territorial unit costs to measure North-South traffic and also to establish that their adjustments were required to compensate for the peculiar characteristics of that traffic. Thus, the Commission merely reversed their unsupported assumptions and calculations and reverted to the Rail Form A costs from which Southern lines had started. In each instance where this occurred, whether referred to by the district court as a representative example or not, the Commission's findings provided an adequate basis, supported by substantial evidence, for its prescription of the new divisions.

III. Nor do the arguments of the Southern Governors' Conference et al., intervening plaintiffs below, contain merit. Although urging that, "as a matter of law," the Northern lines cannot have an increase in divisions in the absence of findings that their higher costs result from inherent territorial disadvantages, the Commission made all the findings necessary to dispose of this claim. The bulk of the Conferences' arguments relate to the Commission's refusal to accept their unsupported and novel concept that "sectional" rather than "national" interests should control the prescription of fair divisions between the railroads. But these claims would disregard the evidence which established a need for revised divisions in order to compensate the Northern lines according to their

expenditures in the joint effort of handling North-South traffic. These arguments merely raise disagreement with judgments the Commission made, supported by evidence, on questions of transportation economics. These are not issues appropriate for judicial review and, even if they were, the Conferences have failed to show any error by the Commission that would justify the invalidation of its orders.

ARGUMENT

I.

THE DISTRICT COURT ERRED IN HOLDING THAT THE COMMISSION IS REQUIRED TO DEVELOP THE ACTUAL COSTS OF THE PARTICULAR SERVICES IN A DIVISIONS CASE AND CANNOT RELY ON RAIL FORM A TERRITORIAL AVERAGE COST COMPUTATIONS, AS ADJUSTED.

The district court held that the Commission must develop more refined data reflecting the actual costs of the particular traffic in an interterritorial divisions case and cannot accept, as a standard of measurement, computations produced through the use of Rail Form A territorial average costs, adjusted to reflect the expenses of handling the specific traffic at issue.[12] Compliance with the district court's ruling would mean that, before the Commission could determine the unlawfulness of existing divisions and prescribe new

[12] While the Commission's order was in terms ultimately set aside for lack of substantial evidence and adequate findings, the district court reached that conclusion only after rejecting the Commission's specific findings as to the adequacy of restated Rail Form A costs because these findings did not comply with the court's view of the proper standard of cost measurement to be applied (see, *e.g.*, A. 335, 349, 353).

divisions, it must develop—or have developed by the parties—special studies as to the costs of each of the services performed in handling North-South traffic. This is an impractical requirement.

Contrary to the decision below, the railroads themselves recognized the necessity for using the Rail Form A formula to measure the relative costs of North-South traffic, and they desired and expected the Commission to use that formula in ascertaining the costs of service. The only complaint was that the Commission had not made all the adjustments to the Rail Form A costs which the Southern lines had suggested. The district court's requirement of finding the exact costs of service is illusory, substitutes the court's view for that of the agency charged by Congress with the duty of prescribing fair divisions and conflicts with past decisions of this Court as well as Commission practice. The Commission plainly has the statutory authority to compute costs by adjusting and applying Rail Form A territorial unit data to the work units incurred in transporting all commodities between two territories by all railroads of these territories.

A. The Decision Of The District Court Is Contrary To Settled Commission Practice Approved Under Decisions Of This Court And Substitutes The Court's View For That Of The Expert Body Charged By Congress With Administering The Interstate Commerce Act.

The need for a comprehensive formula to measure rail costs led to the development of Rail Form A by the Commission's Cost Finding Section more than a

quarter of a century ago.[13] Data reported annually by the railroads to the Commission was first used in applying Rail Form A in *Class Rate Investigation, 1939*, 262 I.C.C. 447 (1945), affirmed, *New York* v. *United States*, 331 U.S. 284 (1947). Ever since this Court sustained the integrity of the Rail Form A formula in the *New York* case, it has been almost universally employed as an acceptable and reliable method for ascertaining relative railroad costs in every type of rate proceeding that comes before the Commission. (A. 953-957). Indeed, this Court has consistently approved the application of restated Rail Form A computations as a proper standard for measuring costs of service in divisions cases involving a large and varied body of interterritorial traffic handled by over 300 railroads, *Chicago & N.W. Ry. Co. v. Atchison, T. & S.F. Ry. Co.*, 387 U.S. 326, as well as a single commodity handled by two railroads interterritorially, *Carolina & N.W. Ry.*

---

[13] Generally, under Rail Form A, the expenses of carriers assigned to geographical areas are first broken down into groups and are translated into territorial average unit costs of performing each of the kinds of service involved in moving specific shipments or in furnishing a given amount of service in each territory. Adjustments are contemplated to fit any peculiar characteristics of particular shipments for individual or groups of railroads. When the average costs for each unit of work are multiplied by the number of work units of each of the services found to be employed in moving a specific shipment or in furnishing a given amount of service, the cost figures thus produced will be the substantial equivalent of specific costs of the particular traffic in question. For a more complete description of Rail Form A and its use in developing regional cost studies, see Sen. Doc. No. 63, 78th Congress, 1st Sess.

Co. v. *United States*, 234 F. Supp. 114, affirmed, 380 U.S. 526.[14]

It has long been recognized that whether a cost study is adequate or should have been refined or supplemented by additional data is a question of fact which is within the special competence and discretion of the Commission, see *e.g.*, *Illinois Commerce Commission* v. *United States*, 292 U.S. 474, 481, 484; *Chicago & N.W. R. Co.* v. *United States*, 387 U.S. at 356. Here the contesting groups of carriers recognized the necessity for using the Rail Form A formula to measure costs of North-South service and requested that costs at the fully distributed level be utilized. The only difference between the parties involved the degree to which such territorial average costs should be modified to fit the specific traffic at issue. In rejecting seven of Southern lines' proposed twelve adjustments to Rail Form A costs, which it found were based on theoretical estimates, unsupported averages or guesses, the Commission merely reverted to the Rail Form A costs from which those railroads had started. Thus, in its determination the Commission merely adhered to the recognized practice of applying Rail Form A territorial unit costs to the work units incurred in handling particular traffic in order to produce a reasonable reflection of the expenses incurred in handling that traffic. In fact, the costing procedures used here in adjusting the South-

[14] And see *Permian Basin Area Rate Cases*, 36 L.W. 4337 at 4356, 4358 (May 1, 1968), where this Court recently sustained the Federal Power Commission's area maximum rates on gas derived from average costs, without further adjustment.

ern lines' studies are the same as those which the Commission employed with the unanimous approval of this Court just last term in *Chicago & N.W. R. Co.* v. *United States*, 387 U.S. at 351, 354, except that, in accordance with the evidence of both groups of railroads, the costs here were computed at the fully distributed level.[15]

The use of Rail Form A cost figures, in ascertaining relative costs in a large interterritorial divisions case such as this, is compelled as a practical matter. Rail Form A data is readily available[16] and does not include the biases which special cost studies conducted by the contesting parties might understandably reflect. Allocation of an appropriate part of overhead or constant cost items to the particular traffic is plainly proper,[17] and, if appropriate, Rail Form A cost

---

[15] This fact is conclusively established by the *amicus* brief filed in the *Chicago & N.W. R. Co.* case by the Southern Governors' Conference and the Southeastern Association of Railroad and Utilities Commissioners, appellees here.

[16] Railroads annually report their costs to the Commission in various accounts according to the purposes for which the money was spent. The dollar expenditures in each account are separated between out-of-pocket costs and constant costs and the former is assigned to functional groupings. When the dollar figures in each account are divided by the number of service units which incurred the expense, a unit cost for each service or work unit is obtained. Unit costs multiplied by the number of service units incurred in a given body of traffic are added and result in the total dollar out-of-pocket costs for the traffic in question. If fully distributed costs are to be found, both the constant cost related and unrelated to distance are added.

[17] In *Northern Pacific R.R. Co.* v. *North Dakota*, 236 U.S. 585, 597, this Court held that when conclusions are based on

figures can be stated so as to exclude all or some constant cost items which should not be taken into account.[18] As to each cost item, however, the question is essentially one of practical and informed judgment. The Commission here found that Rail Form A costs, as adjusted, "more reliably," "accurately," and "adequately reflect the costs which are attributable to the traffic at issue," and are "particularly appropriate * * * because it is a large and varied body of traffic moving to and coming from terminals in all parts of

---

cost, the entire cost must be taken into account, *i.e.*, "the outlays that exclusively pertain to a given class of traffic must be assigned to that class, and the other expenses must be fairly apportioned." And in *Baltimore & Ohio R.R. Co.* v. *United States*, 298 U.S. 349, 360, 378, this Court approved the Commission's use in a divisions case of cost and revenue evidence which reflect a due or fair proportion of the overall burden of doing business. That the language of Section 15(6)—"property held for and used in transportation"—is broad enough to support consideration of all railroad property, and thus fully distributed costs, was recognized in the *Baltimore & Ohio R.R. Co.* case, where this Court stated (298 U.S. at 360):

> It requires no discussion to demonstrate that § 15(6) authorizes the Commission to take into account and give due weight to revenues from all transportation services, the operating expenses and taxes chargeable to the same and the amounts available as compensation for the use of all carrier property. And unquestionably the paragraph also empowers the Commission to take into account the revenues, expenses, taxes and returns attributable to the services covered by the divisions under consideration.

[18] In this case there is no dispute concerning the propriety of using fully distributed costs. Their use here is questioned only in the district court's holding—in our view erroneous—that it was improper to allocate an appropriate part of suburban passenger deficits to the costs of North-South traffic, see *infra*, pp. 40-45.

both territories" (A. 48-50, 77-78, 120-121). Yet, the district court overturned these Commission findings and held that the cost evidence was not adequate since, in its view, more refined data reflecting actual costs was required.

While the district court was quite correct in stating that the Commission prescribed new divisions on the basis of the relative costs of handling North-South traffic, that hardly leads to the conclusion that the restated Rail Form A data used by the Commission was inadequate.[19] Here the Commission ascertained the relative costs of service by applying, with certain adjustments, Rail Form A fully distributed unit costs to each of the work units used in moving North-South traffic which were shown in Southern lines' traffic study of all such traffic moving in one year. What the Southern roads complained about—and persuaded the district court to accept—was that the Commission had not made additional adjustments to the cost data which they had suggested. (A. 343-344). In holding that the Commission violated its statutory duty in

---

[19] Aside from the district court's substantial inaccuracy in defining the purpose of Rail Form A and its application here (A. 348-349), the court appears to hold as a matter of law that the Commission cannot apply Rail Form A costs to North-South traffic in reaching its determination "without further evidence." Since the court disregarded that particular evidence (*infra.* p. 35 *et seq.*) its holding erroneously condemns the use of Rail Form A as a standard of measurement of costs of service. Moreover, the goal in a divisions case is not slavish adherence to any particular exactitude, but rather a method of computation which takes into account the direct and, where appropriate, the indirect expenses and projects a reliable and reasonably accurate estimate of the cost of providing the particular service.

failing to take affirmative action to require the development of an adequate record as to the actual costs of handling the specific traffic at issue, the district court seriously misconceived not only the Commission's function under Section 15(6), but also its own function as a reviewing court. See *United States* v. *Pierce Auto Freight Lines*, 327 U.S. 515, 535-536; *S.E.C.* v. *New England Electric System*, 390 U.S. 207, 211.

Assessing the fairness of existing divisions and prescribing new divisions are matters which are essentially pragmatic in nature. Divisions proceedings cannot be governed by mathematical niceties since the pertinent considerations are at best inexact and imprecise. Congress plainly recognized this in enacting Section 15(6), and has implicitly approved the way the Commission has administered its authority under the statute by leaving it unchanged since 1920. As succinctly stated by this Court in *Baltimore & Ohio R. Co.* v. *United States*, 298 U.S. 349, 357, the purpose of these provisions "is to empower and require the Commission to make divisions that colloquially may be said to be fair." Continuing, this Court stated (*ibid.* at 359):

> The Commission alone is authorized to decide upon weight of evidence or significance of facts. There is no single test by which "just," "reasonable" or "equitable" divisions may be ascertained; no fact or group of facts may be used generally as a measure by which to determine what division will conform to these standards. Considerations that reasonably guide to decision in one case may rightly be deemed to have little

> or no bearing in other cases. Error as to the weight to be given financial needs, operating costs or other material facts is not a misconstruction of the Act.

In carrying out its powers under Section 15(6), the Commission is charged with giving "due consideration, among other things," to various factors there spelled out. And these factors are to be considered only "among other things," and along with "any other fact or circumstance which would ordinarily without regard to the mileage haul, entitle one carrier to a greater or less proportion than another carrier * * *."

No one can dispute that, in enacting Section 15(6) with such sweeping authority, Congress never intended for the Commission simply to perform essentially ministerial tasks in determining how joint freight rates should be divided,[20] whether its determination is grounded on a comparison of costs of service or a consideration of other factors as well. See *Boston & Maine R.R.* v. *United States*, 208 F. Supp. 661, 675 (D. Mass., affirmed, 371 U.S. 26. Rather, the plain duty of the Commission is to effectuate "the public interest in maintaining all essential parts of the transportation system" (325 I.C.C. at 49). See *New England Divisions Case*, 261 U.S. 184, 191. Here, in rejecting Northern lines' claim that they were entitled to an adjustment in their divisions over and above

---

[20] As stated by this Court in *Interstate Commerce Commission* v. *Hoboken R. Co.*, 320 U.S. 368, 381: "* * * [T]he question as to what is a proper division is one for the Commission's discretion, reviewable only for unreasonableness, departure from statutory standards, or lack of evidentiary support."

their relative costs of service because "their revenue needs are greater since the Southern lines' average rates of return are somewhat higher," the Commission specifically pointed out that its "prescription of divisions based on relative costs includes allowances for overhead and return, and in our judgment reflects a due proportion of the burden of maintaining the financial integrity and credit of the carriers involved" (A. 79). Thus, in determining the adequacy of the cost data and the propriety of using adjusted fully distributed costs, the Commission was acting in consonance with the statutory duty imposed upon it by Congress. The significance of that Congressional authorization, and the wide latitude of discretion which necessarily accompanies it, was disregarded by the district court in substituting its judgment for that of the Commission with regard to the sufficiency of the cost evidence on which its determination was based.

Nor is the district court's or railroad appellees' suggested distinction of this Court's decision last term in the *Chicago & N.W. Ry. Co.* case, *supra*, apposite (A. 349-350; Motion to Affirm, p. 13). There, although the lower court had not dealt directly with the cost issues, this Court found that "attacks on the legal validity of the Commission's findings on costs * * * so insubstantial that no useful purpose would be served by furthering proceedings * * *" (*ibid.* at 356). In the instant case, as in *Chicago & N.W. Ry. Co.*, "[t]he presentation and discussion of evidence on cost issues constituted a dominant part of the lengthy administrative hearings, and the issues were thoroughly explored and contested before the Commission.

Its factual findings and treatment of accounting problems concerned matters relating entirely to the special and complex peculiarities of the railroad industry" (*ibid.*). Here, as there, the basic cost study upon which the Commission and all parties relied was Rail Form A territorial averages, with certain proposed adjustments allowed and others rejected.[21] And finally, here, as there, "the Commission's disposition of these matters is sufficient to show that its conclusion had reasoned foundation and were within the area of its expert judgment" (*ibid.*). (See *infra*, pp. 38-47). In the instant case, the district court simply failed to give sufficient weight to the Commission's resolution of such matters and "indulged in an unwarranted incursion into the administrative domain." *S.E.C.* v. *New England Elec. System, supra*, at 211.

In our view, costs of service in divisions cases can not be ascertained with exact mathematical precision —a result which is, of course, technically impossible since empirical judgments are essential, particularly as to the distribution of overhead. *New York* v. *United States*, 331 U.S. 284 at 335; *Baltimore & Ohio R.R. Co.* v. *United States*, 298 U.S. 349 at 378. Indeed, it is rather illusory to assume that the exact costs allocable to specific traffic can be definitively as-

---

[21] Thus, the district court is simply wrong in construing the *Chicago & N.W. R. Co.* case as involving Rail Form A costs only to the extent of three adjustments. Indeed, in basing their studies on Rail Form A data here, Southern lines used unadjusted Rail Form A territorial average costs for 89.45% of the total North-South costs which they attributed to the traffic in question. (See A. 867-876, 877-880, percentage computed).

certained. In point of fact, any shipment's actual cost is necessarily an apportionment of the various expenses incurred in providing and maintaining facilities and in conducting rail operations generally. Thus, there is no such thing as a particular, specific or "actual" cost for handling North-South traffic as distinguished from other traffic because North-South traffic uses physical facilities and employee services in common with other traffic. The costs of the facilities and employee services must be apportioned to each traffic on the basis of the amount of service, *i.e.*, work units, incurred by each. For example, a car of North-South traffic moves in a train with cars of other traffic. Every car in the train is allocated a part of the costs of locomotive maintenance, fuel, train crew costs, etc. The basic unit of apportionment, a gross-ton mile, is the same for every car and ton in the train. There is no reason to assign to a car or ton of North-South traffic a proportion of train running expense which is larger, smaller, or different than to a car or ton of other traffic. This principle of allocating costs on the basis of work units incurred applies to the maintenance expense of the track and roadway over which the traffic moves, the switching expense it incurs, and all other costs.

Finally, judicial and administrative construction and application of Section 15(6) aside, the one thing that is perfectly clear is that the statute does not prohibit the Commission's comparison of costs of service by applying Rail Form A territorial unit data to the specific services in question. A study of the language of Section 15(6) discloses no express or im-

plied suggestion that the criteria for measuring the justness of divisions of joint rates is limited in any way. On the contrary, it specifies that the Commission shall give "due consideration" to any relevant fact or circumstance in the prescription of fair and equitable divisions.

In sum, the district court's holding that restated Rail Form A cost figures were improperly utilized by the Commission is erroneous, conflicts with established practice under decisions of this Court and substitutes the court's own view concerning the adequacy of the cost evidence for that of the agency charged by Congress with the duty of prescribing fair divisions. The Commission plainly has the statutory authority to compute costs of service by applying Rail Form A territorial unit data to the work units incurred in transporting a large and varied body of traffic between two broad territories in a case involving all commodities and all the railroads of each territory. We submit, Section 15(6) must be read as authorizing the Commission to utilize such an approach. This view is confirmed by the fact that the consistent judicial and administrative interpretation of the statute has never been repudiated by the legislative branch even with the slightest modification since Rail Form A was reported to it in 1943—over 25 years ago (see Sen. Doc. 63, 78th Cong., 1st Sess.).

B. Requiring The Development Of Exact Costs Is Illusory And Would Serve No Significant Regulatory Purpose.

As the prior discussion shows, costs of service in divisions cases can not be ascertained with exactitude.

In addition, it is equally as clear that the more refined data required by the district court would have only limited utility.

On the basis of such refined data the Commission could decide that Rail Form A computations are not adequate to measure the costs of handling North-South traffic because the characteristics of the services performed in handling that traffic are so different from average traffic as to require special study and treatment. (*Cf.*, *Boston & M. R.R. Co.* v. *United States*, 208 F. Supp. at 674-5 (D.C. Mass.), affirmed, 371 U.S. 26). But this possibility was provided for by Commission procedure, the parties introduced evidence along these lines, and the contrary was shown. And despite the Southern lines' assertion that Northern lines failed to produce the necessary evidence in their sole possession in order to resolve the issue as to whether Rail Form A territorial average costs required adjustments to reflect the costs of North-South traffic (see A. 336), the Commission in effect concluded—as the district court acknowledged—that "the Northern lines established a prima facie case that Rail Form A costs properly measure the cost of the specific traffic" (A. 343), and that the Southern roads had not overcome this *prima facie* case insofar as their suggested but rejected adjustments were concerned.

A second possible use for the refined data envisioned by the district court would be to demonstrate that the Rail Form A territorial data with respect to individual services was so extreme as to distort the costs of handling North-South traffic. Here again, however,

the Commission allowed for such a showing. The Southern lines proposed some twelve adjustments for specific services. The Commission considered these adjustments, accepted five [22] and rejected seven [23] as unsound in concept or based on unsupported opinions and inapplicable facts or assumptions.[24] With regard to these questions of fact, it is well settled that the Commission is not required to give conclusive weight to unsupported opinion evidence of Southern lines' witnesses. See *Baltimore & Ohio R.R. Co.* v. *United States*, 298 U.S. at 378, 379; and *Loving* v. *United*

---

[22] Accepted were adjustments concerning (1) way and through train separation (A. 87); (2) platform costs (A. 87-89); (3) switching and terminal companies (A. 89-91); (4) short lines (A. 110-113); and (5) train tonnage (A. 121-122).

[23] Rejected were adjustments concerning (1) count of cars interchanged, originated, and terminated (A. 91-94); (2) car costs (A. 94-101); (3) freight car empty return ratios (A. 101-110); (4) switching costs to eliminate the effect of volume switching at origin and destination (A. 113-121); (5) constant costs of suburban passenger service deficits (A. 122-124); (6) constant costs on transit commodities (A. 124-128); and (7) equalization of gateway interchanges (A. 128-129).

[24] In support of the ruling that the Commission violated its duty to develop a more adequate record, the district court appears to rely on the fact that "in several instances [the Commission] held that the absence of comparable evidence in the record itself prevented adjustments in territorial averages," citing several instances (A. 344). The Court misread the findings made since in each instance the cited adjustments were rejected primarily for lack of merit or support in evidence. Lack of comparable evidence, in some cases, was merely an additional reason for the Commission's rejection of Southern lines' proposed adjustments (A. 94; 108; 110; 121).

States, 32 F. Supp. 464 at 467 and cases cited (W.D. Okla.), affirmed, 310 U.S. 609.

As a theoretical matter, the only new purpose to be served by refined cost data would be to challenge the propriety of using Rail Form A costs either to require more accuracy or to restrict consideration to only those costs directly pertaining to the traffic in question. Such an effort to achieve a theoretically perfect formula for ascertaining relative costs of particular traffic without appropriate allowances for overhead and return on investment conflicts with the broad purposes underlying Section 15(6)—even in a case such as this where relative costs of service was the criterion on which the adjustment in the divisions was grounded.

Here the Commission concluded that, as restated with appropriate adjustments, the Rail Form A cost data submitted was of such quality, credibility and accuracy that it could be accepted as adequately reflecting the costs of handling the particular North-South traffic at issue. In view of this conclusion, there was no need for the Commission to have embarked upon an independent investigation to determine whether the parties might be overlooking or concealing some relevant evidence or whether special studies would produce more refined, significant data beyond that already introduced by the parties for and against the proposed adjustments to Rail Form A computations. See *Chicago & N.W. Ry. Co.* v. *Atchison, T. & S.F. Ry. Co.*, 387 U.S. at 343.

Indeed, since the particular carriers involved are obviously in the best position to know if there are

any peculiar characteristics of their traffic which may differ from average traffic, it seems quite fair and reasonable—and wholly consistent with Section 15(6) and this Court's decisions thereunder—to require such carriers to come forward and point out to the Commission the peculiar characteristics which they believe require special treatment. It is difficult to see how the Commission can be expected to know, as an initial matter, whether such peculiar characteristics may exist or whether any "special studies" may be needed. If the Commission, in order to comply with the district court's decision, were to be required to conduct special studies to determine the unit costs of every work unit of the services performed in every case, the administrative proceeding would be virtually interminable. And the results of such an unduly burdensome approach, even if practicable, would be of little, if any, utility in the absence of special circumstances.[25]

In the final analysis, no significant regulatory purposes would be served by the district court's requirement of developing more refined costs.[26] In addition,

---

[25] Moreover, here Southern lines acted throughout the Commission proceeding on the basis of Rail Form A average costs, with suggested adjustments. After the Commission rendered its decision rejecting certain of their proposed adjustments, Southern lines urged that more refined "actual costs" were required. Having voluntarily employed Rail Form A costs, and having failed to justify their proposed adjustments or to overcome their opponents' *prima facie* case that North-South traffic is average traffic, Southern lines should be bound by the findings grounded on the evidence introduced.

[26] In the *Chicago & N.W. Ry. Co.* case, the Commission found significant the smallness of the percentage-point differ-

and perhaps more importantly, the purpose of Congress in conferring authority upon the Commission to adjust divisions fairly might well be effectively frustrated by such a requirement.[27]

II.

SOUTHERN RAILROADS' MORE LIMITED ARGUMENT, AS TO THE REFINEMENT OF COSTS REQUIRED UNDER THE DECISION BELOW, IS WITHOUT MERIT.

In their Motion to Affirm, Southern lines attempted to justify, on a more limited ground, the district court's novel requirement that the Commission cannot

---

ence between two cost showings—one based on a study made in great detail of the particular service rendered, and the other involving a straight Rail Form A application. It concluded that "one substantiates the other, and supports the view that, for a large and varied body of traffic as here at issue, territorial average costs will be the substantial equivalent of specific costs" (A. 78-80). In this case, a similar comparison of two such studies establishes that the percentage-point difference is almost infinitesimal (A. 48-50).

[27] While the district court's ruling refers to "a divisions case" (A. 348), the principle announced is broad and necessarily raises doubt as to the validity of cost formulas similar to Rail Form A, such as Highway Form B and Barge Form C, which have been developed for determining the relative costs of service of the several kinds of carriers subject to its regulation. It is essential that the Commission be able to ascertain relative rail costs on the Rail Form A basis and make adjustments when necessary. As this Court said in another context concerning the necessity to proceed on a group basis in the *New England Divisions Case:* "[o]bviously, Congress intended that a method should be pursued by which the [Commission's] task * * * could be performed." (261 U.S. at 197).

use Rail Form A data as a standard of cost measurement without taking affirmative action to have developed more refined data reflecting the "actual" costs of handling North-South traffic. Apparently, it is now their position that the district court merely rejected the Commission's order for lack of evidence to support the use of restated Rail Form A costs in specific instances corresponding to their suggested but rejected adjustments.[28] (Motion to Affirm, pp. 9-11). They asserted that nothing in the decision below casts doubt on the integrity of Rail Form A or precludes the Commission from relying on Rail Form A costs as appropriately adjusted since "no party here contends that Rail Form A cannot provide the framework for analysis" if supported by evidence. (*Ibid.*, pp. 7 and 13.) The district court, however, reached the very conclusion urged upon it by the Southern lines.[29] (See A. 354). Thus, although having urged the district court to hold the Commission's order invalid because of failure to develop more refined data reflecting "actual" costs of the traffic at issue, Southern lines appear to now maintain that the Commission's order is invalid because there is no evidence "to support the use of unadjusted average Rail Form A costs to measure

---

[28] Such as car costs, the cost of commuter operations, the ratio of empty-to-loaded cars, the costs of interchange and switching the cars.

[29] In requested conclusion of law numbered 5, they asked the lower court to hold that the Commission violated its statutory duty in failing "to take affirmative action to require the development of an adequate record as to the actual costs of handling the North-South traffic at issue."

the critical cost factors" urged in their adjustments. But this narrower contention will not withstand analysis.

As previously indicated, the sharp dispute as to the proper method of ascertaining costs of service concerned only "the degree to which Rail Form A territorial average costs should be modified to fit the specific traffic at issue" (A. 47). The Northern lines relied principally on standard Rail Form A computations since the traffic covered almost all commodities moving over all railroads and between all stations in both Official and Southern territories.[30] They introduced evidence which established the *prima facie* validity of using Rail Form A costs to measure the relative costs of North-South traffic. Train tracing and train utilization studies provided a documented and detailed demonstration that North-South traffic is not handled as a distinct entity, but is rather average traffic handled as an indiscriminate part of all traffic and possesses no distinguishable transportation characteristics. (A. 575-576 and 541-582).[31]

---

[30] For the year 1956, North-South traffic produced revenues which constituted 6% and 21.4% of the total freight revenues of the Northern lines and the Southern lines, respectively (A. 796), which combined represents 10% of the combined revenues of both lines. Compare *New York* v. *United States*, 331 U.S. at 330 and 343 in which this Court approved the use of Rail Form A costs where the class rate traffic involved constituted only a small percentage (4.1%) of the total traffic of the railroads.

[31] The train utilization studies showed how railroad facilities and services are planned and operated so as to transport all freight similarly and demonstrated the extent to which the total train service of the Northern lines was used in mov-

The Southern lines, contending that Rail Form A average costs of all traffic was not a proper yardstick for measuring North-South traffic, presented downward adjustments to reflect alleged particular characteristics of that traffic. (A. 40 and 50). In urging these adjustments in order to gain increases in their divisions based on costs as well as revenue needs, the Southern lines were themselves proponents of a different result from that urged by the Northern lines and, therefore, had a burden to maintain under Section 7(c) of the Administrative Procedure Act, 5 U.S.C. 556(d).[32] (A. 77-78). However, the Northern lines responded with evidence establishing the invalidity of each proposed adjustment and the propriety for using Rail Form A costs. (See, *e.g.*, A. 893-905, 911-931, 933-974). After carefully considering this evidence in 9 pages of its report and 26 pages of an appendix, the Commission found that "the cost computation of each side furnished substan-

---

ing the traffic in question. (A. 544-547, 577-582). It showed, among other things, that in a test week in May of 1959, North-South traffic moved in 45% of all trains operated and, therefore, encountered all operating conditions and transportation burdens incurred on general traffic. (A. 547).

[32] The requirement of Section 7(c) that "the proponent of a rule or order shall have the burden of proof" was explained in the Attorney General's Manual on the Administrative Procedure Act, 1947, at page 75, by referring to Sen. Rep. p. 22 (Sen. Doc. p. 270) and H.R. Rep. p. 36 (Sen. Doc. p. 270), as meaning "not only that the party initiating the proceeding has the general burden of coming forward with a *prima facie* case but that other parties, who are proponents of some different result, also for that purpose have a burden to maintain."

tial verification for that of the other side." It then concluded that, apart from the rejected adjustments, "our restatement * * * based on the Southern lines' cost computation, as applied to their traffic studies, * * * more reliably and accurately reflect[s] the movement of the traffic in question" (A. 48). Thus, on the basis of the evidence submitted by the Northern lines and verified by the Southern lines' own presentation, there is substantial evidence to support the Commission's conclusion that restated Rail Form A costs properly measure the costs of North-South traffic.

Although acknowledging the Commission's conclusion, the district court referred to three cost items [33] as "important separate issues" of "greater significance as illustrations of the more pervasive error" of the Commission in using unadjusted Rail Form A costs and held that the Commission's cost computations were not supported by reasoned findings and substantial evidence. In this respect the district court erred. The Commission made clear and concise findings that Southern lines' proposed adjustments were unjustified and that Rail Form A provided the best method of associating expenses with the services performed in moving the traffic at issue. A discussion of the cost items cited by the district court illustrates this fact.

---

[33] Solely related costs of suburban passenger service, switching costs and empty return ratios of box cars.

A. Empty-Return Ratios Of Box Cars

The Commission substituted Rail Form A empty return ratios for that devised by the Southern lines.[34] These ratios were derived from a seven-day study based upon supervised data spaced throughout a year that all railroads are required to furnish by order of the Commission.[35] It produced ratios of 39% in the North and 33% in the South. The Southern lines proposed to reduce these ratios to 30% in three steps covering the alleged effect of special device cars, Canadian traffic and a judgment factor. The Commission discussed and rejected the adjustments by finding that the first step is "not adequately supported; at best, it is merely illustrative;" that the second step "is in error;" and that the third step "is purely an unsupported assumption." (A. 107-108). The Commission then concluded that:

> "the empty ratios for both boxcars and refrigerator cars developed by the special studies of the Southern lines are not as sound an estimate of the empty return incurred by the Official-Southern traffic as are the 7-day study territorial empty return ratios. The latter reflect the compilation of actual data reported by the railroads on a comparable basis in each territory under an order of this Commission." (A. 110).

---

[34] The district court rejected the Commission's findings by referring only to the single dissent in the proceedings stating that "the nature of this problem is summarized" there. This hardly constitutes a review of the reasons expressed by the Commission or the rationale supporting its conclusion. (A. 346).

[35] This data covered all types of cars, including auto parts' cars.

B. Switching Costs

The Commission disagreed with the Southern lines' treatment of switching costs which proposed to eliminate the effect of volume switching at origin and destination. The Southern lines urged that their Rail Form A territorial average switching costs were depressed by the large proportion of volume movements of certain commodities in their territory to the point that those costs were not representative of North-South traffic which includes only a small amount of such commodities. Their cost study used origin and destination switching costs based on a special study of only 41 out of 967,554 cars in the South. Here again, in rejecting Southern lines' adjustment, the Commission found that (A. 121):

> Territorial average costs are particularly appropriate to the traffic in this case because it is a large and varied body of traffic moving to and coming from terminals in all parts of both territories. In our opinion, and we so find, the depressing effect, if any, of volume switching commodities on the average would affect both territories and, for purposes of comparison, would be largely offsetting.
>
> The switching studies in the South have weaknesses, both in the sample and in the studies themselves. The adjustment in the North was not made on a basis comparable to that in the South, and here, where the relationship of North and South is of prime importance, this is a major defect.
>
> For these reasons, we conclude that the contentions of the northern lines are of merit and

that Rail Form A territorial average switching costs more accurately measure the relative switching costs on each side of the border of the official-Southern traffic than the switching costs computed by the southern lines.

C. Solely Related Costs Of Suburban Passenger Service.

The Commission rejected Southern lines' adjustment for allocating passenger service deficits to constant costs. While the Northern lines initially sought to exclude the entire amount of both Northern and Southern lines' passenger deficits, the Southern lines supported inclusion of such deficits in the cost figures to be used in assaying the propriety of existing, and in prescribing new, divisions. However, they sought to have the Commission draw a distinction between intercity and suburban passenger deficits, since it was desirable, from their point of view, to have the intercity deficits of the Southern roads included.[36] Inclusion of intercity deficits was urged for the reason that such deficits are allegedly almost entirely attributable to the apportioned costs of common facilities which must be incurred to provide freight service. Exclusion of suburban deficits was urged because suburban service facilities are allegedly separate and not used in common with freight or intercity passenger service and could be eliminated by discontinuance of suburban service. The Commission, however, found such a

---

[36] In the context of this case, Southern lines' overall passenger deficits are relatively greater than those of the Northern lines (A. 958-961, 975-977, and 978-979).

distinction unjustifiable. After referring to Southern lines' single example of solely related expenses of certain separate suburban track facilities and noting that other costs relating to roadway and terminals would continue, the Commission found that "although many items of suburban service can be considered solely related, the facilities and service as a whole cannot be considered solely related * * * and treated entirely apart from freight service and intercity passenger service" (A. 124). The Commission then went on to conclude that (*ibid.*):

> "* * * Because the suburban service deficit includes common costs which must be incurred to provide freight service or intercity passenger service, such costs are properly chargeable to those services to the extent they cannot be recovered from suburban operations, and the deficit from suburban operations should not be excluded from the constant costs. * * *"

Thus, after making the basic determination that passenger deficits should be included in the fully distributed costs, the Commission apportioned a share of the entire Northern and Southern lines' passenger deficits to the costs of handling North-South traffic, in the same proportion that the particular traffic bears to the total traffic of each territory.

While the district court acknowledged that the Commission found the distinction between intercity and suburban deficits unjustifiable, it nevertheless overturned the Commission on this question since it viewed intercity deficits as sufficiently related to the

common facilities which must be maintained to provide freight service. However, ignoring the Commission's express findings to the contrary, the district court chose to regard suburban deficits quite differently. In rejecting the Commission's rationale and findings, the district court stated flatly that the Administrative Procedure Act requires a determination and findings on "the critical issue * * * [of] how much of the railroads' cost of commuter service was in fact common with the cost of freight service and how much was solely related to commuter service" (A. 345). It concluded that the Commission failed to make adequate findings in this regard (A. 346). In substituting its own view as to what passenger deficits may appropriately be included in constant costs, the district court once again misconceived its function of judicial review, and departed from prior Commission practice approved by the Court. See *Consolo* v. *Federal Maritime Commission*, 383 U.S. 607, 618-619; *Illinois Central R. Co.* v. *Norfolk & W. Ry. Co.*, 385 U.S. 57, 66, 69.

The Commission's approach in apportioning all passenger deficits to the costs of freight service in a divisions case is consistent with established practice, specifically approved by this Court, of fixing freight rates on the basis of including passenger deficits as a part of freight service costs. In *King* v. *United States*, 344 U.S. 254, 261, 264, 267, most of the principal Southern railroads sought and were granted an increase in the Florida intrastate freight rates on the ground that they discriminated against interstate commerce. The policy reasons for taking passenger deficits into account in adjusting freight rates were

expressed in the Commission's report.[37] In sustaining the order without regard to whether the costs were common or solely related, this Court concluded that (*ibid.* at 267) "there is no reason why the Commission may not give weight to passenger deficits in prescribing the intrastate freight rates in Florida, as it does in prescribing interstate freight rates for the Southern Territory."[38] Here, the passenger deficits were unquestionably included in fixing the level of, and in granting general increases in, the joint freight rates on North-South traffic.[39] Thus, the Commission was merely dividing the joint rates in conformity with the factors which went into their composition and the consistent administrative practice approved by this Court.

---

[37] *Increased Freight Rates, 1948*, 276 I.C.C. 9 at 35:

> "* * * if passenger service inevitably and inescapably cannot bear its direct costs and its share of joint or indirect costs, we have felt compelled in a general rate case to take the passenger deficit into account in adjustment of freight rates and charges. Both the freight and passenger services are essential, and revenue losses or deficits on the one necessarily must be compensated by earnings on the other if the carriers are to continue operations."

[38] *Accord: Chicago, M., St. P. & P. R.R. Co.* v. *Illinois*, 355 U.S. 300, 307; *Public Service Comm'n of Utah* v. *United States*, 356 U.S. 421, 426.

[39] See *Increased Freight Rates, 1948*, 276 I.C.C. 9, 32-39; *Increased Freight Rates E. W. & S. Territories, 1956*, 300 I.C.C. 633, 641-647, 657-658; *Railroad Passenger Train Deficit*, 306 I.C.C. 417, 477-479; and S. Rep. No. 445, 87th Cong., 1st Sess., p. 285.

Indeed, the allocation of passenger deficits to the costs of freight service in a divisions case is rational and compelled as a practical matter. Both intercity and suburban passenger services have some solely related and some common costs and are, therefore, both similar in character. A meaningful comparison of the relationship of fully distributed costs can only be made on the basis of including all passenger deficits.[40] These deficits are incurred and represent money lost to the railroads by reason of the fact that the Interstate Commerce Act requires the continued rendition of necessary passenger services.[41] Such losses must be recovered from railroad freight operations if railroads are to remain solvent.

---

[40] At several places in its opinion, the district court referred to the fact that the Commission itself had noted that some costs of providing suburban service could be considered as solely related to that service (A. 344-345, 355). In light of what it erroneously regarded as "a concession that many commuter facilities are solely related to that service and have nothing whatsoever to do with the cost of handling the North-South traffic or any other freight traffic" (A. 345), the court found the Commission's treatment of suburban deficits inconsistent and unsupportable. The fact that some costs of providing suburban service might be considered as solely related, however, hardly leads to the conclusion that all such costs can or should be so regarded or that the Commission acted improperly or contrary to law in not excluding some of these costs here. Many costs of intercity passenger service are also solely related thereto, such as, among others, stations, cars and train operation, and the Commission included these.

[41] Thus far Congress has refused to permit wholesale abandonment, discontinuance or deregulation of essential passenger services, or to require subsidization of such services. See *Alabama Comm'n* v. *Southern Ry.*, 341 U.S. 341.

As discussed, *supra* pp. 40-42, the Commission made findings plainly explaining its reasons for treating an appropriate part of the suburban passenger deficits as a cost of North-South service. The law requires no more. *Minneapolis & St. Louis Ry. Co.* v. *United States*, 361 U.S. 173, 236. And contrary to the district court's view concerning the applicability of this Court's comments in the *Chicago and N.W. R. Co.* case, *supra*, (A. 345-346), this is not a case where the Commission has given controlling weight to passenger deficits and has required carriers in one part of the country to subsidize passenger operations elsewhere. It was upon Southern lines' insistence that the Commission included passenger deficits within fully distributed costs. However, as to anything beyond the inclusion of a proportionate part of passenger deficits as the constant or overhead costs of North-South freight service, the Commission specifically found (A. 79), that nothing "presented here offers a concrete basis on which to find that either group is entitled to a share of the joint rates larger than accruing under the divisions hereinafter prescribed on the basis of relative costs [which] includes allowances for overhead and return, and in our judgment reflects a due proportion of the burden of maintaining the financial integrity and credit of the carriers involved."

Finally, in the preceding discussion we have considered those aspects of the district court's holding which we regard as significantly in error and have dealt with the court's particularized challenges to the

adequacy of the Commission's findings.[42] Although referred to by the district court as illustrations of the Commission's basic error, we submit that, under a proper view of Section 15(6), the Commission's cost findings provided an adequate basis for its prescription of new divisions.[43] A fair reading of the district

---

[42] In a concluding paragraph of its opinion, the district court also stated that the cost data used by the Commission, in addition to the other infirmities which it had found, "[w]ith the passage of each year * * * becomes more and more vulnerable to the charge of staleness," so that a reopening of the proceeding by the Commission to obtain more current data "well might be warranted" (B&O J.S. App. 32a). Considering the time-consuming and complex nature of interterritorial divisions case such as this one, however, the court's suggestion in this regard might result in the Commission's never being able to decide such cases on the basis of sufficiently recent data—thus negating its authority under Section 15(6). *Cf., Baltimore & O. R. Co.* v. *United States,* 298 U.S. 349, 389 (concurring opinion by Mr. Justice Brandeis); and *Interstate Commerce Commission* v. *Jersey City,* 322 U.S. 503, 514-515, 517-518.

[43] With respect to each of the remaining four proposed adjustments of the Southern lines, the Commission's findings, supported by the evidence, adequately expressed its reasons for relying on Rail Form A data.

(1) Gateway Interchange Costs: Southern lines averaged Rail Form A interchange costs in the North and the South and multiplied the difference between the average and Rail Form A figures by the number of cars involved which produced an overstatement in the North and a corresponding understatement in the South of $797,043. Southern lines attempted to justify this adjustment equalizing interchange costs by referring to certain gateways where engine times were equalized and others where equal charges are made under joint facility arrangements. Finding several weaknesses in Southern lines' adjustment, the Commission rejected it (A. 128-129).

(2) Car Costs: Southern lines sought to substitute aver-

court's opinion shows that nothing short of special studies of each work unit of North-South service would, in its view, have sufficed. In their attempt to rewrite that holding, therefore, the Southern lines must fail. And, as shown, *supra*, pp. 35-46, even as to their more limited claim concerning the lack of rea-

---

age car costs for the entire United States in lieu of Rail Form A territorial averages for each group of carriers. Based upon Northern lines' evidence rebutting Southern lines' justification for their adjustment and firmly establishing that Rail Form A costs properly reflected the costs of handling North-South traffic, the Commission rejected the Southern lines' supposititious car costs because "[t]he use of a national average car cost conceals territorial differences in cost which are important in the consideration of divisions between the two involved territories" (A. 101).

(3) Count of Cars Interchanged: Southern lines proposed that all cars transferred between rail and water carriers at ports be considered as originated or terminated rather than some cars being so considered and others as being interchanged. The Commission rejected this proposed adjustment because it was wrong in theory and not supported by adequate underlying data. (A. 94).

(4) Constant Cost on Transit Commodities: A transit commodity is one moving under a single published rate which provides for some kind of storage or processing in transit and covers the movement of the raw material into and the movement of the finished product beyond the transit or processing point. Although pulpwood and wet phophate rock are not single rate transit commodities, Southern lines claimed a tacit transit arrangement existed which would use the rails on movement of the finished product; and, therefore, that portion of constant costs assigned on a ton and ton mile basis to the raw materials which was not recovered from the revenue received should be added to the cost of moving the finished products. The Commission rejected this adjustment by finding that it was "not well founded" to "transfer to interterritorial traffic * * * a part of the constant costs which had been assigned to intraterritorial traffic." (A. 127-128).

soned Commission findings supported by substantial evidence, their argument is without merit. Cost accounting, to be sure, is not an exact science. Here it was not inexpertly done, yet the district court, although lacking the power, substituted its own fact appraisal for that of the Commission. See *Carolina & N.W. Ry. Co.* v. *United States*, 234 F. Supp. 112, 114 (W.D. N.C. 1964), affirmed, 380 U.S. 526. In the *Carolina & N.W.* case, as here, "[w]ith much ingenuity, counsel for Southern has attempted to find questions of law where there are none." And here, as there, this Court should conclude that "[t]he Commission has acted neither capriciously nor arbitrarily, nor has it misinterpreted or misapplied the law."

III.

THE ARGUMENTS OF THE SOUTHERN GOVERNORS' CONFERENCE, ET AL., AS TO THE INVALIDITY OF THE COMMISSION'S ORDER UNDER THE DECISION BELOW, ARE WITHOUT MERIT.

In their Motion to Affirm, the Southern Governors' Conference and the Southeastern Association of Railroad and Utilities Commissioners [44] trace the untenable cost arguments advanced by the Southern railroads although they submitted no cost evidence of their own. The Conferences, however, tend to emphasize their separate and "most important" claim that, even if the Northern lines experience higher costs of service, the Commission must find that such higher costs reflect inherent territorial disadvantages before giv-

[44] Hereinafter referred to as the "Conferences".

ing effect to them in an interterritorial divisions case —otherwise equal factor divisions must be maintained. (Motion to Affirm, pp. 6, 24-26). Their contention rests upon the premise that the Commission made no adequate findings and, therefore, its order would effectively nullify the economic gains realized by the South as a result of *New York* v. *United States*, 331 U.S. 284. The infirmity in this argument lies in the fact that *New York* v. *United States, supra*, is not pertinent to the point they attempt to make.

In the *New York* case, the Commission, acting under Section 3(1), prescribed a uniformity of *class rate* structures between all territories east of the Rocky Mountains in order to eliminate unduly discriminatory rates which were not justified by differences in costs or transportation conditions. Here the reasonableness of the rates was not in issue and the Commission was merely dividing the revenues paid by the shippers in order to provide the carriers with compensation fairly proportionate to the amount and character of the services which they perform. Changes in divisions are essentially matters between the participating carriers and do not affect the rates in any manner. More significantly, the statutory criteria for removing an undue discrimination in rates under Section 3(1) are not the same as adjusting inequitable divisions under Section 15(6); and no judicial construction of Section 15(6) imposes a restriction upon the Commission's use of relative costs in only those cases where inherent territorial disadvantages exist. Moreover, the dire consequences which the Confer-

ences profess to see in the Commission's treatment of the issues in this case are simply not present.[45]

Nevertheless, the Conferences urge that the Commission erred in failing to make adequate findings disposing of their contentions. We submit that the Commission's reports affirmatively show that there is nothing ambiguous or vague about the Commission's findings rejecting their claim.

With respect to the Conferences' argument that there was a failure "to give effect to the overriding demands of the public interest which, they say, require uniformity in these divisions," the Commission found (A. 50-51):

> * * * We recognize that the public interest must be considered and the importance to the public of the transportation services of the railroads is not a sectional concept. We are required under the [Interstate Commerce] Act to preserve an adequate national system of transportation, and must therefore consider the public interest of all concerned. Such a consideration, however, does

[45] As the Commission found (A. 50), the Conferences' contentions were that "a shift of divisions from the Southern lines would result in higher rates on Southern and interterritorial and intraterritorial traffic, and diminution of services, facilities, and equipment. Thus, they forsee the impairment of the ability of Southern shippers to compete in distant markets and diversion to other modes of transportation, thereby impeding the economic growth of the South." Indeed, it is doubtful whether such conjectural consequences would result solely from the Commission's order in question since the estimated $7.9 million reduction in Southern lines' revenues resulting from the new divisions is only 62/100 of 1% of the Southern lines' total revenues in the year tested, without an appropriate adjustment for income taxes (A. 80; A. 776).

> not by any means require a uniformity of divisions, nor can we find an affirmative virtue in it on this record. * * * Moreover, as pointed out in *New England Division Case*, 261 U.S. 184, 191 (1923), Section 15(6) was designed to help the weak "by preventing needed revenue from passing to prosperous connections." Thus, an adherence to uniformity as such, without a careful evaluation of the statutory criteria and the evidence of record, can hardly result in the fixing of just, reasonable, and equitable shares.[46]

With respect to the question of "inherent territorial disadvantages," several paragraphs of the district court's opinion discuss that issue in quixotic fashion (A. 340-343). Pointing out it was strenuously urged that "as a matter of law the Northern railroads cannot have an increase [in divisions] in the absence of inherent territorial advantages," the district court stated that it could not determine whether the Commission had resolved this issue. The court concluded that, if the Commission had resolved this issue, its determination suffered from a lack of findings and substantial evidence, and that, if it had not, the Commission had failed to resolve a material issue. Since

---

[46] Compare these findings with the district court's erroneous characterizations thereof. (A. 351). The cases relied upon by the court do not stand for the proposition cited, *i.e.*, "that the Commission has consistently followed the view that the primary responsibility for meeting the cost and revenue needs of the railroads of any territory lies with the people and the industry of that territory." The overall purpose of Section 15(6), as expressed by this Court in the *New England Divisions Case*, and cited by the Commission above, is to the contrary. In fact, the concept stated here by the Commission is the one consistently followed.

the case was being reversed on other grounds, the lower court stated that upon remand the Commission "should decide and dispose of this contention in accordance with the Administrative Procedure Act." As the Commission pointed out, "In essence, however, other factors being equal, cost differences generally are the product of, and reflect, the inherent advantages and disadvantages that go to make up the respective overall transportation conditions in the two territories" (A. 51). Additionally, the Commission further stated:

> "Indeed, the continued maintenance of divisions which, all other things being equal, do not reflect the relative costs of service would not suggest justice between the parties. Such inequities being manifest here, we are of the opinion that divisions correcting them can result in no unlawful injury to the South" *(ibid.)*.

Thus, the Commission simply determined that, in a divisions case where the carriers were found to be efficient, their services were of equal importance to the public, and where the fairness of existing divisions and the need for revised divisions was assessed on the basis of relative fully distributed costs of service, it was appropriate to conclude that cost differences reflect inherent territorial disadvantages, insofar as that consideration is relevant under Section 15(6). The Commission's discussion establishes that it gave "due consideration" to all the evidence of record and the contentions of the parties with respect thereto[47]

---

[47] The Conferences appear to be urging that since no difference exists in the physical or natural transportation condi-

and made findings which adequately informed the parties of its actions on their claims. Under these circumstances, no other findings were required by the Interstate Commerce Act, the Administrative Procedure Act, or decisions of this Court. See *Minneapolis & St. Louis R. Co.* v. *United States*, 361 U.S. 173, 193-194; and *N.L.R.B.* v. *Wichita Television Corp.*, 277 F.2d 579 (C.A. 10th 1960), cert. denied, 364 U.S. 871.

We submit, that while the Conferences are disappointed that the Commission was unable to accept their unsupported and novel concept that "sectional" rather than "national" interests should control the prescription of fair divisions, such disappointment falls far short of constituting error of law or fact. Their attempts to read a "sectional" concept into the "importance to the public" factor of Section 15(6) by relying on *New York* v. *United States*, *supra*, is foreign and contrary to the objective of maintaining an adequate national transportation system which Congress sought to achieve in the enactment of Section 15(6). See *New England Divisions Case*, 261 U.S. 184 at 189-190 and the National Transportation Policy, 49 U.S.C. preceding Section 1. The bulk of the arguments of the Conferences are directed to judgments that the Commission made, supported by evidence, on questions of transportation economics. See

---

tions in either territory, the higher Northern costs must be attributed to inefficiency, overcapacity or a higher degree of industrialization in the North (Motion to Affirm, pp. 25-35). The Commission, however, considered and rejected these claims (See A. 31-33, 39).

S.E.C. v. *New England Elec. System*, 390 U.S. 209, 211, 213. Even if these arguments raised issues appropriate for judicial review, which they do not, the Conferences have failed to show any error by the Commission that would justify invalidation of its orders.[48]

---

[48] In concluding that "the Commission has special responsibilities in a case of this magnitude" and must make more specific findings "when it departs from its prior finding" that equal factor divisions were appropriate, the district court erred (A. 351). This Court has held that an order of the Commission must be judged on its own merits and not by comparison with alleged inconsistent findings made in other proceedings. *Virginian Ry.* v. *United States*, 272 U.S. 658, 665-666; *Georgia P.S.C.* v. *United States*, 283 U.S. 765, 775. More specifically, this Court has held that it will not set aside a Commission order merely because the Commission has made different decisions during successive stages of the same controversy. *Manufacturers Ry. Co.* v. *United States*, 246 U.S. 457, 482; *Board of Trade* v. *United States*, 314 U.S. 534, 568. Here there is no inconsistency in the basis for initially prescribing equal factor divisions and subsequently prescribing higher divisions for the Northern lines. Both determinations rested on Rail Form A costs of service. In the first proceeding, the costs were found equal and, in the second, Northern costs were found to be higher. See *American Trucking* v. *A., T. & S. F. R. Co.*, 387 U.S. 397 at 416.

CONCLUSION

For the reasons stated, it is respectfully submitted that the judgment of the district court should be reversed.

Respectfully submitted.

ON APPEAL FROM THE UNITED STATES DISTRICT COURT FOR THE EASTERN DISTRICT OF LOUISIANA, NEW ORLEANS DIVISION

BRIEF FOR APPELLEES SOUTHERN GOVERNORS' CONFERENCE ET AL.

QUESTIONS PRESENTED

The United States District Court for the Eastern District of Louisiana set aside two orders of the Interstate Commerce Commission which would have abandoned the basis of equality in dividing North-South freight revenues and substituted a basis under which the Northern railroads would receive a share of those revenues disproportionately larger than their share of the services performed in handling that freight. The district court's decision was based upon the fact that the Com-

mission's action was not supported by reasoned findings or substantial evidence. The questions presented by these appeals are:

1. Whether the district court invaded the province of the Interstate Commerce Commission in setting aside the orders of the Commission prescribing inflated divisions for the Northern railroads on the ground that such orders were based upon cost conclusions that were not supported by reasoned findings and substantial evidence as required by the Administrative Procedure Act?

2. Whether the district court properly concluded that the Commission had not acted lawfully in prescribing an inflation in the divisions of the Northern railroads on the basis of territorial average costs, without either findings or evidence to support the premise upon which that action rested — that is, that such costs are the product of and reflect inherent territorial disadvantages from which the North suffers as compared to the South?

3. Whether the district court properly concluded that the Commission cannot lawfully impose the burden of the higher transportation costs on one section of the country upon another section, even if such costs reflect inherent differences between the two sections, without findings as to whether the section being subsidized can support its own transportation system and whether the section being called upon for such subsidy can afford to provide it without undue harm to its economy?

STATEMENT

Twenty-one years ago, this Court handed down its historic decision in *New York v. United States*, 331 U.S. 284 (1947), upholding an order of the Interstate

Commerce Commission which struck down as unlawfully discriminatory the basic railroad class rate structure that had impeded the growth of the South since before the turn of the century. Prior to that case, railroad rates had consistently been higher in the South than in the North, and Southern shippers had been compelled to pay substantially higher charges to reach Northern markets than Northern shippers were paying to reach Southern markets, even where the distances involved were the same. The purported justification for this rate discrimination, which both the Commission and this Court rejected, was that the North has "natural advantages" over other sections of the country — such as a heavier "concentration of population" and "the preponderance of the nation's total natural resource of energy supply" — which made it "the logical location" for many industries (331 U.S. at 314). Because of these "natural advantages," it was contended that the North was entitled to lower rates than the South for the same amount and kind of rail service.

In rejecting this proffered justification for a discriminatory class rate structure, this Court acknowledged that the North did indeed enjoy certain immense advantages over other sections of the country. But it agreed with the Commission that these advantages were as much an effect of, as a cause for, the discriminatory rate structure (331 U.S. at 315):

> "... It is sufficient at this point to say that the record makes out a strong case for the inference that natural disadvantages alone are not responsible for the retarded development of the South and the West, that the discriminatory rate structure has also played a part. How much a part cannot be determined, for every effect is the result of many factors. But the inference of prejudice from the dis-

> criminatory rate structure is irresistible. If this discriminatory rate structure is not justified by territorial conditions, then its continued maintenance preserves not the natural advantages of one region but man-made trade barriers which have been imposed upon the country. . . ."

Hence, the Court rejected the suggestion that the advantages of the North were a justification for discrimination against the South, and it ordered that discrimination removed by putting into effect a uniform class rate structure. This was finally done in 1952, and for the first time in this century, the South enjoyed a position of equality with the North with respect to the cost of rail transportation.

Although the decision in *New York* v. *United States* had made it clear that there were no inherent differences in transportation conditions in the North and South, the Northern railroads refused to accept equality with the South. The Northern States having failed to convince the Court that the North was entitled to lower rates because of " natural advantages," the Northern railroads decided to pursue their aim of obtaining a preference for the North through precisely the opposite strategy — by seeking inflated divisions from North-South freight traffic to offset claimed Northern *disadvantages*.*

*In their Brief opposing our Motion to Affirm in this case, the Northern railroads took exception to this characterization of the strategy which they have pursued in these cases, claiming that it charges them with being "*motivated* by a purpose 'to keep the South in a permanent position of economic inferiority' " (Appellants' Brief Opposing Motion to Affirm, p. 13). (Emphasis added.) No such charge is made or intended here, for we are concerned with the effect of the Northern railroads' strategy, not its motivation. We do not deny that "The Northern lines accepted the Commission's decision in the *Class Rates* case" *(ibid.)* and the increase in their revenues which went along with it, nor do we challenge their implicit suggestion that their sole motivation throughout these cases has been their own financial aggrandizement. We only point out that the overall strategy pursued by all of the Northern interests has been formulated without regard to its effect upon the South, and that this strategy, if successful, would greatly harm the South.

During the period following the affirmance of the Commission's order in the *Class Rates* case and prior to the issuance of the orders of the Commission which are the subject of this litigation, revenues from North-South freight traffic were divided on an equal-factor basis — that is, both the Northern and the Southern railroads received a share of the revenues from that traffic based directly upon the amount of service they performed in handling it. This equal-factor basis of divisions was prescribed by the Commission itself to implement the principle of uniformity announced in the *Class Rates* case. *Official-Southern Divisions*, 287 I.C.C. 497, 523 (1953). Under this basis, each group of railroads received an identical share of the joint rate on any shipment involving an equal haul in each territory. Where one group of railroads performed more service than the other, that group received a larger share of the revenues, but the difference in divisions was directly related to the amount of service performed.

In 1956, however, only four years after the uniform class rate structure was put into effect, the Northern railroads filed a petition before the Interstate Commerce Commission claiming that they are entitled to *more* than an equal share of the North-South freight revenues based upon the amount of service they perform because the costs of performing rail service are higher in the North than in the South. They asked the Commission to prescribe a basis of divisions with inflated Northern factors which would have accorded them more than the Southern railroads for each unit of rail service performed.

As representatives of the interests of the people of the South, the Southern Governors' Conference and the Southeastern Association of Railroad and Utilities Commissioners intervened in the proceedings before the Com-

mission. Our participation in these proceedings was not designed to secure any special favor for the Southern public or for the Southern railroads. Quite the contrary, we took the position that all sections of the country should be treated *equally* — that, except where justified by the most imperative of special circumstances, each section should bear the costs of its own transportation system.

The Northern railroads' petition seeking an inflation in their divisions on the basis of claimed higher Northern costs raised two distinct groups of issues, each of which was thoroughly contested in the proceedings before the Commission. The first group of issues, to which most of the evidence and argument of the Southern railroads was directed, was whether costs on North-South freight traffic are actually higher in the North, as the Northern railroads asserted, for the same amount and kind of rail service. The Southern railroads sought to show that the claim of higher Northern costs was based entirely upon *territorial average costs* that did not measure the costs of performing rail services of the same amount and kind in both territories, which, of course, is the only relevant comparison since North-South freight traffic is, by definition, the same traffic in both territories. We joined in and supported the position of the Southern railroads on this issue.

The second, and by far the more important group of issues from the standpoint of these appellees, related to the question of whether, even assuming the Northern railroads' claim of higher costs to be valid, the Commission should prescribe an inflated basis of divisions to reflect such cost percentages. Our position was that the Commission should not force the railroads, and hence, indirectly the public, of one section of the country to subsidize the transportation system of another section, without some showing of special circumstances that

would justify and require shifting the burden of one section to another.

On February 3, 1965, and May 18, 1965, the Commission issued its orders in this case substantially granting the relief prayed for by the Northern railroads in their petition. The Commission's orders inflated the Northern railroads' divisions so that they receive, on the average, 17 percent more than the Southern railroads for the same amount and kind of service. These court proceedings were instituted to review the lawfulness of the Commission's prescription of this inflation.

The district court proceedings revolved principally about the question of whether the Commission's reports lawfully resolved the issues which had been presented to it. In granting the Northern railroads' request for an inflated basis of divisions, the Commission had discussed at length the contention that territorial average costs did not measure the costs of handling North-South freight traffic. But it had rejected that contention largely on the ground that there was no alternative to using territorial average costs, since no other cost data were available to it which had been prepared on a comparable basis in both territories. Moreover, the Commission had virtually ignored our contention that the North's divisions should not be inflated even if their costs of handling North-South traffic were somewhat higher than the South's. On this point, the Commission had said that "an adherence to uniformity as such, without a careful evaluation of the statutory criteria and the evidence of record" would not be proper (325 I.C.C. at 27; A.51). But the Commission had nowhere attempted to evaluate the evidence and arguments which we advanced to support a continuation of the principle of uniformity.

The district court found legal defects in the Commission's treatment of both these aspects of the case. It first

pointed out that the Commission's use of territorial average costs was not supported by reasoned findings or substantial evidence as required by the Administrative Procedure Act (A. 349):

> "The Commission stated its exclusive standard to be the relevant cost of handling the specific freight traffic to which the divisions apply. We are persuaded that the order is not based on substantial evidence nor supported by reasoned findings within the meaning of Sections 8(b) and 10(e) of the Administrative Procedure Act because the use of territorial averages accounting for the Northern inflation has not been supported with findings of evidence relating any such inflation to the North-South Freight traffic."

The district court then went on to observe that the Commission had failed to follow similar statutory requirements in dealing with our contention that bare differences in cost, even if properly found to exist, should not automatically be reflected in interterritorial divisions (A. 351):

> "[F]or many years prior to this case the Commission has consistently followed the view that the primary responsibility for meeting the cost and revenue needs of the railroads of any territory lies with the people and the industry of that territory. [citing cases] In this very case, prior to re-opening, the Commission held that the primary division of revenues accruing from this traffic were to be made on an equal-factor scale. We recognize that the Commission is not perpetually bound by their 1953 holding, but *we do believe that the Commission has special responsibilities in a case of this magnitude when it departs from* its prior finding . . ." (Emphasis added.)

Accordingly, the district court held that "upon remand, the Commission should decide and dispose of this contention in accordance with the Administrative Procedure Act" (A. 343). These appeals followed.

SUMMARY OF ARGUMENT

I.

The Commission's order granting an inflation in the divisions of the Northern railroads at the expense of the South was explicitly and solely based on the premise that Northern costs of handling North-South traffic were higher than Southern costs. However, in reaching this conclusion, the Commission relied upon unadjusted territorial average costs to measure certain critically important service factors which are performed in the course of hauling North-South traffic. This action of the Commission was contrary to law. The evidence in this case establishes conclusively that territorial averages do not measure the relative costs of the Northern and Southern railroads in handling North-South freight traffic. Indeed, the evidence shows that the use of such averages is inherently unfair to the South, since the territorial averages are higher in the North because the North is the beneficiary of a more advanced state of industrialization and economic development than the South. The North's greater output of manufactured goods, which requires special cars and special handling, and its need for such other expensive services as commuter passenger service, necessarily means that its average cost of handling all traffic will be higher for reasons that have nothing whatever to do with the costs of handling North-South traffic, which by definition is the same traffic in both territories. To use territorial averages to establish the proper relationship between the

North and the South in this *Divisions* case is to compel the South to subsidize the higher costs of handling traffic with which it has no contact and from which, therefore, it derives no benefit. The district court was plainly correct in holding that the Commission could not use territorial averages without some affirmative evidence that they actually measure the relative costs of handling North-South freight traffic.

II.

The district court was also correct in holding that the Commission had not dealt lawfully with the basic contention of the Southern Governors' Conference and the Southeastern Association of Railroad and Utilities Commissioners in this case.

Based on this Court's historic decision in *New York* v. *United States*, 331 U.S. 284 (1947), which sustained a Commission order establishing territorial equality in class rates between the North and South, we contended before the Commission that unequal divisions ought not be prescribed even on the basis of relative costs unless the higher costs of the preferred territory were found to be the product of inherent territorial disadvantages. As we read the Commission's report, it agreed that under the standard of the *New York* case, it could grant the Northern railroads inflated divisions only if it found that the North suffers from inherent territorial disadvantages. Hence, it purported to apply this test, holding that the cost differences between the North and South "*are* the product of, and reflect, the inherent advantages and disadvantages in the two territories" (325 I.C.C. at 28; A. 51). (Emphasis added.)

Commission counsel apparently interpret the Commission's report in the same way and seek to defend the

holding that the North suffers from inherent disadvantages. However, they cite neither findings in the Commission's report nor evidence in the record to support such a holding, and, in fact, there are no such findings or evidence. Moreover, the Commission's holding of inherent Northern disadvantages is directly contradicted by evidence that the Northern railroads presently seek through various mergers and consolidations to eliminate the non-inherent costs associated with overcapacity and wasteful duplication of facilities. The Commission itself acknowledged that waste is being eliminated from the Northern rail system, but it persisted in prescribing divisions reflecting costs including such waste until these Northern mergers are actually consummated and merger savings realized.

Throughout these proceedings, the Northern railroads have refused to defend the Commission's finding that the North suffers from inherent disadvantages, claiming instead that the Commission was merely commenting upon our contention. In these circumstances, the district court was uncertain whether the Commission had in fact resolved the issue of whether a finding of inherent disadvantage was a necessary prerequisite to a divisions inflation. The court observed that whether the Commission's statement is regarded as a finding or a comment, it could not lawfully support the Commission's action here, since the Commission had either failed to resolve a fundamental issue before it or had done so without reasoned findings or evidence. Accordingly, the district court directed the Commission to dispose of this issue on remand in accordance with the provisions of 8(b) of the Administrative Procedure Act.

III.

The district court also properly held that the Commission had not lawfully justified its abandonment of

the principle of uniformity, even apart from the question of whether the North suffers from any inherent disadvantages. A central question before the Commission was whether, even if the North's costs are unavoidably higher than those in the South, the South should be required to subsidize any part of such costs. In the proceedings before the Commission, we contended that it should not, relying upon the Commission's long established policy that each territory is primarily responsible for bearing its own transportation costs. We pointed to the absence of any evidence that the South was in a better position than the North to bear these supposedly higher Northern transportation costs.

The evidence indicated that the imposition of this Northern cost burden on the South would impede Southern efforts to attain economic and industrial parity with the North. Accordingly, we urged that any higher Northern costs found to be unavoidably incurred be met with rate increases within the North instead of divisional preferences as against the South. The Commission completely ignored this whole issue, making no ruling at all upon a specific exception presented to it on the point. The district court properly viewed this as erroneous. While recognizing that the Commission was not precluded from altering its previous policy, the court also correctly held that the Commission had failed to explain either its departure from equal-factor divisions or its abandonment of the principle that each territory must bear the primary responsibility for meeting the cost and revenue needs of the railroads which serve that territory.

ARGUMENT

The dominant technique of both of the appellants' briefs in this case is to treat the case as though it is a

mere squabble among railroads with no substantial significance from the standpoint of the public interest. Whether this technique represents a failure to comprehend the true importance of this case, or simply a strategy of submerging troublesome issues with which the appellants cannot effectively deal, we offer no opinion. Whatever may be the underlying reason for appellants' approach to the case, however, it is imperative that the impression they create be dispelled.

This case is of vital importance to the South and, indeed, to the entire country. At stake is nothing less than the question of whether there will be a free economy in this country, unhampered by artificial trade barriers which would prevent the free flow of transportation resources from one section of the country to another. The principle of uniformity in railroad rates and divisions guarantees a free flow of transportation resources. Differing levels of rates and inflated systems of divisions inevitably create barriers to free trade.

As the least prosperous section of the country, the South is vitally interested in the maintenance of freedom in the economy for, without it, the South may be walled into a position of permanent inferiority. However, although appellants contend otherwise (I.C.C. Brief p. 53), the principle of uniformity in rates and divisions is in no sense "sectional," for it guarantees every section of the country equal treatment. Thus, the principle not only offers a way to economic equality for those sections of the country that are currently lagging behind, but it also guarantees other sections that they will not be relegated to such inferior status.

In the final analysis, the principle of uniformity is designed to permit industry to come to people who need

work instead of requiring people to seek out industry. It is common knowledge that one of the major problems in this country has been the emigration of large numbers of people from the South. This has hurt the South by depriving it of its human resources while only creating problems of adjustment in other sections of the country. We believe that a part of the cause for this situation has been the discrimination against the South in matters as vital as railroad rates, which was only ended in 1952. This case would re-impose that discrimination in another form, for it would re-institute the very kind of barriers that have prevented a free flow of industry to the South with its ample supply of labor. This could only mean that the Southern labor force would again be compelled to seek out industry.

We recognize, of course, that these sorts of economic considerations are for the Commission, not for this Court. But that is precisely the problem — the Commission has totally ignored the economic ramifications of its action, treating the case as an intra-industry dispute. We urge the Court to take cognizance of the real issues in this case and to determine whether the Commission has resolved those issues in accordance with the Administrative Procedure Act. We submit that it has not.

I. THE DISTRICT COURT CORRECTLY SET ASIDE THE COMMISSION'S COST FINDINGS AS ARBITRARY AND UNSUPPORTED BY SUBSTANTIAL EVIDENCE.

In order to avoid repetition, we shall not restate here the many points made by the Southern railroads in their Brief in defending the district court's decision setting aside the Commission's orders because of legal defects in

the cost conclusions upon which those orders were based. Nor shall we discuss in detail each of the various arguments advanced by the appellants in attacking this aspect of the district court's holding, which are also dealt with in the Southern railroads' Brief. We are fully in agreement with the position taken by the Southern railroads that territorial average costs cannot conceivably be used on this record as a measure of the costs of handling North-South freight traffic. The record shows uncontroverted differences between North-South freight traffic and territorial average traffic in both those sections of the country with respect to each of the cost elements upon which the Northern railroads' inflation is based. In the face of these differences, the Commission's acceptance of territorial averages to measure the costs of North-South traffic was grossly arbitrary. The record does not show what the relative costs of handling North-South traffic actually are. But the district court was clearly correct in holding that this was the responsibility of the Northern railroads, as proponents of an inflation in their divisions, and of the Commission, as the agency charged with administering the Interstate Commerce Act consistently with the public interest. The record being clear that territorial averages do not measure the costs of North-South freight traffic, evidence of those costs should have been obtained.

We do think it necessary, however, to devote some attention to an argument advanced by appellants which bears directly upon the public interest aspects of the issues presented here — namely, Commission counsel's contention that there is more fairness in cost determinations based upon Rail Form A territorial average costs than there would be in determinations based upon special studies, simply because "Rail Form A data is readily available and does not include the biases which special

studies conducted by the contesting parties might understandably reflect" (I.C.C. Brief, p. 20). We think that this argument is not only fundamentally unsound, but that it carries the seeds of unfairness which, if ever sown, might permanently deprive the South of an opportunity to achieve economic equality with the rest of the country. For the truth is that Rail Form A averages are themselves biased in ways which inevitably work to the disadvantage of the South in interterritorial cases of this kind.

The single most important fact about territorial average costs is that these costs tend to vary directly with the degree of industrialization in the areas served by the railroads for which costs are being computed — that is, the greater the degree of industrialization in any area, the higher the territorial average costs of the railroads serving that area. The reason for this correlation between territorial average costs and the degree of industrialization in an area is that, with few exceptions, it costs considerably more to handle manufactured goods than to handle raw materials. Special equipment must be used to handle many manufactured articles — equipment which is more expensive, which usually requires greater maintenance, and which almost invariably has a much higher than average empty return ratio because it is not suitable for any return haul. Raw materials, on the other hand, usually move in the least expensive equipment in multi-carload quantities which permit a considerable saving in switching expense per car. Moreover, a high degree of industrialization of an area also often forces the railroads serving that area to perform other expensive services, such as commuter passenger service, which increase the Rail Form A average costs of railroads serving the industrialized territory.

The railroads serving the Northeastern portion of the

United States handle far more manufactured traffic than any other group of railroads in the country. The concentration of basic industry, such as iron and steel, in the Northeast is well known. But the dominance of that section of the country is even greater with respect to the manufacture of durable consumer goods, such as automobiles. Nearly all of the automobile parts used throughout the country are manufactured in the North. Hence, there is a very heavy movement of this important traffic both within the North and between the North and other sections of the country in which the Southern railroads do not participate. The South, on the other hand, is a deficit area with respect to most manufactured goods, so the movement of such goods within the South in which the Northern railroads do not participate is much more limited.

The result of this substantial difference in the degree of industrialization and in the amount of manufactured traffic moving in intrateritorial freight traffic in the North and in the South is that the Rail Form A average costs of the Northern railroads are the highest of any railroads in the country, and the average costs of the railroads serving the South are the lowest. (The Western railroads, serving an area less industrialized than the Northeast but more industrialized than the South, show average rail costs precisely in line with that degree of industrialization.) The following table* graphically depicts this situation:

	Per Capita Value Added by Manufacture (1956)	*Rail Form A Territorial Average Costs (1956)*
Official Territory	229	122
Western Territory	118	115
Southern Territory	100	100

*Table based upon data set forth at A. 722 and costs constructed from the Commission's Statement 2-58, which was used by the Commission here (325 I.C.C. at 24; A. 47). The indexes were constructed by treating Southern figures as 100 and calculating percentage deviations for the North and the West.

This table shows a clear correlation between the degree of territorial industrialization and the Rail Form A average costs of the railroads that serve that territory. Of course, the correlation is not a perfect one, since other factors also influence territorial average costs. In the North, for example, the inflating influence of manufactured traffic is partially offset by the greater amounts of coal traffic handled by the Northern railroads, since coal is one of the cheapest commodities to handle. And in the West, the inflating influence of manufactured traffic is only one of several factors (such as the necessity for crossing mountain ranges) which contribute to the higher cost level of those railroads. However, in each case, it is clear that the degree of industrialization of any section of the country is an important factor influencing the level of the territorial average costs of its railroads.

Since the level of territorial average costs is influenced so greatly by the degree of industrialization of the area served, such average costs do not precisely measure either the actual costs to a single railroad of carrying a single commodity or the relative costs of two groups of railroads in carrying the same commodity or commodities. No commodity will have cost characteristics precisely identical to the theoretical average commodity, even in a single territory; nor will the Rail Form A averages for any two groups of railroads be based upon the same amount and kind of service in both territories. In this case, for example, where the cost issue before the Commission was the relative costs of the Northern and Southern railroads in handling North-South freight traffic — a defined body traffic which by definition consists of the same carloads of freight in both territories — use of average costs derived from the different bodies of traffic moving in each territory to measure the relative costs of handling a movement of the same body of traf-

fic in both territories creates the false impression that Northern costs are substantially higher than Southern costs. This distortion can be corrected only by a careful analysis of the particular cost elements which are shown to be higher in the North because of the territorial averages. If the Commission refuses to make such an analysis, supplemented where necessary by special studies, the inevitable result is that it will conclude that Northern costs are higher on North-South traffic merely because the North is more industrialized than the South. Such an uncritical acceptance of unadjusted territorial average costs would, of course, only tend to perpetuate the very difference in the degree of territorial industrialization which brought about the higher Northern averages in the first place. Plainly, there is nothing at all that is fair about that.

In the final analysis, the real issue in this case is not whether the use of territorial averages to measure the costs of North-South traffic is fair but whether such a technique should be tolerated, despite its patent unfairness, out of considerations of administrative convenience. We submit that considerations of administrative convenience have no place in a case as important as this. Whatever may be the Commission's responsibility to obtain specific cost evidence in a routine rate case, it certainly is no burden upon the Commission to require such evidence where necessary to resolve the issues in a case involving basic economic relations between two sections of the country. Commission counsel's claim that this is inconsistent with the nature and purpose of the Rail Form A cost formula simply reveals a basic misunderstanding of that formula. The Commission's Cost Section was created and Rail Form A devised at the urging of these very appellees to dispel the illusion that the North was entitled to preferential class rates. Rail

Form A was properly applied in that case and accomplished its purpose. But now, by applying the averages produced by the formula to a situation in which such averages have no factual basis, the Commission would use the formula to recreate the same kind of preference with respect to divisions which it was intended to remove with respect to rates. Rail Form A was never intended to have such application. The district court quite properly refused to permit any such blind subjugation of the principle of uniformity.

II. THE COMMISSION VIOLATED THE ADMINISTRATIVE PROCEDURE ACT IN DEALING WITH THE CONTENTION THAT NORTHERN RAIL COSTS ARE NOT AFFECTED BY INHERENT TERRITORIAL DISADVANTAGES.

The district court correctly set aside the Commission's order in this case on the ground that the use of unadjusted territorial averages to measure the costs of handling North-South freight traffic was unsupported by evidence; and was thus contrary to the Administrative Procedure Act. However, in applying the standard of relative costs, the Commission committed further errors, which the district court directed the Commission to remedy upon remand. These errors constitute an independent ground upon which the judgment of the district court should be upheld.

In the proceedings before the Commission, the Southern Governors' Conference and the Southeastern Association of Railroad and Utilities Commissioners contended that even if there are cost differences in handling the relevant traffic, an inflation in the divisions of the

Northern railroads would not be justified unless "such differences are the product of the inherent advantages and disadvantages that go to make up the respective overall transportation conditions of the two territories" (Exceptions to Examiners' Recommended Report and Order, A. 1376). Our contention was based on the principle that neither existing overcapacity in the Northern rail transportation system nor any higher cost factor caused by temporary economic conditions in the North should be artificially perpetuated by casting any part of those costs on the people and economy of another territory. We pointed out that in *New York* v. *United States*, 331 U.S. 284, 315 (1947), affirming the Commission decision in *Class Rate Investigation, 1939*, 262 I.C.C. 447 (1945), this Court rejected the contention that Northern shippers should be granted preferential rate treatment in the absence of any "natural" differences in transportation conditions between the North and other sections of the country.

In the *New York* case, it was conceded that the North did enjoy immense advantages over other sections of the country; however, this Court agreed with the Commission that the Northern advantages were not "natural" or inherent, but were produced by such factors as the rate structure itself, which operated as a "man-made trade barrier" (331 U.S. at 315). In this case, we pointed out that a discriminatory divisions structure, "not justified by territorial conditions," likewise would preserve "man-made trade barriers." By burdening the South with the excess Northern costs, a divisional preference would tend to perpetuate both the existing Northern overcapacity of rail facilities and the different economic conditions now existing in the North and the South. Hence, we contended that in light of the principle announced and applied in the

New York case, the Commission should not, and indeed could not, prescribe an inflation in the Northern railroads' divisions based upon higher Northern costs without first considering the reasons for such costs. In no event would an inflation in divisions be proper unless a finding could be made that the inflation would not perpetuate artificial differences upon which it was based.

The Commission, as we read its decision, agreed with the principle laid down in *New York* v. *United States*—but it then proceeded to hold that this principle had been satisfied in this case because "other factors being equal, cost differences generally are the product of, and reflect, the inherent advantages and disadvantages in the two territories" (325 I.C.C. at 28; A. 51). Having thus held that the Northern cost differences are the product of "inherent disadvantages" rather than "other factors," the Commission prescribed an inflation of 17 percent in the Northern railroads' divisions.

There is no evidence, and there are no reasoned findings, to support either the Commission's premise that the "other factors" which could account for higher Northern costs are "equal" in both territories or its resultant conclusion that higher Northern costs are the product of inherent territorial disadvantages. Throughout these proceedings, the Southern carriers contended that if Northern transportation costs are higher than those in the South, it is because of overcapacity in the Northern railroad system. Costs due to overcapacity are not inherent, as the Northern railroads have themselves admitted by seeking to rid themselves of such excess costs in a series of important control and merger cases. See, e.g. *Chesapeake & Ohio R. Co. — Control — Baltimore*

& Ohio R. Co., 317 I.C.C. 261 (1962); *Norfolk & Western Ry. Co. and New York C. & St. L. R. Co. — Merger*, 324 I.C.C. 1 (1964); *Pennsylvania R. Co. — Merger — New York Central R. Co.* 327 I.C.C. 475 (1966); *Norfolk & Western Ry. Co. — Merger — Chesapeake & Ohio R. Co.*, I.C.C. Finance Docket No. 23832 now pending. The overriding purpose of these rail consolidations has been to eliminate the non-inherent costs which arise out of inefficient and wasteful duplication of facilities.

In the *Penn-Central* case, *Pensylvania R. Co. — Merger — New York Central R. Co.*, 327 I.C.C. 475 (1966), the Commission expressly recognized the existence of overcapacity in the Northern railroad system (327 I.C.C. at 512):

> "The Eastern District has, at this time, an oversupply of rail facilities inasmuch as the total volume of rail traffic in the district does not adequately support the existing railroad plant regardless of how the traffic may be apportioned or diverted from one railroad to another."

This single merger is expected eventually to produce savings in excess of $80 million each year (327 I.C.C. at 501). Other Northern rail consolidations will further trim the present excess Northern costs. The C&O-B&O control arrangement is already producing savings of $44 million a year, and will eventually yield greater savings when these two roads are merged (317 I.C.C. at 277). The N&W-Nickel Plate-Wabash merger was found to produce savings of $29 million a year (324 I.C.C. at 80). The N&W-C&O merger would produce savings of $36 million per year, and this figure would be increased to some $50 million by the inclusion of other railroads. (I.C.C. Finance Docket No. 23832, Exhibits 10 and 11).

The cumulative effect of all these proceedings will be a complete re-structuring of the Northern rail network into two powerful systems, each capable of providing single-line service throughout the North. The inevitable result of this realignment will be, not only a massive elimination of duplication and waste in facilities, but, also, a profound change in traffic patterns to permit a more efficient handling of freight by the two systems. Evidence was offered in the Penn-Central merger case showing that some $179 million a year can be saved from the elimination of unnecessary interchanges within the North (I.C.C. Finance Docket No. 21989, Exhibit FH-5). When all these potential savings are considered, it is plain that there is no inherent reason why Northern costs should be any higher than costs in the South.

The Commission's report and order in this case give no effect at all to the fact that there is substantial overcapacity and waste in the Northern rail system, even though the Commission conceded that Northern overcapacity contributed to Northern costs in a manner that cannot conceivably be related to inherent territorial disadvantages. The Commission permitted costs concededly inflated by such factors to be reflected in higher Northern divisions on the theory that the cost savings to be produced by Northern mergers had not yet been realized and were not precisely ascertainable (325 I.C.C. at 17-18; A. 39):

> "It is true the savings expected from proposed mergers and consolidations are not reflected in the cost studies of record. However, the southern lines themselves have noted that mergers are now going forward in all territories, including the South. If and when such proposed mergers are ultimately approved and finally consummated in both groups the savings produced thereby will be *then* reflected in the respective unit costs." (emphasis supplied.)

Neither of the appellants suggests that this consti-

tutes an adequate disposition of our contention that any higher Northern costs found to exist should be regarded as the product of overcapacity, not inherent disadvantages. Commission counsel simply ignore the Commission's treatment of the issue while the Northern railroads prefer to quote from an order of the Commission directed, not to the question of inherent territorial differences, but to the question of whether evidence should have been considered "concerning the effect of proposed combinations and consolidations of rail carriers in Official Territory upon operating costs and revenue needs of said carriers" (B&O Brief, pp. 60-61). This order of the Commission has no relevance to the issue of inherent territorial differences, nor does it respond to that issue any more satisfactorily than the Commission's report. Our point is, not that merger savings should be treated as available to the carriers before they are realized, or that the Commission should prejudge pending mergers and assume that they will be approved, but that the very fact that such savings can be achieved if overcapacity and waste is eliminated demonstrates that higher Northern costs are not the product of "inherent" disadvantages. Whether or not Northern merger savings are ever realized, there is no reason to charge the South for the present Northern cost of overcapacity.

The force of this reasoning is in no way diminished by the Commission's observation that mergers were also proceeding in the South. For although our rail transportation system may have some degree of overcapacity so that Southern rail costs might also be reduced somewhat by Southern rail consolidations, such savings will not even begin to approach the savings achievable by Northern carriers, such as Penn-Central. Overcapacity in the North is simply far greater than in the South. In fact, the dispersion of industry out of the Northeast and into other territories, including the South, creates an in-

creasing demand for rail service in the South at the same time it reduces demand in the North, with the result that Northern overcapacity can be expected to increase while the Southern excess capacity will likely diminish (as discussed in detail at pp. 30-31, *infra*).

Certainly, the Commission did not find, and on this record could not find, that overcapacity in the North and in the South are equal. Thus, there is no foundation for the Commission's conclusion that "other factors" that might explain cost differences are "equal" in the two territories. Without findings or evidence on that critical point, the Commission's ultimate finding that Northern excess costs are the product of inherent disadvantages is unsupported by reasoned findings and substantial evidence as required by the Administrative Procedure Act (5 U.S.C. §§ 557, 706).*

In the district court, the Northern railroads sought to escape from this legal deficiency by claiming that the Commission's finding was merely a "comment" (B&O Brief, dated August 1, 1966, p. 128). However, the district court's action could not be defended on any such ground, for the Commission's disposition of the issue was plainly defective, however this aspect of its report was viewed. Thus, the district court pointed out (A. 342) that if the Commission's language constituted a finding that the Northern excess costs were the product of inherent disadvantages,

*The Commission's conclusion that cost factors, other than inherent territorial disadvantages, are "equal" in both territories is likewise contradicted by the Northern railroads' claim that their higher costs are caused by higher wage and tax levels (B&O Brief, p. 39, note 14). These higher average wage and tax levels are more than offset by the greater traffic density of the Northern carriers (A. 791). But even if they were not, what is important to note here is that such higher costs would be totally unrelated to inherent territorial disadvantages, since they would be the product of the long standing advantage which the North has maintained in economic and industrial development.

> "then the Commission's conclusion (that higher Northern costs reflect inherent territorial disadvantages) is subject to attack because there are no findings as to what these inherent territorial disadvantages consisted of."

On the other hand, if the Northern railroads were correct, and the language was merely intended as a "comment," then,

> "the Court must consider whether the Commission's failure to resolve the material issue raised with respect to that question can be reconciled with the express requirement of Section 8(b) . . . The Administrative Procedure Act requires findings on material issues of law" *(ibid.)*.

In either case, the Commission's treatment of our contention was contrary to the Administrative Procedure Act. Because of the vagueness in the Commission's language, the district court found it impossible to determine with any certainty just what the Commission had done, so it directed the Commission to clarify and explain its disposition of our contention on remand.

This aspect of the district court's decision is clearly correct. In our view, the Commission's error lay in its holding without evidentiary support that "other factors" which might explain the higher Northern costs found to be applicable to North-South traffic were "equal" and that the Northern higher costs thus reflected inherent Northern territorial disadvantages. Otherwise, the Commission is chargeable with having only "commented," without ruling upon, our principal contention in the proceedings before it. However, the district court was clearly warranted in finding the Commission's language to be vague and in directing the Commission to clarify its meaning on remand. As Mr. Justice Cardozo

once said: "We must know what a decision means before the duty becomes ours to say whether it is right or wrong." *United States* v. *Chicago, M., St.P. & P.R. Co.*, 294 U.S. 499, 511 (1935). Accord: *Secretary of Agriculture* v. *United States*, 347 U.S. 645, 654 (1954); *Railway Labor Executives Ass'n* v. *United States*, 379 U.S. 199, 200 (1964).

Commission counsel continue to take cover in the same vagueness which puzzled the district court. In their Brief, they describe the Commission's position as follows (I.C.C. Brief p. 52):

> "[T]he Commission simply determined that, in a divisions case where the carriers were found to be efficient, their services were of equal importance to the public, and where the fairness of existing divisions and the need for revised divisions was assessed on the basis of relative fully distributed cost of service, *it was appropriate to conclude that* cost differences reflect inherent territorial disadvantages, insofar as that consideration is relevant under Section 15(6)." (Emphasis added.)

Is the conclusion referred to a disposition of our contention? The choice of language seems deliberately vague, but as in the case of the Commission's own language in the report, we can only interpret this as an admission that the decision in this case does rest upon a finding of inherent territorial disadvantages. But if that is so, the finding remains unsupported by evidence. Counsel for the Commission do not even now cite a single piece of evidence which would relate cost differences in the North to inherent territorial disadvantages.

The Northern railroads have maintained a different position. They say that the Commission is not required to follow the principle of *New York* v. *United States*. In their view, cost differences alone are a sufficient basis

for divisions without regard to the causes of the higher costs. They concede that the Commission has not even considered whether the costs upon which it acted were based upon inherent territorial differences and argue that in doing so the Commission was justified because this would require "a tremendous factual inquiry" (B&O Brief, p. 59). Their reasons for taking this position are obvious. The Northern railroads know that their higher costs do not derive from inherent disadvantages. Otherwise, of course, they would not continue so anxiously to seek the benefits that accompany consolidation of rail facilities. Obviously, the Northern railroads cannot simultaneously urge that their high costs are inherent and that they should be permitted to reduce their costs through mergers. Thus, the Northern railroads' position here is the same which they pressed in district court — that the Commission merely "commented" on our contention and actually based its decision upon cost differences in the two territories which may have no connection at all with inherent territorial conditions.

But as the district court pointed out, if that is what the Commission has done, it has failed completely to resolve some of the principal issues before it. Can the Commission prescribe a basis of divisions which prefers one section of the country over another where that preference will tend to perpetuate the very economic differences between those sections upon which it is based? And even if the Commission has such power, under what circumstances should it be exercised? Why should the North, as a railroad rate territory, be entitled to maintain, partly at the expense of the South, a rail transportation system far more extensive than that which the South can afford to build for itself? Why should the South be forced to subsidize the uneconomic conse-

quences of attempting to maintain facilities that are partly unneeded in the North? And why should the people of the entire country be deprived of the benefits that flow from a unified national economy unhampered by artificial barriers that prevent the most efficient allocation of transportation resources?

Ironically, one of the leading causes of Northern overcapacity is that industry which was formerly concentrated almost exclusively in the North is now moving out into other territories, including the South. As the Commission itself found in the *Penn-Central Merger* case (Recommended Report, F.D. 21989, p. 198, adopted as the finding of the Commission, 327 I.C.C. at 481):

> "We believe that one of the primary explanations for this trend [the decline in rail traffic in the North] lies in the changing structure and location of industry in the Eastern District and the nation as a whole or the 'industrial mix'. Historically, the Eastern District has been noted for its heavy industry, and the fact that it has supplied the nation with steel and other basic items which have previously moved by rail from Pittsburgh and other eastern industrial points to the western, northern and southern extremities of the nation. The growth of major population centers throughout the nation, however, which are able to support the necessary high fixed investment of heavy industry has caused a certain degree of 'decentralization' of industry. This, in many instances, has eliminated, or at least restricted, eastern producers from such markets and thereby curtailed the use of rail service to some undocumented extent."

The inflation prescribed in the divisions of the Northern railroads in part because of the costs due to Northern overcapacity would require the South to subsidize excess Northern rail facilities at the expense of investing in its

own rail transportation system. Such a subsidy would blunt the cost stimulus which would encourage the North to make further reductions in inefficiency and overcapacity. But worst of all, it would retard the very economic transformation upon which the South must depend if it is to achieve equality of economic opportunity with the North. For if the Southern railroads are deprived of the revenues necessary to construct new facilities for businesses desiring to move South, and if those revenues are diverted to the Northern railroads thus permitting the maintenance of facilities that would otherwise be uneconomic, the inevitable result will be a strong tendency for business to remain in the North even in instances where all other economic factors indicate that it should move South.

As already noted, the Commission found in the *Class Rates* case that there are no inherent differences in transportation conditions between North and South, and this Court agreed with that conclusion in *New York* v. *United States* (331 U.S. at 315). There is no evidence in this case which would support a contrary view. In the absence of any inherent disadvantages, the question which must be confronted is why one territory should be burdened with any part of the burden of higher costs in another territory — costs which are higher because of the benefits of industrialization and a developed economy, because of a transportation system with excess capacity for providing freight service, and because of great population centers requiring extensive commuter facilities. Preferences in rates or divisions preserve and rigidify these territorial differences, rather than promote their disappearance.

The Northern railroads suggest (B&O Brief, pp. 61-62) that the amount of money involved is too small for us to be much concerned. To support this claim they seek to

compare the revenues involved with gross revenues of the railroads. By doing so, however, they seek to submerge the fact that the shift in revenues represents an inflation ranging up to 45 percent on the traffic to which it applies. Obviously, that is the relevant comparison here, for it is certain to be the primary concern of the Southern railroads when they consider rate levels on traffic moving between the North and the South. Since the Southern economy is vitally dependent upon trade with the North, we must be concerned with any discrimination that is likely to impede that commerce. Moreover, a fundamental question of principle is involved here: whether the South should be compelled to pay *any* amount — no matter how great or small — of higher Northern rail costs that do not reflect inherent territorial disadvantages. Either the South is entitled to equal treatment or it is not. That is the central issue before this Court.

III. THE COMMISSION'S ACTION IN PRESCRIBING AN INFLATION IN THE NORTHERN RAILROADS' DIVISIONS VIOLATES THE ADMINISTRATIVE PROCEDURE ACT EVEN IF ITS CONCLUSION THAT THE NORTH SUFFERS FROM INHERENT TERRITORIAL ADVANTAGES IS ACCEPTED.

These appellees also contended before the Commission that whether or not excess Northern costs were found to be the product of inherent advantages, the imposition of any part of that cost burden on the South would be improper and unjustified unless the North were found to be unable to support its own cost burden. Accordingly, when the Commission's Examiner recommended that the Northern railroads be granted an inflation in their divisions because of supposedly higher costs without such a

finding, we took specific exception to the recommended report on the ground that "the burden of that increase could not properly be imposed upon the Southern public, as it was here, without an effort first to determine whether the North is capable of supporting its own transportation system through rate increases" (A. 1388). The Commission failed to rule on our exception, and failed to make any findings which would support the notion that a part of the Northern cost burden should be borne by the South. This constitutes an independent error supporting the decision of the district court.

The principle that each territory is primarily responsible for carrying its own transportation cost burden has been consistently followed by the Commission for more than thirty years. In *New England Divisions*, 126 I.C.C. 579, 599 (1927), the Commission, speaking through Commissioner Eastman, stated:

> "The dangers in (the) . . . assumption that deficiencies in local earnings must inevitably be made up on interchange business at the expense of connecting lines are obvious. Communities and the roads which serve them might too readily arrive at the conclusion that they are 'unable' to increase local rates and, in disregard of the principle of self-help, unduly rely upon others to carry their burdens."

This principle of primary local responsibility through equality of divisions has since been applied in numerous cases involving the division of interterritorial joint rates, including those accruing on North-South traffic. Equal-factor divisions were prescribed for North-Southwest traffic in *Official-Southwestern Divisions*, 287 I.C.C. 533 (1953), and are still in effect today. Equal factor divisions were also prescribed as to North-Midwest traffic in *Official-Western Trunk Line Divisions*, 316 I.C.C. 351 (1962), the Commission noting that "the common level

of class rates in the two territories argues strongly for a single scale of divisional factors" (316 I.C.C. at 365). And when that scale was set aside as improperly constructed (*Atchison, Topeka & Santa Fe Ry. Co.* v. *United States*, 255 F. Supp. 584 (1965), it was replaced by mutual agreement with another equal-factor scale, which was approved by the Commission in an order dated April 8, 1966. The only traffic other than North-South traffic as to which unequal divisions are now in effect is Midwest-Mountain Pacific traffic. However, since higher rates apply throughout Mountain-Pacific territory, the inflation in the Mountain-Pacific divisions scale amounts simply to an arrangement whereby the railroads of Mountain-Pacific territory can retain the higher rates paid by the people of that territory (*Akron, Canton & Youngstown R. Co., et al.* vs. *Atchison, Topeka & Santa Fe Ry. Co., et al.*, 321 I.C.C. 17, 77 (1963), quoted in *Chicago & N.W. R. Co.* v. *Atchison T.&S.F. Ry. Co.*, 387 U.S. 326, 357-358 (1967)).

The principle of equality in divisions has also been applied in dividing the joint rates accruing on North-South freight traffic. In *Divisions of Rates, Official and Southern Territories*, 234 I.C.C. 175 (1939), the Southern railroads were denied a generally higher basis of divisions, despite the Commission's recognition "that transportation costs on the traffic here considered may properly be considered to be higher in the South" (234 I.C.C. at 189). The Southern railroads were permitted a divisions differential only where higher rate levels prevailed in the South, as a way to retain the higher rates paid by Southern shippers: "Where no such increment is to be found in the rates . . . fair application of the principle demands that the divisions of each group of carriers be on the same basis" (234 I.C.C. at 192-193). Following the Commission's decision in the *Class Rates* case (*Class*

Rates Investigation, 1939, 262 I.C.C. 447 (1945), differences in the rate levels of interterritorial North-South traffic and intraterritorial Northern traffic substantially disappeared. Accordingly, in *Official-Southern Divisions*, 287 I.C.C. 497 (1953), the Commission removed the limited divisions differential in favor of the Southern lines, and prescribed the equal-factor basis of divisions which was in effect until the order now in question.

The Commission's order in this case thus represents a radical departure from the principle which has previously governed the decision of divisions cases.* The South is today the only territory in the country which is required to subsidize the railroads of another territory through divisions preferences unrelated to higher rates in the favored territory.** An essential question in this case is whether the Commission's action in abandoning its previous policy and establishing this preference has

---

*Commission counsel's sole response to this contention is the unreasoned assertion that these cases do not "stand for the proposition . . . 'that the primary responsibility for meeting the cost and revenue needs of the railroads of any territory lies with the people and the industry of that territory'" (I.C.C. Brief, p. 51, note 46). This hardly seems adequate unless Commission counsel expect this Court either to read all these lengthy Commission reports itself in a search of a different explanation or to accept on faith the assertion that the district court misinterpreted the reports.

**Commission counsel's suggestion that Section 15(6) was designed for a purpose contrary to the principle of primary local responsibility (I.C.C. Brief, p. 51, note 46) is as unsound as it is unsupported. Certainly, the *New England Divisions* case, in which Commissioner Eastman announced the principle, does not support counsel's suggestion. In that case, this Court stressed the absolute necessity of putting a part of the burden of New England transportation costs upon other sections of the country, saying (261 U.S. at 192).

> "To have raised the additional revenues needed by the New England lines wholly by raising the rates in New England — particularly when the rates west of the Hudson were raised much less — might have killed New England traffic."

In contrast, no consideration at all has been given to the possibility of raising Northern rates in this case.

been justified as required by law. We submit that it has not been.

The Commission, of course, is not precluded from changing its mind. We do not contend that Section 15(6) forever binds the Commission or the nation's railroads to a system of divisions whereby each territory is primarily responsible for the costs of its own railroad transportation system, although we cannot help but agree with Commissioner Eastman that "[t]he dangers" in any other approach "are obvious" (126 I.C.C. at 599). In any event, abandonment of equality deserves an explanation. The Commission erred in ignoring our exception,* and in refusing to consider the respective capabilities of the North and South to pay for Northern excess rail costs.

Furthermore, the report violates the well-established rule that when an agency departs from previously adopted principles, it must explain and spell out the legal basis for its decision. *Secretary of Agriculture* v. *United States*, 347 U.S. 645, 653 (1954). The Commission in this case offered no explanation for its displacement of the principle of primary local responsibility. As the district court pointed out, such a radical departure from prior Commission policy should have been explained (A. 351). Even now, counsel for the Commission make no effort to explain the departure, nor do they refer to evidence that the North cannot bear its own cost burden, since no such evidence exists.**

The Commission's action in abandoning the principle

*Section 8(b) of the Administrative Procedure Act expressly condemns this aspect of the Commission's action, for it provides: "The record shall show the ruling on each . . . exception presented" (5 U.S.C. §557(c)).

**The Commission's Brief contributes only one footnote (I.C.C. Brief, p. 54, note 48) to this issue, and it makes no mention of the Commission's failure to spell out the reasons for abandoning the principle of primary local responsibility. The Commission's view seems to be that there is no responsibility, "special" or otherwise, to elucidate the basis for its decision here.

of primary local responsibility has especially harsh consequences here, since it permits the claimed higher rail costs of the North to be imposed upon the South. The evidence in this case demonstrates that the North is still by far the most prosperous territory in the United States. In *New York* v. *United States* this Court took specific note of the wide disparity between Northern and Southern economic development. In the two decades that have passed since that decision, little has occurred to alter the relative economic situation in the two territories. Despite an 849 per cent increase shown in "Value Added by Manufacture" in the South between the years 1935 and 1956 (A. 72), the South still contributes only 11.7 per cent of the "Value Added by Manufacture" in the country as a whole. The per capita statistics are to the same effect *(ibid).* In every category shown, the South still lags far behind the North in wealth and in level of economic activity. The Commission itself found that both the freight revenues and the net operating income of the carriers in Northern territory far outstripped those of the Southern railroads (325 I.C.C. at 13-14; A. 33-34), and that there was no such difference between the revenue needs of the Northern and Southern carriers as would justify a divisions preference (325 I.C.C. at 49; A. 79).

The South, of course, has realized gains as a result of the establishment of the principle of uniformity in *New York* v. *United States.* But the orders in this case would effectively nullify those gains. Although the orders here operate *directly* only upon the revenues of the railroads and not upon rates, an inflation in the Northern railroads' divisions on North-South freight traffic will inevitably have an impact not merely upon the Southern railroads' revenues but also upon the transportation system and, consequently the whole economy of the South. Because the earnings of the Southern railroads have consistently

been found by the Commission to be inadequate,* any action which would further reduce those rates of return for the benefit of the Northern railroads would necessarily result either in a diminution of rail services in the South, or in an increase in the rates which Southern shippers must pay for such services, or both.

It is obvious that the Southern railroads cannot spend money for maintenance and expansion of their services unless they have the money to spend. Consequently, if the Southern railroads have no excess revenues to spend for this purpose in their current earnings, a substantial decrease in those earnings would inevitably have an impact upon the railroads' operations.

The only alternative to a substantial diminution in the quality of rail service available to the people of the South would be a substantial increase in rates. Any substantial rate increase would obviously put these shippers at an even more serious disadvantage in their efforts to compete with shippers located closer to the center of population.

The extent of this unfairness becomes even more apparent when it is realized that the Northern railroads'

---

*The Commission has consistently stated in its own proceedings that the rates of return of the Southern railroads are inadequate. In *Increased Freight Rates, 1951*, 284 I.C.C. 589, 612 (1952) the Commission found rates of return, of these railroads to be substandard, even though they were then substantially higher than they have been in recent years, saying:

> "Judged by any standard shown of record, the rates of return earned or prospectively to be earned by the railroads by the districts and regions specified in our former reports in this case, are substandard."

And only last year, in *Increased Freight Rates*, 1967, 329 I.C.C. 854 (1967), the Commission reiterated this finding (329 I.C.C. at 872) in holding that the Southern railroads were entitled to another general freight rate increase designed to generate the revenues necessary to permit them to maintain their current level of service.

primary duty is to serve the competitors of Southern industry. It is common knowledge that most of the buying power of the country is concentrated in the North and that, notwithstanding the substantial geographical disadvantage which must be overcome, industries located in other parts of the country must seek to reach that market. The Commission itself recognized this situation in its report in the *Class Rates* proceeding (262 I.C.C. at 696):

> "Official territory is the greatest consuming territory in the country, and is the market that nearly all manufacturers desire to reach, particularly where they have a surplus of their products to sell. In shipping to official territory, manufacturers in the other territories not only have the disadvantage of location, but are subjected to an additional burden in those instances where they must pay class rates on a much higher level than their competitors in official territory. This situation reacts to the disadvantage of manufacturers in the other territories, and to the advantage of those in Official Territory, tends to restrict the growth and expansion of the manufacturers in the other territories, and to some extent, to prevent the establishment of new manufacturing plants in those territories."

Moreover, the alternative of a rate increase is particularly ominous here since revenues lost to the Northern railroads through their inflated divisions might be made up, in part at least, from an increase in intrastate rates within the South — rates which are of vital importance both to the growth of an independent Southern economy and in their effect upon the overall ability of Southern shippers to compete in the markets of the North. Over the protest of some of the appellees (see e.g. *King* v. *United States*, 344 U.S. 254), the Commission has successfully asserted the power under Section 13 of the Interstate Commerce Act to take into account the entire

financial condition of the railroads, rather than restricting itself to those aspects related to intrastate commerce, in passing upon the adequacy of intrastate rates.* Under this rule, any loss of revenues in this interterritorial divisions case may later be used by the Commission as a basis for compelling intrastate rate increases. Hence, in future Section 13 proceedings the very rates of return which the Commission has here depressed to meet the burden of claimed higher transportation costs in the North may have to be augmented by increases in intrastate rates.

The basic unfairness of imposing the burden of higher Northern transportation costs upon the South is apparent where the economy of the South is demonstrably and dramatically weaker than that of the North, as the record here unquestionably shows that of the South to be. The inevitable effect of any divisional structure that accords higher divisions to the Northern railroads would be to improve the rail transportation system of the North at the expense of the Southern public, for any transfer of divisional revenues to meet the needs of the Northern railroads could not fail to have an adverse impact upon rail transportation in the South, either

*The Commission has repeatedly utilized Section 13 orders based upon this theory as a source of additional revenues for the Southern railroads. Indeed, as a result of such proceedings or the threat of such proceedings, intrastate rate increases have been effected in each one of the States represented here during the period covered by the rate of return date set out above. See, e.g., *Louisiana Intrastate Rates and Charges*, 284 I.C.C. 467 (1952); *Alabama Intrastate Express Rates and Charges*, 288 I.C.C. 423 (1953); *Mississippi Intrastate Freight Rates and Charges*, 291 I.C.C. 39 (1953); *Louisiana Intrastate Freight Rates and Charges*, 291 I.C.C. 279 (1954); *North Carolina Intrastate Freight Rates and Charges*, 293 I.C.C. 541 (1954); *Tennessee Intrastate Freight Rates and Charges*, 294 I.C.C. 633 (1955); *South Carolina Intrastate Freight Rates and Charges*, 296 I.C.C. 159 (1955); *Alabama Intrastate Rates and Charges on Coal, Lumber, and Scrap Iron*, 297 I.C.C. 241 (1955); *Lousiana Intrastate Passenger Fares*, 305 I.C.C. 137 (1958); *Louisiana Intrastate Freight Rates and Charges*, 306 I.C.C. (1959).

through increased freight rates or through a diminution in the availability of rail services, facilities and equipment, or both. Consequently, a transfer of divisional revenues to the Northern railroads would bear heavily upon the Southern public regardless of the reasons that might be offered to support it.

The record shows that the Southern people are fighting a long uphill struggle in their efforts to raise their standard of living to that already enjoyed in other parts of the country. In such a situation the South cannot properly be expected to make a disproportionate contribution to the maintenance of the rail system in the North. The South has many needs of its own which must be met, and we are striving mightily to meet them despite the handicap of a still woefully inadequate industrial base. There is simply nothing whatever in the record to justify a further shackling of the efforts of our people by requiring them to subsidize the rail transportation system of the North.

The undisputed facts show no basis for the Commission's action in imposing the burden of the allegedly higher Northern transportation costs upon the Southern people. That action is therefore unlawful under Section 10(e) of the Administrative Procedure Act.

CONCLUSION

When the claims being pressed by the Northern railroads in this case are considered against the background of the historical context out of which they arose, it is plain that what is involved here is simply another effort by Northern interests to obtain preferential treatment in rail transportation charges, without regard to the fact

that the inevitable effect of such preferences, whether they occur in rates or divisions, is to keep the South in a permanent position of economic inferiority. Whether the fashionable justification is inherent Northern disadvantages, as here, or inherent Northern advantages, as in the *Class Rates* case, and whether Northern rail costs are argued to be higher than those in the South or lower, the result is always the same. Thurman Arnold summed it up almost thirty years ago in a speech delivered August 22, 1941 at Hot Springs, Arkansas:

> "The industrial East has been the Mother Country. The South and West have been the colonies. The colonies have furnished the Mother Country with raw material. The Mother Country has been exploiting the colonies by selling them manufactured necessities at artificially controlled prices . . . How this all happened in a complicated process. Big business has treated the West and South primarily as a source of raw materials, not as a place to manufacture and sell finished products at competitive prices.
>
> "This is the age-old principle of colonial empires. It is dictated by the necessity of keeping up dividends in the Mother Country against cheaper local competition in the colonies. The methods of maintaining control of industrial markets in the South and West are based on the power of tightly organized cartels to control supply, transportation and distribution in such a way as to put new competing enterprise in the colonies under a continuing handicap."

In refusing to permit the Interstate Commerce Commission to promote this kind of policy without reasoned findings based upon substantial evidence as required by the Administrative Procedure Act, the district court has done nothing more than to guarantee the South the minimal protections of the law against this threat. The rightful province of the Commission has in no sense been in-

vaded, for the Commission is still free to decide the case as it sees fit so long as it observes legal requirements.

For the foregoing reasons, the judgment of the United States District Court for the Eastern District of Louisana should be affirmed.

Respectfully submitted,

	PAGE
Question Presented	1
Statement	2
Proceedings Before the Commission	3
Proceedings Before the District Court	6
Summary Of Argument	7
Argument	12
I. The District Court Properly Set Aside The Commission's Order Granting An Inflation In The Northern Railroads' Divisions Where That Inflation Was Not Supported By Substantial Evidence Or Reasoned Findings	12
II. Review Of The Commission's Treatment Of Each Of The Specific Items Accounting For The Northern Inflation Reveals A Lack Of Support In Substantial Evidence And Reasoned Findings	30
A. The Commission's Inclusion of Commuter Deficits in the Northern Railroads' Costs is Wholly Unjustified	31
B. The Commission Acted Arbitrarily and Without the Support of Substantial Evidence When It Ascribed 58 Percent Higher Costs to the Northern Railroads for Interchanging Freight Cars at the Territorial Border	43
C. The Commission's Use of Territorial Average Car Costs 32 Percent Higher in the North Violates Both the Administrative Procedure Act and the Interstate Commerce Act	46
D. The Commission's Determination Of Switching Costs Is Not Supported By Reasoned Findings Based Upon Substantial Evidence	54

torial average costs of all traffic carried by the Northern and Southern railroads; and (2) the costs of the North-South freight traffic, which constitute only 6 percent of the total freight traffic of the North and 21 percent of the total freight traffic of the South (A. 795-796). The Commission made it plain that its standard was the costs of the North-South freight traffic (325 I.C.C. at 50; A. 79-80):

> ". . . everything else being substantially equal, the relative costs of the parties *reflecting their respective operations as to this traffic* can properly serve here as a guide for the determination of just, reasonable and equitable divisions."
>
> • • •
>
> ". . . an adjustment in the divisions is required to compensate the respective groups according to their expenditures in the joint effort *of handling this interterritorial traffic.*" (emphasis supplied).

The Commission also stated that "the purpose is to measure the cost of services performed under the line-haul rates to be divided" (325 I.C.C. at 56; A. 89); and that the purpose is to "reflect the costs which are attributable to the traffic at issue" (325 I.C.C. at 26; A. 49-50). The Commission itself thus made it plain that, in using costs as a standard, the relevant costs are those associated with the North-South traffic which produces the revenues being divided. Use of average costs of all traffic, including primarily intraterritorial traffic, would inject revenue needs concepts foreign to the costs of service.

Under the Commission's own standard, the inflation which was accorded the North can be justified only by a showing of higher Northern costs in handling the North-South traffic in issue. The cost evidence relied upon by the Northern railroads was based upon the average costs of all traffic handled within the North and South, coupled with a "train

utilization study" purporting to show that North-South traffic and other traffic reflected in the territorial average were handled in the same trains in the North (A. 541-582). Analysis of the elements of the territorial average costs, however, revealed that for most items of rail freight service, including all of the costs of operating trains, maintaining roadway and stations, and the like, Northern costs are no higher than Southern costs, as measured by the averages relied upon by the Northern railroads. The entire difference between the Northern and Southern costs was accounted for by a relatively few factors (*e.g.*, border point interchanges, car costs, empty return ratios, switching at terminals, commuter deficits) (A. 864-865). The Northern railroads introduced no evidence showing that North-South traffic has characteristics substantially similar to territorial average traffic with respect to these cost elements.

With respect to each of the several elements of territorial average costs which account for the entire difference between Northern and Southern costs, the Southern railroads introduced evidence showing that the higher Northern territorial averages could not be related to the cost of handling North-South traffic. They also proposed adjustments to each such cost element. The Commission criticized and rejected these adjustments proposed by the Southern railroads and, instead, used unadjusted territorial average costs for each of the controverted cost elements that account for the difference between the Northern railroads. However, the Commission did not cite any evidence relating the higher Northern territorial average costs on these elements to the costs of the North-South freight traffic at issue. Nor did it make reasoned findings with respect to the specific contentions advanced by the Southern railroads on the basis of the evidence showing that territorial averages do not measure the relative costs of handling North-South traffic.

PAGE

E. The Commission's Determination of the Empty Return Ratios Applicable to North-South Traffic Is Wholly Unsupported 58

F. The Commission's Resolution of the Issues With Respect to the Count of Cars Interchanged Was Unlawful 65

G. The Commission's Treatment of the Constant Cost of Transit Commodities Was Unlawful.. 67

III. The Commission Has Not Lawfully Justified Its Abandonment Of Uniform Divisions Between Territories Having Uniform Rates 68

On Appeal from the United States District Court for the Eastern District of Louisiana, New Orleans Division

BRIEF FOR SOUTHERN RAILROAD APPELLEES

QUESTION PRESENTED

The Interstate Commerce Commission has ordered that the Northern railroads be given a disproportionate share of the uniform rates on North-South freight traffic. The exclusive basis for this order was that the Northern railroads incur higher costs than the Southern railroads in handling that particular traffic. However, the entire Northern inflation resulted from a few cost elements, as to each of which the Commission used the territorial average costs of all traffic in the respective territories. These averages were not adjusted to measure the relative costs

of the North-South freight traffic constituting only a small fraction of the total traffic. The question presented is whether, on a record in which the higher Northern territorial averages for the several cost elements accounting for the Northern inflation had been challenged as not reflecting the characteristics of the North-South traffic, the district court properly set aside the Commission's order on the ground that there was neither substantial evidence nor reasoned findings relating these higher Northern territorial averages to the North-South freight traffic at issue.

STATEMENT

Prior to the decision of the Commission, the revenues from freight traffic moving between the North and the South were divided on the basis of equality and uniformity. Divisions were made by use of an equal-factor divisional scale, which provided equal compensation for the same amount of service performed by either group of railroads. Thus, for shipments moving the same distance in each territory, the Northern and Southern railroads each received 50 percent of the joint revenue. *Official-Southern Divisions*, 287 I.C.C. 497, 547, 552 (1953).

The establishment of equal-factor divisions followed the Commission's historic decision in *Class Rates Investigation, 1939*, 262 I.C.C. 447 (1945), which was affirmed by this Court in *New York* v. *United States*, 331 U.S. 284 (1947), and which became fully effective in 1952, *Class Rates Investigation, 1939*, 281 I.C.C. 213 (1951). In the *Class Rates* case, the Commission determined that the higher rate levels at that time applicable to the movement of rail freight throughout Southern territory constituted an unlawful discrimination against the South and, accordingly, ordered the discriminatory rate structure replaced with a uniform rate structure applicable throughout the United States east of the Rocky Mountains. The prescrip-

tion of equal-factor divisions of joint rates followed the establishment of rate uniformity in the *Class Rates* case. *Official-Southern Division*, 287 I.C.C. 497, 523 (1953); see also *Official-Southwestern Divisions*, 287 I.C.C. 553, 578 (1953).

Proceedings Before the Commission

The present proceeding began when the Northern railroads filed a petition seeking, as they conceded, "*disproportionate* divisions of a uniform structure of rates" (A. 1543) (emphasis in original). The Commission's order accorded the Northern railroads disproportionate divisions by prescribing divisions calculated from divisional scales in which the scale for the North is substantially higher than the scale for the South. Thus, under the new divisions, for a shipment moving 300 miles in each territory, the Northern divisional factor is 241, whereas the Southern factor is 206 (325 I.C.C. at 51, 82; A. 81, 130), an inflation of 17 percent. The inflation becomes much greater (up to 45 percent) for shorter hauls and somewhat less for longer hauls (*ibid.*).

The inflation in the Northern railroads' divisions granted by the Commission was based exclusively on the Commission's conclusions with respect to cost of service. In considering the standards of Section 15(6) of the Interstate Commerce Act, the Commission found that the Northern and Southern railroads should be considered equally efficient (325 I.C.C. at 18; A. 39), that each group of railroads was of equal importance to the public (325 I.C.C. at 28; A. 51), and that neither group had greater revenue needs than the other (325 I.C.C. at 49; A. 79). Differences in costs were then expressly stated to be the exclusive basis of the Commission's decision (325 I.C.C. at 50; A. 79-80).

The Commission also stated explicitly what costs it relied upon as its standard, distinguishing between: (1) the terri-

Proceedings Before the District Court

The Southern railroads filed this action in the district court to set aside the portion of the Commission's order prescribing an inflation in the divisions of the Northern railroads (A. 6). The three-judge district court (Circuit Judge Wisdom and District Judges Hunter and West) set aside the Commission's order and remanded the case to the Commission. The basis of the district court's decision is summarized in the following portions of its opinion (A. 335, 349-350):

> "Only a relatively few elements of the Northern railroads' average costs are higher than the Southern railroads' costs. It is uncontroverted on this record that most elements of railroad costs (such as operating trains, maintaining roadways, etc.) are no higher in Northern railroads than for the Southern railroads. The inflation in the costs is attributable to a relatively few cost items. These include the cost of commuter operations, the cost of interchanging cars, the ratio of empty to loaded cars, the cost of railroad freight cars, and a few other items. As to each of these controverted items, the Commission relied exclusively on territorial average costs (Rail Form A)."
>
> • • •
>
> "The Commission stated its exclusive standard to be the relevant cost of handling the specific freight traffic to which the divisions apply. We are persuaded that the order is not based on substantial evidence nor supported by reasoned findings within the meaning of Sections 8(b) and 10(e) of the Administrative Procedure Act because the use of territorial averages accounting for the Northern inflation has not been supported with findings or evidence relating any such inflation to the North-South freight traffic.
>
> "What is appropriate in one case may be inappropriate in another. We do not hold that the Commission was required to start from scratch and construct a new divisional scale directly from cost data. We do

find that, having stated its exclusive standard to be the relevant cost of handling the freight traffic to which the divisions apply, the Commission's order is not based on substantial evidence within the meaning of the Administrative Procedure Act. . . .

"With the Commission's expertise in mind, it is our duty to review the record and the conclusions reached, as required by the provisions of the Administrative Procedure Act. As to the sufficiency of the evidence to support the order, it is not the proper function of this Court to substitute its judgment or to weigh evidence. On the other hand, it is our duty to ascertain whether or not the findings and conclusions are supported by substantial evidence."

The district court also observed that compliance with the requirements of the Administrative Procedure Act was especially important in this case in which the outcome "is bound to cut deeply into economic relations on such a scale and when the result involves a departure from an equal divisions formula previously adopted" (A. 355).

The judgment of the district court has been appealed by the Northern railroads (B&O, et al.) and the Interstate Commerce Commission. The United States, the statutory defendant (28 U.S.C. § 2322), did not appeal.

SUMMARY OF ARGUMENT

I. In order to assure effective judicial review of administrative orders, Congress has provided that three-judge district courts shall have the power and the duty to set aside orders of the Interstate Commerce Commission found not to be supported by substantial evidence or reasoned findings. The court below, in performing that statutory duty, reviewed an order of the Commission which abandoned the uniform and equal basis upon which Northern and Southern railroads had been dividing the uniform

rates on North-South freight traffic and substituted divisional factors which are substantially higher for Northern railroads than for Southern railroads.

The exclusive standard adopted by the Commission in this case was the relative costs incurred by Northern and Southern railroads in handling North-South freight traffic at issue. For most elements of costs (including operating trains, maintaining roadway and stations and the like) the average costs were equal in the North and South. As a result, the entire inflation granted to the Northern railroads resulted from the Commission's treatment of a relatively few cost elements (including border interchanges, car costs, empty return ratios, switching and commuter deficits). With respect to each of these several elements that accounted for the entire Northern inflation, the Commission used the territorial average costs of all traffic in the North and in the South rather than the costs of the North-South freight traffic, which constitutes only a small fraction (6 percent) of all traffic in the North and only 21 percent of all traffic in the South.

The Commission's reliance on the higher territorial averages for the cost elements accounting for the entire inflation granted the Northern railroads was not supported by any evidence or reasoned findings relating that inflation to the North-South freight traffic. Since the Commission had adopted the costs of North-South traffic as its exclusive standard, the district court found that the Commission's order was not based upon substantial evidence or reasoned findings as required by Sections 10(e) and 8(b) of the Administrative Procedure Act.

Upon this record, reviewed in light of the standard adopted by the Commission itself, not only was the district court's decision within its power of judicial review but any other decision would have constituted an abdication of

the duty of judicial review established by Congress in the Administrative Procedure Act.

II. The correctness of the district court's holding that the inflation granted the Northern railroads was not supported by substantial evidence or reasoned findings relating any such difference in costs to North-South freight traffic is further shown by analysis of the several cost elements that account for the entire inflation.

The costs attributed by the Commission to the Northern railroads included deficits incurred in providing commuter service in Northern cities. The sole reason given by the Commission for including commuter deficits was that such deficits arise from costs common to freight and passenger service. But the Commission also found as a fact that "many individual items of suburban service" are not common costs at all but are, instead, "solely related" to suburban service (325 I.C.C. at 78; A. 124). The Commission did not justify imputing to the costs of North-South freight service the commuter deficits arising from costs which are solely related to commuter service and which thus have no relation to the costs of North-South freight service.

Appellants' efforts to justify the Commission's inclusion of the entire deficit from Northern commuter operations as an element of freight costs find no support in any finding of the Commission. Appellants' attempted justification rests on concepts of "revenue needs" which the Commission rejected as a basis for decision in this case, and upon a concept of consistency with rate-making—a concept which the Commission did not adopt but which, if adopted, would require uniform divisions of uniform rates rather than an inflation for the North. In recent cases and in reports to Congress, the Commission has articulated a policy *against* burdening freight shippers with deficits from commuter service, and favoring subsidy by the Northern communities

if such services are to be continued. The Commission unlawfully failed to supply any rationalization of its action here in imposing the burden of Northern commuter deficits on Southern railroads and shippers.

The Commission included a separate element in its prescribed cost scales to represent the costs incurred by Northern and Southern railroads in interchanging cars at territorial border points. Based upon territorial averages, this element shows costs 58 percent higher for the North than for the South. The Commission applied these territorial averages to North-South traffic, even though the Northern and Southern railroads are interchanging the *same* cars at the *same* border points and there is no evidence or finding justifying *any* higher costs for the Northern railroads than for the Southern railroads at these interchange points, much less 58 percent higher costs.

Although North-South freight traffic moves in the same cars between the North and the South, the Commission used territorial average car costs which are 32 percent higher for the North. There is no evidence to support any higher costs for the North with respect to the cars used jointly in handling North-South traffic, and the underlying findings of the Commission do not support, but in fact impeach, the prescription of any inflation. Moreover, because the difference in the territorial average costs results from differences in the railroads' car-owning and leasing activities, as contrasted with their function as transportation agencies, the Commission's use of such average costs also violates Section 15(6) of the Interstate Commerce Act, under which the only relevant costs are those incurred in "the service of transportation."

The Commission used the average terminal switching costs for all traffic in each territory in the absence of any evidence relating the higher Northern territorial average costs for all traffic to the relative costs of Northern and

Southern railroads in switching the cars carrying North-South traffic. The Commission rejected the Southern railroads' switching studies as having the "major defect" of being applicable only to the Southern costs of switching North-South traffic and not showing comparable figures for the North (which the Northern railroads declined to study). As the courts have previously held, such treatment of switching costs is untenable.

The Commission applied territorial average empty return ratios to North-South traffic without any evidence that the higher Northern averages were applicable to North-South traffic. And it did so in the face of evidence of record showing that the higher Northern territorial average resulted from traffic characteristics within that territory that had no bearing upon the empty return ratios incurred with respect to North-South traffic. Also, the Commission's use of admittedly inconsistent methods in counting cars improperly inflated the Northern costs. Furthermore, the Commission rejected an adjustment to reflect the full Southern costs of handling essentially transit commodities in North-South traffic on the ground that no comparable adjustment was made for the Northern costs, despite the concession of the Northern railroads that no comparable situation existed in the North.

III. The Commission's departure from its long-standing policy of relating divisions to rate structures, a policy which resulted in uniform divsions of uniform rates in the North and South, has not been justified. Even if the costs applied by the Commission to North-South traffic had been supported by evidence, no reason was given for using the inflation in the Northern costs as a basis for inflating the Northern share of the entire revenue from North-South traffic, which produces a substantial profit over and above the costs incurred in handling that traffic.

IV. There is no merit to the argument made by the Northern railroads that the district court erred in setting aside the Commission's order without reserving jurisdiction where, as here, the Northern railroads did not ask that court to reserve jurisdiction, the procedure followed was in accordance with the express stipulation of the Northern railroads, and re-establishment of uniform divisions is not inequitable to the Northern railroads, which have failed to prove any higher costs in the handling of North-South traffic.

ARGUMENT

I. THE DISTRICT COURT PROPERLY SET ASIDE THE COMMISSION'S ORDER GRANTING AN INFLATION IN THE NORTHERN RAILROADS' DIVISIONS WHERE THAT INFLATION WAS NOT SUPPORTED BY SUBSTANTIAL EVIDENCE OR REASONED FINDINGS.

The action of the Commission challenged in this case is the abandonment of equal and uniform divisions related to the uniform rate structure and the substitution of a new basis under which the divisional scale for the North is substantially higher than the divisional scale for the South.

Although this action of the Commission was expressly based upon its conclusion that the Northern railroads' costs of handling North-South traffic are higher than those of the Southern railroads with respect to a relatively few elements of service, appellants do not attempt to justify the inflation granted to the North by supporting the few specific cost determinations upon which it rests. They prefer, instead, to discuss generally the Commission's undenied discretion and expertise in finding costs and prescribing divisions. But this case does not turn on any such generalities. The specific question presented by this case and decided by the district court is whether the inflation accorded the Northern railroads is supported by substantial evidence and reasoned findings as required by statute.

In Section 10 of the Administrative Procedure Act, Congress provided for effective judicial review of administrative action. Section 10(e) provides: "The reviewing court shall . . . hold unlawful and set aside agency action, findings and conclusions found to be . . . unsupported by substantial evidence" (5 U.S.C. § 706). Congress further provided that all agency decisions "shall include a statement of . . . findings and conclusions, and the reasons or basis therefor, on all material issues of fact, law, or discretion presented on the record" (5 U.S.C. § 557(c)).

Thus, under the statute, it was the duty of the district court to determine whether the Commission's order granting an inflation to the Northern railroads contained reasoned findings which were supported by substantial evidence. *Universal Camera Corp.* v. *N.L.R.B.*, 340 U.S. 474, 487-488 (1951). The district court held that, where the Commission had prescribed divisions "on the basis of the average cost of all traffic for this series of important elements of cost which are higher in the North for reasons that have not been shown to have any relation to the North-South freight traffic here at issue," the Commission's "order is not based on substantial evidence nor supported by reasoned findings within the meaning of Sections 8(b) and 10(e) of the Administrative Procedure Act" (A. 348-349).

The record before the district court compelled this conclusion. The basic issue in the case was whether inflated divisions for the Northern railroads were justified on the basis of relative costs. Both Northern and Southern railroads used the Rail Form A cost formula as a framework for analysis. Of the scores of separate cost elements covered by Rail Form A, the Northern railroads' claim for an inflation depended upon the use of the unadjusted territorial average costs of all traffic for a few elements. Analysis of these several elements did not involve any attack upon Rail Form A as a framework for cost analysis, and the

Commission itself did not reject the Southern railroads' claims on any such basis. Instead, the controversy as to each of the challenged cost elements centered on the question of whether the difference in the territorial averages represented higher Northern costs incurred in handling North-South traffic.

The Southern railroads presented evidence to show that the higher Northern territorial average costs could not be used to justify an inflation with respect to the North-South traffic at issue in this case in light of the physical facts of handling North-South traffic. For example, as more fully described *infra* (pp. 43-46), the Southern railroads showed that North-South traffic moves between the territories in the same cars, and that these cars are interchanged between Northern and Southern railroads at points located on the territorial border under such circumstances that these costs, whatever their dollar amount, are the same for both Northern and Southern railroads. No Northern railroad witness even claimed that these costs were higher for the Northern railroads. Yet the Northern railroads relied upon and the Commission used territorial average interchange costs which are 58 percent higher in the North. Although critical of the Southern railroads' efforts to estimate the dollar amount of the equal costs of interchanging the same cars at the same points, the Commission did not find that the Northern costs for this element of service are in fact higher than Southern costs, but simply used the 58 percent higher territorial average. An unexplained and unjustified reliance upon the territorial average costs for all traffic cannot serve as evidence when the whole issue is whether any difference in the costs, much less the 58 percent difference in the territorial averages, is applicable to North-South traffic.

The Northern railroads did not present evidence even attempting to show how the higher average costs of all traffic could have any relation to the North-South traffic at issue insofar as the elements which accounted for the entire Northern inflation were concerned. The Northern railroads did introduce a "train utilization study" designed to show that North-South traffic moves in the same trains as other traffic (ICC Brief, p. 35 n. 31; B&O Brief, pp. 32, 38). But there is no controversy as to train costs, such as "locomotive maintenance, fuel, train crew costs" (ICC Brief, p. 27), because average train costs are not higher in the North than in the South (A. 864-865). As a result, these costs had nothing to do with the cost elements upon which the inflation prescribed by the Commission rested (as the district court recognized, A. 335). Analysis of train costs merely confirms that the costs of handling North-South traffic are equal in the respective territories.

Appellants' present theory that the "train utilization study" supports the use of territorial averages to measure *all* elements of cost on North-South freight traffic finds no support in the record and is contradicted by the Commission's own decision since, as counsel concede (ICC Brief, p. 8), the Commission itself adjusted the territorial averages in several separate respects. Nowhere did the Commission itself rely upon generalizations about train costs or the "train utilization study" as justifying use of unadjusted territorial averages to measure the several elements, including gateway interchanges, car costs, empty return ratios, and commuter deficits, which actually account for the inflation granted the Northern railroads but which have nothing whatever to do with "train utilization".[1]

---

[1] In citing the conclusions of the Northern railroads' witness who introduced the "train utilization study" (ICC Brief, p. 35), Commission counsel fail to indicate that this same witness confined

As to these disputed cost elements, the Northern railroads simply rested upon the territorial averages themselves. Thus, unlike the usual case in which the Commission decides on the basis of conflicting evidence whether or not the territorial average properly measures the cost of a particular service performed on the traffic involved, the record here was devoid of evidence justifying the application of higher Northern territorial average costs to North-South traffic with respect to the cost elements that accounted for the entire Northern inflation. Upon such a record, the district court properly concluded that the Northern inflation prescribed by the Commission was not supported by substantial evidence or reasoned findings.

Such a holding does not, as appellants would have this Court believe, condemn Rail Form A or render it unwork-

---

his conclusion to train operations and admitted that he knew nothing about empty return ratios or the other cost elements that cause the inflation in the Northern costs (A. 986).

The Northern railroads refer to Northern wage levels, which they say are higher than those in the South (B&O Brief, p. 39, n. 14). The cost of labor was not one of the elements of Rail Form A costs relied upon by the Commission to show a generally higher Northern cost level. Nor could the Commission have relied upon labor costs because wages in the North, which are only 2 per cent higher than in the South and which occur in the "executive and professional" categories (A. 941, 1035-1036), are offset by the far greater traffic density on the lines of the Northern railroads than is enjoyed on the lines of the railroads operating in the South (A. 791). Whatever the factors affecting the levels of these costs in the several territories, their net effect is that the costs *per unit* of traffic are not higher in the North except for the several elements of territorial average costs referred to in the text that account for the entire Northern inflation.

able. All that the district court required, and the least that it could have required, was that with respect to the several cost elements which produced the entire Northern inflation, there be evidence relating the difference in the territorial average costs to the North-South traffic at issue (A. 348-349):

> "Defendants argue that the question of whether or not Rail Form A was representative, and whether it should have been supplemented are questions of fact, the determination of which is within the competence of the Commission. We start, of course, from the premise that on the subject of transport economics, the Commission's judgment is entitled to great weight. The appraisal of cost figures is itself a task for experts and, unlike a problem in mathematics, it cannot be precisely right or wrong. We know, too, that the Rail Form A cost formula was devised for the express purpose of measuring territorial average costs and has been widely used as an acceptable means of comparing relative transportation costs. It represents a comprehensive study entitled to full weight when the issue is one that it was designed to cover. However, this formula was designed to measure the cost of handling all the traffic in two or more territories, and cannot appropriately be accepted *without further evidence* for mechanical application to particular segments of traffic in a divisions case. The 'many minute calculations' contained in Rail Form A were used to measure the overall average costs and certainly produce a misleading appearance of exactitude when applied mechanically to measure a specific cost of a specific body of traffic such as that involved here. Evidence of overall territorial averages surely can and should be considered, *but as to specific important cost items the Commission should not wholly and exclusively rely on such averages. United States* v. *Abilene and Southern R.R. Co.*, 265 U.S. 274; *Atchison, Topeka and Santa*

Fe Ry. Co. v. *United States*, 225 F. Supp. 584." (Emphasis supplied).[2]

It is thus apparent that the district court did not hold or even suggest that the Commission should not follow the Rail Form A method of analyzing transportation costs by breaking down transportation services into the particular elements of cost. What the district court did hold was that in using this method of cost determination, the Commission could not simply assume, without evidence, that a higher Northern territorial average for a particular element of cost necessarily meant that the Northern railroads incurred similarly higher costs on North-South traffic.

It is simply arbitrary to assume, without any supporting evidence, and in the face of the undisputed physical facts, that the average costs of 100 percent of the Northern traffic and 100 percent of the Southern traffic measure, as to all elements of cost, the relative costs of handling North-South traffic, which represents only 6 percent of the total traffic in the North and 21 percent of the total traffic in the South (A. 795-796). The average costs of the Northern railroads are obviously governed by the costs of the 94 percent of the total traffic which is not North-South traffic. Indeed, nearly 80 percent of the total Northern traffic is intraterritorial (A. 908), and it is that traffic, handled entirely within the North, that has the dominant

---

[2] In *United States* v. *Abilene and Southern R. Co.*, 265 U.S. 274, 291 (1924), Mr. Justice Brandeis emphasized in a divisions case that "averages are apt to be misleading." In *Atchison, T. & S. F. Ry. Co.* v. *United States*, 225 F.Supp. 584, 606-607 (D. Colo. 1964), the three-judge court (opinion by Judge Doyle) set aside a Commission order prescribing divisions where the Commission had relied upon misleading averages without the reasoned findings required by the Administrative Procedure Act. Neither the Commission nor the United States appealed that decision.

influence on the Northern average. A higher Northern average cost may well mean that the cost of handling intraterritorial traffic is higher than the cost of handling the *different* intraterritorial traffic in the South. But it is arbitrary to assume, without further evidence, that territorial averages alone prove that the Northern costs are higher than the costs of the Southern railroads in their joint handling of the *same* traffic between the North and the South.[3] As the Court held in setting aside an order of the Commission in *I.C.C.* v. *Mechling*, 330 U.S. 567, 583 (1947): "The unsifted averages put forward by the Commission do not measure the allegedly greater costs [of the carriers] nor indeed show they exist."

The ruling of the district court that the several territorial average cost elements which account for the entire Northern inflation could not be sustained without any evidence relating the differences in the territorial average cost to North-South traffic is the minimum ruling that the court could have made consistent with the statutory requirement that Commission orders be supported by substantial evidence. Contrary to the contentions of Commission counsel that the district court ruling will somehow frustrate the Commission's administration of divisions and rate cases (ICC Brief, p. 33, n. 27), the Commission itself has imposed a far more rigorous and all-inclusive standard. In *Increased Freight Rates, 1967*, 332 I.C.C. 280 (1968), the Commission held on three separate occasions that territorial average costs have little value in determining the costs of handling particular segments of traffic. For example, the Commission held: "Territorial costs are not necessarily

---

[3] The question is not whether any averages may be used. Rather the question is whether the relative costs of handling two bodies of traffic (all traffic in each of the two territories) may be used, without any supporting evidence, to measure the relative costs of handling a single and different body of traffic (North-South traffic).

determinative of the costs of particular movements. See *Louisville & N. R. Co.* v. *Akron, C. & Y. R. Co.*, 309 I.C.C. 491 [a divisions case involving one Southern railroad and all Northern railroads]" (332 I.C.C. at 294). The Commission also ruled that "territorial average costs are entitled to little weight in determining the costs of handling particular movements" (332 I.C.C. at 303; see also 332 I.C.C. at 296).

No one has ever suggested that these holdings, or similar holdings of the Commission in divisions cases[4] and rate cases,[5] cast any doubt upon the usefulness of Rail

---

Mass. 1962), affirmed 371 U.S. 26 (1962); *Louisville & N.R. Co.* v. *Southern Ry. Co.*, 319 I.C.C. 639, 654 (1963), affirmed sub nom. *Carolina & Northwestern Ry. Co.* v. *United States*, 234 F.Supp. 112 (W.D. N.C. 1964), affirmed, 380 U.S. 526 (1965). In *Illinois Central R. Co.* v. *Great Northern Ry. Co.*, I.C.C. Docket No. 34699 (Examiner's report dated September 15, 1966, adopted by the Commission July 31, 1967, modified March 20, 1968), the Commission relied upon a cost study in which, contrary to the contention of the Northern railroads (B&O Brief, p. 33, n. 10), the Illinois Central had adjusted Rail Form A "to take into account the particular characteristics of the traffic involved" including switching costs, interchange costs and other elements (Examiner's report, sheet 4). None of the several cost elements which account for the entire Northern inflation in this case was specifically controverted in the *Illinois Central* case.

[5] *Midwest Emery Freight System, Inc.* v. *Baltimore & O. R. Co.*, 321 I.C.C. 637, 650 (1964); *American Agricultural Chemical Co.* v. *Atlantic C. L. R. Co.*, 258 I.C.C. 779, 786 (1944); *United States* v. *Great Northern Ry. Co.*, 293 I.C.C. 341, 345 (1954); *State Corporation Commission of Kansas* v. *Atchison, T. & S. F. Ry. Co.*, 301 I.C.C. 703, 742 (1957); *Rochester & Pittsburgh Coal Co.* v. *Baltimore & O. R. Co.*, 294 I.C.C. 423, 433-435 (1955); *Rath Packing Co.* v. *Ahnapee & W. Ry. Co.*, 296 I.C.C. 693, 715 (1955); *Phosphate Rock to Shreveport and Nacogdoches*, 298 I.C.C. 353, 358-359 (1956); *Crude Sulphur from Louisiana and Texas to Virginia*, 300 I.C.C. 715, 726 (1957).

Form A as a tool for cost determination.[6] The Commission simply held in those cases, as the district court held here with respect to the several cost elements that account for the entire Northern inflation, that unadjusted territorial averages should not be used without independent evidence to support their application to the particular traffic at issue.[7]

---

[6] Nor has the Commission itself ever suggested, as appellants strenuously urge here (ICC Brief, p. 26, B&O Brief, p. 34), that the requirement of anything more precise than territorial average costs is illusory, and that more reliable costs are impossible of ascertainment. If more reliable costs can be determined in rate cases for large categories of traffic moving throughout the various territories with a degree of accuracy sufficient to lead the Commission to reject territorial averages as entitled to little weight, the same improvement in reliability can be achieved with any other body of traffic, including North-South traffic.

[7] Appellants' reliance on the use of Rail Form A in *New York* v. *United States*, 331 U.S. 284 (1947) (ICC Brief, p. 35, n. 30; B&O Brief, pp. 31-32), is misplaced. In that case, the Commission made it plain that "the intent of the cost study was to reflect territorial average operating conditions . . ." *Class Rates Investigation, 1939*, 262 I.C.C. 447, 588 (1945). The Commission was not, as appellants assert, undertaking to measure the cost of the small volume of traffic actually moving on class rates, but was deliberately seeking to measure the average costs of all traffic. Class rates constitute a maximum or ceiling for all traffic, and the Commission has consistently used the class rates prescribed in that proceeding as the guide for rates generally. See *Page Belting Co.* v. *Boston & M. R. Co.*, 294 I.C.C. 307, 309 (1955); *Mannington Mills, Inc.* v. *Abilene & S. Ry. Co.*, 301 I.C.C. 275, 276, 283 (1957), and cases cited therein. In *New York* v. *United States*, 331 U.S. 284 (1947), the Court upheld the Commission's action on the premise that it was intended to affect all traffic (331 U.S. at 309). The Commission's deliberate use of territorial averages applied to all traffic in the *Class Rates* case is in marked contrast to the Commission's declaration in this case that the standard here is the cost of handling the North-South traffic in issue (325 I.C.C. at 26, 50, 56; A. 49-50, 79-80, 89).

Appellants also argue that the district court imposed an undue burden upon the Commission when it pointed out that the Commission has extensive powers to require the production of cost evidence (ICC Brief, pp. 31-33; B&O Brief, pp. 34-39). The district court did not impose any burden on the Commission, much less an undue burden. The holding of the district court was simply that the Commission itself having stated as its exclusive standard the costs of North-South traffic, the Commission's action in prescribing an inflation for the North was not supported by substantial evidence or reasoned findings relating any such inflation to the North-South traffic (A. 349).

The question of the extent of the Commission's power "to investigate and gather evidence beyond that presented" (A. 353) was raised by the Commission's rejection of several of the adjustments proposed by the Southern railroads on the ground that, although the Southern railroads had presented evidence showing the costs of handling North-South traffic in the South, the Northern railroads had not presented evidence of the costs of handling North-South traffic in the North and, therefore, no "comparable evidence was available in the record" (district court opinion, A. 344 n. 13, citing four such instances in the Commission's report, 325 I.C.C. at 60, 66, 69, 76; A. 94, 105, 110, 121). Under these circumstances the district court properly observed: "The I.C.C. is not the prisoner of the parties' submissions. It is empowered to investigate and gather evidence beyond that presented . . ." (A. 353). The district court added that, in a case in which there is a lack of substantial evidence to support the Commission's order, so that additional cost evidence "is necessary to assure an adequate record," the Commission has a duty before it acts "to take affirmative action to require the development of an adequate record" (A. 354).

In referring to the Commission's powers to obtain evidence, the district court was simply emphasizing its holding that an order prescribing an inflation for the Northern railroads based upon the costs of handling North-South traffic must be supported by substantial evidence. Whether the Northern railroads supply the evidence,[8] or the Commission itself gathers the evidence, there must be substantial evidence to support the prescribed Northern inflation before the Commission's order can be sustained (see A. 1279-1290). The district court held that, because the evidence to support the inflation had not been obtained by *any* means, the inflation was unsupported by substantial evidence.[9]

Appellants would obscure the question presented by this case and decided by the district court. For example, Commission counsel state (ICC Brief, p. 3):

> "The question presented is whether, in ascertaining the relative costs of service in an interterritorial divi-

---

[8] As the Court stated in *Interstate Commerce Commission* v. *New York, N.H. & H.R. Co.*, 372 U.S. 744, 760, n. 12 (1963):

> "Of course, when such an issue is raised, each carrier should bring forward the data relating to its own costs that are required for resolution of the issue."

[9] In *Boston & Maine R. Co.* v. *United States*, 162 F. Supp. 289, 298 (D. Mass. 1958), the district court set aside a Commission order and held that if the cost evidence is not sufficient, the Commission has the duty to take further evidence or "turn the matter over to its accounting staff for investigation." On appeal by other parties, the Commission declined to defend its order and advised this Court of its readiness to "'proceed in accordance with the terms of the remand". *Boston & Maine R. Co.* v. *United States*, 358 U.S. 68, 71 (1958). See also *Eastern Central Motor Carriers Ass'n* v. *United States*, 239 F. Supp. 591, 599, 601 (D. D.C. 1965); *Pacific Inland Tariff Bureau* v. *United States*, 129 F. Supp. 472, 486 (D. Ore. 1955). The Commission did not appeal either of these holdings as imposing any undue burden upon its administration of the Act.

> sions case, the Commission may rely on Rail Form A data as to territorial average costs, *adjusted* to more accurately reflect the costs of the particular traffic involved, or is required to develop more refined cost data." (Emphasis supplied).

This statement of the question ignores the dominant feature of this case, namely, that the Commission ordered a change from uniform divisions of uniform rates to a substantial inflation in the divisions of the Northern railroads, and that with respect to the few specific elements of cost which account for the entire Northern inflation, the Commission used territorial average costs *without any adjustment* and without evidence relating the higher Northern territorial average costs to the North-South traffic.

Appellants do not dispute the district court's statement that "the entire inflation is pegged on relative costs derived from Rail Form A" (A. 350). But counsel nevertheless present arguments that have no bearing upon the issues presented by this case. For example, Commission counsel urge: "The Commission plainly has the statutory authority to compute costs by adjusting and applying Rail Form A territorial unit data [to North-South traffic]" (ICC Brief, p. 17). No one, least of all the district court, challenges the statutory authority of the Commission "to compute costs by *adjusting* and applying Rail Form A" (emphasis supplied). The issue in this case arises from the fact that the entire inflation accorded the Northern railroads is produced by the Commission's use of Rail Form A territorial average costs for several specific cost elements as to which the Commission made *no adjustment at all,* and as to which there was no evidence relating the higher Northern average costs of all traffic to the North-South traffic, which

constitutes only 6 percent of all traffic in the North and 21 percent of all traffic in the South (A. 795-796).[10]

Appellants also obscure the issue by arguing that the district court has interfered with the administration of the Interstate Commerce Act by *requiring* the Commission to decide divisions cases on the basis of the costs of handling the specific traffic at issue (ICC Brief, pp. 3, 11, 12, 16; B&O Brief, pp. 5, 16, 18, 29, 33-34, 37). But the district court did not decide that these divisions should be based on the relative costs of North-South freight traffic. That was the Commission's decision.[11] As the district court stated: "The Commission stated its exclusive standard to be the relevant cost of handling the specific freight traffic to which the divisions apply" (A. 349). The district court

---

[10] *Carolina & N.W. Ry.* v. *United States*, 234 F. Supp. 112 (W.D.N.C. 1964), affirmed, 380 U.S. 526 (1965), cited by Commission counsel for the proposition that this Court has approved "restated Rail Form A computations" (ICC Brief, pp. 18-19), has no bearing on the issue where, as here, the entire inflation is produced by several territorial average cost elements which were not "restated" by the Commission. In the case cited, the district court upheld the Commission's action in *making* an adjustment in the critical element of car costs to reflect the costs of the traffic at issue, dismissing a complaint that the Commission should not have "deviated," as it did (319 I.C.C. at 654), from the unadjusted Rail Form A average cost.

[11] This is not a case in which the district court has attempted to impose upon the Commission its own views with respect to the economics or any other feature of the standard selected by the Commission. Compare *American Commercial Lines, Inc.* v. *Louisville & N. R. Co.*, — U.S. — (decided June 17, 1968), where the district court had disagreed with the cost standard adopted by the Commission in passing upon rail rates reduced in competition with barge rates.

properly and necessarily[12] examined the record to ascertain whether there was substantial evidence to support the Northern inflation under the standard which the Commission itself had adopted. The Commission having selected as its exclusive standard the costs of handling North-South traffic, the question for judicial review was whether the inflation accorded the Northern railroads was supported by substantial evidence and reasoned findings relating that inflation to the costs of the North-South traffic at issue.[13]

As Commission counsel recognize, Rail Form A breaks down the total expenses of the carriers into a number of groups or elements, such as train crew costs, locomotive maintenance, car costs, and many others; and each element is subject to adjustment as required by the facts of a particular case (ICC Brief, p. 18, n. 13). In this case, the use of territorial average costs for a relatively few elements accounts for the *entire* inflation accorded to the Northern railroads (A. 864-865). The district court expressly recognized this significant feature of the case (A.

---

[12] "A reviewing court, in dealing with a determination or judgment which an administrative agency alone is authorized to make, must judge the propriety of such action solely by the grounds invoked by the agency." *S.E.C.* v. *Chenery Corp.*, 332 U.S. 194, 196 (1947); *Burlington Truck Lines* v. *United States*, 371 U.S. 156, 168-169 (1962); *N.L.R.B.* v. *Metropolitan Life Ins. Co.*, 380 U.S. 438, 443-444 (1965).

[13] For this reason, Commission counsel's reliance upon *S.E.C.* v. *New England Electric System*, 390 U.S. 207 (1968) (ICC Brief, pp. 14, 23, 26), is misplaced. In that case, the lower court was reversed for an "unwarranted incursion into the administrative domain" where that court had disagreed with the agency on the basis of its own "fresh review of all the evidence" (390 U.S. at 211-212). This Court observed the statutory standard that administrative findings were conclusive "if supported by substantial evidence" (390 U.S. at 211). The district court in the present case has observed the same standard.

335) and directed its attention to the particular question of whether there was substantial evidence to support "the use of territorial averages accounting for the Northern inflation" in measuring the relative costs of North-South traffic (A. 349).

The district court found no substantial evidence or reasoned findings "relating any such inflation to the North-South freight traffic" (A. 349). Contrary to the overdrawn assertions of Commission counsel (ICC Brief, p. 22, n. 19), the district court did not require "slavish adherence to any particular exactitude." It did require that there be substantial evidence relating the prescribed inflation to the North-South traffic. Appellants make no effort to cite any evidence that even purports to show that the several territorial average cost elements which produce the entire inflation have any relation to the comparative costs incurred in handling the North-South freight traffic. Instead, appellants devote their discussions of the specific cost elements that produce the inflation to an attack on estimates made by the Southern railroads to adjust these costs (ICC Brief, pp. 38-48; B&O Brief, pp. 40-42). But even assuming for the purpose of judicial review that the adjustments suggested by the Southern railroads were properly rejected by the Commission, the use of the unadjusted territorial averages that produce the entire inflation remains unsupported by evidence relating such an inflation to the North-South traffic.

Contrary to appellants' repeated assertions to the contrary (ICC Brief, pp. 18, 20, 25; B&O Brief, pp. 19, 26-30), the decision of the court below is not inconsistent with the decision in *Chicago & N.W.R. Co.* v. *Atchison, T. & S. F. R. Co.*, 387 U.S. 326 (1967). In that case, a district court had set aside a Commission order on the ground that it failed to make findings as to the revenue needs of individual railroads. The United States and the Commission

appealed in order to defend the group basis of determining divisions. This Court held that the district court had erred (387 U.S. at 340-351), and went on to uphold the Commission's cost findings as well (387 U.S. at 356). The Court pointed out that the parties *attacking* the order (the Mountain-Pacific railroads) were the *beneficiaries* of an inflation in their divisions.[14] The Court reviewed the Commission's cost findings and upheld Commission's decision "to base its cost findings upon the special cost study and analysis prepared by the Mountain Pacific carriers," subject to "certain adjustments to the Mountain-Pacific analysis which, in the judgment of the Commission, more accurately reflected the true costs of the traffic involved" (387 U.S. at 352).[15]

---

[14] The inflation granted by the Commission was expressly related to the different and higher level of rates west of the Rocky Mountains (387 U.S. at 357-358).

[15] The Northern railroads contend that the Commission's treatment of two of the seven cost elements that account for the entire Northern inflation in this case (car costs and empty return ratios) "was sustained by this Court" in the *C&NW* case (B&O Brief, p. 42, n. 16, 17).

With respect to car costs, the Court expressly stated in *C&NW* that it did *not* review the Commission's treatment of that cost element because "this issue related only to the Eastern divisions," which, as the Court emphasized, were "no longer in issue" (387 U.S. at 354).

With respect to empty return ratios, the Court sustained the Commission's treatment, quoting from the Commission's report in that case which showed that "[m]any special studies of empty-return movement were undertaken in these proceedings" (387 U.S. 352). One of these special studies, presented by the Midwestern railroads, was designed to show that the territorial average empty return ratios did, in fact, reflect the empty-return relationship applicable to the traffic at issue (I.C.C. Docket 31503, Exhibit MW-586, pp. 42-44). Thus, the record in that case did contain evidence relating the territorial average costs to the traffic in issue. No such evidence exists in the present case. Indeed, the Northern railroads expressly refused to make a study on this subject (see p. 60, n. 35, *infra*).

Appellants' arguments, including their mistaken reliance upon the *C&NW* case, all come down to the proposition that Commission orders relating to divisions or costs are simply beyond the scope of any effective judicial review (*e.g.*, ICC Brief, p. 19; B&O Brief, pp. 25-26).[16] This is not the law. Congress has empowered and directed the federal courts to provide effective judicial review and has specifically directed that administrative orders be set aside by the courts where not supported by substantial evidence or reasoned findings. Administrative Procedure Act, Sections 8(b) and 10(e).[17] This Court has emphasized that these provisions are meant to be enforced. *Burlington Truck Lines* v. *United States*, 371 U.S. 156, 167-168 (1962).

---

[16] The Northern railroads rely heavily on the pre-Administrative Procedure Act decision in *Illinois Commerce Commission* v. *United States*, 292 U.S. 474 (1934) (B&O Brief, pp. 25, 39, 43; also ICC Brief, p. 19), although that case had nothing whatsoever to do with the requirements of adequate findings or substantial evidence. It involved a Commission order directing "the removal of unjust discrimination against interstate commerce, resulting from disparity of the intrastate and interstate switching rates of interstate rail carriers in the Chicago Switching District" based on a specific cost study of switching movements in Chicago (292 U.S. at 476). That case would be analogous to the present case only if the cost study relied upon to measure Chicago switching costs had been developed from the average cost of all switching movements throughout the entire North.

[17] As Judge Prettyman held in reviewing a cost determination by another agency in *Mississippi River Fuel Corp.* v. *F.P.C.*, 163 F.2d 433, 439 (D.C. Cir. 1947):

> "The discretion which must be exercised is that of the Commission. Congress has confided that function to it. At the same time, Congress has forbidden arbitrary action and has imposed upon the courts a duty of review in that respect. Arbitrary action, if it means anything, means action not based on facts or reason. The discretion and judgment confided in the Commission must be exercised upon facts and for reason. The duty of review imposed upon the courts requires that the

The district court in the present case has performed its statutory duty of determining whether the inflation granted the Northern railroads was based upon substantial evidence and reasoned findings with respect to the cost of North-South traffic—the standard adopted by the Commission itself. Since appellants are unable to refer this Court to any evidence of record relating the territorial averages of all traffic to the costs of North-South traffic with respect to the several elements of cost which account for the entire inflation, it is manifest that the district court was correct in its holding.

II. REVIEW OF THE COMMISSION'S TREATMENT OF EACH OF THE SPECIFIC ITEMS ACCOUNTING FOR THE NORTHERN INFLATION REVEALS A LACK OF SUPPORT IN SUBSTANTIAL EVIDENCE AND REASONED FINDINGS.

As has been shown, the district court was correct in setting aside the Commission's order because of the lack of substantial evidence and reasoned findings relating the higher territorial average costs for the several cost items that accounted for the entire Northern inflation to the costs of handling the North-South traffic here in issue. The correctness of this holding is further demonstrated by analysis of each of the specific cost items in controversy.

---

facts be found and the reasons stated. Otherwise, the courts cannot determine whether a given action is or is not arbitrary.

"The Congressional provisions extend to complicated, difficult matters as well as to simple questions. The courts cannot evade their responsibility merely because the subject matter is obscure. And neither can they be required to probe the minds of the agency for unfound facts or unexpressed reasons. The coordination of the two functions of administrative discretion and judicial review requires that the facts upon which the discretion is exercised, and the reasons, be clearly and completely stated. When the matter is complicated, the necessity is greater."

A. The Commission's Inclusion of Commuter Deficits in the Northern Railroads' Costs is Wholly Unjustified.

One of the important reasons why the Northern railroads' territorial average costs are higher than the average costs of the Southern railroads is that the Northern railroads' average costs are increased by the inclusion of suburban passenger deficits, whereas the Southern railroads do not have any substantial commuter operations.

The underlying facts are not in dispute. Through the use of average costs, the deficits attributable to both intercity passenger service and suburban commuter service are included in the cost computations for the Northern and Southern railroads. It is generally agreed that the intercity passenger deficits must be considered as part of the costs of providing freight service, for such deficits are usually the result of costs allocated to passenger operations from common facilities which must be maintained in order to provide freight service (A. 713-714).[18] Suburban passenger deficits, however, are quite another matter. The railroads which carry large numbers of people from their homes in the suburbs to their places of work in the cities often, if not exclusively, use separately constructed and maintained lines. These suburban commuter operations require facilities with no other use whatever.

At no time during the proceedings before the Commission did the Northern railroads even try to offer any sup-

---

[18] The necessity of maintaining common facilities for freight service was recognized by the Court in *King* v. *United States*, 344 U.S. 254, 265 (1952):

> "In Florida, moreover, the discontinuance of railroad passenger service would not permit the discontinuance of high-speed tracks and equipment because of the need for fast freight schedules to transport perishable fruits and vegetables from Florida."

port for treating all commuter deficits as a part of the cost of freight service. Indeed, the position of the Northern railroads at that time emphasized the solely-related character of commuter service (Statement of Northern commuter railroads quoted at A. 714-715):

> "Another vitally important feature of railroad suburban service is the subject of wide misunderstanding by the public. This is the extent of railroad investment and railroad costs represented by fixed facilities, such as track. It is a widely held but entirely false belief that railroads use, for their suburban and commutation services, primarily those roadway facilities which they must necessarily have and maintain for their other operations. . . .
>
> "These notions are completely false as applied to railroads handling a substantial volume of suburban passengers. Reference to Exhibit J [a chart showing exclusive use of tracks for suburban service] exemplifies the situation which actually exists. . . .
>
> ". . . one-half of the track facilities in this territory are maintained solely because of the company's suburban service operations. A far larger proportion of other roadway facilities, such as stations, terminals, coach yards and repair shops, are maintained solely in connection with suburban service."

The sole reason given by the Commission for the inclusion of commuter deficits in Northern railroad costs is that "*Because* the suburban service deficit *includes common costs* which must be incurred to provide freight service or intercity passenger services, *such* costs are properly chargeable to those services to the extent they cannot be recovered from suburban operations" (325 I.C.C. at 78; A. 124) (emphasis supplied). This finding of the Commission justifies inclusion of suburban deficits to the extent, and only to the extent, that they relate to common costs.

But the Commission also found as a fact that "*many* individual items of suburban service can be considered *solely related* . . . to suburban service" (325 I.C.C. at 78; A. 124) (emphasis supplied). This finding was required by the uncontroverted evidence of record showing that commuter equipment, and many tracks, yards, stations and other facilities are solely related to commuter service and thus have nothing whatever to do with the cost of handling North-South or any other freight traffic. The Commission gave no reason for including any of these costs solely related to commuter service in determining the costs of North-South freight traffic.

Under the Commission's own basis for decision, the district court correctly found (A. 345):

> "The critical issue on this cost item was to determine how much of the railroads' cost of commuter service was in fact common with the cost of freight service and how much was solely related to commuter service. But, in accordance with its general approach to these issues, the Commission, by adopting Rail Form A, inflated the Northern railroads' freight costs by the entire commuter deficit of those railroads, without regard to the plain conflict between this action and its own finding that 'many individual items of suburban service can be considered solely related . . . to suburban service.'"

Contrary to the contention of Commission counsel that the district court was "substituting its own view" (ICC Brief, p. 42), the district court decided the case on the standard adopted by the Commission—the costs of North-South freight traffic—and further accepted the *Commission's* view that passenger deficits arising from common costs should be attributed to North-South freight traffic.[19] What the district

---

[19] Much of the Northern railroads' argument (B&O Brief, pp. 23-24, 49 n. 24, 53-54, 55) constitutes an attack upon the position stated by the Commission that passenger deficits are included in freight costs *because* of common costs (325 I.C.C. at 78, A. 124).

court did not, and could not, accept was the unexplained and unjustified inclusion of costs "solely related" to commuter service.[20]

Appellants no longer even attempt to defend the attribution of the entire northern commuter deficit to the costs of freight traffic. Instead, they now attempt to explain the Commission's inclusion of commuter deficits unrelated to freight traffic on the ground that commuter deficits represent a kind of "overhead" which must be recovered by proportionate charges to other traffic.

Appellants point to the Commission's statement that the prescribed divisions are based upon fully distributed costs, which include allowances for "overhead," as indicating that the Commission itself included commuter deficits not on a relative cost theory, but on a revenue needs theory (ICC Brief, p. 44; B&O Brief, p. 48). There is no merit in this attempted defense of the Commission's treatment of the cost of commuter deficits. The Commission did not inflate the Northern railroad divisions on the basis of "revenue needs," since these were found to be the same in both terri-

---

[20] The Northern railroads also argue that there are solely related deficits in intercity passenger services in the South (B&O Brief, pp. 53-54; see also ICC Brief, p. 44, n. 40). This argument was recited as a contention of the Northern railroads but was not adopted by the Commission as a ground for its decision (325 I.C.C. at 78; A. 123). Even if this theory were sound, it would not lead to the conclusion that passenger deficits in both territories which are unrelated to freight service should nevertheless be used to inflate freight costs. The obvious solution, if there were passenger deficits not related to freight operations in both North and South, would have been to exclude such deficits in both territories. Even under the Northern railroads' argument, the failure to exclude all solely related passenger deficits was prejudicial to the Southern railroads in view of the much greater effect of the commuter deficits in inflating the costs of the Northern railroads (A. 1291).

tories (325 I.C.C. at 15-16; A. 36-37). As the district court held (A. 345):

> "The complete answer to this contention is that the Commission did no such thing. The revenue need issue was hotly contested before the Commission, each group contending that its needs were greater—the Northern railroads, on the basis of lower rates of return; the Southern railroads, on the basis of their growing service responsibilities to an expanding economy. The Commission rejected both contentions . . ."

The stated basis for the Commission's order in this case was the relative costs of handling North-South freight traffic (p. 4, *supra*). The Commission's decision to include "overhead" in the costs in addition to out-of-pocket costs did not imply any departure from its standard that North-South freight costs are determinative. Under the Commission's own standard, the only allowance for "overhead" to be included would be those overhead items inherent in handling North-South freight traffic (such as officers' salaries, general office expenses and other overhead inherent in freight operations). Since the Commission recognized that "many individual items of suburban service" were "solely related" to that service (A. 124)—that is, completely unrelated to any kind of freight traffic—the entire commuter deficits could not be a part of the "overhead" that make up the costs of North-South traffic under the Commission's own standard.

The Commission's action in dealing with other cost factors makes it plain that its decision to include allowances for "overhead" referred only to such items of overhead as are related to North-South freight traffic. For example, the Commission specifically excluded the platform deficits realized or incurred by the Northern railroads in the handling of other traffic because such deficits were not related to

North-South freight traffic (325 I.C.C. at 56; A. 89). The Commission refused to include any part of these deficits as a part of the costs to be determined in this case, not because such deficits do not have to be made up if the financial integrity of the railroads is to be maintained, but because the Commission recognized that no part of these deficits is properly considered a part of the cost of North-South freight traffic (*ibid.*). The same is true with respect to the commuter deficits of the Northern railroads attributable to facilities and operations solely related to suburban service.[21]

Appellants also argue that since commuter deficits constitute a burden which might justify higher rates, such deficits should also be reflected in higher divisions for the railroads incurring the deficits on the theory that rates should be divided in accordance with the manner in which they are made (ICC Brief, p. 43; B&O Brief, p. 47). No such theory was adopted or even suggested by the Commission itself. Moreover, the theory that rates should be divided as they are made cannot be used to support the Commission's action in prescribing an inflated basis of divisions for the Northern railroads based upon commuter deficits or for any other reason because, notwithstanding the Northern commuter deficits, freight rates are no higher

---

[21] Commission counsel themselves recognize the true function of the allowances for overhead and return in fully distributed costs when they point out that such allowances should be included in cost determinations only "if appropriate" (ICC Brief, p. 20) and that fully distributed costs can be restated "so as to exclude all or some constant cost items which should not be taken into account" (ICC Brief, p. 21). The inclusion of a constant cost would not be "appropriate" under the standard adopted by the Commission in this case—the costs of North-South freight traffic—whenever the item is unrelated to the transportation service for which costs are being determined. To include constant cost items not related to the service being measured is to prescribe divisions, not by any standard of costs, but by an allocation of general revenue needs.

in the North than they are in the South. Nor is there any increment in the Northern portion of the North-South freight rates which reflects higher Northern passenger or commuter deficits. On the contrary, the rate levels in both territories are shown by the record to be uniform; and the interterritorial rates being divided here are on the same uniform level.[22]

Appellants' reliance on *King* v. *United States,* 344 U.S. 254 (1952) (ICC Brief, pp. 42-43; B&O Brief, pp. 47, 50-52) is misplaced. *King* was a rate case, and this Court has recognized, citing *King,* that "the issues are quite different when, in a divisions case, it is argued that carriers in one part of the country should subsidize the passenger operations of carriers elsewhere." *Chicago & N.W.R. Co.* v. *Atchison T. & S.F.R. Co.,* 387 U.S. 326, 350 (1967). Moreover, in *King,* the rate increase did not purport to be related to the cost of any freight traffic, but was designed "to meet overall revenue needs" (344 U.S. at 264). And, as a factual matter, the *King* case related to an increase in Florida intrastate freight rates. There is no commuter service in Florida, and this Court had no occasion to consider, and did not consider, the treatment of deficits arising from costs solely related to passenger service.

Appellants' efforts to support inclusion of deficits resulting from costs solely related to passenger service as a part of freight costs are not only unsound in principle, but they are improper arguments to address to the Court. Since none of appellants' theories has been set forth by the Commission as a justification for its action, the advocacy of such

---

[22] As previously shown (pp. 2-3, *supra*), the Commission ordered, and this Court upheld, uniform class rates for both North and South; and this uniformity of rates is in effect today. The Northern railroads admitted that they sought "disproportionate divisions of a uniform structure of rates" (A. 1543).

theories in this Court constitutes a plain violation of the fundamental principal that "a reviewing court . . . must judge the propriety of such action solely by the grounds invoked by the agency. If those grounds are inadequate or improper, the court is powerless to affirm the administrative action . . ." *S.E.C.* v. *Chenery Corporation,* 332 U.S. 194, 196 (1947); *Burlington Truck Lines* v. *United States,* 371 U.S. 156, 168-169 (1962). This Court held in *United States* v. *Champlin Refining Co.,* 341 U.S. 290, 301 (1951) that "it is not the function of this Court to rescue the Commission by making findings *de novo* which the Commission itself was unable or unwilling to make."

Moreover, appellants misstate the question of transportation policy presented by commuter deficits when they ask this Court to accept the proposition that "[commuter] losses must be recovered from railroad freight operations if railroads are to remain solvent" (ICC Brief, p. 44; also B&O Brief, p. 46). The other policy choice, if commuter service is to be continued, is to place the financial burden of the deficits on the communities receiving the service instead of upon either the Northern railroad stockholders or the freight shippers in the North or the South. Although the Commission gave no explanation of any policy justifying its action in this case, the Commission has specifically addressed itself to the policy considerations underlying the treatment of commuter deficits in other cases and has arrived at a conclusion which is diametrically opposed to the theories advocated by appellants. Prior to its decision in this divisions case, the Commission had adopted the policy that commuter service should not burden freight operations (*Railroad Passenger Train Deficit,* 306 I.C.C. 417, 483 (1959)):

> "That where the railroads are unable to operate a particular local or commuting service at a profit, and

> where such service is essential to the community or communities served, that steps be taken by State and local authorities, or both, to provide the service paying the carrier the cost plus a reasonable profit."[23]

The principle that commuter service is a separate service that should not be subsidized by other services is consistent with Congressional policy as stated in House Report No. 1922, Committee on Interstate and Foreign Commerce, on the Transportation Act of 1958, 85th Cong., 2d Sess., p. 11 (1958):

> "It is obvious that in very great measure these passenger losses are attributable to commuter service. It is clear that where such necessary services cannot be made to pay their way, the interested communities have a very real interest in working out the problem. It would seem evident that if such urban or interurban commuting service must be preserved, losses incurred will have to be met in some way by the communities. It is unreasonable to expect that such service should continue to be subsidized by the freight shippers throughout the country."

The Commission has continued to express its policy that commuter deficits should be borne by the local communities, not freight shippers throughout the country, in its decisions[24] and in recent reports to Congress.[25]

---

[23] This policy statement was transmitted to Congress in the Commission's 1959 Annual Report (p. 34). As shown in this policy statement, contrary to the present argument of the Northern railroads (B&O Brief, p. 40), the Commission itself has identified commuter service as a separate problem raising separate policy considerations.

to Problems of Improved Commuter Service in Mass Transportation, 90th Cong., 2d Sess. (March 26, 27, 28, 1968) (hereinafter cited as Hearings), pp. 213, 218-219, 220. The Chairman of the Commission summarized the policy of the Commission as follows (Hearings, p. 42):

> "We feel that the public must be willing to assist private carrier management, in appropriate circumstances, in a cooperative joint effort to revitalize and further improve essential rail commuter service. The appropriate public-private policy mix will vary with particular carriers and needs of the urban area. In some cases, direct operating subsidiaries or capital grants for new equipment and facilities will be required; in others, more equitable policies in the treatment of carriers' property for local tax purposes and a favorable local regulatory policy may suffice. It is perfectly clear that rail commuter transportation is a critical element in urban transportation and, if allowed to be eliminated, will impose heavy economic and social cost upon our urban areas and our population. It is for this reason that we believe that this type of joint private-public undertaking, much of which is already going on in many parts of the country, should be continued and expanded in years to come."

See also Report and Recommendation of Interstate Commerce Commission to Senate Committee on Commerce and House Interstate and Foreign Commerce Committee (June 25, 1968), pp. 4-6.

[26] In Boston, the Boston and Maine and the New Haven have been authorized to discontinue commuter service and the Massachusetts Bay Transit Authority has contracted with these carriers for the continuation of service (Testimony of Commission Chairman Tierney, Hearings, pp. 29, 39). In New York, the state has purchased and operates the Long Island Railroad (Testimony of William J. Ronan, Hearings, p. 130). Moreover, New York and Connecticut jointly are paying subsidies to the New Haven and, pursuant to an announced $80 million modernization program, are negotiating for long-term control of the New Haven's west end commuter service (Testimony of William J. Ronan, Hear-

not exist at the time the record in this divisions case was made, the practical effect of the Commission's action here is to provide a double subsidy for the Northern railroads, one from the local communities, consistent with the policy expressly articulated by the Commission elsewhere, and a second as a result of the Commission's unexplained action in this case of including the Northern railroads' pre-subsidy deficits arising from costs solely related to commuter service as part of the costs of North-South freight traffic.

The policy question inherent in the treatment of solely related passenger deficits is far too important to brush aside without explanation as the Commission did in this case. The Court recognized the intrinsic importance of the passenger deficit issue in *Chicago & N.W.R. Co.* v. *Atchison, T. & S. F. Ry. Co.*, 387 U.S. 326 (1967). In that case, in which

---

ings, pp. 130, 136). In Philadelphia, the Southeastern Pennsylvania Transit Authority has entered into commuter service agreements with Penn Central and Reading (Testimony of Alan S. Boyd, Hearings, p. 6; Testimony of Robert W. Minor, Hearings, p. 56). In New Jersey, the State has contracted with Erie Lackawanna and Central Railroad of New Jersey for the performance of commuter service and has also instituted substantial tax reductions and capital improvement programs (Brief of the State of New Jersey, pp. 1-2, I.C.C. Finance Docket 23832, et al., June 7, 1968; Testimony of Chairman Tierney, Hearings, p. 39. See *Erie-Lackawanna R.R.* v. *United States*, 279 F. Supp. 316, 341-342 (S.D. N.Y. 1967), affirmed 389 U.S. 486 (1968)).

As illustrated by the $28 million federal grant for the improvement of New Haven commuter service, the federal government is increasingly providing assistance to northern communities by planning and funding commuter service (Testimony of Alan S. Boyd, Hearings, p. 6). See also Urban Mass Transportation Act, 49 U.S.C.A. §§ 1601-1611 (Supp.).

the Commission had *excluded* passenger deficits in considering both costs *and* revenue needs, the Court stated (387 U.S. at 350):

> "And while the Commission has sometimes acted to offset passenger deficits in freight rates cases,[29] the issues are quite different when, in a divisions case, it is argued that carriers in one part of the country should subsidize the passenger operations of carriers elsewhere."
>
> "[29] E.g., *Increased Freight Rates, 1948*, 276 I.C.C. 9, 35. See also *King* v. *United States*, 344 U.S. 254, 263-264."

The Court accepted the Commission's explanation of its action in excluding passenger deficits in that case, noting that (387 U.S. at 350-351):

> "If the Commission were to give controlling weight to passenger deficits in a divisions case, it might be appropriate to take more evidence on the issue and discuss it in greater depth than the Commission did here. But in light of the fact that, in this case, passenger deficits were of negligible relevance to the Commission's decision to increase the Midwestern divisions, we find no errors in the Commission's findings and procedure on this point . . ."

In this North-South case, however, the Commission's treatment of deficits arising from costs solely related to passenger service is far from being "of negligible relevance," and the Commission has not provided any discussion supporting the inclusion of such costs as part of the costs of North-South traffic.

In summary, the Commission has prescribed divisions of North-South freight revenues on the basis of costs which include passenger deficits. The Commission has explained why the deficits with respect to costs common to both freight and passenger services should be allocated as part

of the costs of North-South freight traffic, but has given no explanation why costs solely related to passenger service should be included. Section 8(b) of the Administrative Procedure Act requires reasoned findings upon such a material issue (5 U.S.C. § 557(c)), and exposition of Commission policy is especially required where, as here, the Commission has acted in a manner contrary to its own previously articulated policy. *Secretary of Agriculture v. United States,* 347 U.S. 645, 654 (1954).

B. The Commission Acted Arbitrarily and Without the Support of Substantial Evidence When It Ascribed 58 Percent Higher Costs to the Northern Railroads for Interchanging Freight Cars at the Territorial Border.

The Commission's treatment of the costs of interchanging North-South traffic at territorial border points constitutes a plain violation of the requirement that its findings and conclusions be supported by substantial evidence and reasoned findings.

The physical facts are simple and uncontroverted. Most North-South traffic moves in freight cars which are interchanged between Northern and Southern railroads at territorial border points. For example, a car moving between New Orleans and Philadelphia over the Southern Railway and Penn Central would be interchanged at Potomac Yard, immediately south of Washington, D.C. Potomac Yard is a joint facility which charges each railroad using the facility the same amount per car for performing the service of interchanging the car (A. 746-749). Another example would be a car moving between New Orleans and Cleveland over the Louisville & Nashville and Penn Central railroads. Such a car would be interchanged at Cincinnati,

a terminal area in which both the L&N and Penn Central maintain yards (A. 757-759). Railroad operating officers presented testimony reviewing all of the important interchange areas and showing that the interchange operations performed by the Northern railroads were no more costly than those of Southern railroads in interchanging the same cars at the same points.[27]

In the face of this uncontroverted evidence, the Commission prescribed divisions which include a separate allowance for the costs of "border interchange" which are 58% higher for the North than for the South.[28] This figure is based upon Rail Form A territorial average interchange costs reflecting all interchange services in the respective territories. Whatever might be the cause of the higher Northern costs on the average of all traffic, the bulk of which is intraterritorial traffic, the physical facts of the interchange of North-South traffic at the territorial border points show that the Northern railroads' costs could not be higher than the Southern railroads' costs of performing interchanges at the same border points.

The Commission made no findings and cited no evidence supporting any higher costs, much less 58 percent higher

---

[27] This testimony covered all of the significant points at which North-South traffic is interchanged, i.e., Potomac Yard, Cincinnati, Evansville, Louisville, Elkhorn City, St. Paul, Richmond, Petersburg, Jarrett, and East St. Louis (A. 729-740; 741-745; 746-753; 757-761; 762-770; 771-775).

[28] In its initial report, "Terminal and border interchange" are shown as a combined figure (325 I.C.C. at 37; A. 63). From the appendix to the Commission's supplemental report, it can be calculated that the factor representing "border interchange" (also referred to as "cost of interchange at gateways") is 8.54 for the North and 5.41 for the South (325 I.C.C. at 456; A. 185) (line 11 ÷ line 23). 8.54 is 57.8 percent higher than 5.41.

costs, for the Northern railroads with respect to border interchanges. Instead, the Commission's discussion of the subject of the cost of border interchange criticizes the Southern railroads' "estimate" of the costs of such interchange, without in any way attempting to support its own use of 58 percent higher costs for the North.

This disposition of the cost of border interchanges would not be a lawful one, even if the Commission's "criticisms" of the Southern railroads' estimate of equalized border interchanges were sound, which they are not.[29]

---

[29] In fact, the Commission's criticisms of Southern railroads' "estimate" are themselves arbitrary. The first three criticisms simply seek to minimize (but not to eliminate) the effect of the practice of equalizing switch engine hours as a factor which equalized costs of interchange at border points (325 I.C.C. at 81; A. 128). (This practice was emphasized by both Northern and Southern operating witnesses, A. 987, 757-758). But assuming that there are factors other than switch engine hours affecting relative costs of interchange in the same interchange areas, neither the Commission's report nor the Northern railroads' evidence even attempts to identify any factor which could make the Northern railroads' costs any higher, much less 58 percent higher, than the Southern railroads' costs of interchange in the same areas.

Nor does the Commission's final criticism fill the void created by this failure to suggest any factor possibly causing higher Northern costs. This criticism is that the assigning of costs of border interchanges to North-South traffic which differ from the average costs of all interchanges on all traffic throughout the North and South results in a distortion unless some corresponding adjustment is made in the cost of all the other interchanges included in the territorial averages (325 I.C.C. at 81; A. 129). The Commission expressed its concern that "some" dollars will be "left over and not assigned to anything" (*ibid.*). This is statistical nonsense in this case in which the North-South traffic constitutes only 6 percent of the total traffic of the North. The obvious answer to the problem raised by the Commission is to assign any balance to the traffic *other* than North-South traffic, which constitutes 94 percent of the total traffic of the North and which obviously governs the level of the Northern railroads' average costs in any event.

The Southern railroads made no claim before the Commission that their particular method for estimating the level of border interchange costs had to be accepted. The claim was that there was no substantial evidence to support any higher level of border interchange costs for Northern than for Southern railroads, whatever the precise dollar amount of the equal costs. The Commission's criticisms do not dispose of this claim, nor do they supply any support for its affirmative action in granting the Northern railroads a separate allowance for border interchanges which is 58 percent greater than the allowance given the Southern railroads for providing the same service at the same border points.

Appellants merely rely on the Commission's criticisms of the Southern railroads' estimates and do not even attempt to cite any evidence supporting the use of any higher, much less 58 percent higher, costs for the Northern railroads in interchanging traffic at territorial border points (ICC Brief, p. 46, n. 43; B&O Brief, p. 42). Thus, as this case stands, the only evidence related to border interchanges shows equality of costs. In the absence of any evidence whatever in this record to support the Commission's action in awarding the Northern railroads a 58 percent inflation on this cost item, that action must be set aside as unsupported by substantial evidence.

C. The Commission's Use of Territorial Average Car Costs 32 Percent Higher in the North Violates Both the Administrative Procedure Act and the Interstate Commerce Act.

Another important instance of the Commission's unlawful use of territorial average costs is reflected in its treatment of car costs (325 I.C.C. at 60-64; A. 94-101). Car costs embrace the costs associated with the railroad freight

car itself, including repairs, depreciation, and an allowance for return on investment.[30] Since each shipment of North-South traffic at issue in this case moves between the territories in the same freight car, which may be owned by a railroad in either territory or, indeed, by a Western railroad not even involved in this case, common sense would indicate that the car costs of Northern and Southern railroads would be equal.

However, the Commission did not base its order in this case on the cost of the cars handling North-South traffic. Instead, the Commission used the average cost of *all* per diem cars handling *all* traffic in each territory, although the majority of the cars included in the average costs in each territory are open-top cars that do not carry North-South traffic to any appreciable extent (A. 858-860). This use of territorial average costs for all cars instead of making a rational determination of the costs of the cars used in handling the traffic here at issue led the Commission to adopt car costs which are 32 percent higher in the North than in the South (325 I.C.C. at 60; A. 95) in the absence of any evidence that the higher Northern territorial average car costs have anything whatever to do with the relative costs of the cars handling North-South traffic.

A major reason that the average car costs of the Northern railroads are higher than the average car costs of the Southern railroads is that several of the coal-originating

---

[30] The car cost issue as it arises in this case concerns "per diem" cars—that is, box, flat, hopper and gondola cars on which owning railroads receive a per diem rental for the use of the car. The cost of "mileage" cars (refrigerator and tank cars) raises no problem because the Commission used a uniform mileage charge in both North and South for such cars (A. 855). The preponderance of the per diem cars carrying North-South traffic are box cars (325 I.C.C. at 60; A. 95).

Southern railroads own fleets of hopper cars which are used to terminate coal on Northern railroads. These Southern railroads thus rent their open-top cars to Northern railroads far more often than the Northern railroads rent cars to Southern railroads. Thus, the record shows that the Southern railroads' annual car rental (per diem) net credit is more than seven times greater than the net balance of the Northern railroads—$23,987,115 as compared to $3,405,826 (A. 863).

The greater net per diem balance of the Southern railroads substantially depresses their average car costs. This is so because, as the Commission itself pointed out (325 I.C.C. at 63; A. 100):

> "per diem [car rental] charges have been based upon car costs computed on a reproduction basis insofar as depreciation and return on investment of the cars are concerned. This differs from the original cost basis used in Form A car cost computations for owned cars."

Because the reproduction cost of freight cars far exceeds original cost, a car-owning railroad receives rental payments which greatly exceed its car costs on that car computed on an original cost basis (A. 862). When these rental "profits" are credited to the car cost accounts, they lower the total costs in that account. Consequently, when unit car costs are determined by dividing the total car-miles of service performed by a railroad into the total costs in the car account, the car-owning railroads appear to have substantially lower unit car costs.[31] This is a reason why the Southern rail-

---

[31] A dramatic example of the extent to which per diem rentals received on other cars reduce average car costs is the situation of the Clinchfield Railroad which, because other railroads regularly use the coal cars which account for most of the Clinchfield's business, actually shows a *negative* cost for the Clinchfield's average

roads' territorial average car costs are lower than the territorial average car costs of the Northern railroads.

Coal traffic is not involved in this case (325 I.C.C. at 55; A. 86), and the relative use of cars carrying coal, while significant in its influence on the territorial average cost of all cars in the North and in the South, has nothing whatever to do with the relative cost of the box cars that predominate in the handling of North-South traffic (325 I.C.C. at 60; A. 95).

While the territorial average car costs are strongly influenced by the car rental balance resulting from the Northern railroads' use of the Southern railroads' coal cars, car rental balances have just the opposite effect with respect to the North-South traffic here at issue. The Commission itself found that on North-South traffic "there is a greater relative use . . . of cars owned by official territory railroads than those of cars of southern ownership" (325 I.C.C. at 64; A. 100-101). Thus, on North-South traffic, it is the Northern railroads whose costs are reduced by the fact that the level of per diem rentals is higher than the cost of the cars. In this situation, the territorial average car costs of the Southern railroads, which are substantially reduced by car rentals on cars handling other traffic, cannot conceivably measure the car costs incurred on North-South traffic, as to which the Southern railroads themselves must make substantial car rentals payments.[32]

---

car (A. 862). It would be preposterous to suggest, with respect to a movement of North-South traffic moving in a box car owned by the Clinchfield, or more likely a car on which the Clinchfield must pay rental charges, that the railroad nevertheless incurs less than no cost at all. Yet this is the arithmetic effect of applying the average cost of all cars to the cars carrying North-South traffic.

[32] The Commission itself had previously recognized that average car costs are depressed by net per diem balances. Thus, in *Louisville & N. R. Co.* v. *Southern Ry. Co.*, 319 I.C.C. 639, 654

The Commission did not even purport to find as a fact that the car costs associated with North-South traffic are 32 percent higher in the North. The Commission instead merely stated that "there are very real differences in the car costs in each territory and the causes are known" (325 I.C.C. at 63; A. 100). But the three "causes" listed by the Commission do not provide any rational support for a 32 percent inflation in the Northern car costs.

The first "cause" assigned by the Commission is "a difference in utilization of 39.4 car-miles per day in the North and 49.5 car-miles per day in the South" (325 I.C.C. at 63-64; A. 100). These figures are *not* related to North-South traffic. The Northern railroads' witness who presented these figures admitted that they represent territorial averages for "all traffic in all types of cars and without separation of line-haul and terminal" (A. 1027-1028). That is to say, the utilization figures employed by the Commission are the average miles per car computed by dividing all car miles by all car days in a territory whether a car is moving on line or standing in some terminal. It is arbitrary and irrational to defend the application of average car costs to North-South traffic by citing car utilization

---

(1963), the Commission held that, because the *L&N* was a car-owning railroad, its average car costs, as computed under the Commission's "Rail Form A" original cost method, were depressed by car rental payments, computed on a reproduction cost basis. The Commission there held that it should "deviate from Rail Form A" in computing car costs for divisions purposes in order to nullify this essentially irrelevant factor (319 I.C.C. at 654). This decision was challenged on the ground that the Commission improperly departed from the average car costs, but the Commission was upheld on judicial review. *Carolina & Northwestern Ry. Co.* v. *United States*, 234 F. Supp. 112 (W.D.N.C. 1964), affirmed, 380 U.S. 526 (1965).

figures that relate to "all traffic in all types of cars." These average car utilization figures have no more relationship to North-South traffic than the average car costs. There is no finding, and no evidence, to indicate that the car utilization (car miles per day) of the Northern railroads is any less than that of the Southern railroads with respect to the cars handling the North-South traffic in issue.[33]

The second "cause" relied upon by the Commission to explain the average car cost differences as between the territories is "differences in tax and wage rates" (325 I.C.C. at 64; A. 100). There is no evidence of record to support any difference in tax rates on railroad freight cars. The evidence in the record relates to the tax rate per dollar of investment in all railroad property, and that evidence shows that the tax rates are *higher in the South* (A. 1295). The only evidence of differences in wage rates shows a 3 percent higher wage rate for maintenance of equipment in the North (A. 943), and this fails to take any account of the relative prices of materials in the South and in the North (see A. 1030-1031; 793-794). Moreover, a 3 percent differential, even if properly related to a part of the car costs, cannot justify a 32 percent inflation for the North for all car costs.

The third and final "cause" assigned by the Commission as an explanation for differences in car costs in the respective territories is "a difference in the relative amount of off-line use of owned cars in all territories," specifically, "a greater relative use in connection with the traffic here at issue of cars owned by official territory railroads than

---

[33] The Northern railroads' own evidence indicates that the North-South traffic is handled in through trains in the North (A. 983-985), whereas traffic not at issue here but important to the Northern average experiences very low utilization of cars (A. 797-805).

of cars of southern ownership" (325 I.C.C. at 64; A. 100-101). But, as already shown, far from supporting the Commission's use of territorial average car costs, this fact clearly demonstrates the error of that action, for it shows that North-South traffic is unlike, not like, the total traffic from which the territorial averages are computed.

The above-described treatment accorded to the issue of car costs by the Commission is unlawful on at least three grounds. In the first place, because the Commission action in imputing 32 percent higher car costs to the Northern railroads is not justified by its own findings, this action violates the requirement of Section 8(b) of the Administrative Procedure Act that there be reasoned findings to support administrative action. Secondly, because there is no evidence in the record to support a finding of 32 percent higher Northern car costs in handling the same cars carrying North-South traffic, and because the record shows instead that this higher territorial average figure is the product of a car rental situation which is not characteristic of the North-South traffic here at issue, the Commission's use of the territorial average figure is arbitrary and without the support of substantial evidence, as required by Section 10(e) of the Administrative Procedure Act.

Finally, the Commission violated Section 15(6) of the Interstate Commerce Act by failing to differentiate the railroads' separate functions as car-owning or renting agencies (a rental transaction) and as transportation agencies. In a divisions case under Section 15(6), the responsibility of the Commission is to determine the costs incurred by the respective railroads "in the service of *transportation*" (emphasis supplied). This determination has nothing whatever to do with the separate problem of the financial results each railroad experiences in car

rentals. Yet, the territorial average car costs used here are dominated by the results of car rentals, and the Commission openly and mistakenly relied upon the results of car rentals to justify its use of such average figures.

This action was directly contrary to Section 15(6) for reasons that Commission counsel and the United States recently stated to this Court. In defending the Commission's action in adjusting average car costs to offset the effect of net per diem balances in the *L&N* case previously cited (p. 50, n. 32, *supra*), Government counsel replied as follows to the contention that territorial averages should have been used (Motion to Affirm of United States and I.C.C. in *Carolina & Northwestern Ry. Co.* v. *United States*, No. 838, Oct. Term 1964, pp. 9-10):

> "This argument confuses two wholly unrelated subjects, namely, *freight* revenues and *rental* revenues. Section 15(6) of the Act, as it applies here, deals with rate divisions on the basis of carriers' respective costs and revenues in providing *'the service of transportation'* (emphasis added). 49 U.S.C. 15(6). The L.&N. participates in a 'transportation service' only between the coal mines and Knoxville. Beyond the interchange point on the Southern's lines, L.&N. is merely renting its facilities to another railroad. Whether the L.&N. made or lost money on the rental transaction does not affect L.&N.'s costs in providing 'the service of transportation' on its own lines."

This Court affirmed the judgment of the three-judge court sustaining the Commission's action in the *L&N* case (380 U.S. 526 (1965)). In the present case, however, in failing to exclude the effect of the car rental income on the average costs of the Southern railroads, and in thus commingling the entirely separate rental factor with "the service of transportation," the Commission committed the very legal

error which it emphasized and carefully avoided in the *L&N* case.

D. The Commission's Determination Of Switching Costs Is Not Supported By Reasoned Findings Based Upon Substantial Evidence.

The district court found that the Commission had committed legal error in its treatment of the issue of "switching costs." The specific cost factor in controversy before the Commission was the switching service actually performed in originating and terminating North-South freight traffic. As the Commission elsewhere acknowledged in its report:

> "There is a great variation from one point to another in the amount of both terminal switching and interchange switching due to the physical layout of the tracks, volume handled, and other causes" (325 I.C.C. at 59; A. 94).

The factual question before the Commission was the measure of the switching costs actually associated with cars handling the North-South freight traffic in issue.

In line with their general cost approach, the Northern railroads placed their entire reliance upon the territorial average switching service for the average car in each territory. The Southern railroads, on the other hand, sought to develop the costs associated with the particular traffic in issue. However, the Southern railroads only had access to the data necessary to develop the switching service per car of North-South traffic for the service performed in the South, and, accordingly, the studies which they made, based upon a scientifically selected sample of North-South freight traffic (325 I.C.C. at 73; A. 115), were limited to the South. These studies showed that substantially greater

switching services were performed by the Southern railroads in originating and terminating North-South traffic than were performed in handling average traffic within the South (325 I.C.C. at 72; A. 114). In the face of these special studies, the Northern railroads continued to rely upon the territorial average switching costs which were substantially higher in the North (325 I.C.C. at 73; A. 116). Consequently, the record does not show the switching services performed by the Northern railroads in handling North-South traffic. Instead, the Southern railroads were obliged to make an estimate as to the cost of these services, which estimate, based on the best information available to the Southern railroads, showed that the territorial average switching costs did not accurately measure the costs of switching North-South traffic (A. 875-876, 883).

In another case, the Commission criticized the use of territorial average switching costs and stated that the parties in possession of the facts "should have made detailed switching studies to determine the switching minutes per car" (*Commodities—Pan-Atlantic Steamship Corporation*, 313 I.C.C. 23, 57 (1960)). However, in the present case the Commission rejected the Southern railroads' switching studies and used Rail Form A territorial average switching costs in prescribing the new divisions (325 I.C.C. at 77; A. 121). A basic reason for the rejection of the Southern railroads' studies was that "the adjustment in the North was not made on a basis comparable to that in the South, and here, where the relationship of North and South is of prime importance, this is a major defect" (325 I.C.C. at 76; A. 121). This treatment of the question of comparability was unlawful because it placed upon the Southern railroads the impossible burden of making switching studies in the North. And the absence of any independent

evidence in the record to support the applicability of territorial average switching costs leaves the Commission's order without the support of substantial evidence.

Commission counsel correctly state the issue presented to the Commission when they point out: "The Southern lines urged that their Rail Form A territorial average switching costs were depressed by the large proportion of volume movements of certain commodities in their territory to the point that those costs were not representative of North-South traffic which includes only a small amount of such commodities" (ICC Brief, p. 39). However, Commission counsel make no effort to explain how this issue was resolved with reasoned findings based upon substantial evidence. Instead, they simply quote from the Commission's report the very language in which the Commission refused to pass upon the issue because of the lack of comparable evidence (ICC Brief, pp. 39-40).

The Northern railroads seek to confuse the issue by reference to their train utilization study (B&O Brief, p. 32) and to the Commission's statement that North-South traffic "is a large and varied body of the traffic moving and coming from terminals in all parts of both territories" (B&O Brief, p. 40), intimating, but not saying, that the train utilization study constitutes independent evidence to support the application of territorial average switching costs to the North-South traffic at issue. This is plainly not the case. The fact that North-South traffic might at some time be hauled over every route in both territories would not lend any support to the use of average switching costs in the terminals in each territory, since the issue, as Commission counsel point out, is not whether there is some peculiar characteristic of North-South traffic which affects its switching costs, but whether the territorial averages for

the North and South are affected by differences in the characteristics of *intraterritorial* traffic that are not applicable to North-South traffic.

In *Boston and Maine R. Co.* v. *United States,* 208 F. Supp. 661 (D. Mass. 1962), affirmed, 371 U.S. 26 (1962), the Court reviewed a Commission decision in which the same Northern railroads had contended for the use of Rail Form A territorial average costs on the ground that the only comparable cost data as between Northern and Southern carriers were those on the basis of territorial averages (see 309 I.C.C. at 509). The Commission rejected the use of territorial average costs and prescribed instead the uniform divisional scale applicable to North-South traffic. The order was sustained on judicial review with specific reference to switching costs (208 F. Supp. at 675):

> "In the supplemental exceptions, dated March 9, 1959, filed by N.Y.C. to the proposed report of the examiner, it is stated (at page 24) that L&N's restatement of the northern railroads' cost study 'destroyed any possible comparison by adjusting the L&N costs without making similar adjustments in the N.Y.C. costs.' N.Y.C. went on to say that 'it would be unrealistic to expect the New York Central to study the movements at the 130 points involved' on its railroad. N.Y.C. argues that since the burden of proving the unreasonableness of existing divisions was upon the complainant L&N, it was incumbent upon the latter carrier to produce evidence of the relative costs of handling the traffic in question. L&N, however, did introduce in evidence its own actual costs in place of average costs. The costs put in evidence by N.Y.C. were unadjusted average costs for the northern railroads which did not reflect the actual costs. The Commission found that this evidence was not helpful in determining the costs of the particular traffic involved in this case. N.Y.C. now takes the position that the burden of adjusting the

> average costs presented in evidence by the *plaintiffs* [Northern lines] was on the L&N, even though the data necessary to make these adjustments were not available to the L&N and could only be produced by the plaintiffs themselves. We think this position is untenable."

The same position of the same Northern railroads is untenable here.

The decision of the court below in this case is thus in accord with the treatment of switching costs previously affirmed by the Court. In the absence of any evidence relating territorial average switching costs to the relative costs of the Northern and Southern railroads in handling the North-South traffic here in issue, the district court was clearly correct in setting aside the Commission's order.

E. The Commission's Determination of The Empty Return Ratios Applicable to North-South Traffic Is Wholly Unsupported.

A significant factor in calculating the cost of transporting a loaded freight car is the empty movement of freight cars associated with the loaded movement. This factor, stated in the form of an "empty return ratio" (the ratio of the empty mileage related to the loaded mileage of the traffic in question), is applied to the unit costs for loaded movements and has an important effect upon the determination of railroad costs. Even though the cost of hauling a loaded car in one territory might be exactly the same as the cost of hauling the same car in another territory, such uniformity of cost is drastically altered if a higher ratio of empty to loaded mileage is applicable to the costs in one territory. To an important extent, the higher costs of the Northern railroads result from the Commission's use of higher Northern territorial average empty return

ratios. The district court held that the Commission's determination to use these territorial average empty return ratios in developing the costs of North-South traffic was unlawful (A. 355). Again, an analysis of the Commission's statement of the issue clearly demonstrates that the district court's holding was correct.

Since the bulk of the North-South traffic moves in box cars (A. 95), the primary controversy over empty return ratios concerned the Northern railroads' use of territorial average empty return ratios for all box cars in determining the cost of the box cars carrying North-South traffic. The territorial average ratios are 39 percent in the North and 33 percent in the South (325 I.C.C. at 64; A. 102), meaning that the Northern average is 18 percent higher than the Southern average. The Commission used these ratios without any evidence at all that they are applicable to North-South traffic and in the face of evidence which showed that the application of the territorial averages to North-South traffic is inherently misleading.

A basic problem in dealing with territorial average box car empty return ratios is that numerous box cars are specially assigned to shuttle between particular points and thus have a 100 percent empty return ratio. Automobile parts manufactured in the Detroit area are carried almost exclusively in assigned box cars to automobile plants in New Jersey, Kansas, Texas, California and Georgia, and those box cars return empty to the Detroit area origin point (A. 746, 1011-1018). In contrast, most other box cars are in general service and experience much lower empty return ratios.[34] The result, as a matter of simple arithmetic, is

---

[34] The Commission described this basic situation as follows (325 I.C.C. at 64; A. 102):

> "In this category of boxcars are general purpose cars which can be utilized by and are available to all shippers for loading

that the territorial average box car empty return ratio of any territory will be substantially influenced by the proportion of box cars which have a 100 percent empty return ratio. All other things being equal, the territory with the highest proportion of assigned cars to total box cars will have the highest territorial average box car empty return ratio. Thus, even if the North and the South in fact have the *same* empty return ratios on general purpose box cars, and the *same* 100 percent empty return ratio on assigned box cars, the application of the territorial average empty return ratio of all box cars would produce an artificial inflation for the North if the Northern railroads have a significantly higher proportion of assigned cars (A. 847, 1306-1308).

The record does not show the precise extent to which the higher average box car empty return ratios of the Northern railroads are actually the product of this purely statistical phenomenon. The Southern railroads did not have this evidence in their possession, and the Northern railroads did not come forward with it.[35] The Southern railroads did show that virtually all of the automobile

---

all types of commodities not requiring special type equipment, and boxcars suitable for loading special commodities, which, though they may be suited for some type of return load, are in assigned service and thus returned empty, with some exceptions, to the point of loading. Included therein are cars used for transporting auto parts, which are specifically designed to handle such commodities."

[35] Indeed, the Northern railroads flatly rejected a proposal, made by the Southern railroads at the first hearing, that a joint study of box car empty return ratios be conducted (A. 991-994, 847-849). The Northern railroads refused to furnish the data for the box cars on their lines in the form requested, or to make any alternative proposal for separating the territorial average box car empty ratio.

parts manufacturing plants are in the Detroit area and that the Northern proportion of automobile parts traffic is substantially higher than the Southern proportion (A. 849). And the Southern railroads showed that the railroads which predominantly serve Detroit and handle a greater proportion of the automobile parts traffic report box car average empty return ratios substantially higher than even the territorial average for the North (A. 104).[36]

The Commission was plainly in error when it rejected the only factual showing with respect to the influence of assigned cars on the Northern averages which the Southern railroads were in a position to make. The Commission's response to this showing was as follows (325 I.C.C. at 66; A. 105):

> "The comparison is based on only three observations and is therefore too limited to be representative. At best, *it may be a coincidence or caused by some unknown factor,* and is not otherwise supported" (emphasis supplied).

---

[36] The Northern lines were well aware that the proportion of special cars was greater in the North and that this fact inflated the average box car empty return ratio in the North to a greater extent than for the South (A. 1024-1026). Indeed, it was this knowledge of the impact of the Southern railroads' request for a special study of empty return ratios that dictated the Northern railroads' refusal to produce the facts, as their witness admitted (A. 1023):

> "When this request is made, it is made for a definite purpose. We have to consider the object when we consider whether we want to comply."

The Northern railroads thus frustrated the Southern railroads' efforts to obtain the basic data on box car empty return ratios and then criticized every effort of the Southern railroads to estimate the box car empty return ratios actually applicable to the North-South traffic in the absence of a study which only the Northern railroads could make.

Of course, the Northern railroads, and the Northern railroads alone, were in a position to show that an "unknown factor" was the cause of the unusually high empty return ratios of the railroads serving Detroit. Presumably, if such ratios could have been explained on any ground other than the high proportion of assigned cars that they handle, such explanation would have been offered. In the face of the Northern railroads' refusal to present evidence on this subject, the Commission nevertheless concluded (325 I.C.C. at 67; A. 106):

> "There are undoubtedly instances where specially equipped or directly assigned boxcars have a 100-percent empty return. . . . The five items above tend to show that these cars may have some effect on the empty return ratio, but they do not support a conclusion that any adjustment is warranted here as to the amount of the effect other than that reflected in the averages used."

If the high proportion of automobile parts traffic of the Northern railroads serving Detroit was not the cause of the Northern railroads' higher average box car empty return ratios, the Northern railroads and only the Northern railroads were in possession of the data necessary to explain this phenomenon. To impose upon the Southern railroads the burden of proof with respect to facts as to which the Northern railroads had the duty to come forward was unlawful (p. 23, n. 8, *supra*). But quite apart from any considerations of burden of proof, the Commission's rejection of the Southern railroads' explanation of the higher territorial average empty return ratio for the North does not support the Commission's order. In the absence of *any* evidence, whether submitted by the Northern railroads or otherwise obtained, showing that the empty return ratios with respect to box cars carrying North-South traffic are higher in the North, the Commission's action

in granting the Northern railroads an inflation in their divisions because of higher box car empty return ratios is not supported by substantial evidence.

The district court correctly recognized the essential unlawfulness of the Commission's treatment of empty return ratios (A. 346), quoting from Commissioner Murphy, who summarized the situation in his dissenting opinion as follows (325 I.C.C. at 54; A. 85):

> "The higher than average empty return ratios used for cars moving over the official lines is another instance where true costs have not been used. The official lines handle approximately 800,000 carloads of automobile parts annually which originate in the Detroit, Mich., area and are destined to assembly plants in various parts of the country, including New Jersey, California, and Georgia. Many of these cars are fitted with special devices to protect the automobile parts in transit. Because these cars carrying parts contain special devices and are assigned to particular plants manufacturing such parts in official territory, they normally experience an empty return movement which is, for all practical purposes, 100 percent. No adjustment is made in the cost data to cover the higher empty return costs of this type of equipment. Territorial average box car empty return ratios, as used in the report, overstate the costs of the official railroads when applied to Official-Southern traffic."[37]

[37] Commissioner Murphy's point is particularly significant because, in an earlier divisions case involving a Southern railroad and all Northern railroads, the Commission itself had criticized the Northern railroads for failing to adjust the territorial average empty return ratios because of the "cars specifically equipped for automobile parts, which cannot be used for return loading." *Louisville & N. R. Co.* v. *Akron, C. & Y. R. Co.*, 309 I.C.C. 491, 509 (1960) affirmed sub. nom. *Boston and Maine R. Co.* v. *United States*, 208 F.Supp. 661 (D. Mass. 1962), affirmed 371 U.S. 26 (1962).

Appellants object to this disposition of the issue by the district court, claiming that the district court failed to discuss "the reasons expressed by the Commission or the rationale supporting its conclusion" (ICC Brief, p. 38 n. 34; B&O Brief, p. 41). But the problem here is that the Commission did not express reasons or supply a rationale for its refusal to consider the impact of automobile parts traffic on the territorial average empty return ratios, and that is precisely why the district court held its action to be unlawful. The district court was eminently correct in quoting and relying upon Commissioner Murphy's opinion, since there has not been, and on this record there could not be, an answer to his criticism of the application of territorial average empty return ratios to North-South traffic.

The plain fact is that the Commission's action in using average box car empty return ratios as the measure of such

---

The Commission seeks to distinguish this *L&N* case on the ground that automobile parts are "not at all dominant" in the present case, comprising only 33,983 cars of the North-South traffic (325 I.C.C. at 67; A. 106). Actually, this is as many cars as were involved in that entire litigation (309 I.C.C. at 493). Even if only 33,983 cars of North-South traffic are involved, there is no basis for using a territorial average which is higher in the North while conceding that 33,983 cars have a uniform 100 percent empty return ratio in both the North and the South.

Moreover, the Commission's statement is no answer at all to the basic problem created by the 100 percent empty return ratio of the assigned cars in the North which inflates the territorial average applied by the Commission to box cars in general service. Indeed, the relatively small number of such cars in the traffic in which Southern railroads participate as compared to other traffic handled by the Northern railroads is the very source of this problem, and this is the point Commissioner Murphy was making. It shows that the Northern railroads' territorial average empty return ratio for all box cars is higher than that of the Southern railroads for a reason that has no relationship to the general purpose box cars used in handling North-South traffic.

ratios on North-South traffic is not supported by substantial evidence, or any evidence at all, but it is directly contrary to the evidence.[38] The Northern railroads have not established and cannot establish, that their box car empty return ratios are any higher than those of the Southern railroads on North-South traffic. The whole claim here rests upon a statistical illusion, a classic example of the sort of thing to which Mr. Justice Brandeis was referring when he recognized that "averages are apt to be misleading." *United States* v. *Abilene & Southern R. Co.*, 265 U.S. 274, 291 (1924). It is also the kind of case to which Section 10(e) of the Administrative Procedure Act was directed in requiring that the courts set aside administrative orders not supported by substantial evidence.

F. The Commission's Resolution of the Issues With Respect to the Count of Cars Interchanged Was Unlawful.

The nature of the cost problem presented by the count of cars was summarized in the dissenting opinion of Com-

---

[38] Refrigerator cars present essentially the same problem with respect to the empty return ratio cost factor as do the general purpose and assigned service box cars discussed above. Fresh meat moves in assigned refrigerator cars owned by the meat packing companies in much the same fashion as automobile parts move in assigned box cars. Because the proportion of fresh meat traffic is greater in the North than in the South (A. 851-852), these assigned refrigerators cars, like their box car counterparts, inflate the Northern railroads' average refrigerator car empty return ratios for a reason that has nothing to do with the North-South freight traffic at issue. Yet the Commission used territorial average refrigerator car empty return ratios without making any allowance at all for the impact upon these averages of such assigned cars.

missioner Murphy as follows (325 I.C.C. at 54-55; A. 86):

> "The improper counting of a car interchanged instead of terminated by the official lines affects the weighting of that car in computing switching costs. The official lines report a large volume of coal and ore terminated at port dumping facilities for loading onto boats as cars interchanged, while the southern lines report a large volume of phosphate rock hauled to ports for loading onto boats as cars terminated. These cars receive analogous services and should be treated as such. In both these instances the lading from the car is removed and the empty car is returned to the delivering carriers. The erroneous counting of cars terminated as cars interchanged on the official lines produces higher unit costs for official territory than for southern territory, both for origin and destination switching and for interchange switching."

No feature of this statement of the problem is questioned in the Commission's report. Instead, the Commission devotes its report to an attack upon the "estimate" used by the Southern railroads in an effort to correct the inconsistent counting of cars (325 I.C.C. 58-60; A. 91-94). The estimate in question was based upon certain reports made by the Northern railroads to the Commission (325 I.C.C. at 58; A. 92). The Northern railroads contended that "the information available is inadequate to correctly compute the adjustment" (325 I.C.C. 58; A. 92). The Commission accepted the "contentions" of the Northern railroads, and made no adjustment at all to correct the admitted inconsistency in the car count statistics underlying the average costs (325 I.C.C. 60; A. 94).

This was not a lawful disposition of the issue. Even assuming that the estimate made by the Southern railroads was inadequate, it was incumbent upon the Northern railroads to produce the data in their possession necessary to make an adjustment without resort to any estimate. Other-

wise, the Commission itself should have required the production of this data if, as it held, such data were necessary to a proper determination of the cost issues. Instead, the Commission permitted the Northern railroads to benefit from an inflation in their costs which was due in substantial part to a manifest inconsistency in the statistical count of cars, by accepting the Northern railroads' criticisms of the Southern railroads' effort to correct the statistics as a ground for making no adjustment at all. The Commission's action in granting an inflation to the Northern lines is not supported by substantial evidence where the inflation results from an admitted inconsistency in the count of cars interchanged.

G. The Commission's Treatment of the Constant Cost of Transit Commodities Was Unlawful.

This issue concerns the proper treatment of constant costs (including overhead costs of freight service) where the rates on raw materials are inseparably related to the rates on finished products. For example, pulpwood moves to paper plants within the South on rates which include little or no allowance for recovery of overhead costs (A. 881-882). The low rates on the inbound pulpwood are made at a very low level because they are related to the rates on finished paper products moving from the paper plants, including paper moving from the South to the North (A. 881).

When the Southern railroads urged an adjustment in the territorial average costs imputed to the North-South paper traffic to reflect the full costs of this traffic in the South, the Northern railroads again objected to the Southern railroads' position on the ground that a comparable adjustment would have to be made in the costs for the North (325 I.C.C. at 79-80; A. 126-127). But the Northern rail-

roads failed to come forward with any data showing that there is, in fact, a similar situation in the North. Indeed, the Northern railroads' own witness conceded that no such situation existed there (A. 1011). Yet the Commission upheld the Northern railroads' position and used average costs for both groups of railroads. On a record showing that no comparable situation existed in the North, the Commission's action was not supported by substantial evidence.[39]

III. THE COMMISSION HAS NOT LAWFULLY JUSTIFIED ITS ABANDONMENT OF UNIFORM DIVISIONS BETWEEN TERRITORIES HAVING UNIFORM RATES.

Beyond the question of the legal defects in the Commission's determination of relative cost of service and the unlawfulness of its treatment of particular cost issues, the

---

[39] The Southern railroads' claim for inclusion of the deficits on pulpwood traffic as part of the cost of North-South traffic was based on the relationship between the rates on the inbound raw materials and the outbound movement of the finished products. *Pulpwood, North Carolina and Virginia to Cypress, Virginia*, 235 I.C.C. 11, 13 (1939). Assuming, however, that Commission counsel were correct in arguing that there is not a sufficient relationship between the inbound raw materials and the outbound traffic (ICC Brief, p. 47, n. 43), the fact remains that there is a pulpwood deficit borne by the Southern railroads (A. 881). If appellants were correct in their argument that commuter deficits, incurred wholly within the North and without any relationship to North-South traffic, "must be recovered from railroad freight operations if railroads are to remain solvent," as appellants argue (ICC Brief, p. 44; see also B&O Brief, p. 48), the same reasoning would apply to the deficits incurred by the Southern railroads on unrelated traffic. Appellants make no effort to reconcile their position on Northern commuter deficits with their position on the deficits borne by Southern railroads.

Commission committed a separate error in not justifying its abandonment of uniform divisions between the North and the South, particularly since those territories have uniform rate levels. On this issue, the district court pointed out (A. 351):

> "Furthermore, for many years prior to this case the Commission has consistently followed the view that the primary responsibility for meeting the cost and revenue needs of the railroads of any territory lies with the people and the industry of that territory. *New England Divisions,* 126 I.C.C. 579, 599 (1927); *Divisions of Rates, Official and Southern Territories,* 234 I.C.C. 175, 190 (1939); *Official-Southern Divisions,* 287 I.C.C. 497, 523 (1953); *Akron, Canton & Youngstown R. Co. v. Atchison, T. & S.F. Ry. Co.,* 321 I.C.C. 17, 51 (1963). In this very case, prior to re-opening, the Commission held that the primary division of revenues accruing from this traffic were to be made on an equal-factor scale. We recognize that the Commission is not perpetually bound by their 1953 holding, but we do believe that the Commission has special responsibilities in a case of this magnitude when it departs from its prior finding. (*Sec'y of Agriculture* v. *United States,* 347 U.S. 645)."

Appellants criticize this holding, suggesting: "[T]here is clearly nothing novel about one group of lines having proportionately higher divisions than the other on North-South traffic" (B&O Brief, pp. 61-62, n. 30), and pointing out that the Commission has power to change any of its decisions (ICC Brief, p. 54, n. 48). However, the district court expressly recognized the Commission's power to change its policies and decisions, holding only that when such a change is made, the Commission must explain the reasons for its action. This principle is plainly sound and fully supported by the decision of this Court in *Secretary of Agriculture* v. *United States,* 347 U.S. 645, 652-654 (1954), cited by the district court.

Appellants do not and cannot deny that in prescribing divisions on North-South traffic the Commission has regularly followed its policy of placing the primary responsibility for meeting the cost and revenue needs of any territory upon the people and industry of that territory. In 1939, the first time that the Commission prescribed a general basis of divisions on North-South traffic, the Commission ordered an inflation in the divisions of the Southern railroads on the express ground that the rates in the South were higher than the rates in the North. *Divisions of Rates, Official and Southern Territories,* 234 I.C.C. 175, 190 (1939):

> "In view of the factors which have been responsible for the measure of these rates, therefore, there is logic in the argument of the southern lines that 'the rates which contain something above the official level, because of the southern lines' participation, should be divided so as to give the increment in the rate to the southern carriers.'"

On that portion of the North-South traffic as to which the rate level in the South was not on a substantially higher level than in the North, no inflation was prescribed (234 I.C.C. at 191, 192-193):

> "In our view the existence of the increment or excess in the interterritorial rates may and should be taken into account by allowing the southern lines divisional factors on general traffic higher than those of the northern lines by a uniform percentage.
>
> • • •
>
> . . . Where no such increment is to be found in the rates . . . fair application of the principal demands that the divisions of each group of carriers be on the same basis."

Thereafter, the Commission found that the higher rate level in the South discriminated against the South and

prescribed a uniform level of class rates. *Class Rates Investigation, 1939,* 262 I.C.C. 447 (1945); 281 I.C.C. 213 (1951). The Commission's action was upheld by this Court in *New York* v. *United States,* 331 U.S. 284 (1947). In 1953, in recognition of its previous action in prescribing a uniform rate level, the Commission prescribed divisions on a uniform basis with no inflation for either Northern or Southern railroads. *Official-Southern Divisions,* 287 I.C.C. 497, 523 (1953). The same action was taken in *Official-Southwestern Divisions,* 287 I.C.C. 553, 580 (1953).

Measured against this long-established relationship between divisions and the relative rate levels in the two territories, what reason or basis does the Commission now advance for changing its method of determining the propriety of an inflation? There has been no change in the uniformity of the class rates prescribed by the Commission and upheld by this Court. And there was no showing by the Northern railroads that there is any higher rate level in the North which would justify an inflation in the Northern divisions under the Commission's long-established standard.

In citing past North-South divisions cases in which divisions inflations were prescribed (B&O Brief, pp. 61-62, n. 30), appellants disregard the critical fact that in those cases, differences in divisions were justified by different rate levels. If the alleged higher costs in the North were actually reflected in higher rates in the North than in the South, the situation would be very different. Under such a hypothesis, the Southern railroads and the Southern economy would have a competitive advantage over shippers in the North, an advantage which would offset the payment of inflated divisions reflecting the higher rate level in the North. This situation was just the reverse when the Southern railroads received inflated divisions due to a higher rate level in the South.

Now, however, the rates are uniform in the North and South. They were made uniform for the express purpose of relieving the Southern economy of the disadvantage of a higher rate level. *New York* v. *United States*, 331 U.S. 284 (1947). The Northern railroads do not suggest that they are willing to subject the North to the disadvantages of a higher rate level. The Northern railroads want it both ways. They would keep the rate structure uniform so that Northern shippers can compete with Southern shippers on an equal basis, but they would nevertheless impose upon the Southern railroads the burden of subsidizing the allegedly higher Northern costs. This puts the cart before the horse. Unless and until the Commission prescribes higher rates for the North, higher *territorial average* costs may not be used to take money from the Southern railroads and the economy which they serve. The Commission itself did not purport to base its order on costs representing the territorial average costs, but upon the costs of North-South traffic (p. 4, *supra*).

Nothing in Section 15(6) of the Interstate Commerce Act authorizes the Commission to regard divisions based upon relative costs as so obviously just, reasonable, and equitable, that their prescription follows as a matter of course and without the reasoned findings to explain such action as required by the Administrative Procedure Act. It is important to recognize that cost-oriented divisions, even if based upon the costs incurred in handling the traffic at issue, have an effect far beyond merely returning higher costs to the railroads which incurred them. Such a cost basis of divisions also divides the profits realized on the traffic involved in accordance with cost proportions, which means that the railroads with higher costs for performing the same services not only recover those costs, but also receive a greater share of the profits by virtue of

the existence of such higher costs. Thus, in this case, the Northern railroads are given an inflated share of approximately $140 million in profits realized in excess of all of the costs incurred by all of the railroads participating in the movement of North-South freight traffic, even under the cost findings of the Commission.[40]

On the face of the matter, the division of profits realized from the movement of freight traffic would seem to turn more upon considerations of revenue need than costs. Indeed, in *Akron, Canton & Youngstown R. Co.* v. *Atchison, T. & S.F. Ry. Co.*, 321 I.C.C. 17, 51 (1963), the Commission itself took the position that constant costs, as well as profits, "are significant in the consideration of revenue need." Under this approach, the revenues in excess of out-of-pocket costs would have been divided on the basis of revenue needs rather than cost considerations.

The arguments advanced by the appellants in this Court greatly strengthen this conclusion. For appellants attack the judgment of the district court requiring the Commission to determine the actual costs of North-South traffic in large part upon the ground that it is impossible to determine the actual costs of this traffic (ICC Brief, pp. 26-27; B&O Brief, pp. 33-34). The Commission has not itself suggested that no greater precision than unadjusted territorial averages is possible in costing a body of traffic. But if appellants were correct that it is impossible to determine the costs of North-South traffic with any precision, what then is the justification for the inflation accorded the Northern rail-

---

[40] From the Commission report (325 I.C.C. at 25-26; A. 48-49), it can be calculated that total revenues on this traffic amount to $496,086,000 ($221,430,000 plus $274,656,000), while total costs as found by the Commission amount to $357,572,000 ($165,746,000 plus $191,826,000), from which figures the profit on the traffic appears as $138,514,000.

roads? This argument reduces this entire proceeding to a shell game. The Northern railroads ask for and receive an inflation in their divisions to offset allegedly higher costs of handling North-South traffic. But when the district court sets aside that order because the claim of higher Northern costs is not supported by evidence of the specific higher costs claimed, that judgment is criticized on the ground that it is impossible to determine specific costs. If the Commission cannot determine with reasonable reliability that the Northern railroads have higher costs on North-South traffic, there is no basis for abandoning the policy of uniformity in divisions of revenues.

Moreover, the Northern railroads would have no just claim to recover higher costs incurred, even if such costs had properly been shown to be related to the traffic at issue, where these higher costs are the product of such factors as those claimed and found by the Commission to exist in this case. The higher Northern costs found and relied upon by the Commission in this case are not based upon any showing of inherently more difficult transportation conditions in the North. Instead, the Northern railroads' cost inflation is based wholly upon higher costs claimed to have been incurred on the specific items previously discussed (pp. 30-68, *supra*). Thus, even if the Commission's cost findings are accepted as establishing everything which they purport to establish, we are left with nothing more than findings such as: that the cost of interchanging cars is higher for the Northern railroads than for the Southern railroads, even where interchange occurs at jointly owned freight yards; that the Northern railroads have substantially higher car costs on traffic that moves in the same cars in both territories; that it costs the Northern railroads more to switch the same cars than it does the Southern railroads; and so on.

It is simply not correct, at least in the absence of specific justification by the Commission, that higher costs based upon these sorts of factors should be recoverable in the form of an inflation in divisional factors, even if such costs were shown to be applicable to the particular traffic involved. The very first standard toward which the Commission's attention is directed by Section 15(6) is that of relative efficiency. Although the Commission here concluded in ultimate terms that the two groups of carriers are equally efficient (325 I.C.C. at 16-18; A. 37-39), it never explained, or even attempted to explain, how this ultimate statutory conclusion could be squared with its cost findings. In the absence of any justification, the Commission's specific cost findings impeach the conclusion of equal efficiency.

The only discussion of any of these problems in the Commission's report appears in connection with the rejection of the position of the Southern Governors Conference and Southeastern Association of Railroad and Utilities Commissioners (325 I.C.C. at 26-28; A. 50-51). That portion of the report falls far short of containing any rational explanation that would enable anyone to understand why uniformity of rate levels is regarded as immaterial in this case although the same factor has been regarded as controlling by the same Commission administering the same statute for a generation.

As the district court pointed out, the Commission is not perpetually bound by prineiples it has previously followed in prescribing divisions between the North and the South, but it does have a statutory duty to articulate a policy which justifies any such major and radical change as is involved here.

IV. THE DISTRICT COURT WAS CORRECT IN SETTING ASIDE THE COMMISSION'S ORDERS WITHOUT RESERVING JURISDICTION.

The Northern railroads also argue that the district court erred in failing to reserve jurisdiction so as to permit a retroactive "application of such divisions as the Commission might ultimately prescribe to all traffic moving subsequent to April 20, 1965" (B&O Brief, p. 57). Commission counsel made no such request and the Northern railroads themselves never asked the court below to reserve jurisdiction. To the contrary, the Northern railroads expressly agreed in the court below to re-settle all revenues accruing during this litigation in accordance with the pre-existing basis of divisions, in the event the Commission's orders were set aside. Thus, the order of the district court denying an interlocutory injunction states (A. 170):

> "In the event the plaintiffs are successful in permanently setting aside the order of the Interstate Commerce Commission of February 3, 1965, intervening defendants, The Baltimore & Ohio Railroad Company et al., will resettle their accounts with plaintiffs, on traffic covered by the order of the Commission, on the basis of the present divisions, on all shipments made on and after April 20, 1965, with interest at the rate of 5% per annum on the monthly differences between revenues based upon the divisions prescribed by the Commission and revenues based upon the divisions now in effect, the said interest to be calculated from the customary accounting monthly settlement dates."

This order expressly recites that these are conditions "to which the intervening defendants, The Baltimore and Ohio Railroad Company et al., have agreed by filing written consent with the Clerk of this Court" (A. 169). There can be no justification for permitting the Northern railroads to renege on an explicit undertaking.

The refund obligation to which the Northern railroads subjected themselves relates to nothing more than the inflation in their divisions which was unlawfully prescribed. Clearly, the Northern railroads are not entitled to an inflation where they have not supported such a claim with evidence.

There is nothing unfair to the Northern railroads in such a procedure. It leaves those railroads in the precise position in which they affirmatively placed themselves when they successfully resisted an interlocutory injunction by their specific agreement to refund revenues they never would have received if an interlocutory injunction had issued. Moreover, it leaves the Northern railroads in precisely the same situation with respect to their claim for an inflation as that in which the Southern railroads find themselves with respect to their claim that the structure of the pre-existing equal-factor divisions unfairly favors the Northern railroads.

Throughout the proceedings before the Commission, the Southern railroads contended that the equal-factor basis of divisions then in effect contained a terminal allowance which was excessive to the extent of 37 factors (A. 829-830). Because the Northern railroads are predominately short-haul carriers on North-South traffic, this excessive terminal allowance accords the Northern railroads some $7,426,000 a year more revenue from North-South traffic than those railroads would be entitled to under a properly constructed equal-factor scale (A. 329).

The nature of this unfairness in scale construction may be illustrated by a comparison of the previously existing divisional scale (287 I.C.C. at 552, col. 1), with the equal-factor scale which the Southern railroads showed to be properly constructed in the proceedings before the Commission (287 I.C.C. 552, col. 1; A. 829-830):

Miles	Pre-existing Uniform Divisional Scale		Same Scale Corrected to Deduct 37 Factors	
	North	South	North	South
50	65	65	28	28
100	77	77	40	40
150	89	89	52	52
200	101	101	64	64
250	113	113	76	76
300	125	125	88	88
350	137	137	100	100
400	149	149	112	112
450	161	161	124	124
500	174	174	137	137
550	186	186	149	149
600	198	198	161	161
650	210	210	173	173
700	222	222	185	185
750	234	234	197	197
800	246	246	209	209
850	258	258	221	221
900	270	270	233	233
950	282	282	245	245
1000	294	294	257	257

Under either of these scales, if the hauls in the North and South are the same (300 miles in each territory, for example) each territory would receive 50 percent of the revenue. But if the hauls are different, then the difference in the construction of the scales has a substantial effect on the shares of the revenues. For a 50-mile haul in the North and a 1000-mile haul in the South, the existing uniform divisional scale would produce a division of 18 percent for the 50-mile haul in the North. Using the corrected scale, the division for the 50-mile haul in the North becomes 10 percent. This is a difference of 8 percentage points, or $8 out of every

$100 of revenue, and this difference in the revenues occurs even though both scales are uniform scales for both North and South with no inflation for either territory.

In its report, the Commission agreed with the Southern railroads' contentions with respect to the improper construction of the pre-existing equal-factor scale (325 I.C.C. at 37; A. 63):

> "The new evidence adduced upon further hearing demonstrates that the foregoing contentions of the southern lines have merit, and we so find."

Accordingly, the new scales prescribed by the Commission, although even more favorable to the Northern lines by reason of the inflation in their factors, do not contain the excessive terminal allowances which were present in the pre-existing equal-factor scales.

In the district court the Southern railroads took the position that in setting aside the inflation prescribed for the Northern railroads, the court need not disturb the Commission's action in correcting the terminal allowance in the scales, because, in our view, that latter aspect of the order was severable. The Northern railroads strongly opposed this contention and succeeded in convincing the district court that if the order were to be set aside, it must be set aside in its entirety (A. 330).

Under these circumstances, the effect of the judgment below is to set aside the Commission's order and leave the Northern railroads with an equal-factor basis of divisions that benefits the Northern railroads at the rate of $7,426,000 per year because of a distortion in the construction of the equal factor scales already found to be unlawful by the Commission on the basis of the evidence. The Southern railroads will have every bit as much incentive to expedite a decision of the Commission to correct a defect in the

divisional scales which they have already proved as the Northern railroads will have in attempting to obtain an inflation which they have not proved. Since there is nothing about this situation that is inequitable to the Northern railroads, there is no reason for this Court to disturb the form of judgment to which the Northern railroads agreed in the district court.

Nor, in a case in which the Commission's order has been held to be unlawful, is there anything inequitable about remanding the case to the Commission simply because the proceedings began some years before. The Northern railroads suggest that because of the lapse of time since this case was started before the Commission, this Court should sustain an otherwise unlawful order (B&O Brief, pp. 20, 30, 56). The Court has never sanctioned the notion that lapse of time justifies denying an aggrieved party effective judicial review.[41] And it would be grossly inequitable to burden the Southern railroads with reduced divisions where the Northern railroads, despite full opportunity to prove their case, failed to produce evidence to support any Northern inflation on North-South traffic.

---

[41] The cases relied upon by the Northern railroads are inapposite. In three of the cases, the question was whether judicial review of a particular issue should be granted in this Court or in a lower federal court, not whether effective judicial review should be denied altogether. *Consolo* v. *Federal Maritime Commission*, 383 U.S. 607, 621 (1966); *Chicago & N.W. R. Co.* v. *Atchison, T. & S. F. Ry. Co.*, 387 U.S. 326, 356 (1967); *Permian Basin Area Rate Cases*, 390 U.S. 747, 823-824 (1968). In the remaining case cited, *Illinois Central R. Co.* v. *Norfolk & Western R. Co.*, 385 U.S. 57, 75 (1966), the question was whether, upon holding that the Commission order was valid on the record as made, the Court should nevertheless remand the case to the Commission to take evidence of "present conditions." No such question is involved in this case, in which the district court has remanded the case to the Commission because it found that the order was not lawfully supported by the record (A. 354).

The duration of the most recent phase of the controversy, beginning with the Northern railroads' petition for an inflation in 1956, is chargeable to the Northern railroads and the Commission, not the Southern railroads.[42] Realistically, the struggle between the Northern and Southern railroads over divisions of freight rates was carried on for generations prior to this most recent phase. It was resolved in 1953, consistent with the landmark decision ordering uniformity of rates in *New York* v. *United States*, 331 U.S. 284 (1947), by the prescription of a uniform and equal basis of divisions. The Commission has not entered a lawful order, supported by evidence, changing those uniform divisions, and there is no reason to assume that the Commission will abandon equal divisions when the case is reconsidered on remand.

CONCLUSION

The district court has properly applied the standards of the Administrative Procedure Act in reviewing the Commission's order in this case. It has emphasized—not undermined—the Commission's responsibilities. The district

---

[42] Although the Northern railroads filed their petition for inflated divisions in November of 1956 (A. 373), they did not present their first witness until November of 1959 (A. 415). The Southern railroads completed the presentation of their evidence in July of 1960. The record was closed in February of 1961, but the Examiners' report was not served until July of 1963, and the Commission's report and order were not served until March of 1965.

Contrary to the contentions of the Northern railroads (B&O Brief, pp. 16-17), the district court did not hold that the Commission must make new traffic and cost studies. While observing that evidence was becoming more and more vulnerable to the charge of staleness, the district court specifically stated that this observation did not "indicate that it would necessarily be an abuse of discretion for the Commission not to re-open the investigation to receive later operating figures . . ." (A. 356).

court, in remanding the cause to the Commission, has not restricted the Commission in its use of Rail Form A costs or any other factor so long as their application under the standard adopted by the Commission is supported by evidence: No new limits or standards have been imposed on the Commission's discretion. There is only the requirement that its orders be based upon findings which are supported by evidence.

This case has been remanded to the Commission for further proceedings consistent with requirements of the Administrative Procedure Act. The United States, which is charged by statute with the responsibility for defending orders of the Commission, has not appealed this disposition of the case.

Accordingly, the judgment of the district court should be affirmed.

IN THE

Supreme Court of the United States

OCTOBER TERM, 1968.

THE BALTIMORE AND OHIO RAILROAD COMPANY, ET AL.,

Appellants

v.

ABERDEEN AND ROCKFISH RAILROAD COMPANY, ET AL.,

Appellees

ON APPEAL FROM THE UNITED STATES DISTRICT COURT FOR THE EASTERN DISTRICT OF LOUISIANA, NEW ORLEANS DIVISION.

REPLY BRIEF FOR APPELLANTS.

Appellants, generally herein called "Northern railroads", will first answer the brief of the Southern railroads, to the extent necessary and will thereafter answer the brief of the Southern Governors' Conference, et al.[1]

1. After stating that this case has been remanded to the Commission for further proceedings consistent with the requirements of the Administrative Procedure Act, Southern railroads say on page 82 of their brief: "The United States, which is charged by statute with the responsibility for defending orders of the Commission, has not appealed this disposition of the case." At page 7, Southern roads again bring this matter to the attention of the Court. In the court

I. Reply to Southern Lines' First Point, That "The Inflation" Was Not Supported by Substantial Evidence or Reasoned Findings.

It should be said, at the outset, that the Southern lines' assertion that the Commission did not make adequate findings is simply incorrect. In addition to its general findings about its cost determinations, Appendix B to its report (A. 87-129) contains a detailed discussion of the disputed cost adjustments and shows specifically the reasons that led the Commission to reject the adjustments which it did reject. Northern lines believe that the Court will find in that Appendix an unusually thorough statement of findings in support of the action taken with respect to these disputed cost points.

The cost evidence upon which the Commission acted in the proceeding here under review was that resulting from Southern lines' application of regional unit costs for Official and Southern territories (as adjusted in five respects advocated by Southern lines) to the exact units of transportation involved in the North-South traffic, as disclosed by Southern lines' traffic study. The Commission found that these costs "adequately reflect the costs which are attributable to the traffic at issue" (A. 49-50), and are "reasonably accurate and reliable for purposes of determining the relative contribution by the groups on a cost-of-service basis . . ." (A. 78).

It may be noted in summary form, that the following facts before the Commission supported these findings:

The case involved transportation between the whole of Official Territory and the whole of Southern Territory, be-

below the United States urged that the order of the Commission should be sustained. Lest the Court be misled into believing that the United States has changed its position and now agrees with the decision below, Appellants desire to state that they have been informed by the Attorney General that the reason that the Department of Justice did not prosecute its appeal was that it could make no special contribution to the defense of the order involved and that the order could be adequately defended by counsel for the Interstate Commerce Commission.

tween all stations and over all railroads in each territory, and related to virtually all commodities. The initial indication that territorial unit costs were appropriate was thus quite strong. And this conclusion was confirmed by previous rulings of the Commission that territorial costs are proper for use in a case such as this involving "the calculation of relative costs for transporting all traffic, or important and well-defined segments of traffic, by territorial groups of carriers." *Class Rate Investigation, 1939*, 262 I.C.C. 447, 693 (1945).

The percentage of the total traffic of the railroads involved was about two and one-half times as great as the percentage of total traffic involved in the *Class Rate* case [2] and a much greater percentage of all traffic than the percentage of total traffic in other important cases (e.g. *Class Rates, Mountain-Pacific Territory*, 296 I.C.C. 555 (1955) where the traffic involved was only 1% of the total traffic) (p. 614) and in cases wherein Southern lines used Form A

---

2. Appellees say with relation to this point that in the *Class Rate* decision the Commission's effort was to ascertain, by the use of costs, whether territorial conditions justified differences in the class rates. This simply emphasizes that it regarded territorial costs as being appropriate for application to class rate traffic as an important and well-defined segment of traffic being transported by territorial groups of carriers between all points. As the Court pointed out in reviewing the Commission's order in that case, the orders "affect class rates and class rates alone" and that ". . . this proceeding pertains only to class rates, which move but a small percentage of the traffic"; 331 U.S. at 330 and 343.

On p. 19 of their brief the Southern lines say that in *Increased Freight Rates, 1967*, 332 I.C.C. 280, the Commission held that territorial average costs have little value in determining the costs of handling particular segments of traffic. It will be noted from the quotation on pp. 19 and 20 of that brief that in support of the quoted language the Commission cited *Louisville & N.R. Co. v. Akron, C. & Y. Co.*, 309 I.C.C. 491, the very case which, in the order here under review, the Commission distinguished from the situation here presented, contrasting the very limited scope of that case (*Louisville & N.R. Co.*) with this territory-wide divisions case embracing "a large and varied body of traffic . . ." (A. 106).

territorial costs as representative (A. 796, A. 953-957).

Another fact of significance is that in the initial (January 12, 1953) report in the proceeding in which the order here under review was issued, the Commission found that the Northern lines' territorial cost studies based upon Form A must be regarded as "adequate proof" of the relative costs (except that the Commission believed that the facts would change with respect to certain maintenance items) (287 I.C.C. 497, 525, 526).

The record also established that the North-South traffic is an inseparable part of the whole, utilizing the transportation facilities and services of Northern lines and, in the witness's opinion, of Southern lines, in the same way as other traffic (A. 575). This conclusion was supported by studies showing the intermingling of the North-South traffic with traffic in general in such operations as switching, transfer movements, mine runs, yard and classification service, interchange service, local freight service, through freight service, car float and lighterage service, and yard terminal service, and it related to both loaded and empty cars (A. 548-582). While the witness testified directly as to operations on Eastern railroads, he established his knowledge of the methods by which railroad operations are conducted generally, and testified that, in his opinion, the same interdependence and commingling of traffic would apply on the Southern lines as well (A. 542, 543, 575).

Southern lines state in their brief that the witness who presented this evidence knew nothing about "empty return ratios or the other cost elements that cause the inflation in Northern costs" (fn. 1, pp. 15-16); but the fact is that at the record reference given by Southern lines (A. 986) the witness who had testified that "Eastern lines are fully justified in attributing to the Official-Southern traffic the average costs of handling all traffic" (A. 576) stated, on cross-

examination, that he included within the term "costs", such things as interchange costs, wages, fuel, maintenance of way, car repairs, depreciation and return (A. 985).[3]

The Commission also had before it the fact that the great part (89.45%—Appellants' Brief p. 32) of the costs submitted by the Southern lines as representing the cost of North-South traffic were the territorial average costs, a fact which strongly suggests that the territorial costs were representative of the North-South traffic. Finally, it had before it the Northern lines' evidence in opposition to each of the adjustments proposed by Southern lines (A. 893-904; A. 911-931; A. 933-959).

It is manifest that all of the foregoing constituted "such relevant evidence as a reasonable mind might accept as adequate to support a conclusion" and "be enough to justify, if the trial were to a jury, a refusal to direct a verdict when the conclusion sought to be drawn from it is one of fact for the jury" (*Consolo v. Federal Maritime Comm'n.*, 383 U.S. 607, 620 (1966)).

Southern lines argue, however, that the higher Northern costs result from a relatively few elements of service and that the Northern lines did not show that such higher costs had any relation to the North-South transportation. In effect, they here argue that Northern lines were bound to make a special case as to those factors which were higher for Northern than for Southern lines.

---

3. It should be noted that the Southern lines stated with relation to this witness that "The Northern railroads did introduce a 'train utilization study' designed to show that the North-South traffic moves in the same trains as other traffic . . ." (p. 15). The "train utilization study", however, was *only one of two studies* which the witness submitted. He testified that "The first of these studies may be termed a train utilization study . . .", and that "The studies in the second group . . .are illustrative of the commingling of traffic and the interdependence of trains comprising the general transportation network" (A. 545). Southern lines do not mention the studies in the second group (A. 548-582).

The mere fact that a given factor resulting from the application of a cost formula may be higher for one group than the other does not give rise to a requirement that more proof be adduced with respect to the representative character of that element than is needed with respect to such elements of costs as are the same for both groups. The Northern lines' evidence, the factual situation as to the scope of the proceeding, and the Commission's precedents all strongly show that the average unit costs (applied to a proper traffic study of this precise transportation) were reasonably accurate for use as to the North-South traffic. Southern lines attempted to adjust them for the improvement of their case, but they did not succeed with respect to all of the adjustments thus proffered.

They now contend that even if their adjustments were properly rejected by the Commission, the use of the cost factors from Form A which "produced the entire inflation" (i.e. which were higher for Northern than for Southern lines) "remains unsupported by evidence relating such an inflation to North-South traffic" (Southern lines' brief, p. 27). The Northern lines showed to the satisfaction of the Commission that the Southern lines' adjustments which were rejected, were faulty and based upon assumptions and it was shown that they were inferior to the Form A costs and, as shown above, that the territorial costs were reasonable and reliable for use as to the North-South traffic. Northern lines had no greater duty with respect to those costs which were higher than with respect to those which may have been the same. While stated in terms of substantial evidence, the Southern lines' contention to the contrary, represents, in essence, simply another way of saying that the courts, rather than the Commission, shall determine the degree of refinement required in the complex matter of transportation costs, and shall determine what

weight shall be given to the evidence and what conclusions shall be drawn therefrom. This the Court has repeatedly said it would not sanction, and as recently as in *Chicago & N.W. R. Co. v. Atchison, Topeka & S.F. R. Co.*, 387 U.S. 326 (1967), which involved exactly the problem that is involved here.

II. The Appellees' Purported Distinction of Chicago & N.W. R. Co. Is Invalid.

The Northern lines urged in their opening brief (pp. 26-30) that the recent decision in *Chicago & N.W. R. Co. v. Atchison, T.&S.F. R. Co., supra,* constitutes an unusually strong precedent for the reversal of the District Court in the present appeal. In purported answer to this point, the Southern lines say in their brief (28) that "The Court pointed out that the parties *attacking* the order (the Mountain-Pacific railroads) were the *beneficiaries* of an inflation in their divisions." [Italics by Southern lines.] This attempt at distinction is obviously no distinction at all. The parties attacking the order suffered a substantial reduction in their divisions and the fact that their new divisions were still higher ("inflated") than those of the Midwestern lines is not a fact of significance. An order must be supported by substantial evidence whether or not it involves either party's getting or retaining an "inflation".

The Southern lines do not answer the statements in Northern lines' brief (pp. 28 and 29) to the effect that the costs upon which the Commission acted in *C.&N.W.* were basically the average costs of handling all traffic. They quoted two phrases from this Court's opinion in *C.&N.W.* to the effect that the Court upheld the Commission's decision to base its cost findings upon the "special cost study and analysis" prepared by the Mountain-Pacific carriers, subject to certain adjustments which "in the judgment of

the Commission, more accurately reflected the true costs of the traffic involved'' (p. 28). But, that the special cost study consisted of Form A territorial costs with some adjustments allowed and some disallowed, as in the present case, is a fact not mentioned in the Southern lines' discussion of *C.&N.W.* As pointed out in our opening brief (pp. 28-29), the Southern Governors' Conference et al., Appellees in the present case, stated in their *amici* brief to this Court in *C.&N.W.* (pp. 2-3) that the Commission's cost findings in that case, and in the present case, reflected the very same approach, that in the *C.&N.W.* order the Commission relied ''almost exclusively upon the average costs of handling all traffic in these territories'' and that ''there, as here, virtually every objection to reliance upon such territorial averages was brushed aside without either findings or evidence to support such action'' (pp. 2 and 3).

The nature of the cost evidence in *C.&N.W.* as being substantially similar to that involved in the present appeal, with the same arguments against its use having been urged, was also made clear by the brief of the Appellees (Mountain-Pacific railroads, represented by the same principal counsel as Southern lines here) to this Court in that case (p. 90):

> ''The underlying problem is that, for important elements of cost, the Commission's 'restatement' uses the *average* costs of *all* traffic handled by the respective groups of railroads, as contrasted with the costs of handling the transcontinental traffic at issue. The Commission's report concedes that the 'principle, which is correct,' is to determine the costs of handling the transcontinental traffic at issue (R. 1010). But the Commission's 'restatement' of costs nevertheless uses average costs in many important respects, an approach which grossly overstates the costs of the Midwestern

railroads, particularly in their capacity as intermediate (bridge) carriers of transcontinental traffic."

From every substantial standpoint, Northern lines' contention that *C.&N.W.* should control the decision in this case remains unanswered.

III. Reply to Appellees' Point Concerning Specific Items of Cost.

A. The Commuter Deficit.

In Northern lines' opening brief it was pointed out (pp. 44-45) that the Southern lines insisted that passenger deficits be included as part of the constant costs[4] in arriving at the cost of the North-South freight service and that as a result of considering passenger deficits the Southern lines' annual revenues from the prescribed divisions are greater by at least $1,389,000 than if passenger deficits had not been included in the costs. Now Southern lines argue that the Commission made no findings relating to the North-South traffic so much of the commuter deficit as resulted from costs solely related to commutation service. In Northern lines' opening brief (p. 48) it was pointed out that it is of the very nature of constant costs that they are not incurred in the performance of particular services to which they are assigned. It was also shown (p. 53) that the Commission's consideration of overall passenger deficits resulted in the assignment of Southern lines' solely related passenger costs to the freight service involved, but that this was not true as to such costs of Northern lines, since Northern lines'

4. This Court noted in *American Lines v. L. & N.R. Co.*, 392 U.S. — (1968) at p. —, note 3, 88 S. Ct. 2105, 2107, that the Commission defines fully-distributed costs as the out-of-pocket costs "plus a revenue ton and revenue ton-mile distribution of the constant costs, including deficits . . ."

passenger revenues exceeded their solely related passenger expenses.

Realizing their inconsistency in insisting that the solely related passenger costs pertaining to commutation service were improperly considered because of the alleged absence of a finding relating them to freight service, and their benefiting from the Commission's having considered their own solely related passenger costs without any such finding, the Southern lines state that (fn. 20, p. 34 of their brief):

> "The obvious solution, if there were passenger deficits not related to freight operations in both North and South, would have been to exclude such deficits in both territories. Even under the Northern railroads' argument, the failure to exclude all solely related passenger deficits was prejudicial to the Southern railroads in view of the much greater effect of the commuter deficits in inflating the costs of the Northern railroads (A. 1291)."

This appendix reference is to a figure of $1,502,181 (A. 1291) which is given as representing the amount by which Southern lines' cost of performing the freight service involved would be reduced by the exclusion of their solely related passenger deficit. This figure they compared with a higher figure said to represent Northern lines' suburban deficit. The calculation which produces this figure ($1,502,181) appears in a footnote in the Southern lines' exceptions to the Examiner's recommended report (A. 1356-1357). It is surprising that the Southern lines should cite this figure to this Court, in view of what it conceals:

(1) While approximately 44.8% of the figure shown by Southern lines as representing Northern lines' suburban deficit represents return on investment[5] (A. 873), in calcu-

5. A. 873. The amount shown for return ($36,500,000) is 44.8% of that figure plus the remaining part ($44,869,450) of the Suburban deficit, a pro rata part of which was allocated to North-South traffic.

lating their own solely related passenger deficit, the Southern lines include nothing for return although it is obvious that they have many millions of dollars invested in passenger stations, locomotives, cars, coach yards, and other passenger facilities;

(2) While the Northern lines' suburban deficit figure relied upon by Southern lines includes rents and taxes, along with operating expenses (V. S. 40, p. 21; A. 872-874), their figure for their own solely related passenger deficit allocated to North-South traffic includes nothing for these items, not even for taxes on such things as passenger stations or the payroll taxes on the wages of the train crews, station and other passenger service employees. It simply matches passenger revenues with operating expenses (Ex. R. 13; A. 980-981);

(3) While the Southern lines' adjustment for Northern lines' suburban deficit was based upon figures for the year 1957 (V. S. 14, Ex. D and E; A. 719-720), their adjustment for their own solely related passenger deficit employed figures for the year 1956 (A. 1356-7). The passenger deficits of both groups of lines were substantially higher in 1957 than in 1956 (Ex. R. 13; A. 980-981). Having used Northern lines' suburban deficit for 1957, Southern lines clearly should have used their 1957 solely related passenger deficit in making adjustment for that factor. Had they done so, that deficit as apportioned to the North-South traffic (and without including anything for return on investment, rents or taxes) would have been $2,798,236.00 (see the Appendix hereto). This plus Southern lines' allocation of $377,070 to the North-South traffic for the Southern suburban deficit totals $3,175,306, as compared with Southern lines' calculation of a Northern suburban deficit of $2,830,575 for the North-South traffic (A. 1291).

From the foregoing it will be seen that, over and above everything else, in the light of the admission of Southern lines' counsel (Tr. 16; A. 229 and Southern lines' brief, p. 34, fn. 20) that the Southern lines' solely related deficits should be excluded from their costs if the commuter deficits of the railroads are to be excluded, the matter of the Commission's treatment of passenger deficits, including suburban deficits, manifestly did not prejudice the Southern lines.[6]

On p. 34 of their brief Southern lines infer that Northern lines argue that since the Commission included allowances for "overhead" it included commuter deficits "not on

---

6. On p. 32 of their brief the Southern lines quote from the Commission's decision a sentence reading:

> "Because the suburban service deficit includes common costs which must be incurred to provide freight service or intercity passenger services, such costs are properly chargeable to those services to the extent they cannot be recovered from suburban operations, * * *."

The words "such costs" obviously refer to the costs represented by the suburban deficit; it is only the deficit which is charged to the freight service, the excess of the costs over the revenue, not the entire costs themselves.

The Southern lines argue that the only allowance to be included under "overhead" would be for officers salaries, general office expenses and other overhead inherent in freight operations. This is a surprising contention from parties who insisted that the passenger deficit be included as part of the constant costs. The term "constant costs" and "overhead burden" or "overhead expenses" have essentially the same meaning—*American Lines v. L. & N.R. Co.*, 392 U.S. —; 88 S. Ct. 2105 (Appellants' brief, p. 44).

Southern lines' argument based upon the Commission's exclusion of platform costs (So. Br. 35-6) is unsound. The Commission found that in the situation involved unloading had become the responsibility of the shippers (A. 88). When the carrier performs the service for the shippers and the charges which it established do not cover costs, the Commission simply declined to include the deficit in the North-South costs. Exercising its discretion in this manner with respect to platform costs obviously did not prevent it from considering passenger deficits as part of constant costs, as the Southern lines insisted it should.

a relative cost theory, but on a revenue needs theory", and the Southern lines say that this is not correct because the Commission found the revenue needs the same in each territory. The revenue needs which the Commission refused to allow were general revenue needs *over and above fully distributed costs.* (See Appellant-Railroads' brief p. 49). As the Southern lines stated in their brief to the Commission (pp. 198-199)

> ". . . the nature and operation of the so-called 'revenue needs' test must be examined in relation to the vital cost of service issue. Since the costs include allowance for overheads and return, divisions based on relative costs reflect '*a due proportion* of the burden of maintaining the financial integrity and credit of the carrier.' *New England Divisions,* 66 I.C.C. 196, 199. Accordingly, and by definition, a separate claim based upon 'revenue needs' is a claim for a disproportionate share of the revenues, a share in excess of the 'due proportion' of the financial burden reflected in the cost evidence.

At p. 36 of their brief, the Southern lines argue that Appellants contend that the "rates should be divided in accordance with the manner in which they are made." This matter was discussed in the Commission's brief (p. 43), the point being made that passenger deficits were included in fixing the level of the joint freight rates on North-South traffic and that in considering passenger deficits in fixing the divisions, the Commission merely divided the rates in conformity with the factors which went into determining their level. Southern lines argument (p. 37) that ". . . the rate levels in both territories are shown by the record to be uniform; and the interterritorial rates being divided here are on the same uniform level" is false. They are here referring only to class rates. Only about 1% of all carload

tonnage moves on class rates in the Eastern United States; *Eastern Central Motor Carriers Association v. B.&O. R. Co.*, 314 I.C.C. 5, 17 (1961).

Rate levels within the North have become higher than those within the South. *Official Southern Divisions*, 287 I.C.C. 497, 523; *Increased Freight Rates, E.W. and S. Territories, 1956*, 300 I.C.C. 633, 686. It is clear therefore, that the rates of the Northern lines which actually move the great body of the traffic are higher than those of the Southern railroads. Moreover, the mere fact that class rates are uniform would not require the exclusion of deficits from consideration in fixing divisions. Total passenger deficits were taken into consideration in making those class rates even though they are uniform (*Class Rate Investigation, 1939*, 262 I.C.C. 447, 573).

The passenger deficit considered by the Commission in fixing the level of freight rates is the entire passenger deficit. The Commission considered overall rates of return from all operations (see, for example, *Increased Freight Rates, 1948*, 276 I.C.C. 9), and the increase in operating expenses due to wage, price and tax increases attributable to all services (see, for example, *Increased Freight Rates, 1948*, 276 I.C.C. 9, at 20-24, and *Increased Freight Rates, E.W.&S. Territories, 1956*, 300 I.C.C. 633, at 641-647, 657-658. Since the entire passenger deficit was taken into consideration in fixing freight rates, it would manifestly be unfair in dividing the freight rates to eliminate part of the deficit, a part which bears more heavily upon one group than the other.[7]

Southern lines argue that there is another policy choice in dealing with suburban deficits, that is to place the

7. Southern lines say (Br. 30) that there is no commuter service in Florida and that this Court had no occasion to consider the treatment of deficits arising from costs solely related to passenger service in *King v. U.S.*, 344 U.S. 254. There the Court sustained an order requiring that Florida intrastate rates be brought up to the inter-

financial burden of the deficits on the communities receiving the service. In support of their assertion that the Commission has "adopted the policy" that commuter service should not burden freight operations, they quote (p. 38) from *Railroad Passenger Train Deficit,* 306 I.C.C. 417, 483 (1959) to the effect that where railroads are unable to operate a particular "local or commuting" service at a profit, and where such service is essential to the community, steps should be taken by state and local authorities to provide the service paying the carrier the cost plus a reasonable profit.

What is thus represented to be the adoption of a "policy" by the Commission, is in fact, one of a series of "recommendations" to others (306 I.C.C. at 482). There is a great difference between making a recommendation and adopting a policy.

It should also be noted that the Commission did not state that from and after the making of that recommendation it would no longer include deficits resulting from the performance of such services in the constant costs allocated to freight service. Finally it should be observed that the Commission's recommendation applied to local train service as well as commuter, yet the Southern lines included all of their local passenger service deficits in ascertaining the cost of performing the North-South freight service here at issue.

At p. 39 of their brief the Southern lines quote from a House Report to the effect, *inter alia,* that it would seem evident that if commuter service must be preserved losses incurred will have to be met "in some way" by the com-

---

state level. That level had been fixed on the basis of including the entire passenger deficits of the Southern Region lines. Whatever commuter deficits those lines (including the Illinois Central, which has a large commutation operation) incurred was considered in fixing that rate level; and no distinction was made between solely related and common costs. Id. 265-266; *Increased Freight Rates, 1948,* 276 I.C.C. 9, 40.

munities, and that it is unreasonable to expect that such service should continue to be subsidized by the freight shippers. Plaintiffs contend that this shows Congressional policy. The very next sentence of the report goes on to state:

> "There are substantial losses, however, occurring in passenger service beyond those attributable solely to commuter service. Where this passenger service * * * cannot be made to pay its own way because of lack of patronage at reasonable rates, abandonment seems called for." (pp. 11-12)

It is interesting that the Southern lines are not urging that in this paragraph the Congressional policy as to non-commutation passenger service was abandonment and that, therefore, the Commission erred in including deficits incurred in the performance of passenger service other than commutation, i.e., the kind of passenger service that Southern lines provide.[8]

The Commission has not departed from its policy or practice of including a proportionate part of the entire passenger deficit in determining freight service costs, which is all it has done here. Moreover, policy questions are for the Commission and do not present legal questions.[9]

---

8. This Court said with reference to deficit passenger trains operated by the Southern Railway, "The problems raised by the discontinuance of trains Nos. 7 and 8 cannot be resolved alone by reference to appellee's loss in their operation but depend more upon the predominantly local factor of public need for the service rendered." *Alabama Comm'n. v. Southern R. Co.*, 341 U.S. 341.

9. On pp. 39 and 40 of their brief Southern lines state that the Commission has continued to express its "policy" that commuter deficits should be borne by the local community. They fail, however, to refer to the fact that the Commission has made the same declarations with respect to non-commutation passenger service. See, for example, *New York, N.H. & H. R. Co., Discontinuance of Trains*, 327 I.C.C. 151 (1966) at pp. 219-223.

The Southern lines' contention based upon the *Chicago & North Western* case (their brief, pp. 39-40) is answered in our opening brief at p. 54.

The Southern lines also argue that the commuter service is today subsidized by local communities in the North and that since these subsidies did not exist at the time the record in this case was made, the practical effect of the Commission's action is to provide a double subsidy.

If Southern lines believe that there has been a material change in the facts since the record before the Commission was closed, the proper procedure would be for them to file a petition with the Commission for further hearing. The order under review is at all times subject to change under Section 16(6) of the Interstate Commerce Act (49 U.S. Code 16(6). Moreover, it should be noted that factors which the Commission considered and which affect the passenger deficit of the Southern lines have undergone a change. They have discontinued a large number of trains, as have other railroads throughout the country. It is clear that if consideration of *any* changed facts is desired by any party the proper procedure is not to set aside the Commission's order but for the party desiring to present argument on the basis of the changed facts to petition for further hearing and modification of the order by the Commission. *Tagg Bros. v. United States,* 280 U.S. 420, 443-445 (1930).

B.-The Commission's Treatment of the Gateway Interchange Issue Was Lawful in All Respects.

Beginning at p. 43 of their brief, the Southern lines argue that the Commission's treatment of the costs of interchange at territorial border points is not supported by substantial evidence and reasoned findings. They state (p. 44) that ". . . the Commission prescribed divisions which include a separate allowance for the costs of 'border interchange' which are 58% higher for the North than for the

South." They leave the false impression that the only interchanges involved are at border points, whereas, in fact, interchanges on North-South traffic are made throughout Official and Southern territories.[10] The Commission used the Northern and Southern territorial costs at all points where North-South traffic was interchanged, whether at territorial borders or at junctions in the South or in the North.

In an effort to show that these costs for interchange services throughout the respective territories did not reflect relative interchange costs of Northern and Southern lines at certain individual territorial gateways, Southern lines presented statements of their operating officers describing generally the operations and various local practices respecting equalization of engine time or the bearing of certain interchange expenses at such gateway points, concluding that the interchange operations performed by the Northern railroads at the several gateways were no more onerous than those of the Southern railroads at the same points (Southern lines' brief, pp. 43-44).

With this background the Southern lines, upon brief and exceptions to the Commission, took the simple average of the Northern and Southern territorial average interchange costs, applied it to an estimated number of cars interchanged between Northern and Southern railroads at such territorial gateways and thereby obtained a figure of

---

10. For example, a shipment from Boston to Miami might be routed via the New Haven to New York, then interchanged by car float across New York Harbor to the Jersey Central, thence carried to Bound Brook, N.J. and interchanged to the Reading, thence to Philadelphia and interchanged to the B. & O., thence to Potomac Yard and interchanged to the R. F. & P., thence to Richmond and interchanged to the Atlantic Coast Line, thence to Jacksonville and interchanged to the Florida East Coast for carriage to Miami. Of all the interchanges in this route, Southern lines discussion leaves an impression of the existence of only one, that at the territorial gateway, Richmond.

$797,043, which they asserted, represented the amount by which Northern costs were overstated and Southern costs were understated, a combined difference of $1,594,086 (SL Brief, p. 146, A. 1054-5; SL Ex. pp. 104-105, A. 1349-50). Nevertheless, Southern lines did not themselves attempt to adjust their cost study to reflect these figures (SL Brief, p. 146). Instead, they included this item with other considerations of a catch-all character addressed to the general consideration of the Commission apart from their proposed specific cost adjustments (SL Brief, pp. 136-158). Thus, Southern lines, in summing up concerning these catch-all items, stated (SL Brief, p. 158; A. 1057):

> "These factors affecting costs must be considered by the Commission in prescribing just, reasonable and equitable divisions for future application to the traffic involved in this proceeding. The Commission may not refuse to give effective consideration to these differences in costs established by the evidence *simply because it has not been possible to measure them precisely in dollars and cents.*" (Emphasis supplied.)

The Northern lines rebutted this testimony, and the Commission found that:

(1) Equalizing the number of engine hours performed on the other lines' rails does not equalize interchange service because each carrier performs a major part thereof on its own rails.

(2) Although many important gateways were cited by the Southern lines' witnesses, not all were included and the proportion of cars passing through unequalized gateways was not shown.

(3) The cost of engine time is not equal in the two territories.

Then the Commission found that there was another, and major, criticism of the proposed adjustment. It found that since Rail Form A territorial costs produce an average cost for all the service units in the territory, such as interchange handlings, when greater or lesser costs than the Form A costs are assigned to particular items, correspondingly lesser or greater costs must be assigned to the remaining units. Thus in proposing the territorial gateway adjustment the Southern lines did not attempt to show to what extent their cost of the other interchanges on the traffic involved would be decreased nor to what extent the Northern costs of the other interchanges would be increased (A. 129).

For all of the reasons indicated above, the Commission refused to accept the proposed adjustments (A. 129).

The Southern lines now argue that they made no claim before the Commission that their method for estimating the level of border interchange costs had to be accepted.[11] They state that there was no substantial evidence to support a higher level of border interchange costs for Northern than for Southern railroads, whatever the precise dollar amount of the equal costs. But contrary to Southern lines' statement that the Commission granted "a separate allowance for border interchanges which is 58 percent greater" for the Northern lines than for Southern lines (Brief, p. 46), the Commission granted no such separate allowance; it dealt with all the interchanges of the Northern lines and all the interchanges of the Southern lines and applied the territorial average interchange cost for the respective territories to all such Northern and Southern interchanges,

11. But at p. 105 of their Exceptions they stated that: "This overstatement in Official territory costs and understatement in Southern Region costs totals $1,594,086 (referred to by the Examiners as '$1.6 million' (sheet 58). A proper restatement of the costs of handling Official-Southern traffic should reflect such equalization of the interchange costs at the territorial gateways."

respectively. Its action in doing so was sustained by the facts, discussed in (1) above, showing justification for the use of territorial average costs. Moreover, Southern lines did not rebut the use of the costs so supported by introducing figures so unreliable that even they disclaimed reliance thereon (Brief, p. 46). Nor did they, by bringing forth such figures cast any burden upon the Northern lines to search for other facts relating to operations of the Northern and Southern lines which might be used in substitution for the territorial figures which the Commission, as the expert body, found satisfactory.

C. The Commission's Use of Territorial Average Car Costs Is Sustained by Adequate Findings and Evidence.

In the case before the Commission, when dealing with car costs the Southern lines abruptly departed from the position which they had so emphatically maintained with respect to other proposed cost adjustments, namely, that the costs should be more refined than territorial averages in order to bring them closer to the North-South traffic. As to car costs, they proposed the average costs for all railroads in the United States in substitution for the territorial car costs of the Northern and Southern lines (A. 94-95). The Commission rejected their proposal—finding that "The use of a national average car cost conceals territorial differences in cost which are important in the consideration of divisions between the two involved territories (A. 101).

In their present brief the Southern lines do not even mention the fact that they had urged the substitution of average United States car costs for those of the railroad groups involved in the litigation. They now abandon any attempt to justify the use of United States average car costs, and rest their attack on the ground of an alleged lack of evidence and findings to support the Commission's use

of territorial costs. The Commission's thorough analysis of the evidence and the contentions regarding car costs are found at A. 94-101.

Southern lines' first basis for contending that the territorial average car costs were not representative of the North-South costs was that the composition of the car fleets of Northern and Southern railroads, respectively, differed from the proportions by types of the cars used in transporting freight between the North and the South, because the car fleets contain substantial proportions of open hopper cars, whereas the cars in predominant use in the North-South traffic are box cars. Before the Commission Southern lines argued (br., pp. 70-75) that the cost of owning and maintaining hopper cars is greater than that of owning and maintaining box cars, and that the lesser utilization of railroad cars on Northern lines is due to hopper cars and not box cars.

The Northern lines answered these contentions by showing that (1) the cost of a box car is greater than the cost of open hopper and gondola cars (V.S. 76, p. 11; A. 918-919). This means that the cost element represented by rate of return is greater on box than on hopper or gondola cars and that the depreciation base is also greater on box cars. This would mean that the presence of a greater proportion of open hopper and gondola cars in the North and the South would serve to reduce the territorial average car costs, thus understating box car costs rather than overstating them. Since the proportion of these open top cars is greater in the North than in the South (V.S. 39, p. 45; A. 858) the comparison would not be unfavorable to Southern lines.

Secondly, so far as the element of repairs is concerned, it was shown that the Southern lines' chief cost witness in this case testified in another recent case that the cost of

car repairs is higher on box cars than on open top cars (V.S. 76, p. 11; A. 918).

Third, with respect to utilization, the Southern lines admitted that (Exceptions, p. 25; A. 1293) "Low utilization of the average car in the North could explain the 32 percent higher territorial average car costs in the North * * *", and Northern lines' evidence showed that the North-South traffic is handled the same as traffic in general, and intermingled with it, on Northern lines. Moreover, the utilization of open hopper cars is higher in the North than in the South (V.S. 76, Appendix B, A. 931; 325 I.C.C. at 63, A. 99), and therefore the lesser overall utilization of cars within the North is not due, as Southern lines have asserted, to Northern lines' greater gondola and hopper car traffic.

The Commission found these cost and utilization figures to be "uncontroverted" (A. 100). It also found that differences in utilization and in costs per year for repairs, depreciation and return are insignificant as between types of cars (A. 96).

The other contention raised by Southern lines against the use of territorial car costs was that those costs were affected by per diem credits and debits and that in figuring the return element in the per diem rate the base is cost of reproduction, whereas in the Form A formula the base for rate of return is original cost. As to this the Commission pointed out that the method by which the per diem rate is arrived at is not the important thing. The important thing is that dollars are collected by the owning road and paid by the using road and that these dollars are just as truly a part of car costs as any other costs connected with the provision and use of cars (325 I.C.C. at 62-63; A. 97-98). Thus, when a railroad uses a car owned by it for transportation over its line, and at other times receives money for its use

on the lines of other carriers the money so received should obviously be used to offset the costs of providing the car. The Commission so found (A. 98).[12]

And it further found (A. 100):

> "We recognize that per diem charges have been based upon car costs computed on a reproduction basis insofar as depreciation and return on investment of the cars is concerned. This differs from the original cost basis used in Form A car cost computations for owned cars. As explained above, the Form A method necessarily includes per diem in the car costs, and is appropriate in situations where, as here, the issues involve divisions of rates on almost all commodities handled in different types of cars, although mainly boxcars, and between numerous carriers throughout both territories."[13]

These findings by the Commission are obviously determinations by an expert body on complex administrative

---

12. "All of the items entering into the Rail Form A car costs represent actual expenses, and therefore, any difference in the car costs between the two territories, whether caused by per diem or other items, is not a discrepancy but is a reflection of the actual situation, and this difference (because it is actual) should be considered in the comparison of the relative costs of the two territories." (A. 98).

13. The net credit and debit balances given on p. 48 of Southern lines' brief for the Northern and Southern railroads relate to their entire operations, which include debits and credits among themselves and with Western and Canadian lines (A. 863).

As "A dramatic example" of the effect of per diem rentals on car costs, Southern lines refer to the situation of the Clinchfield Railroad, as to which it says that the effect, under Rail Form A, of offsetting per diem rentals against costs is to say that that railroad incurs "no cost at all." (Footnote 31, pp. 48-49) Southern lines' evidence simply said that the effect on the Clinchfield was to produce "negative unit costs for return" on investment in cars, and not a negative car cost.

facts; *Chicago & N.W. R. Co. v. Atchison, T.&S.F. R. Co.*, 387 U.S. 326 (1967).[14]

At p. 51 of their brief, the Southern lines say with reference to the Commission's finding that among the causes for the difference in car costs as between the North and the South are "differences in tax and wage rates" (A. 100), that there is no evidence to support any difference in tax rates on railroad freight cars and that the evidence shows that the tax rates are higher in the South. The evidence of higher taxes in the North than in the South embraces all taxes, other than federal income and payroll taxes (V.S. 80, Ex. F-4; A. 951) and included taxes relating to cars. To make the comparison between the Northern and Southern lines, the total tax figures were expressed in dollars per mile of road, but they applied to cars, to car shops, and other items of property. With reference to the higher wage rates in the North, the Southern lines intimate (Brief, 51) that prices of materials in the South are higher than in the North. There is no evidence to support any such intimation.

On p. 51 of their brief, the Southern lines say that the third cause assigned by the Commission as an explanation for the differences in car costs is " 'a difference in the relative amount of off-line use of owned cars in all territories' ". In the Commission's report the sentence ends with a period after the word "territories". In the Southern lines' brief, however, a comma is substituted for

---

14. The Commission did not say "We are approving car costs 32 percent higher for the North than for the South." It approved the use of the car costs as they were determined on the basis of the formula which it found proper. Moreover, when Southern lines assert that the Commission did not have evidence to support the use of car costs "which are 32 percent higher in the North than in the South" it should be noted that the 32 percent figure represents only a hypothetical example made up by Southern lines and has no relation to the hauls as they actually are in this case (A. 912-913).

the period after the word "territories" within the quotation marks, and then the Southern lines follow it by saying "specifically, 'a greater relative use in connection with the traffic here at issue of cars owned by official territory railroads than of cars of southern ownership' (325 I.C.C. at 64; A. 100-101)." The word "specifically" and its implications are those of Southern lines, not of the Commission. The word used by the Commission to begin the sentence concerning the greater relative use of Official Territory cars was "Moreover", which is quite different from "specifically". The discussion on pp. 51 and 52 of Southern lines' brief can in no way detract from the Commission's statement of the causes of the difference in territorial car costs as including "a difference in the relative amount of off-line use of owned cars in all territories".

The last alleged error urged by Southern lines is that in a divisions case the Commission's responsibility is to determine costs applicable to transportation and that this has nothing to do with the "separate problem" of the financial results which railroads experience in car rentals. The word "transportation" is specifically defined to include cars by Section 1(3)(a) of the Interstate Commerce Act, 49 U.S.C. 1(3)(a), and under Section 1(10) of the Act the use, movement, and interchange of cars is included in the definition of "car service", and a duty to observe reasonable rules and regulations with respect thereto is imposed by Section 1(11). The contention that payment for the use of cars interchanged in the course of transportation is a matter not to be noticed in the fixing of divisions is superficial in the extreme and runs counter to the Commission's finding of the reliability of Rail Form A costs in *Class Rate Investigation, 1939*, 262 I.C.C. 447, 639 (its order in which was sustained in *New York v. U.S.*, 331 U.S. 284), and the consideration and use of Rail Form A in literally hundreds of other cases. With reference

to Southern lines' argument (Br. 49, n. 32) based on *Louisville & N. R. Co. v. Southern Ry. Co.*, 319 I.C.C. 639 (1963), it may be observed that the Commission found the factual situation to be such as to disallow that case as a precedent here.[15]

The Commission's use of territorial car costs is legal in all respects and is sustained by adequate evidence and detailed findings.

D. The Commission's Determination of the Switching Cost Issue Was Lawful in All Respects.

Southern lines contended that their territorial switching costs were depressed by the presence within the South of a number of commodities moving in large volume and which, they stated, have lower than average switching minutes per car. They offered evidence purporting to show the effect of said volume movements and made an adjustment in the Form A switching costs for the Southern

---

15. "We distinguish the situation here from that presented in *Louisville & N. R. Co. v. Southern Ry. Co.*, 319 I.C.C. 639, sustained in *Carolina & N.W. Ry. Co. v. United States*, 230 F. Supp. 581 (W.D.N.C. 1964), wherein an adjustment for reproduction costs was made. There the sole commodity at issue was coal (not involved here), only a certain kind of car was used and such equipment was owned exclusively by the originating carrier, the traffic moved intraterritorially over only specified segments of each carrier's lines, and the car costs of the destination carrier consisted solely of the per diem charge." (A. 100)

Southern Lines' exceptions to the Recommended Report in the present case notes (p. 28):

> "Southern Railway System lines do not agree that there is any inconsistency between using original costs in Rail Form A and the use of actual per diem debits and credits. Furthermore, the Southern Railway maintains that, in computing the costs of car ownership, it is proper to credit the excess of per diem credits over cost of ownership to the cost of ownership of the cars involved."

lines, which they followed with a different adjustment for Northern lines. The effect of the proposed adjustment was to increase their switching minutes and, therefore, costs, substantially more than they increased those of Northern lines (A. 113-121).

In this Court Southern lines appear to contend that the action of the Commission in disallowing the adjustment was due entirely, or almost so [16] to their failure to present evidence as to switching in the North comparable to their special switching studies in the South. But this is not correct. The Commission found that their switching studies in the South had weaknesses, both in the sample and in the studies themselves (A. 121). These are set forth in detail in the Commission's thorough analysis of this point at pages A. 113-121.

Southern lines also contend that the Commission's treatment of the "question of comparability" was unlawful because it places upon Southern railroads the impossible burden of making switching studies in the North (p. 55). However, since the switching studies within the South were found to be unsound, the making of special studies by Northern lines within the North for "comparability" would have been futile. Moreover, the Commission was satisfied with the territorial switching costs and, therefore, there would have been no purpose in making additional switching studies throughout the North.

The decision in *Boston & Maine R. Co. v. United States*, 208 F. Supp. 661 (1962) upon which Southern lines rely is inapposite. The traffic involved in that case was largely composed of vehicle parts and electric appliances moving

16. On p. 55 of their brief, they said that "A basic reason" for rejection of their studies was that the adjustment in the North was not made on a comparable basis to that in the South; but when they get to the next page they imply that the Commission held against them "because of the lack of comparable evidence . . ."

to or from only one place. The L. & N. gave evidence of its switching costs at the localities involved and there was no finding that its studies were defective, as the Commission found with respect to Southern lines' switching studies in the present case (A. 121). And the Commission found that the average switching cost in the North was not helpful in that case (208 F. Supp. at 675), which comprised but a very narrow segment of traffic.[17]

Southern lines argue that there is no evidence in the record to support the applicability of territorial average switching costs. There was the evidence that this case involves virtually all commodities and all stations and railroads in the North and the South, as well as evidence that the traffic is intermingled with all other traffic. The Commission concluded that (A. 121):

> "Territorial average costs are particularly appropriate to the traffic in this case because it is a large and varied body of traffic moving to and coming from terminals in all parts of both territories. In our opinion, and we so find, the depressing effect, if any, of volume switching commodities on the average would affect both territories and, for purposes of comparison, would be largely offsetting."

E. The Commission's Disposition of the Issue Concerning Empty Return Ratios Was Lawful in All Respects.

At the beginning of the discussion of this subject in their brief before the Commission, the Southern lines stated, at pp. 46-47:

---

17. Southern lines also cite (brief, p. 55) *Commodities-Pan Atlantic Steamship Corp.*, 313 I.C.C. 23, 57 (1960) as a case in which it was indicated that detailed switching studies should have been made by the parties in possession of the facts. This case also involved a narrow segment of traffic moving to and from specialized terminals.

> "The Northern lines' cost study and Southern lines' cost study each purports to use empty return ratios applicable to the types of cars handling Official-Southern traffic. The differences between the parties arise only in respect to the data used for box and refrigerator cars and present the issue as to which study uses the most reliable measure of the empty return experienced by the types of cars which actually handle the traffic here at issue.

And again at p. 51:

> "* * *. The issue is one of fact—whether the refinements of empty return data used by the Southern lines within the several categories of box and refrigerator cars, provided more reliable data for application to the Official-Southern traffic than the average data produced by the 1956-1957 seven-day study and used by the Northern lines."

It is submitted that no question could be more of an administrative question peculiarly within the competence of the Commission than the determination of the "fact" issue as to "which study uses the most reliable measure of the empty return experienced by the types of cars which actually handle the traffic here at issue." After extensive analysis the Commission directly determined that issue, finding that the Southern lines' data were not as sound an estimate of the empty return incurred by the Official-Southern traffic as were the Commission's seven-day study ratios (A. 110).

That the Southern lines' attack on this conclusion is without foundation may readily be demonstrated.

A study conducted under an order of the Commission (a study based upon a seven-day sample covering a 12-

month period in 1956-1957) developed a box car empty return ratio of 39% for the Northern lines and 33% for the lines of the Southern Region. These ratios were used by Northern lines. The adjustment proposed by Southern lines in this case was to reduce the Northern lines' ratio from 39% to 30%, and to reduce their own, more modestly, from 33% to 30% (A. 102).

Contrary to the impression given in the Southern lines' brief (pp. 58-65) their adjustment for Northern lines did not rest simply upon their contention relating to the use of special equipment in transporting automobile parts. Rather, the adjustment was accomplished in three independent stages. Only the first of these purported to eliminate the claimed influence of special cars for automobile parts traffic upon empty box car miles in the North (A. 108). The second stage of their reduction in the Northern lines' ratio was sought to be justified by an alleged imbalance in the directional flow of traffic between Official territory and Canada (A. 108).

The third stage of the adjustment did not have even the pretense of factual support. It was based upon the witnesses' assumption that there are more movements of assigned cars in the North than in the South because of the greater industrialization in the North (A. 108). The witness admitted that he had made no calculation to support this theory. He agreed that "it is an assumption" (Tr. R. 1694-95; A. 1001-1002).

Each of these stages was carefully analyzed by the Commission. It summarized the evidence presented by Southern lines in support of their vehicle parts adjustment under five points (A. 102-4). The first of these was dismissed as being merely a computation showing what the effect would be if certain assumptions are made and without

any evidence that the conditions assumed actually exist (A. 104, Para. (a)).

The second point, a table of Southern lines purporting to show that Northern lines own more special device cars than Southern (A. 103), was criticized because it failed to take into consideration the fact that cars are interchanged among territories and "It is the car-miles in each territory which affect the empty ratio, and the relative ownership does not necessarily coincide with the relative number of car-miles" (A. 105, Para. (b)).

Southern lines' third point was represented by some figures purporting to show that they participate to a much more limited extent in vehicle parts traffic than do the Northern lines (A. 103-104). As to this, the Commission found that the use of the relationship between carloads and revenues pertaining to vehicle parts to the total "manufactures and miscellaneous" group of commodities does not measure the relationship of special box cars to total box cars "for the reason that many boxcars carried commodities other than manufactures and miscellaneous, and vehicle parts do not all move in special boxcars" (A. 105, Para. (c)).

The next point related to the Southern lines' showing of empty return ratios of box cars for certain Detroit lines in comparison with other Northern lines and the Southern lines and the percentage of vehicle parts to total box car traffic handled by each of the groups of lines (A. 104). Southern lines' brief (p. 61) would seem to suggest that this was the Commission's sole ground for rejecting their "factual showing". The Commission found this to be based on only three observations and too limited to be representative (A. 105, Para. (d)).

The last of this group of five points of Southern lines was an attempt to show statistically the effect on empty

return ratios of the elimination of vehicle parts traffic (A. 104). It was by this step that the first stage of the adjustment—reducing Northern lines' ratio from 39% to 34.66% —was achieved (A. 849, A. 866). The Commission found this statistical evidence (1) to be based on certain assumptions, such as that vehicle parts move only in special cars and that all special cars have a 100% empty return, which "assumptions have not been proven" and, in fact, 12% of the vehicle parts move in other than box cars; (2) the individual steps taken to arrive at the answer "contain estimates or approximations with a wide margin of error"; and (3) the "equating factors for revenue are also only very rough approximations" (A. 106, Para. (e)).

The Commission concluded, *inter alia,* that the five items above "tend to show that these cars may have some effect on the empty return ratio, but they do not support a conclusion that any adjustment is warranted here as to the amount of the effect other than that reflected in the averages used" (A. 106).[18]

The Commission thereafter analyzed the Southern lines' contention concerning Canadian traffic and found that the figures given "do not indicate that Canadian traffic has a greater empty return ratio than other traffic" (A. 107).

The Commission's conclusion as to the three stages was in these words:

> "In light of the foregoing, we find that: (1) the adjustment for special device cars of 4.27 percentage points is not adequately supported; at best, it is merely

18. In Footnote 37 on p. 63 Southern lines cite *Louisville & N. R. Co. v. Akron, C. & Y. R. Co.,* 309 I.C.C. 491 (1960) as a case in which the Commission criticized the use of territorial empty return ratios. The Commission distinguished that case from the present case (A. 106) as being factually different and pointed out, *inter alia,* that the entire traffic involved in the case was largely composed of vehicle parts and electric appliances moving to and from Louisville.

illustrative; (2) that the adjustment for Canadian traffic is in error; and (3) that the last adjustment of 2.53 percentage points is purely an unsupported assumption."

The issue as tendered by the Southern lines, whether their data or that relied upon by Northern lines, was "more reliable" for application to the Official-Southern traffic was directly decided by the Commission:

> "For the reasons discussed above, we find that the empty return ratios for both box cars and refrigerator cars developed by the special studies of the Southern lines are not as sound an estimate of the empty return incurred by the official-southern traffic as are the 7-day study territorial empty return ratios. The latter reflect the compilation of actual data reported by the railroads on a comparable basis in each territory under an order of this Commission." (A. 110)

Southern lines now say that there was no substantial evidence to sustain the Commission's use of the box car ratios resulting from the 7-day study. The appropriateness of applying those ratios was demonstrated, as before indicated, by the fact that the issues relate to all traffic between all of Official and all of Southern territory, by the evidence showing that this huge block of traffic is the product of all of the myriad of operating conditions which influence the loaded and empty movement of railroad equipment (V.S. 8, A. 541-582, and V.S. 73, A. 893-904), by the Southern lines' use in this case of the figures produced by the same 7-day study on traffic moving in all types of equipment other than box and refrigerator cars, and by the fact that movements of auto parts in assigned cars takes place between Official and Southern territories, as well as elsewhere and, as the

Commission found, is therefore reflected in the average figures for Official and Southern railroads (A. 106).[19]

F. The Commission's Resolution of the Issue With Respect to Count of Cars Interchanged Was Lawful in All Respects.

The Southern lines introduce their discussion of this issue by a quotation from the dissenting opinion and then say, "No feature of this statement of the problem is questioned in the Commission's report. Instead, the Commission devotes its report to an attack upon the 'estimate' used by the Southern railroads in an effort to correct the inconsistent counting of cars" (Br. 65-66).

The quotation from the dissenting opinion begins with the sentence "The improper counting of a car interchanged instead of terminated by the official lines affects the weighting of that car in computing switching costs." It ends with a like sentence: "The erroneous counting of cars terminated as cars interchanged on the official lines produces higher unit costs for official territory than for southern territory . . ." (Br. 66).

The fact is that the majority report disagreed with the dissenter's assumption that the count of cars was "im-

19. Southern lines stated (Brief, p. 60, fn. 35) that Northern lines rejected a proposal for a joint study of box car empty return ratios. Southern lines sought data in the hands of Northern lines consisting of thousands of wheel reports, and it was clear (1) that the proposed study would have no value, and (2) that whereas the Commission's 7-day study embraced sample days spaced throughout a 12-month period, the 3-day study suggested by the Southern lines would have covered but a span of 18 days, an obviously unrepresentative period and also one which was affected by a strike. A new study spaced throughout a year would have delayed the case, and the Northern lines, as well as the Commission, found the existing data satisfactory. It may be noted that the study proposed by Southern lines was of all traffic on Northern and Southern lines, not just Official-Southern traffic (A. 991, 992).

proper" or "erroneous". The Commission quoted from the evidence of Northern lines on this point:

> "This traffic has been counted as interchange traffic for many years. The rates on this traffic are different than the rates on traffic originated or terminated at the same ports. Evidence was introduced to show that the switching characteristics of the port service on this traffic are more akin to interchange than to terminal service.". (A. 94)

The Commission concluded, *inter alia*, that (A. 94):

> ". . . the contentions of northern lines have merit, and that a change in the classification of this traffic for costing purposes in this case is not justified."

Contrary to the statement in Southern lines' brief that the Commission devoted its report to an attack upon the estimate used by Southern lines in an effort to correct what the dissenting opinion called an erroneous counting of the cars as interchanged, the report is entirely clear that the Commission rejected Southern lines' contention that the cars in question were improperly classified.

The Commission also found that the estimates which Southern lines proposed for the correction of what they regarded as an improper classification "lacks sufficient probative force" (A. 94). Those lines now argue (Br. 66): "Even assuming that the estimate made by the Southern railroads was inadequate, it was incumbent upon the Northern railroads to produce the data in their possession necessary to make an adjustment without resort to any estimate."

Southern lines petitioned for the data desired by them to make an adjustment in the figures classifying the cars in question as interchange traffic. Northern lines consented

to Southern lines having access to the data (A. 1037). Southern lines represented that this data "provides adequate detail for the adjustment reflected in the Southern lines' cost study . . ." (Southern lines' brief before the Commission, p. 109.)

G. The Commission Acted Lawfully in Rejecting Southern Lines' Addition of Pulpwood and Phosphate Rock Constant Costs to Their Cost of Handling North-South Traffic.

This section of Southern lines' brief deals with the Commission's rejection of an adjustment proposed by Southern lines for the addition of over $7,800,000 to their costs to make up for the full share of constant costs which, they say, are not recovered on intra-south shipments of wet phosphate rock and pulpwood.

The movements are wholly intraterritorial within the South. Southern lines' theory in proposing this adjustment, however, was that the movement of pulpwood, for example, into paper mills is on rates that are made low so that the paper products which are made from the pulpwood will be induced to move outbound by rail, and paper products do move from the South to the North. They stated, for example, that the relationship between the inbound movement of pulpwood and the outbound movement of paper products was essentially a "transit" relationship and that, therefore, to the extent that the revenues for the transportation of the pulpwood inbound to the paper mill did not cover the total of out-of-pocket plus constant costs attributable to that local transportation, the deficit in constant costs should be charged to the North-South traffic and added to the Southern lines' costs in this case. The Northern lines argued, among other things, that there was no such transit relationship as the Southern lines had postu-

lated as an essential part of their argument.[20] They also pointed out that they were not parties to the rates involved, that they had no control whatever over their level or any other aspect thereof. The Commission's power as to divisions is to prescribe the division of *joint* rates (49 U.S.C. § 15(6)).

The Commission disagreed with Southern lines' essential theory and was unable to find that the pulpwood and wet phosphate rates within the South are so related to the interterritorial rates that there is a sound basis for the adjustment proposed by Southern lines (A. 128). Southern lines in no way attack that determination. Indeed, their brief does not even hint that it was made. They pretend that the Commission decided the point on the ground that there were comparable situations in the North and they argue that Northern lines failed to come forward with facts concerning similar situations in the North notwithstanding which the Commission "upheld the Northern railroads' position and used average costs." As indicated above, this does not accurately represent the Commission's disposition of this point.

IV. Southern Lines' Argument That the Commission Has Not Justified Its "Abandonment of Uniform Divisions Between Territories Having Uniform Rates" Is Without Merit.

Under their Point III the Southern lines urge that the Commission erred in not "justifying" its abandonment of uinform divisions between the North and the South "particularly since those territories have uniform rate levels" (Br. 68-9).

---

20. A description of a proper transit arrangement is contained in *Board of Trade v. United States*, 314 U.S. 534, 537-538 (1942).

In arguing the point the Southern lines say (p. 72):

> "Nothing in Section 15(6) of the Interstate Commerce Act authorizes the Commission to regard divisions based upon relative costs as so obviously just, reasonable, and equitable, that their prescription follows as a matter of course and without the reasoned findings to explain such action as required by the Administrative Procedure Act."

These are the same parties who urged in their brief before the Commission in the present case that (p. 249):

> "The Divisional Scale Must Reflect Cost Relationships in Order To Produce Fair Divisions on Official-Southern Traffic."

At pages 254-5 of that brief the Southern lines quoted this statement and stated that they endorsed it:

> "The Commission's objective should be to ascertain the relative amounts of service rendered by each group of lines as reflected in their relative service costs and to let that standard govern the distribution of the revenues. Scales of pro-rating factors based upon relative costs automatically make appropriate provision, on an average basis, for both the terminal and line-haul services rendered."

The Southern lines carried that contention into a formal proposal for the prescription by the Commission of specific scales based upon Southern lines' contentions of what the relative costs were. At page 271 of their brief before the Commission, they stated:

> "The divisional scales proposed by the Southern lines are constructed directly from the costs developed in their cost study. The proposed scales are incorporated in the proposed findings attached to this Brief."

These scales are found in the Appendix (p. A-3) to said brief (A. 1071). Reference thereto will show that, in recognition of their claimed higher costs, Southern lines proposed scales higher for themselves than for Northern lines. They had no concern for "uniformity in divisions based upon uniformity in rates."

Having urged the Commission to predicate the prescribed divisions on the basis of relative costs, it is manifest that the Southern lines cannot now be heard to say that the Commission committed an error of law in so doing. They purport to rely upon § 8(b) of the Administrative Procedure Act. The pertinent provision thereof is that all decisions shall include a statement of findings and conclusions as well as the reasons or basis therefor "upon all material issues of fact, law, or discretion presented on the record." There was no issue when the party now complaining about the matter urged the Commission to do the very thing about which complaint is being made.[21]

Wholly independent of the fact that the Commission did what Southern lines urged it to do in prescribing divisions on the basis of relative costs, it should be noted that the factual basis upon which Southern lines predicate their argument is unsound. Contrary to the statement on page 70 of Southern lines' brief to the effect that the Commission's decision in *Divisions of Rates, Official & Southern Territories*, 234 I.C.C. 175 (1939), "prescribed an inflation in the divisions of the Southern Railroads on the express ground that the rates in the South were higher on such traffic than

---

21. On p. 73 of their brief Southern lines argue that the prescribed divisions also divide profits realized on the traffic and that the division of profits would seem to turn more upon consideration of revenue needs than costs. Divisions divide rates, regardless of the amount of revenue produced thereby. And this argument is in conflict with Southern lines having insisted before the Commission that the rates should be divided on the basis of relative fully-distributed costs.

the rates in the North" and allowed Southern lines a higher division only where interterritorial rates were higher than those within Official Territory, it may be noted that in that case (1) the Commission prescribed divisions on vegetables from Florida over 50% higher for Southern lines than for Northern, yet there is not the slightest indication in the report that the rates from the South to the North were 50% higher than vegetable rates within the North or even that there were any significant vegetable rates within the North; (2) the Commission prescribed as to all existing rates, on general traffic, divisional factors 25% higher for Southern than for Northern lines except on only three categories of traffic, denatured alcohol, cast iron pipe, and export and import rates between Central Territory and certain Southern ports. Notwithstanding the fact that there were countless rates between the North and the South that were on the same level as those within the North, the Commission excepted only these—among all the then present rates—from its order that the Southern lines should have 25% higher divisions.

At page 192 of its report in that case the Commission said that it considered the 25% difference in the prescribed divisional factors "fair in the light of all the facts before us." Among those facts were the evidence as to service costs, the discussion of which started at page 186 and ran over to page 190, with a conclusion, on page 189 that:

> ". . . transportation costs on the traffic here considered may properly be considered to be higher in the South, and that, although the exact degree of difference is indeterminable, it is not negligible, as the northern lines argue."

Then, in the next case (the first decision in the instant docket) the Commission said, concerning the earlier case (287 I.C.C. at p. 524):

> "The element of cost was given weight in our 1939 report upon a showing that from 1932 to 1936 the cost per revenue ton-mile in the South was about 16 percent higher than that in the North."

Moreover, with respect to the Commission's having prescribed divisional factors on citrus fruit which were 85% higher for Southern than for Northern lines, this Court said the factor of financial need appeared to have been given much weight. (*Baltimore & O. R. Co. v. United States,* 298 U.S. 349, 361.)

Southern lines are incorrect in their statements or implications that equal divisions between Official Territory and the South and between Official Territory and the Southwest were prescribed in the 1953 decisions because equal (class) rates were prescribed. The Commission made it clear in those reports that it was not the equal class rates, as such, but the facts behind the prescription of equal class rates—the findings as to equality of costs at that time—that induced the prescription of equal divisions; *Official-Southern Divisions,* 287 I.C.C. 497, 523, 526; *Official-Southwestern Divisions,* 287 I.C.C. 553, 578.

The major premise of Southern lines' proposition that the present order of the Commission, in reflecting cost relationships, constitutes a departure from a long-standing standard of fixing North-South divisions in relation to rate levels is, therefore, shown to be unfounded in fact. That the Commission has not adopted any such policy or standard, either as to North-South divisions or generally, is shown also by its report in *Atlantic Coast Line R. Co. v. Arcade & A.R. Corp.,* 198 I.C.C. 375, at 378-379:

> "At several places in defendants' petition we are charged with serious error in not following and respecting *principles* said to have been laid down in

our decisions or those of the Supreme Court dealing with divisions. It may well be doubted whether decisions in prior cases may properly be said to be a *source of principles governing divisions, which are rather to be sought in the statute empowering us to fix divisions.* Examination of our prior decisions will show that we have at all times asserted it to be our duty to consider each divisional controversy coming before us strictly on its own merits without regard to any fixed basis or general standard of divisions . . ." (Emphasis added.)

In essence, the Southern lines are arguing that equal class rates require equal divisions. As previously shown, class rates are of extremely minor importance from the standpoint of the amount of traffic moved thereon. The general body of rates is higher in the North than in the South.[22]

Even more important is the fact that the class rates were prescribed on the basis of territorial cost relations as of 1939 (27 years ago) in *Class Rate Investigation, 1939,* 262 I.C.C. 447 (1945). There has been a tremendous change since that time. It would be arbitrary in the extreme to take those class rates and then reason that because class rates are equal, divisions must be equal. To do this would involve ignoring the evidence of record with respect to current facts in favor of facts existing twenty-seven years ago as reflected in the little-used class rates.

In addition to the invalidity of Southern lines' contention on the grounds discussed above, it is invalid as a matter of law. Mere inconsistency with a prior decision is not a valid basis for setting aside a later decision of an administrative agency. *William N. Feinstein & Co. Inc. v,*

22. See *supra,* p. 14.

United States, 317 F. 2d 509, 512 (1963); *Manufacturers Ry. Co. v. United States,* 246 U.S. 457, 482 (1918); *Virginia Ry. v. United States,* 272 U.S. 658, 665 (1926); *Baltimore & O. R. Co. v. United States,* 298 U.S. 349, 359 (1936).

In *Secretary of Agriculture v. United States,* 347 U.S. 645 (1954) the Court required the Commission to explain "its departure from prior norms" (347 U.S. 653). The prior norm in that case was virtually a rule of law. Here, however, the Commission is asked by Southern lines to explain why it departed from a past decision establishing a uniform scale on a purely factual basis, in favor of a scale based on relative costs. This is a matter for the Commission's administrative determination on the record before it. Its departure from the prior scale is not a departure from a prevailing rule. *Atlantic Coast Line R. Co. v. Arcade & A. R. Corp.,* 194 I.C.C. 729.

The final argument advanced by Southern lines is that if the Commission correctly found that the Northern lines had relatively higher costs, then *ipso facto* the Northern lines must be deemed relatively inefficient as compared with the Southern lines and the Commission's finding that the two sets of carriers were equally efficient is contradictory and inconsistent. Obviously, higher costs may be incurred for any number of reasons having nothing to do with relative efficiency, e.g., higher wages, higher taxes, number and size of cities served with their influence on terminal operations, etc. Southern lines made no claim of inefficiency, as such, before the Commission. The only matters they raised with even remote relevance thereto were decided against them (A. 38). And, of course, they claimed that their costs were higher than those of Northern lines without any suggestion that they—Southern lines—were inefficient.

V. Reply to the Contention That the District Court Was Correct in Not Reserving Jurisdiction.

At p. 55 of Northern lines' principal brief in this Court it was pointed out that in view of the large sum of money involved those lines would have to proceed with great caution, that they believed that the Commission's order would be sustained but suggested that in the unlikely event that there should be a remand, the prescribed divisions should be permitted to continue in effect subject to possible readjustment following the remand proceedings.

Beginning at p. 76 of their brief, the Southern lines argue that Northern lines agreed to conditions requiring them to resettle all revenues accruing during this litigation in accordance with the preexisting basis of divisions "in the event the Commission's orders were set aside."

The order of the District Court containing the conditions to which Northern lines agreed provides that in the event the Southern lines are successful in "permanently setting aside" the Commission's order Northern lines will resettle their accounts on shipments made on and after April 20, 1965, with interest at 5% on the difference between revenues based on the divisions prescribed and revenues based upon the old divisions (A. 169-171).

If the Commission's order should be found deficient in such a way that the deficiency would not go to the merits of the whole order it would be unjust to set it aside permanently, or to set it aside at all. It might be found deficient, for example, with respect to the Commission's rejection of only one cost adjustment that was advocated by Southern lines and refused by the Commission. In such circumstances it would be unjust to deprive Northern lines of the entire relief to which the Commission found them entitled. It would, therefore, be unjust to enter an order permanently setting aside the Commission's order.

As noted at p. 57 of our opening brief, in *Secretary of Agriculture v. United States*, 347 U.S. 645 (1954), the case under review was remanded to the Commission for further proceedings, but without invalidating the Commission's order or enjoining its enforcement, thus leaving the unloading charges fixed by the Commission's order in effect pending completion of the remand proceedings. A similar procedure here, in the event of remand, would protect the interest of all parties by assuring the application of such divisions as the Commission might ultimately prescribe to all traffic moving subsequent to April 20, 1965, the effective date of the divisions now being applied.

On p. 57 of their initial brief Northern lines suggested an alternative to the procedure just mentioned, namely, a direction to the District Court to retain jurisdiction to make an equitable resettlement of the divisions in the event that upon remand the Commission in a valid order prescribed new divisions for the Northern lines more favorable than the old divisions.[23]

VI. Reply to the Brief of the Southern Governors' Conference et al.

The brief of the Southern Governors' Conference and the Southeastern Association of Railroad and Utilities Commissioners, hereinafter called the "Conferences",

---

23. In their argument on this general point Southern lines contend that the preexisting scale was found to be defective to their prejudice and appear to urge that the settlement of revenues on the basis of the preexisting divisions would, nevertheless, give Northern lines the benefit of that preexisting scale. The Commission's conclusion to revise the scheme of the scales was made, however, only in the light of its conclusion to be guided by the relative costs in its general determination (A. 63) and, as the District Court pointed out:

> "It cannot be known what the Commission would have done with respect to giving weight to that argument if it were viewed independent of the other facts which induced the Commission to prescribe the divisional bases which it did prescribe."

makes many assertions as to facts but the brief is characterized by an unusual paucity of references to evidence in support of such assertions.

The brief also contains repeated assertions to the effect that although *New York v. United States* had made it clear that there were no inherent differences in transportation conditions in the North and the South, Northern railroads refused to accept equality with the South (p. 4), that in seeking cost related divisions Northern lines did so pursuant to "their aim of obtaining a preference for the North" (p. 4), as a part of the "overall strategy pursued by all of the Northern interests" (p. 4, n.) to obtain preferential treatment in rail transportation charges and, quoting from a speech of Mr. Thurman Arnold, made 27 years ago, that the East had been exploiting the South and treating it as a colony (p. 42). The Northern railroads accepted the Commission's decision granting equality of class rates in *Class Rate Investigation, supra,* and did not join in the appeals (decided in *New York v. United States*) from that decision. Cost relationships have changed since that time and fully justify those railroads seeking higher divisions.

Extravagant claims to the effect that this case is of vital importance to the South and will erect territorial trade barriers (Conference Br. p. 13) and that this case represents an effort to obtain a preference for the North have no foundation whatever. Indeed, recognition of the higher costs of Northern railroads, to the extent that such would be pertinent at all in the fixing of rates, could only mean that the rates within the North would be higher than within the South and between the two territories. The situation would be just the reverse of that which existed as to class rates prior to the decision in *Class Rate Investigation, supra.* Moreover rates and divisions are governed by different statutory criteria and the rates are subject to many

competitive factors which influence their level and relationships. Shippers, including those in the South, pay rates, not divisions.

A. There Is No Sound Basis for Requiring the Commission, as a Prerequisite to Prescribing Cost-Related Divisions, to Find That the Costs Reflect Inherent Territorial Advantages and Disadvantages.

Section 15(6), which empowers the Commission to prescribe divisions and requires that it give "due consideration" to specified elements, puts upon the Commission no such restriction concerning its use of relative costs as Interveners ask this Court to impose.

No judicial construction of Section 15(6) supports Intervenors' theory.[24] On the contrary, the cases clearly establish that it is the exclusive province of the Commission to make findings of fact, to draw inferences therefrom and to evaluate and determine the weight to be given the evidence of record. See *New York v. United States, supra,* at pp. 49-50; *Chic. St. P. M. & O. R. Co. v. United States,* 322 U.S. 1, 2, 3 (1944); *Alton R. Co. v. United States,* 315 U.S. 15, 23 (1942).

---

24. While the Conferences do not attempt to define what they would include within the scope of "natural" or "inherent" territorial disadvantages, it may be noted that they would exclude therefrom such matters as differences in wage rates (p. 27) (this and all other references in this footnote are to the pages of the Conferences' opening brief in the District Court), differences in tax rates (p. 27), differences in car utilization (p. 27), higher empty return ratios (p. 25), higher switching costs (p. 25), higher interchange costs (p. 25), economic conditions (p. 22), differences "which can be and will be eliminated by the normal working of economic forces", without limitation as to time. Thus, under "inherent territorial advantages and disadvantages" the Interveners would apparently exclude virtually everything that might affect relative costs except physical or "natural" conditions such as topography, grades and curves, and climatic conditions.

The Conferences rely upon *New York v. United States* as supporting their contention that, as a prerequisite to the prescription of divisions on the basis of relative costs, the Commission was obliged to find that the costs of Northern lines reflected inherent territorial disadvantages (A. 51). *New York v. United States* imposes no such requirement. In that case the Commission found that conditions as between the respective territories did not justify the then existing differences in the class rate structures (331 U.S. at 315). The Court pointed out (at pp. 315-16) that:

> "In reaching that conclusion it first inquired whether the differences in the costs of furnishing the railroad service in the several rate territories justified the existing differences in the levels and patterns of the class rate scales."

Thus the Commission looked to the costs as the primary evidence of relative transportation conditions affecting the rates involved; it did just the opposite of what the Interveners now claim, namely, that it imposed a requirement that costs could not be used without in some way validating them by reference to territorial conditions.

In the present case the Commission stated (A. 51):

> "Relying on *New York v. United States,* 331 U.S. 284, 315 (1947), the interveners also take the position that natural disadvantages must be found in the North before we may increase the divisions of the northern railroads. In essence, however, other factors being equal, cost differences generally are the product of, and reflect, the inherent advantages and disadvantages that go to make up the respective overall transportation conditions in the two territories. Cf. *Louisville & N.R. Co. v. Southern Ry. Co.,* 319 I.C.C. 639, at pages 646-47."

Obviously the most important of the other "factors" that could affect this matter would be the factor of efficiency. At A. 39 the Commission found that:

> ". . . the northern lines' cost of service is not shown to be affected by purported waste or inefficiency. More affirmatively, we find that both groups are being operated efficiently and that neither group should be considered as more or less efficient than the other."

The Commission found, in addition, that the other factors required to be considered by the statute, as well as the other facts, were substantially equal (A. 79 and A. 80).

These findings of the Commission disposed of the Interveners' argument and completely satisfied the requirements of the Administrative Procedure Act.[25]

Very much like the Commission's statement in the present case to the effect that cost differences generally reflect the inherent advantages and disadvantages that go to make up overall transportation conditions is the following from this Court's opinion in *New York v. United States, supra,* at 348-49:

---

25. It will be noted that the Commission made reference to *Louisville & N. R. Co. v. Southern Ry. Co.,* 319 I.C.C. 639, at A. 51. There the Commission, consistent with its conclusion here, said, after describing contentions concerning operating conditions:

> "While an appraisal of the evidence regarding physical operations indicates that both the complainant and the defendant operate in mountainous terrain, there is no need to determine whether such transportation conditions are more favorable or onerous to one than to the other. The nature of the physical transportation circumstances is concededly reflected in the cost of operations. In this respect, the cost data hereinafter discussed form a sounder basis for a determination of the issue raised than any conclusions to be drawn from the numerous factual statements regarding operating conditions."

This decision was upheld in *Carolina & Northwestern Ry. Co. v. United States,* 234 F. Supp. 112; affirmed, 380 U.S. 526.

> "Revenue needs, *like costs of rendering the transportation service,* are germane to the question whether differences in territorial rate structures are justified by territorial conditions. They are amongst the standards written into § 15a; *they reflect the totality of conditions under which the carriers in the respective territories operate.*" (Emphasis added.)

In addition to the fact that there is no such legal requirement as the Conferences contend, the factual basis of their argument is completely unsupported. It cannot be stressed too greatly that there is nothing in the record to substantiate the sweeping claim of the Conferences, repeated over and over again, that the higher costs of the Northern lines are the result of over-capacity and consequent waste. There is simply no evidence comparing the Northern and the Southern lines from any standpoint of overcapacity. Moreover, the record in the instant case contains ample evidence of differences in Northern and Southern territorial conditions which are not related to overcapacity but which reflect themselves in cost consequences. Thus, by way of examples, Eastern lines operate in a more populous territory where they have shorter hauls and a greater proportion of terminal to line-haul service (V.S. 5, 6 & 7; A. 493-496, 504, 518-520, 523-525, 532); as shown in V.S. 69, at pages 5 to 8 (A. 890-892), railroad terminal expenses tend to rise much faster than line-haul costs; wage rates and taxes are higher in the North than in the South (A. 938-940). As demonstrated in V.S. 80, Section F, if the Northern lines in 1956 had the benefit of Southern lines' wage and tax bases they would have realized savings of $168,598,737 (A. 939-940).

The presence or absence of over-capacity as affecting relative territorial costs can be indicated by making com-

parisons of fully distributed costs and out-of-pocket costs, which latter eliminates fixed costs (50% of the return on road property as well as 20% of all expenses, taxes and rents).[26] When comparison is made of Eastern District and Southern territorial costs on an out-of-pocket basis the Northern proportion of total costs is *larger* than when using fully distributed costs (V.S. 3, Ex. B, p. 14; A. 454).

In fact, the claim of Northern lines' over-capacity is founded upon Interveners' generalizations concerning merger activity in the North. However, the Commission found "the southern lines themselves have noted that mergers are now going forward in all territories, including the South" (A. 39). It is a matter of common knowledge that all major Southern railroads have been parties to merger negotiations. This includes such important lines as the Illinois Central and Gulf, Mobile & Ohio, and the already approved mergers of the Central of Georgia and Southern Railway and of the Seaboard Air Line and the Atlantic Coast Line, the latter carrier, of course, already being in control of the Louisville & Nashville.

The Commission found that if and when the proposed mergers are ultimately approved and finally consummated "in both groups the savings produced thereby will be then reflected in the respective unit costs." It then stated: "The economies hoped to be effected thereby and the savings expected are not ascertainable for future operation to the degree required for any specific adjustment here of the cost studies of record. We find upon this record that the northern lines' cost of service is not shown to be affected by purported waste or inefficiency" (A. 39).

Nothing could be more a matter for determination by the administrative body than that dealt with in the conclu-

---

26. See *American Lines v. L. & N.R. Co.*, 392 U.S. —, (1968) fn. 4, p. —, 88 S. Ct. 2105, 2108.

sions that expected savings are not ascertainable for future operation to the degree required to adjust cost studies of record. These findings together with the findings under "Importance to the Public" at A. 50 and A. 51 are all the findings that the Commission was required to make in disposing of the Conferences' point.

B. The Conferences Contention That the "Principle" of Local Responsibility Requires Equal Divisions Notwithstanding the Higher Costs of One Group of Railroads Is Unsound.

Under this point the Conferences argue (Br. 32 et seq.) that they contended before the Commission that whether or not the Northern lines' higher costs were the product of inherent disadvantages, "the imposition of any part of that cost burden on the South" would be improper unless "the North were found to be unable to support its own cost burden." The conferences urge that the effect of the Commission's decision will be to increase the rates of Southern shippers or diminish their service (Br. 37-38). They contend that the Commission failed to rule on this point and that such failure constitutes a violation of the Administrative Procedure Act.

This argument of the Conferences means that a shipper who happens to live in Boston, and who ships to Detroit, for example, would be required to pay not only the cost allocable to his own shipments but enough, in addition, to make up the amount by which a rate paid by a shipper from Atlanta to Detroit, for example, is reduced below the cost allocable thereto in recognition of the higher costs of the Northern line which participates in the shipment. The man in Boston is a user of the Northern railroads and so is the man in Atlanta (whose shipment moves, for example, by the L.&N. to Cincinnati, thence the B.&O. to Detroit).

Neither customer of the railroad is any more responsible for those railroads than the other. Each is simply a patron thereof.

The Conferences indicate that "the principle" that each territory is primarily responsible for carrying its own "cost burden" is established in *New England Divisions,* 126 I.C.C. 579, 599 (1927) and, on p. 33 of their brief, they quote therefrom about the dangers in the assumption that deficiencies in local earnings must inevitably be made up on interchange business. But this had nothing to do with relieving shippers or carriers of another territory from paying rates, or having divisions, related to the cost of a railroad whose services the shipper uses. In that decision, Commissioner Eastman first quoted from *United States v. Abilene & Southern R. Co.,* 265 U.S. 274, at pp. 284-85, wherein it was stated that it is settled that in determining divisions the Commission may, in the public interest, take into consideration the financial needs of a weaker road and that it may be given a division larger than justice merely as between the parties would suggest in order to maintain it in effective operation.

Then the decision continued (126 I.C.C. at 599):

> "If the operating costs of the New England roads per ton-mile are twice those of their connections, their revenues per ton-mile must of course be approximately twice as much also, in order merely to produce an approximate parity in operations, without even considering investments. If on the one-third of their tonnage which is local to New England they are unable to receive revenues which are twice those of the Trunk Lines on local business, then their divisions must be enough more than twice those of the Trunk Lines per ton-mile to make up the difference."

It is clear, therefore, that in *New England Divisions* the Commission simply declined to push its "financial need" power to the extent desired by the complainants. It was in no way indicated that where divisions are prescribed without reliance on the financial need doctrine but merely to achieve justice as between the parties the Commission might not make divisions on a cost-related basis but, instead, must require the shippers of the territory wherein the railroad operates to bear not only the costs attributable to their own shipments but a part of the cost attributable to the traffic of those who ship from the territory wherein railroad costs are lower.

The Commission here rejected any reliance upon the financial need doctrine (A. 78-79). It was completely within its discretion to employ a relative cost basis as a common standard of measurement reflecting "what justice merely as between the parties would suggest . . ."[27]

Indeed, as was pointed out above, the Southern lines urged in the present case that the Commission should prescribe the divisions on exactly that basis.[28]

None of the Commission cases cited by the Conferences at pages 33-35 of their brief support their suggested "prin-

---

27. The quoted phrase is from *U. S. v. Abilene & So. Ry. Co., supra,* at p. 285; and is also used in *B. & O. R. Co. v. United States,* 298 U.S. 349, 370.

28. The primacy of relative costs as the initial indicator of justice as between the parties is indicated by numerous expressions of the Commission. For example, in *Akron, C. & Y.R. Co. v. Atchison, T. & S.F. Ry. Co.,* 322 I.C.C. 491, at 506, the Commission concluded:

> "In the prescription of just and equitable divisions the matter of rate level is not controlling since our objective is to prescribe fair proportions of revenue whether the rates be on a high or a low level. In fixing such proportions it is the relative contribution of the parties, in terms of costs, that furnishes the initial indication of what is just and equitable among the carriers."

This Court held that the Commission's orders in that case were valid. *Chicago & N.W. R. Co. v. A.T. & S.F. R. Co.,* 387 U.S. 326. See also *New England Divisions,* 66 I.C.C. 196, 198 and 199 (1922).

ciple of primary local responsibility through equality of divsions . . . " which they assert "has been consistently followed by the Commission for more than thirty years."

Thus, in *Official-Southwestern Divisions,* 287 I.C.C. 553, 579 (1953), while recognizing that acceptance of relative transportation costs in 1948 at face value "would necessarily support the contention of the eastern lines that the divisional factors to be prescribed should be weighed 10 percent in their favor," the Commission concluded:

> "Upon all the evidence bearing on operating costs we believe it would be unsafe to conclude that in the future there will be any appreciable difference in the average cost levels of the southwestern and eastern lines."

For similar reasons the 1953 decision in *Official-Southern Divisions,* 287 I.C.C. 497-526, does not support the Conferences' alleged "principle". In none of the other cases cited in which the Commission prescribed equal-factor divisions did it recognize the existence of higher costs in the East, but refuse to give effect thereto because of the "principle" for which the Conferences contend. *Divisions of Rates, Official and Southern Territories,* 234 I.C.C. 175 (1939), is not such a case, since the Commission there regarded the costs within the South as then being higher than in the North (234 I.C.C. 175, 189).

With respect to the Conferences' point about the necessity for findings, it should be noted that although the Commission is not required to make subordinate findings on every collateral contention advanced, *Minneapolis & St. Louis Ry. Co. v. United States,* 361 U.S. 173, 193 (1959), their finding that the continued maintenance of divisions which, all other things being equal, do not reflect the relative costs of service would not suggest justice as between

the parties (A. 51), is clearly sufficient with respect to the present contention of the Conferences.

The last five pages of discussion under this point (Point III) of the Conferences' brief discusses alleged economic facts which are in no way pertinent to the point urged by them. It, therefore, needs no reply although much of what is said is in conflict with the Commission's conclusions under the heading "Economic Trends" in its report in this case (A. 31-33). One interesting statement in the report (A. 32) is the following:

> "A southern respondent in 1960 represented 'that the South's economic development since World War II has outpaced the national rate of growth in practically every category you can name.'"

With reference to the Conferences' statement concerning the inadequacy of the rate of return of Southern railroads (Br. 38), it may be noted that in the recent case cited by them, *Increased Freight Rates, 1967*, 329 I.C.C. 854 (1967), the Commission found that rates of return on net investment for the Eastern and Southern railroads were as follows:

Year	*Eastern district*	*Southern district*
	Percent on net investment	
1950	3.63	5.31
1951	3.47	4.74
1952	3.86	5.27
1964	2.56	4.01
1965	3.32	4.16
1966	3.54	4.45
12 months to March 31, 1967	3.15	4.44

The suggestion that the Commission's decision in the present case would result either in a substantial diminution in the quality of rail service within the South or a "substantial increase in rates", and all the speculative consequences thereof which are alleged by the Conferences, are hollow in the extreme. The Commission's estimate of the amount of the revenue reduction to the Southern lines as a result of the order here under review ($7,948,000, A. 80) is only 62/100 of 1% of the freight revenue of the Southern lines ($1,280,900,000, A. 776) for the year in which the Commission's calculations were made (1956). After an appropriate adjustment for income taxes therefor, it would appear that the reduced revenue might be somewhere in the neighborhood of 4/10 of 1% of the gross freight revenue of Southern lines. It is difficult to understand, therefore, how Southern lines could be envisaging "a substanstial increase in rates" as a consequence of this divisions order. The Commission considered the Southern lines' contentions and found that the prescribed divisions "can result in no unlawful injury to the South" (A. 51).

CONCLUSION.

For the foregoing reasons, it is respectfully submitted that the judgment of the District Court should be reversed and the cause remanded to that court with instructions to dismiss the complaints.

Respectfully submitted,

APPENDIX

This is a reproduction of a footnote on page 119 of Southern lines' Exceptions to the Examiners' Recommended Report, showing Southern lines' calculation of the amount of their solely related passenger deficit for 1956 to be allocated to Official-Southern (North-South) traffic.

The figures under the year 1957 were added by Northern lines. The record references given in Plaintiffs' table apply also to the figures added by Northern lines.

• The portion of the so-called "solely related" passenger deficit for the year 1956 included in the costs assigned to Official-Southern traffic, and excluded in the Southern lines' restatement of costs in these Exceptions, is computed from the record as follows:

			1957
1.	Solely Related Passenger Deficit, Southern Region, Year 1956 (Exhibit R-13)	$11,302,132	19,959,810
2.	Portion of Solely Related Passenger Deficit related to distance (.70† times line 1)	$ 7,911,492	13,971,867
3.	Portion of Solely Related Passenger Deficit unrelated to distance (.30† times line 1)	$ 3,390,640	5,987,943
4.	Ton-miles, Southern Region, Year 1956 (V.S. 3, Ex. A, p. 15)	93,914,726,000	89,166,854,000
5.	Tons originated plus terminated, Southern Region, Year 1956 (V.S. 3, Ex. A, p. 22)	509,992,564	480,343,351
6.	Solely related passenger deficit per ton-mile (line 2 ÷ line 4)	.00842¢	.01488 ¢
7.	Solely related passenger deficit per ton (line 3 ÷ line 5)	.66484¢	1.17412 ¢
8.	Ton-miles of Official-Southern traffic south of break points (V.S. 40A, Ex. K)	15,625,356,000	
9.	Tons of Official-Southern traffic originated or terminated in South (V.S. 40A, Ex. K)	28,055,721	
10.	Portion of solely related passenger deficit related to distance allocated to Official-Southern traffic (line 6 x line 8)	$1,315,655	2,448,494
11.	Portion of solely related passenger deficit unrelated to distance allocated to Official-Southern traffic (line 7 x line 9)	$ 186,526	349,743
12.	Total portion of solely related passenger deficit allocated to Official-Southern traffic (line 10 + line 11)	$1,502,181	2,798,236

† 70-30 is the approximate allocation of passenger deficits as between distance and unrelated to distance under Rail Form A. Changing this factor would have no appreciable effect on the result of this calculation since such a change would not change the total amount of the solely related passenger deficit allocated to Official-Southern traffic, but would have only a minor effect on the relationship between terminal and line-haul costs.

No. 13, OCTOBER TERM, 1968.

THE BALTIMORE AND OHIO RAILROAD COMPANY ET AL.,

Appellants,

v.

ABERDEEN AND ROCKFISH RAILROAD COMPANY ET AL.,

Appellees.

ON APPEAL FROM THE UNITED STATES DISTRICT COURT FOR THE EASTERN DISTRICT OF LOUISIANA, NEW ORLEANS DIVISION.

PETITION FOR REHEARING RELATING SOLELY TO THE TERMS OF THE JUDGMENT AND ORDER TO BE ENTERED BY THIS COURT.

These Appellants respectfully petition the Court for rehearing for the purpose of providing by its judgment and order that the District Court—in order to prevent inequity, unnecessary expense, and a multiplicity of actions—shall hold the case in *statu quo* pending the Interstate Commerce Commission report on remand. The following reasons are shown in support thereof:

After many years of litigation upon petition of Northern lines for an increase in their share of freight revenues on traffic handled jointly with Southern lines, the Interstate Commerce Commission granted Northern lines increases, solely on the basis of their higher costs. The District Court found that seven cost items accounted for those higher costs (A. 343), and it ruled that the Commission's decision was legally deficient with respect to all seven (A. 348, 349). This Court, however, concluded that the Commission's findings were adequate with respect to four of the items and deficient with respect to only three thereof (Opinion of Nov. 12, 1968, pp. 6-8), as to which the Commission on remand was to make "specific findings" (p. 6). The opinion concluded that the judgment of the District Court be modified and, as modified, affirmed (p. 6).

The divisions prescribed by the Commission's order went into effect on April 20, 1965 upon the District Court's denial of an interlocutory injunction. That order of denial provided that the railroads would be obliged to resettle their interline accounts on the basis of the pre-existing divisions as to all traffic moving after April 20, 1965 if the Commission's order should be "permanently set aside" (A. 169-171, 359). The District Court's judgment, after hearing on the merits, provided that the Commission's order be set aside and the cause remanded to the Commission, and judgment has been stayed pending disposition of the present appeals (A. 358-359).

It is respectfully submitted that until the Commission makes the specific findings on the three cost issues as directed by the opinion of this Court, it cannot be known whether a permanent setting aside of the order would be appropriate.

If the Commission's order were to be permanently set aside at this time and, after consideration on remand, the Commission should make valid findings sustaining the previ-

ously prescribed divisions (or some other basis higher for Northern than for Southern lines), the following expensive and wasteful transactions would result:

1. Northern lines would be obliged to pay over to Southern lines in excess of $25 million plus interest at 5% on past shipments;

2. On current shipments the railroads would be obliged to rearrange their interline accounting procedures on North-South traffic (about a million cars annually) and apply the pre-existing divisions in lieu of those prescribed by the Commission's order;

3. The refund of the $25 million and the changeover from the prescribed to the pre-existing divisions on current business would entail a large amount of accounting work and expense, with Northern lines bearing the Southern lines' changeover expenses as provided in the District Court's order of June 3, 1965;

4. Thereafter, following the Commission's making of valid findings reaffirming its prior conclusions (or approving some other divisions higher for Northern than for Southern lines) the $25 million (or the other appropriate amount) would, in equity and justice, have to be reshifted, this time from the Southern lines to the the Northern lines, and the accounts of current business would have to be resettled and the money attributable thereto retransferred. This would entail still more accounting expense, and this, together with the accounting expenses previously paid over to Southern lines, would now have to be refunded to Northern lines.

5. In the absence of the relief here sought, a multiplicity of actions would be required to recover the moneys due under the facts of paragraph 4 above. See *B.&O. R. Co. v. United States*, 279 U. S. 781 (1929).

Under Section 15(6) of the Interstate Commerce Act, the Commission is without authority to prescribe divisions retroactively except in circumstances not here present. *Brimstone R. R. Co. v. United States,* 276 U. S. 104, 117-123 (1928); *United States v. Baltimore & Ohio R. Co.,* 284 U. S. 195 (1931).

In view of the foregoing, it is respectfully submitted that, in addition to providing (as now contemplated by this Court's opinion) for remand to the Commission with instructions to make specific findings on the three cost items found deficient, this Court's judgment should instruct the District Court to hold the case, staying its final decree, until the Commission issues its report on remand.

The decisions of this Court clearly support the propriety of such an order.

In *Morgan v. United States,* 298 U. S. 468 (1936), 304 U. S. 1 (1938), 307 U. S. 183 (1939), a number of agencies performing stockyard services sued to set aside an order of the Secretary of Agriculture prescribing reduced charges for their services, and the District Court had issued a temporary restraining order enjoining enforcement of the reduced charges but upon the condition that the difference between those and the old charges be paid into Court pending final disposition of the case. This Court held that the Secretary had not accorded to Appellees the full hearing required by the Act, and the case was remanded for further proceedings before the Secretary. Thereafter, before the Secretary acted on remand, an appeal was taken from an order by the District Court requiring distribution of the fund to the market agencies. In 307 U. S. 183, at 190, this Court stated the questions involved, including the question ". . . whether, in the exercise of its discretion, the court should retain the fund until such time as the Secretary, pro-

ceeding with due expedition, shall make his final determination and order." Then the Court went on to state:

> "In answering these questions there are two cardinal principles which must guide us to our conclusion. The one is that in construing a statute setting up an administrative agency and providing for judicial review of its action, court and agency are not to be regarded as wholly independent and unrelated instrumentalities of justice, each acting in the performance of its prescribed statutory duty without regard to the appropriate function of the other in securing the plainly indicated objects of the statute. . . . The other guiding principle is that in reviewing the action of the Secretary and in similarly reviewing the action of the Interstate Commerce Commission in conformity with the provisions of the Urgent Deficiencies Act, the district court sits as a court of equity, see *Ford Motor Co. v. National Labor Relations Board,* 305 U. S. 364, 373; *Inland Steel Co. v. United States,* 306 U. S. 153; and in exerting its extraordinary powers to stay execution of a rate order, and in directing payment into court of so much of the rate as has been found administratively to be excessive, it assumes the duty of making disposition of the fund in conformity to equitable principles."

The Court concluded (at page 198):

> "A proceeding is now pending before the Secretary in which, as we have seen, he is free to determine the reasonableness of the rates. His determination, if supported by evidence and made in a proceeding conducted in conformity with the statute and due process, will afford the appropriate basis for action in the district

court in making distribution of the fund in its custody. *Atlantic Coast Line R. Co. v. Florida, supra,* 312-313, 317. Due regard for the discharge of the court's own responsibility to the litigants and to the public and the appropriate exercise of its discretion in such manner as to effectuate the policy of the Act and facilitate administration of the system which it has set up, require retention of the fund by the district court until such time as the Secretary, proceeding with due expedition, shall have entered a final order in the proceedings pending before him."

Addison v. Holly Hill Company, 322 U. S. 607 (1944) was an action by employes of a canning company to recover minimum wages under the Fair Labor Standards Act. The Act had no application to persons employed in processing agricultural products in the area of production. After plaintiffs recovered below, this Court ruled that the Administrator had exceeded his authority in defining the area of production with relation, in part, to the number of persons employed by a given company. The Court held, therefore, that the case should be remanded to the Administrator for a redefinition of the area of production. Although the money involved had not been paid into Court, the District Court was instructed by this Court to "hold the case" until the Administrator "by making a valid determination * * * with all deliberate speed acts within the authority given him by Congress" (p. 619).

In *Atlantic Coast Line R. Co. v. Florida,* 295 U. S. 301 (1935), intrastate charges had been collected by a railroad in accordance with an order of the Interstate Commerce Commission later held invalid because not supported by adequate findings. Thereafter the Commission, upon new evidence and new findings, made the same order it had made

before. Shippers who had paid the higher rates sued to recover the excess over the old charges on shipments that moved during the period when the first order was in effect. Notwithstanding the defect in the Commission's first order, in view of its having supplied the necessary findings upon the reopening of the case, recovery was denied.

A result similar to that achieved in the cases just discussed was brought about in *Secretary of Agriculture v. United States*, 347 U. S. 645 (1954), wherein this Court concluded that the Commission's findings were inadequate to show the basis for its approval of charges for unloading freight. It vacated the judgment of the lower court which had upheld the Commission and it remanded the case to the Commission for further findings, but without setting the Commission's order aside. The increased rates which had been approved by the Commission therefore continued to be charged while the Commission gave consideration to the matter on remand.

The propriety of the relief sought by this petition is thus well established in the precedents of this Court.

CONCLUSION.

In view of the foregoing, Appellants, the Northern railroads, respectfully pray that the Court enter an order remanding this case to the District Court with instructions

(a) to enter an order providing that its judgment is modified to conform to the opinion of the Supreme Court;

(b) to remand the case to the Interstate Commerce Commission for specific findings on the three items of adjustment of average territorial costs as to which this Court held the Commission's findings to be deficient; and

(c) to stay its final decree pending consideration by the Commission upon remand, and thereafter to make such further order or orders as may in equity and justice be required with respect to the resettlement of accounts as between Northern and Southern lines on the basis of valid findings made by the Commission in the remand proceedings.

OCTOBER TERM, 1968

THE BALTIMORE AND OHIO RAILROAD COMPANY, *et al.*, *Appellants*,
v.
ABERDEEN AND ROCKFISH RAILROAD COMPANY, *et al.*, *Appellees*.

No. 13

On Appeal from the United States District Court for the Eastern District of Louisiana, New Orleans Division

REPLY TO PETITION FOR REHEARING ON BEHALF OF SOUTHERN GOVERNORS' CONFERENCE ET AL.

The Southern Governors' Conference and the Southeastern Association of Railroad and Utilities Commissioners urge denial of the petition for rehearing filed by the Northern railroads in this case on the ground that the relief sought herein has no basis in law and is contrary to the public interest.

Although the Northern railroads seek to convey the impression that their petition essentially deals only with an administrative problem of avoiding unnecessary accounting expense, the relief sought in the petition would substantially reverse the decision which this Court has rendered on the merits of this case and would completely deprive these appellees of any of the benefits of this Court's decision for the foreseeable future. Throughout the proceedings in the case, the basic issue has been whether the Northern railroads have proved their right

to an inflated share of the revenues from North-South freight traffic. As representatives of the public interest, we have contended that the record contains no evidence to support such an inflation, and that, in the absence of such evidence, the divisions prescribed by the Interstate Commerce Commission constitute an unjust discrimination against the South.

Both the district court and this Court recognized the soundness of this contention. The district court emphasized the gravity of a divisional structure that would place the South at a disadvantage and pointed out that the Commission has special responsibilities when considering the establishment of such divisions (270 F. Supp. at 711):

> "For many years prior to this case the Commission has consistently followed the view that the primary responsibility for meeting the cost and revenue needs of the railroads of any territory lies with the people and the industry of that territory. New England Divisions, 126 I.C.C. 579, 599 (1927); Divisions of Rates, Official and Southern Territories, 234 I.C.C. 175, 190 (1939); Official-Southern Divisions, 287 I.C.C. 497, 523 (1953); Akron, Canton & Youngstown R. Co. vs. Atchison, T. & S. F. Ry. Co., 321 I.C.C. 17, 51 (1963). In this very case, prior to reopening, the Commission held that the primary division of revenues accruing from this traffic were to be made on an equal-factor scale. We recognize that the Commission is not perpetually bound by their 1953 holding, but we do believe that the Commission has special responsibilities in a case of this magnitude when it departs from its prior finding."

This Court pointed out that an abandonment of uniformity in divisions without evidence to justify the resulting discrimination against the South could put the South in the same disadvantaged position which it occu-

pied prior to the establishment of uniform class rates for traffic moving to, from and within the South (393 U.S. at 91-92):

> "We agree with the District Court that there is no substantial evidence that territorial average costs are necessarily the same as the comparative costs incurred in handling North-South freight traffic. If we were to reverse the District Court, we would in effect be saying that the expertise of the Commission is so great that when it says that average territorial costs fairly represent the costs of North-South traffic, the controversy is at an end, even though the record does not reveal what the nature of that North-South traffic is. . . . If indeed that lax procedure were sanctioned in a North-South divisions case, whose solution turns solely on costs, the class rate discrimination in favor of the North and against the South which we condemned in *New York v. United States*, 331 U.S. 284, could well flourish in another form."

The Northern railroads' petition for rehearing flies directly into the teeth of both of these holdings. On the assumption that nothing more is involved here than the ownership of money as between two groups of railroads, the petition urges that the Northern railroads be permitted to retain the fruits of the discrimination from which the South has suffered for the last four years and that this discrimination be continued indefinitely into the future until the Commission rehears this whole controversy and issues a new order. In view of the holdings of the district court and of this Court, there can no longer be any question that the relief sought by the Northern railroads would have a profound impact upon the South. Retention by the Northern railroads of the revenues collected under the Commission's invalid order would obviously add to the harm already inflicted upon the South by the discriminatory divisional structure which has impeded needed development of rail services in the South

since the Commission's order became effective. An indefinite continuation of that discriminatory divisional structure would leave the South subject to the trade barrier effects of such a structure, even though the harmful and discriminatory nature of that structure has been established by the opinion of this Court. There can be no justification for such a perpetuation and institutionalization of this discrimination against the South.

The fundamental principle that should govern the Court's disposition of the petition for rehearing is the principle that all sections of the country are entitled to equal treatment in the matter of railroad rates and divisions unless and until a firm basis in fact and transportation policy has been established to justify different treatment. This is precisely the principle which this Court applied in *New York v. United States*, 331 U.S. 284 (1947), in upholding the requirement of uniformity in class rates between the North and the South. In that case, the Court rejected attacks upon an interim order of the Commission removing discrimination, even though the Court conceded that conditions may have changed so as to warrant "adjustments in the new permanent uniform scale" that would eventually determine interterritorial class rate relationships (331 U.S. at 350). The Court did not preclude efforts to justify a re-imposition of discriminatory class rates; however, it made it clear that until a justification for discrimination had been established on the basis of substantial evidence embodied in valid findings of the Commission, the principle of uniformity must be observed.[1]

---

[1] It is noteworthy that the claims of a justification for discrimination were never pressed in the *Class Rates* litigation and that the uniform class rate scale prescribed in that case is still in effect.

In view of the unchallenged finding of this Court in this case that the Northern railroads have not proved their claim to a higher basis of divisions than the Southern railroads, the same principle requires an immediate re-establishment of uniform divisions and the return of revenues collected under the discriminatory divisional structure that has been in effect for the past four years. The South can never be made completely whole from the harm that has already been inflicted upon it by this discriminatory structure, money that could have been invested to bring about improved rail service in the South has been withheld from the Southern railroads, and the adverse impact of this reduction in railroad investment has already necessarily begun to run through the Southern economy. However, an immediate return of these revenues can repair some of this harm and prevent the infliction of further harm. The Southern railroads' investment program for this year are not yet firmly set, and at least one railroad is awaiting the return of the revenues involved in this case before it finalizes its program (see *Traffic World*, November 16, 1968, p. 20). Plainly, the Southern economy should not be deprived of the benefit of such investments and further subjected to the disadvantage of a discriminatory divisional structure imposed without evidentiary justification.

The decision of this Court in *Morgan v. United States*, 307 U.S. 183 (1939), relied upon as the principal support for the petition for rehearing, does not justify the relief sought by appellants. The *Morgan* case rests upon the principle that a court reviewing administrative action should further, not frustrate, the statutory policy which the administrative agency was created to implement. As the Court put it in *Morgan* (307 U.S. at 191):

> "[I]n construing a statute setting up an administrative agency and providing for judicial review of

> its action, court and agency are not to be regarded as wholly independent and unrelated instrumentalities of justice, each acting in the performance of its prescribed statutory duty without regard to the appropriate function of the other in securing the plainly indicated objects of the statute. Court and agency are the means adopted to attain the prescribed end, and so far as their duties are defined by the words of the statute, those words should be construed so as to attain that end through coordinated action."

Accordingly, the decision in *Morgan* to give retroactive effect to an administrative order requiring reductions in rates was placed squarely upon "the meaning and application of the provisions of the Packers and Stockyards Act" (307 U.S. at 188) which specifically provided for reparations. The present situation is precisely the opposite, since Section 15(6) of the Interstate Commerce Act specifically precludes retroactive adjustment of divisions of voluntarily established joint rates. If this Court were to give retroactive effect to an administrative order prescribing divisions, it would effectively repeal this provision of Section 15(6) and introduce chaos into the whole rate-making procedures for North-South traffic.[2]

---

[2] The public interest in facilitating the movement of freight over through routes and on joint rates would be seriously threatened by the creation of equity procedures which circumvent the Congressional policy against retroactive divisions orders. Carriers voluntarily enter into, and maintain, joint rates because they can be sure of the divisions; and because, considering the level of the joint rate and the divisions thereof, the performance of freight service on that joint rate is a profitable enterprise. However, if the divisions which the other participating carriers offer are presently inadequate or uncertain because they might be changed retroactively in the future, a carrier has the option of refusing to enter into the joint rate, and instead offering service on a separate rate. The shipper thus would have to pay combination rates—that is several rates to separate carriers—rather than a single joint rate to the participating carriers. Transportation on these multiple rates is almost always more expensive to shippers—both because the sum of the components is generally higher than a single rate covering the same service, and because the multiple rate system requires more administrative expense.

This would have incalculable effects upon the economy of both the South and the North, which are in no way justified by the principle stated in *Morgan* that courts should cooperate with administrative agencies to achieve statutory aims.

In fact, the *Morgan* principle leads to precisely the contrary conclusions here. In *Morgan*, the goal of effectuating the purposes of the Packers and Stockyards Act led the Court to use its equitable powers to give retroactive effect to a rate reduction that had been justified by evidence but set aside solely because of procedural defects. Here, the purpose of the Interstate Commerce Act would be frustrated by such relief. In *New York v. United States*, 331 U.S. 284 (1947), this Court made it clear that the basic statutory purpose of the Interstate Commerce Act was the removal of discrimination (331 U.S. at 296):

> "The principal evil at which the Interstate Commerce Act was aimed was discrimination in its various manifestations. Louisville & N. R. Co. v. United States, 282 U.S. 740, 749, 750."

In the context of this case, the *Morgan* principle thus plainly means that neither the Interstate Commerce Commission nor any reviewing court should countenance any form of discrimination unless and until a firm and lawful basis for such discrimination has been established.

The other cases cited by appellants are simply additional examples of the same principle. In each case, the action of the Court rested upon and was designed to implement the policy of the particular statute involved. Hence, these decisions do not provide a guide for dealing with a situation which turns upon the non-discrimination policy of the Interstate Commerce Act. Appellants cite no case, and there is none, in which discrimination has been given retroactive effect or permitted to continue to exist before a justification for that discrimination has been established under the Interstate Commerce Act.

CONCLUSION

For the foregoing reasons the petition for rehearing is without merit and should be denied.

Respectfully submitted,

v.
ABERDEEN AND ROCKFISH RAILROAD COMPANY, *et al.*, *Appellees*.

No. 13

On Appeal from the United States District Court for the Eastern District of Louisiana, New Orleans Division

REPLY TO PETITION FOR REHEARING ON BEHALF OF SOUTHERN RAILROAD APPELLEES

Preliminary Statement

In their Petition for Rehearing the Northern railroads seek to retain over $25 million in divisions collected under an order of the Interstate Commerce Commission which this Court has held to be unsupported by substantial evidence. They also seek to continue to collect higher Northern divisions under that same invalid order. The stated justification for these requests is that it would be expensive to reestablish the previously effective equal-factor basis of divisions.

The petition rests entirely on the premise that if upon remand the Commission again gives the Northern railroads a higher basis of divisions, North-South divisions would have to be retroactively adjusted in accordance with the

Commission's new order (Petition, p. 3). This premise is never established in the Northern railroads' petition and is, in fact, demonstrably false.

The principles which govern the disposition of this petition are clear, having been recognized by the Northern railroads themselves in the district court, where they proposed and consented to the provision of the district court decree which imposed upon them the obligation to restore these revenues to the Southern railroads if the Commission's order were found to be unlawful. But for their agreement—which the Northern railroads now would have this Court rescind—the Commission's 1965 order would have been enjoined pending judicial review, the inflation in the Northern railroads' divisions would not have gone into effect, and the sums the Northern railroads now seek to retain would now be in the posession of the Southern railroads.

As we shall also show in this reply, the Northern railroads seek an order which, in addition to repudiating their agreement in the court below, would violate the policy of the Interstate Commerce Act and would frustrate rather than further the aims of equity.

I. EQUITY SHOULD NOT RELIEVE THE NORTHERN RAILROADS OF THEIR OBLIGATION TO RETURN THE MONEY COLLECTED UNDER THE COMMISSION'S INVALID ORDER.

A basic deficiency in the Northern railroads' Petition for Rehearing in this case arises from the total failure of the petition to deal with the promise which they made in the district court to return to the Southern railroads the money collected under the Commission's order of February 3, 1965, if that order were subsequently held to be invalid. The Northern railroads admit that the district court's order of

June 3, 1965, denying an interlocutory injunction in this case, "provided that the railroads would be obliged to resettle their interline accounts on the basis of the pre-existing divisions as to all traffic moving after April 20, 1965, if the Commission's order should be 'permanently set aside' (A. 169-171, 359)" (Petition, p. 2).

However, the Northern railroads do not inform the Court that this protective condition was included in the order denying the injunction because they proposed it as an alternative to an interlocutory injunction; nor do they inform the Court that this obligation was made effective upon the filing of written consent by the Northern railroads.[1] In none of the cases relied upon in the Petition for

---

[1] The order of the district court denying the application of plaintiff Southern railroads for an interlocutory injunction provides as follows (A. 169-170):

"3. The foregoing denial of the application for interlocutory injunction and dissolution of the temporary restraining order is subject to the following conditions, to which the intervening defendants, The Baltimore and Ohio Railroad Company, et al., have agreed by filing written consent with the Clerk of this Court:

"A. In the event the plaintiffs are successful in permanently setting aside the order of the Interstate Commerce Commission of February 3, 1965, intervening defendants, The Baltimore and Ohio Railroad Company et al., *will resettle their accounts with plaintiffs, on traffic covered by the order of the Commission, on the basis of the present divisions, on all shipments made on and after April 20, 1965,* with interest at the rate of 5% per annum on the monthly differences between revenues based upon the divisions prescribed by the Commission and revenues based upon the divisions now in effect, the said interest to be calculated from the customary accounting monthly settlement dates.

* * *

"C. Upon the happening of the event specified in para-

Rehearing was there a consent decree providing for resettlement, and the Northern railroads do not even discuss the controlling principle that a decree entered by consent is not subject to general review by an appellate court. As this Court held in the leading case on consent decrees, *Swift & Co.* v. *United States,* 276 U.S. 311, 324 (1928):

> "Decrees entered by consent have been reviewed upon appeal or bill of review where there was a claim of lack of actual consent to the decree as entered, . . . or of fraud in its procurement; . . . or that there was lack of federal jurisdiction because of the citizenship of the parties. . . . But 'a decree, which appears by the record to have been rendered by consent, is always affirmed, without considering the merits of the cause.' *Nashville, Chattanooga & St. Louis Ry. Co.* v. *United States,* 113 U.S. 261, 266."

This Court has applied this principle to a decree containing a commitment to return revenues collected pending review of an order of the Interstate Commerce Commission. In *Chicago, Milwaukee, St. P. & P.R. Co.* v. *Illinois,* 356 U.S. 906 (1958), the Milwaukee Railroad had sought and received from the Commission an order increasing intrastate rates on the ground that the existing low intrastate rates constituted an undue burden on interstate commerce. The State of Illinois sought judicial review, and the district court set aside the Commission's order for want of adequate findings and for reliance on evidence improperly received (146 F.Supp. 195 (N.D. Ill. 1956)). Pending ap-

---

graph A . . . hereof, intervening defendants, The Baltimore and Ohio Railroad Company et al., shall be required to reimburse plaintiffs for their reasonable expenses for accounting change-overs incurred as a result of this denial of the application for interlocutory injunction." (emphasis supplied)

peal, the district court stayed its judgment setting aside the Commission's order on the condition, agreed to by the Milwaukee in open court, that the amount of the increase in rates would be refunded in the event the judgment of the district court were affirmed (see 168 F.Supp. at 707; 355 U.S. at 302, note 2). On appeal, this Court affirmed the judgment setting aside the Commission's order on the ground of inadequate findings, modified the district court's judgment to the extent that it held the Commission had considered improper evidence, and remanded the case to the Commission for further proceedings. *Chicago, Milwaukee, St. P. & P. Co.* v. *United States,* 355 U.S. 300, 307-309 (1958). Thereafter, the Milwaukee sought in the district court to delay the refund of the increased rates "pending the further proceedings before the Commission contemplated by the judgment of this Court" (356 U.S. at 907). The district court denied the Milwaukee's request and ordered an immediate refund. The Milwaukee applied to this Court for a writ of supersedeas, which was denied without opinion (356 U.S. 906).[2]

There can be no question that the decree entered with the consent of the Northern railroads in this case requires immediate return to the Southern railroads of the revenues collected as a result of the Commission's invalid order of February 3, 1965. The decree specifically states that resettlement will be "on the basis of the present divisions," not some basis that the Commission might prescribe in a

[2] Mr. Justice Frankfurter, dissenting with three other Justices, was of the opinion that the Milwaukee should have been relieved of its resettlement obligation on the ground that statutory policy and the public interest so required. For reasons discussed *infra* (pp. 12-24), such considerations operate in just the opposite direction in this case and provide further reasons for enforcement of the Northern railroads' agreement, not for its rescission.

future order following remand. The commitment was to resettle in the event the Southern railroads were successful in "permanently setting aside the order of the Interstate Commerce Commission of February 3, 1965." The North now attempts to play on the word "permanently" (Petition, p. 2), but that word simply contrasted the action of the district court on the merits of the request for a permanent injunction setting aside the Commission's order of February 3, 1965, with the request for an interlocutory injunction which was under consideration at the time the consent decree was entered.

The Commission's order of February 3, 1965, has now been held to be unsupported by substantial evidence both by the district court (A. 349) and by this Court (393 U.S. at 91). As required by Section 10(e) of the Administrative Procedure Act,[3] the final judgment of the district court (A. 357), affirmed by this Court (393 U.S. at 96), sets aside the Commission's order.[4] This holding has not been challenged by the Northern railroads in their Petition for Rehearing. Thus, the Commission's order of February 3, 1965, will never—under any circumstances—go into effect. If the Northern railroads ever succeed in proving that they are entitled to a higher basis of divisions than the Southern railroads, it would have to be by virtue of some new order of the Commission based upon a different record contain-

---

[3] "The reviewing court shall . . . set aside agency action . . . found to be . . . unsupported by substantial evidence. . . ." (5 U.S.C. § 706)

[4] The modifications in the judgment ordered by this Court went to the several specific findings required on remand, not the conclusion that there was a lack of substantial evidence to support the Commission's order (as discussed at pp. 17-21, *infra*). A far more fundamental difference between the grounds of decision adopted by the Supreme Court and those relied upon by the district court was not sufficient to relieve the Milwaukee Road of its agreement (p. 5, *supra*; 356 U.S. at 908-909).

ing evidence necessary to support such an order. The validity of any such future order could not operate to resurrect the one which has been invalidated in the present proceedings.[5]

The Northern railroads' own pleadings in the district court make it abundantly plain that their agreement was to restore the uniform basis of divisions once the Commission's order was set aside, even if (as the Northern railroads erroneously assume in ignoring the Court's holding that there was a fundamental lack of substantial evidence) the judgment setting it aside rested only on the inadequacy of findings with respect to three important cost items (Petition, p. 2). When Appellants appeared before the district court in opposition to the Southern railroads' application for interlocutory injunction, they urged that if the Commission's order of February 3, 1965, were found to be deficient with respect to a single cost item, the order would have to be set aside in its entirety and would have no further effect. The Northern railroads took this position in opposing the contention of the Southern railroads that the order should be set aside only in part because the Commission's invalid action prescribing an inflation in the Northern divisions was separable from its valid determination that the terminal factor in the pre-existing uniform divisional scales was prejudicial to the long-haul Southern railroads.[6]

---

[5] Moreover, in this case, any new order would necessarily differ from the order herein found to be invalid. For example, the court below and this Court have held that the Southern railroads could not be burdened with "costs related solely to commuter service in the North." (393 U.S. at 94; see A. 344-346) Any future order of the Commission would have to reflect the cost adjustments which necessarily follow.

[6] The background of this contention is discussed in Appellee Southern Railroads' Brief (pp. 77-80). The district court agreed with the Northern railroads and the Commission in holding that "the Commission's order is not severable" (A. 330).

The Northern railroads unequivocally stated their position as to what the proper disposition of the case would be if the Southern railroads were successful in showing the Commission's order of February 3, 1965, "to be legally deficient in some respect":

> "Intervening Defendants are confident that, upon final review, the Court will conclude that the Commission's order is in all respects lawful. *But if the Court should find it to be legally deficient in some respect,* its decree, in the terms of the statute, would be one to enjoin, set aside, annul or suspend the said order. *Thereafter the Commission's report and order would have no effect.*
>
> "It is respectfully submitted, therefore, that any condition for readjustment of the divisions which would be required as a result of a possible annulment of the Commission's order *should be on the basis of the divisions which are now in effect and which have been in effect for the past twelve years, the divisions which represent the status quo.*" (emphasis supplied)[7]

The Northern railroads thus made it as plain as language permits that they fully understood, and indeed urged, that

---

[7] Memorandum in Opposition to Application for Interlocutory Injunction, May 17, 1965, p. 26.

Counsel for the United States and for the Interstate Commerce Commission appeared at the hearing on the interlocutory injunction, but left it to the "parties having a financial interest" to argue the question of whether the injunction should or should not issue. (Memorandum of United States and I.C.C., May 21, 1965, pp. 1-2). The position of the Government was summarized as follows (*id.* at 7-8):

> "To preserve the status quo this Court should impose a condition which would require either resettlement from April 20, 1965, on the new prescribed basis if a preliminary injunction is granted or, if a preliminary injunction is not granted, resettlement from April 20, 1965, *on the basis of the divisions which have been in effect for the past 13 years . . .*" (emphasis supplied).

if the Commission's order of February 3, 1965, were found to be invalid "in some respect," that order should be set aside with the result that the pre-existing uniform basis of divisions would be restored and the resettlement conditions would become operative.

In view of the clarity of the provisions of the consent decree entered by the district court and the context in which that decree was entered, there exists no genuine question of interpretation with respect to that decree. If the issue which the Northern railroads seek to present were actually one of interpretation, they doubtless would have presented that issue to the district court, which ought to interpret its own decree, at least in the first instance. What the Northern railroads seek here, therefore, is not an interpretation of the consent decree but relief from that decree and from the obligation which they assumed in consenting to it. There is not the slightest basis for any such relief under the standards which govern the application of consent decrees.

The principles applicable to review of consent decrees were summarized as follows in *Walling* v. *Miller*, 138 F.2d 629, 631 (8th Cir. 1943), cert. denied, 321 U.S. 784 (1944):

> "The law is that a decree entered by consent may be reviewed upon appeal or bill of review where there is a claim of lack of actual consent to the decree as entered; or of fraud in its procurement; or that there was lack of federal jurisdiction. But 'a decree, which appears by the record to have been rendered by consent is always affirmed, without considering the merits of the cause.' All errors going to the merits and remediable on appeal are waived by consent to the decree. . . . *Swift & Co.* v. *United States*, 276 U.S. 311, 324, 326, 327. . . .
>
> "One reason for the rule is obvious. A court which, having jurisdiction of the parties and of the subject matter, renders a consent decree, if it sustains a motion

> of one of the parties to vacate such decree, not only sanctions the breach of a contract but in effect becomes a party to the breach. . . .
>
> "There is no claim here that the parties were not competent to contract; or that there was lack of consent; or that there was fraud in the procurement of the decree. Neither can it be doubted that the court at the time the decree was entered had general jurisdiction of the subject matter and of the parties. The court so found, and no appeal was taken by the defendants from that finding."

Having proposed the consent decree in the district court, the Northern railroads are now bound by their agreement. They fully understood that their obligation to resettle and restore the pre-existing divisions would become operative under the circumstances which now exist. And the Northern railroads proposed and consented to the decree with the full knowledge that they had waived any right to retroactive relief in the event of a remand to the Commission.[8]

---

[8] In a pleading filed in another divisions case shortly before the entry of the consent decree here, the same counsel for the Northern railroads recognized that the decision of this Court requiring immediate refund in *Milwaukee Road,* 356 U.S. 906, had been

> "influenced by the fact that the carrier which held excess fares had consented to a distribution thereof if the administrative order were set aside *and thereby waived its right to retroactive relief in the event of a remand of the cause to the Interstate Commerce Commission."* (emphasis supplied)

(Objections of Intervening Railroad Defendants, February 3, 1965, p. 10, in *Atchison, T. & S. F. Ry. Co.* v. *United States,* S.D. Calif, Civil Action 63-745-EC).

In another divisions dispute between the same Northern roads and Western railroads, the North had agreed to resettle in the event the order of the Commission under review were set aside, as it was in *Atchison, T. & S. F. Ry. Co.* v. *United States,* 225 F.Supp. 584 (D. Colo. 1964). Although that case was also remanded to the Commission for further proceedings, the Northern railroads did not attempt to avoid their obligation but restored the pre-existing divisions and completed the resettlement in 1964.

Had it not been for the resettlement condition in the district court's order, which the Northern railroads proposed and to which they consented, the Commission's order of February 3, 1965, would have been enjoined pending this litigation, and the Southern railroads would today have in their possession the revenues in controversy. If the district court had known at the beginning of this action for judicial review what it later concluded on the merits—namely, that the Commission's order is not supported by substantial evidence—the Commission's order would have been enjoined at the outset. However, issuance of the interlocutory injunction pending determination of a judicial review proceeding requires a showing of irreparable injury. The purpose and effect of the Northern railroads' agreement to restore the uniform basis of divisions for the period after April 20, 1965, in the event the Commission's 1965 order were set aside, was to eliminate the Southern railroads' claim of irreparable injury. Having accomplished that purpose, and having thus obtained possession of the revenues which belong to the Southern railroads, the Northern railroads are now estopped from seeking to annul their agreement. The Northern railroads are not prejudiced by enforcement of the terms of the district court's order, to which they consented, since enforcement will simply restore the parties to the same position they would be in today if an interlocutory injunction had issued.

Accordingly, equity should leave the Northern railroads precisely where they agreed to be when they proposed and consented to restore the uniform basis of divisions in the event the Commission's order of February 3, 1965, were set aside.

II. THE ORDER SOUGHT BY THE NORTHERN RAILROADS IS CONTRARY TO THE POLICY OF SECTION 15(6) OF THE INTERSTATE COMMERCE ACT.

The Northern railroads' consent to restore the pre-existing uniform basis of divisions disposes of the issues raised by Appellants in their Petition for Rehearing. In addition, the order sought by the Northern railroads should be denied because it is flatly inconsistent both with the language of Section 15(6) of the Interstate Commerce Act (49 U.S.C. § 15(6)) and with the policy underlying that statutory provision.

Under Section 15(6), the Commission is empowered to prescribe divisions of joint rates for the future only. The single statutory exception relates to divisions of rates where the rates themselves have been prescribed by the Commission. The Northern railroads concede that, under Section 15(6), "the Commission is without authority to prescribe divisions retroactively except in circumstances not here present" (Petition, p. 4). However, the sole purpose and effect of the order sought by the Northern railroads' Petition for Rehearing is to avoid this statutory limitation. The Northern railroads are asking this Court to use its equity powers to give retroactive effect to inflated divisions which might be accorded the Northern railroads in the proceedings upon remand. This request is flatly inconsistent with the policy of Section 15(6).

In *Brimstone R.R. and Canal Co.* v. *United States,* 276 U.S. 104 (1928), this Court reviewed the legislative history of Section 15(6) and explained the purpose of Congress in precluding retroactive application of divisions of agreed joint rates, as follows (276 U.S. at 121-122):

> "Section 15(6) established the right to prescribe future divisions of agreed rates, but we think *the studied pur-*

pose was to grant no power to require readjustments of past receipts from agreed joint rates. Theretofore power in respect of past divisions existed only when rates had been determined and prescribed after full hearing—that is where the commission had passed upon the reasonableness of the rate and required observance. *Obviously a carrier may have assented to a through rate only because of the divisions accorded to it: to permit the Commission to change this arrangement as to past transactions would be exceedingly harsh if not wholly unreasonable.* Ordinarily, divisions of a particular rate are not of public interest if the rate itself is reasonable.

• • •

"The power to require readjustments for the past is drastic. It may reasonably exist in cases where the particular rate has been approved by the Commission after full hearing: it ought not to be extended so as to permit unreasonably harsh action without very plain words." (emphasis supplied)

The limitations upon the Commission's power to prescribe retroactive divisions of agreed joint rates thus reflect the "studied purpose" of Congress to preclude such retroactivity. Retroactive application of divisions was held to be inequitable, indeed harsh, where a railroad voluntarily enters into joint rates and remains a party to the agreed joint rates because the divisions are acceptable. Once a shipment has moved, a railroad cannot retroactively withdraw from a rate already paid by the shippers. In all fairness, therefore, orders prescribing divisions of agreed rates must operate prospectively only.

The statutory policy precluding retroactive determination of divisions is particularly applicable in this case. The Southern railroads have entered into numerous joint rates with the Northern railroads since the litigation in this case began; and virtually all North-South rates have

been the subject of adjustment in general increase proceedings. In making and adjusting these joint rates, the parties have relied upon existing divisions arrangements, including the North's resettlement obligation. The Southern railroads have acted on their belief (since confirmed by the district court and this Court) that the Commission's 1965 order was invalid; their position with respect to new and adjusted rates has been based upon the statutory provision that the equal-factor basis of divisions established in 1953 could not be changed except prospectively, by virtue of a valid Commission order. The Northern railroads confirmed this premise by undertaking to refund revenues in excess of the equal-factor divisions if the 1965 order were held to be invalid. In this situation, it would be patently inequitable to nullify the limitations of Section 15(6) and give retroactive effect to a Commission order prescribing divisions.[9]

United States v. *Morgan,* 307 U.S. 183 (1939), heavily relied upon by the Northern railroads, arose out of an entirely different situation and was governed by an entirely different statute. Indeed, the Court emphasized in *Morgan* that: "Decision turns on the meaning and application of the Packers and Stockyards Act" (307 U.S. at 188). The Court cited the provisions of that Act which provided for reparations where rates were found to be unreasonable (307 U.S. at 189), and explained that the action of the district court in ordering that the rates in controversy be deposited in a court-administered fund had "obstructed any effective reparations order" (307 U.S. at 193) because the regulated

---

[9] Moreover, such action could only produce chaos in the period preceding a Commission decision on remand, for without knowledge of the divisions that would ultimately apply to traffic that moved in that period, neither the Southern railroads nor the Northern railroads could sensibly decide upon their participation in many joint rate proposals.

market agencies no longer were in possession of the revenues for payment of reparations (307 U.S. at 197). *Morgan* held that equity would not allow the statutory policy favoring retroactive application of rates to be obstructed and frustrated by distribution of the impounded fund to the market agencies.

In *Brimstone,* on the other hand, the Court recognized that Congress had expressed its "studied purpose" in differentiating between divisions, as to which retroactive adjustments on "past transactions would be exceedingly harsh if not wholly unreasonable" (276 U.S. at 122), and rates, as to which the Commission was given extensive reparations power (49 U.S.C. §§ 8, 9). The Congressional determination of the essential equities with respect to divisions necessarily governs a court of equity in dealing with the same subject.

The *Morgan* principle that court and agency should work together to achieve "the plainly indicated objects of the statute" (307 U.S. at 191) required the retroactive judicial application of rate orders under the Packers and Stockyards Act, only because that Act itself provided for retroactive adjustments of rates through reparations. The same principle precludes a court of equity from fashioning a procedure which calls for the retroactive application of divisions contrary to the "studied purpose" of Congress.

The Northern railroads do not cite any case in which a divisions order has been given retroactive application, contrary to the purpose of Congress as described in the *Brimstone* case. The Northern railroads ask the Court to "See *B&O R. Co.* v. *United States,* 279 U.S. 781 (1929)" (Petition, p. 3). In that case, a Commission order had been set aside for lack of supporting evidence, *Baltimore & Ohio Ry. Co.* v. *United States,* 277 U.S. 291, 300-301 (1928), and it was thereafter held that the railroads which had lost

revenues under the invalid order were entitled to restitution (279 U.S. at 785-786). The case thus vindicates the purpose of Section 15(6) as stated in the *Brimstone* case by holding that, even if there had been no resettlement condition in the consent decree of the district court denying an interlocutory injunction in this case, the Northern railroads would still be obligated to resettle the divisions collected during the period of litigation under the invalid Commission order.[10]

The Northern railroads conceded in the district court that restitution of the revenues in controversy would be the necessary effect of a judgment setting aside the Commission's order of February 3, 1965,[11] and that this practice in divisions cases was reflected in the accounting rules of the railroad industry.[12]

---

[10] In *United States* v. *Baltimore & Ohio Ry. Co.*, 284 U.S. 195 (1931), three Commission orders had been entered prescribing the same divisions. The first order was not supported by evidence; and the second order raised a question of adequacy of the statutory 30-day notice. This Court held that the divisions took effect with the third order, over a dissent contending that the second order was sufficient. No member of the Court believed that the divisions could be made effective retroactive to the date of the first order, which is the necessary effect of the Northern railroads' contention here.

[11] The Answer of Defendant Northern railroads to Plaintiff Southern railroads' Application for Interlocutory Injunction, April 7, 1965, stated (p. 2): "If there were no stay and the order were later held invalid, northern lines would have to resettle accounts on the basis of the present divisions."

[12] This is shown in the affidavits filed in the district court by the Northern railroads in opposition to the Southern railroads' Application for Interlocutory Injunction. Affiant E. T. Scheper, Auditor of Freight Accounts of the New York Central, testified (Affidavit dated April 8, 1965, p. 4): "If the Commission's order is not stayed and after hearing on the merits this Court sets aside the Commission's order, it will be necessary to resettle accounts. Affiant further says that in the last situation, although resettlement of accounts

Thus, the procedure now requested by the Northern railroads is not only inequitable and contrary to the statutory policy, but conflicts with court decisions and industry practice in divisions cases.

III. THERE ARE NO EQUITABLE CONSIDERATIONS THAT WOULD PERMIT THE NORTHERN RAILROADS TO RETAIN THE REVENUES IN CONTROVERSY.

As previously shown, both the Northern railroads' obligation to restore the pre-existing uniform basis of divisions, and the statutory policy forbidding retroactive application of division orders, require denial of the Petition for Rehearing. We shall now show in addition that the equities of this case independently support the conclusion that the Northern railroads should not be permitted to benefit from the Commission's invalid order.

A. Equitable Considerations Do Not Support an Order Permitting the North to Retain an Inflation in Divisions Which Has Not Been Supported by Evidence.

The Northern railroads' Petition assumes that this Court held the Commission's order to be deficient solely because

---

would be required, such resettlement would not subject complainants to irreparable injury for the reason that the Freight Mandatory Railway Accounting Rules to which all parties to this proceeding are subscribers would require that the New York Central and other intervening defendants resettle their interline accounts with the complainants on the basis in effect prior to April 20, 1965."

Similarly, Affiant R. S. Bergey, Freight Auditor of the Pennsylvania Railroad, testified (Affidavit dated April 7, 1965, pp. 11-12): "If there were no stay and the order were later held invalid, the settling carriers would have to resettle accounts on the currently effective basis. This would be automatically necessary under the accounting rules, as invalidation of the order would destroy the basis on which the divisions prescribed by it depended."

the Commission failed to make "specific findings" with respect to three particular cost items (Petition, p. 2). In so construing this Court's opinion, the Northern railroads simpy ignore the principal holding of the Court that the Commission's order was not supported by substantial evidence. The Northern railroads are obliged to ignore this central holding of the Court because the cases upon which they rely have no application to the present case, in which Appellants have failed to present necessary supporting evidence.

Before the Commission, the Northern railroads conceded that they sought "disproportionate divisions of a uniform structure of rates" (A. 1543) on the basis of the costs of North-South traffic. However, the North relied upon the average costs of all traffic, and failed to present evidence relating to the cost of the North-South traffic in issue. The Commission's order granting the North inflated divisions was challenged in the three-judge district court, and again in this Court, on two grounds: first, that the order was not supported by substantial evidence, in violation of Section 10(e) of the Administrative Procedure Act; and, second, that findings of the Commission dealing with particular contested cost items were inadequate, in violation of Section 8(b) of that Act.

The opinion of this Court deals separately with the evidence issue and the findings issues (after quoting Sections 10(e) and 8(b)) (393 U.S. at 90, note 2). The opinion first deals with the question of lack of substantial evidence, and concludes as follows (393 U.S. at 91-92):

> "We agree with the District Court that there is no substantial evidence that territorial average costs are necessarily the same as the comparative costs incurred in handling North-South freight traffic. If we were to reverse the District Court, we would in effect be saying that the expertise of the Commission is so great that when it says that average territorial costs fairly repre-

sent the costs of North-South traffic, the controversy is at an end, even though the record does not reveal what the nature of that North-South traffic is."

Having concluded that the Commission's order must be set aside for lack of substantial evidence, the Court's opinion also holds that: "On remand of the case to the Commission we think specific findings must be made on . . . several [cost] items" (393 U.S. at 93). These directions in connection with the remand do not detract at all from the principal holding of the opinion that the order must be set aside for lack of substantial evidence.

None of the decisions upon which the Northern railroads' Petition relies sanctions equitable relief for a litigant who has failed to present evidence necessary to support his claim. In *Atlantic Coast Line R. Co.* v. *Florida,* 295 U.S. 301 (1935), the initial rate increase order of the Commission was held defective by the Court "solely upon the ground that the facts supporting the conclusion were not embodied in the findings" (295 U.S. at 311). The deficiencies of findings were regarded as "imperfections of form, . . . slips of procedure" (295 U.S. at 312). The railroad in that case had presented in evidence all of the facts necessary to support the rate increase ordered by the Commission, and these increased rates were collected until the Commission's order was held to be invalid, without any commitment by the railroad to refund the excess rates if the order were later set aside.[13] After these procedural slips were remedied by a second Commission order granting the same rate increase, this Court permitted the railroad to retain those rates because equity would not "make the

[13] The railroad did not collect the increased rates for the period between the judicial determination that the first Commission order was invalid, and the effective date of the second Commission order (295 U.S. at 307).

carrier pay the price of the blunders of the commerce board in drawing up its findings" (295 U.S. at 314).

Atlantic Coast Line was relied upon by the dissenting Justices in the *Milwaukee* case (*supra*, pp. 4-5) because the order of the Commission in *Milwaukee* had also been held defective "solely" on the ground of inadequacy of findings by the Commission, rather than because of any failure of the railroad to present necessary evidence (356 U.S. at 907).

The same principle was the basis for the decision in *United States* v. *Morgan*, 307 U.S. 183 (1939), where the Court ordered that rates deposited with the district court not be returned to the regulated market agencies[14] in light of the fact that the first order of the Secretary, like the Commission order in *Atlantic Coast Line*, was "voidable for procedural defects" (307 U.S. at 196). The procedural defect in *Morgan* was the "failure of the Secretary to follow the procedure prescribed by the statute" (307 U.S. at 185). No deficiency was found in the record, which contained voluminous evidence that was not even reviewed by the Court (307 U.S. at 188).

The equities in the cases upon which the Northern railroads base their Petition are thus just the opposite of the equities in the present case. This Court has held that, although the "Southern roads had offered evidence showing the costs of handling North-South traffic in the South," the North failed to present comparable evidence (393 U.S. at 91). The Northern railroads were the proponents of an

---

[14] The fund consisted of the amount of the rate reduction paid into court during the litigation arising out of the first order of the Secretary. There was no claim that the Secretary's second order could be made effective for the period between the date the first order was held invalid and the date of the second order—the controversy over the rates for this period having become moot because the Secretary had agreed to increased rates (307 U.S. at 199).

order prescribing an inflation in the North; and under Section 7(c) of the Administrative Procedure Act, the proponents of an order "shall have the burden of proof" (5 U.S.C. § 556). The Northern railroads have only themselves to blame for the absence of substantial evidence in this record which resulted in the invalidity of the Commission's order. The present case having turned on the lack of essential evidence, the Northern railroads cannot now claim that they are in the position of the railroad in *Atlantic Coast Line,* or the rate-payers in *Morgan,* who had presented ample evidence to support their position but had seen an administrative order in their favor held defective for purely procedural defects which were solely the fault of the administrative agency.

The remaining two cases cited by the Northern railroads in their Petition are inapposite for similar reasons. In *Addison* v. *Holly Hill Fruit Products, Inc.,* 322 U.S. 607 (1944), there was no contention of any lack of evidence to support the employees' suit for wage payments. The case turned on the administrative definition of the coverage of the Fair Labor Standards Act (322 U.S. at 609). Similarly, in *Secretary of Agriculture* v. *United States,* 347 U.S. 645 (1954), there was no holding that there was any deficiency in the evidentiary record upon which the Commission had acted. The case was remanded because the Commission had "not adequately explained its departure from prior norms and . . . sufficiently spelled out the legal basis of its decision" (347 U.S. at 653).[15]

---

[15] The Northern railroads state that in *Secretary of Agriculture* the case was remanded "but without setting the Commission's order aside" (Petition, p. 7). Whatever may be the extent of a court's power to remand a case for further findings or explanation by an administrative agency without setting aside the order, it is the statutory requirement of Section 10(e) of the Administrative Procedure Act that: "The reviewing court shall . . . hold unlawful and set aside agency action, findings, and conclusions found to be . . . unsupported by substantial evidence. . . ." (5 U.S.C. § 706).

B. The Procedure Sought by the Northern Railroads Is Contrary to the Public Interest.

In *Morgan*, the Court invoked the principle (307 U.S. at 194):

> "It is familiar doctrine that the extent to which a court of equity may grant or withhold its aid, and the manner of moulding its remedies, may be affected by the public interest involved."

This principle was applied in *Morgan* to protect the public, for whose benefit the reparations provisions of the Packers and Stockyards Act had been passed, from the consequences of the district court's having taken possession of the excess rates (*supra*, pp. 14-15).[16] In divisions cases, however: "Ordinarily, divisions of a particular rate are not of public interest," as observed in *Brimstone* (276 U.S. at 122).

Unlike the *Milwaukee* case (supra, pp. 4-5) in which the dissenting Justices were of the opinion that the railroad should be relieved of its agreement to resettle because of "the rights of the public" and "the policy of the Federal Act protecting the revenues of interstate carriers" (356 U.S. at 909), in the present case the Northern railroads are unable to suggest any reasons of public interest or statutory policy that could justify relieving them of their agreement to make resettlement. No such reasons are pres-

---

[16] The *Atlantic Coast Line* case concerned orders of the Commission which affected the public interest in preventing unjust discrimination against interstate commerce (295 U.S. at 306).

An additional equity stressed by the Court in *Atlantic Coast Line* was that the prior rates were so low as to be confiscatory (295 U.S. at 313). In the present case, the Northern railroads cannot invoke any such equity. Under the pre-existing uniform divisions, the profit of the Northern railroads exceeded $55 million per year ($221,430,000 revenue as compared with the overstated full costs found by the Commission of $165,746,000 (325 I.C.C. at 25-26; A. 48-49)).

ent in this case, as the Commission itself concluded in expressly disclaiming public interest considerations such as revenue needs as the basis for its order of February 3, 1965.[17]

Any possible doubt that carrier agreements to resettle divisions might conflict with the public interest was eliminated by the Commission itself when it modified its order of February 3, 1965 "to allow the establishment of a basis of divisions other than those prescribed, when agreed to by all parties affected thereby."[18] Where, as here, the Commission itself has expressly sanctioned carrier agreements

---

[17] As this Court held (393 U.S. at 94):

"Revenue problems under § 15(6) at times have resulted in putting a part of one area's transportation costs upon other sections of the country. See *New England Divisions* Case, 261 U.S. 184, 191-195. But that issue is not presented in these cases. The issue in the present case was costs, not revenue. . . .

"On revenue needs the Commission said:

'We find that no affirmative reasons appear in this record which would warrant any adjustment of the divisions in question over and above the relative costs of service, either on the grounds of greater revenue needs or otherwise. 325 I.C.C., at 49.'"

[18] Order dated May 24, 1966, I.C.C. Docket No. 29885. The recital to that order states:

"That in the absence of reason or cause for the Commission to prescribe divisions of revenues from joint rates, *such divisions are ordinarily the concern of the carriers;* and that the parties should be permitted to negotiate and mutually agree upon the establishment of different divisions of revenue in lieu of those prescribed as conditions may warrant." (emphasis supplied)

This order, which was modified by order dated February 1, 1967, to require that notice of agreed divisions be given to all parties in the proceeding, formalized the Commission's prior practice of vacating its order of February 3, 1965, whenever the parties agreed upon divisions other than those prescribed.

which result in divisions other than those prescribed, there is no possible basis for any contention that enforcement of the Northern railroads' agreement to resettle and restore the pre-existing uniform basis of divisions is inconsistent with the public interest or the policy of the Interstate Commerce Act.

On the contrary, public interest considerations condemn the Northern railroads' efforts to avoid an immediate restoration of the pre-existing uniform basis of divisions. As the Court held (393 U.S. at 92):

> "If . . . [reliance upon costs unsupported by substantial evidence] were sanctioned in a North-South divisions case, whose solution turns solely on costs, the class rate discrimination in favor of the North and against the South which we condemned in *New York* v. *United States,* 331 U.S. 284, could well flourish in another form."

Under these circumstances, it would be contrary to the public interest in preventing territorial discrimination to perpetuate the Northern inflation prescribed in an invalid Commission order.

C. The Northern Railroads' Assertions With Respect to Accounting Expense Are Contrary to Their Representations in the District Court.

Counsel for the Northern railroads also argue that the Court should act to prevent enforcement of their agreement to restore the pre-existing uniform basis of divisions because resettlement "would entail a large amount of accounting work and expense" (Petition, p. 3). This claim, even if true, would not justify rescinding the Northern railroads' agreement to resettle. Moreover, this assertion of counsel is contrary to the affidavits of the Northern railroads' accounting officers, filed in the district court in opposition to the Southern railroads' Application for Interlocutory Injunc-

tion. These officers testified that no more than "nominal expense" would be involved in restoring the pre-existing divisions.[19] The present argument is also inconsistent with the position taken by the same counsel that in view of the Northern railroads' agreement to resettle, a court should not concern itself with the cost of resettlement.[20]

The Court should not countenance the Northern railroads' present effort to renege not only on their agreement to resettle but on their sworn representations to

---

[19] New York Central Auditor E. T. Scheper (Affidavit dated April 8, 1965, pp. 2-3):

> "[T]he double (second) changeover which might be entailed if the Commission's order is ultimately not upheld should neither disrupt plaintiffs' accounting staffs, impair other Accounting Department procedures nor involve more than nominal expense because the accounting machine cards and tapes and charts now employed can be retained and readily substituted for the new cards, tapes and charts required on and after April 20, 1965."

Pennsylvania Auditor R. S. Bergey (Affidavit dated April 7, 1965, p. 15):

> "We would maintain our present file until the case is resolved, and, therefore, the cost in any reconversion would be nominal and is estimated to not exceed $1000.00 plus about $180.00 cost per month to convert new records established in the intervening period."

[20] Memorandum in Opposition to Application for Interlocutory Injunction dated May 17, 1965, p. 12:

> *"But the question of the exact cost of making the resettlement is not a material question for this Court to consider in arriving at its decision as to whether or not to grant an interlocutory injunction. The Intervening Defendants are willing to assume the obligation of paying Plaintiffs their reasonable costs for this work should the Commission's order go into effect and the Court should later decide that the order be set aside as unlawful.* They respectfully ask the Court to deny the application for an interlocutory injunction and to make such obligation to repay accounting costs, in the contingency specified, a condition of the order." (emphasis in the original)

the district court, on the basis of which they obtained possession of the revenues in question through denial of an interlocutory injunction below.

Furthermore, the Northern railroads have benefited from their possession of the revenues in dispute during the period of litigation to an extent far exceeding the costs of resettlement. Under the order of the district court, the Northern railroads have held this money subject to resettlement at a 5% rate of interest (A. 170) during a period in which interest rates have risen to 7% and above. Under these economic conditions, the Northern railroads have benefited to a very material extent from denial of the interlocutory injunction subject to the agreed conditions. Thus, the expense of resettlement lends no equity whatever to the Northern railroads' effort to annul their agreement and continue to reap the benefits which they would never have enjoyed if the district court had known at the outset of the litigation what it later concluded on the merits—that the Commission's order of February 3, 1965, was not supported by substantial evidence.

CONCLUSION

Denial of the Northern railroads' Petition for Rehearing will restore the Northern and Southern railroads to the equal basis of divisions which was in effect for over twelve years prior to this litigation, and will place the parties in precisely the situation that they would be in today if the Commission's invalid order had never gone into effect. An interlocutory injunction was not issued, and the Commission's order did go into effect, only because the Northern railroads agreed to return the money if the order were later found to be invalid. Reasons of statutory policy with respect to retroactive application of divisions, the public interest in uniformity of territorial relationships and the

equities of this case provide additional reasons for enforcing the Northern railroads' agreement, not for relieving those railroads of their bargain. It is not the function of this Court to relieve business corporations, represented by counsel, from the fully-contemplated consequences of an agreement under which those corporations have benefited since the beginning of this litigation.

For the foregoing reasons, the Northern railroads' Petition for Rehearing should be denied.

ON APPEAL FROM THE UNITED STATES DISTRICT COURT FOR THE EASTERN DISTRICT OF LOUISIANA, NEW ORLEANS DIVISION

ANSWER TO NEW MATTER IN SOUTHERN LINES' REPLY TO PETITION FOR REHEARING

Northern lines will not answer all the assertions and arguments made in Southern lines' reply. They will deal with the new matters that are represented by Southern lines' arguments concerning Northern lines' promise to resettle in accordance with the condition in the District Court's order denying an interlocutory injunction, with Southern lines' argument based upon non-retroactivity of divisions prescribed under § 15(6) of the Interstate Com-

merce Act, and their argument based upon the public interest.

I. The Southern railroads urge that the Northern lines must pay over to Southern lines some $25 million and that the Southern lines shall forever keep this money regardless of whether the Commission should, on remand, validly find that the relative service costs of Northern and Southern railroads are such as to sustain the divisions prescribed by the order under review (Reply, pp. 6-7).

In support of this position, Southern lines argue, *inter alia,* that Northern lines promised to pay over to the Southern railroads the money collected under the Commission's order of February 3, 1965, if that order were subsequently held "to be invalid" (Reply, p. 2). The District Court's order, however, and Northern lines' promise was that they would resettle their accounts with Southern lines on the basis of the old divisions "if the Commission's order should be permanently set aside" (Petition, p. 2). The petition asks that final decree be stayed pending consideration by the Commission upon remand (Petition, p. 8) and points out that until the Commission makes the specific findings required by this Court's opinion it cannot be known whether a permanent setting aside of the order would be appropriate (Petition, p. 2). If the stay were granted, the obligation imposed by the District Court's order and the Northern lines' promise to be bound thereby would not arise at this time, at least.

It is said on p. 6 of the Reply that the District Court's final judgment "affirmed by this Court (393 U.S. at 96), sets aside the Commission's order" and that the Commission's order granting increased divisions "will never—under any circumstances—go into effect." The Commission's order granting increased divisions has been in effect since April 20, 1965, and, if this Court should grant the

instant petition for the withholding of final decree, and the Commission then makes valid findings in the remand proceedings, the order prescribing new divisions can continue in effect.[1]

In this connection, it should be noted that with respect to the three cost adjustments as to which this Court concluded the Commission's findings were defective, it will be possible for the Commission, on remand, to conclude that the Northern lines' costs are relatively as high or higher than those originally found. For example, the most important of these cost adjustment issues before the Court was the one relating to commutation deficits. The gist of the Southern lines' argument and the Court's holding with respect to this matter was that costs solely related to commutation service were not shown by the Commission's decision to have any relation to North-South freight transportation, the cost of which was the Commission's standard for decision. Southern lines admitted at the argument (Transcript of Argument, pages 60-63) and in their brief in this Court (fn. 20, p. 34) that deficits arising from costs which are solely related to the provision of other passenger services must likewise be excluded. Southern lines' own computation of the portion of their solely related passenger deficit that is allocated to North-South traffic was $1,502,181 (Southern lines' Exceptions to Recommended Report, p. 119). The cost study contained nothing for solely related

1. Southern lines' argument that a judgment holding an ICC order invalid may be stayed pending further Commission action only if the invalidity lies in the lack of necessary findings or some procedural defect is unsound. In *United States v. Morgan*, 307 U.S. 183 (1939) the defect involved was the lack of a fair hearing, and in *Addison v. Holly Hill Fruit Products, Inc.*, 322 U.S. 607 (1944), the defect was a mistake of law in the application of a statute. And see *Atlantic Coast Line R. Co. v. Florida*, 295 U.S. 301 (1935) where the Commission's action in the proceeding following the condemnation of its first order was based upon new *evidence* and new findings. (295 U.S. at p. 307).

passenger deficits of Northern lines; they had no such deficit. Accordingly, the effect of this cost adjustment (to exclude Southern lines' solely related passenger deficit) will be to substantially increase Northern lines' relative share of the cost of performing the North-South freight service. This example, based upon the most prominent of the defective findings, will serve to exemplify the fact that it is entirely reasonable to believe that the Commission may issue a valid report finding that Northern lines' costs are at least as high in relation to Southern lines as found in the original report. If, as Northern lines believe, their costs should be found to be somewhat higher in relation to Southern lines than as originally found, Northern lines would waive the difference and ask the Commission simply to confirm the divisions originally prescribed which would have remained in effect if the instant petition to this Court should be granted.[2]

II. Southern lines' § 15(6) argument is that to grant the relief sought by the petition would be contrary to the policy of that statute which withholds from the Commission the power to make a divisional order retroactive except in circumstances not here present. A grant of the relief sought by the petition would not entail the making of a retroactive divisions order by the Commission. It would simply require that a final decree by the lower court be withheld until the Commission has issued its report on

2. Southern lines argue (Reply, pp. 18-19) that this Court first decided that the evidence did not sustain the Commission's order and that it then separately held that the findings were defective. But the issue as to lack of substantial evidence involved only the Commission's findings with relation to seven proposed cost adjustments. Contrary to the action of the District Court, this Court held that as to four thereof the Commission's findings were adequate. This conclusion was not simply that they satisfied the requirement that findings must explain the basis for the Commission's action; it was clearly a conclusion that the findings had a substantial evidentiary basis.

remand. It will also be noted that the limitation in § 15(6) is on the power of the Commission, and not upon the powers of a court of equity.

III. Under their public interest discussion, entirely overlooking the $25 million which Southern lines say they should have and forever keep, those lines urge that the Northern lines' petition is predicated entirely upon accounting expenses in making settlements and resettlements and they refer (p. 5) to certain affidavits of Northern lines with respect to resettlement costs but do not disclose their own affidavits showing substantially higher figures. Thus, in the affidavit of Mr. Luckett, it is stated, with respect to the Southern Railway, that:

> "This [the Southern's] study shows that the additional accounting costs alone would be $190,000 plus $66,000 per month for each month that the new division basis is temporarily in effect. This means that if the divisions were changed on April 20 [1965] and the return to the present basis of divisions should be delayed for twelve months from the effective date of the Commission's order, the additional accounting expense incurred by Southern would amount to $982,000. In the event the Commission's order is set aside there would be no way in which Southern could recover the amount of this additional expense."

If Mr. Luckett is correct, for the four years since the new divisions went into effect the accounting expenses as to the Southern Railway alone—just one of many Southern railroads—would amount to over $3,350,000. The District Court made no finding as to the amount of this accounting cost, but dealt with the question by providing in its order that the Northern lines would have to bear the costs of resettlement if there were a resettlement.

With respect to the argument that there is no public interest involved in this matter, a requirement that the Northern lines pay $25 million to Southern lines, which Southern lines shall keep regardless of any other facts, would be a direct and severe blow to the public interest. In 1967, the latest year for which the figure is available, Northern railroads had a rate of return of 1.58% on net property investment, the lowest of any group of railroads in the country. *Increased Freight Rates, 1968,* 332 I.C.C. 590, 607. These are the railroads serving the most populous area of the United States.

SUPREME COURT OF THE UNITED STATES

NOS. 13 AND 15.—OCTOBER TERM, 1968.

The Baltimore & Ohio R. Co. et al., Appellants, 13 *v.* Aberdeen & Rockfish R. Co. et al. Interstate Commerce Comm'n, Appellant, 15 *v.* Aberdeen & Rockfish R. Co. et al.	On Appeals From the United States District Court for the Eastern District of Louisiana.

[November 12, 1968.]

MR. JUSTICE DOUGLAS delivered the opinion of the Court.

In these cases the Interstate Commerce Commission undertook to prescribe just, reasonable, and equitable divisions of joint rates pursuant to § 15 (6) of the Interstate Commerce Act.[1] The Commission found that exist-

[1] 49 U. S. C. §15 (6) provides in relevant part:

"Whenever . . . the Commission is of opinion that the divisions of joint rates, fares, or charges, applicable to the transportation of passengers or property, are or will be unjust, unreasonable, inequitable, or unduly preferential . . . the Commission shall by order prescribe the just, reasonable and equitable divisions thereof to be received by the several carriers . . . . In so prescribing and determining the divisions of joint rates, fares and charges, the Commission shall give due consideration, among other things, to the efficiency with which the carriers concerned are operated, the amount of revenue required to pay their respective operating expenses, taxes, and a fair return on their railway property held for and used in the service of transportation, and the importance to the public of the transportation services of such carriers; and also whether any particular participating carrier is an orginating, intermediate, or delivering line, and any other fact or circumstance which would ordinarily, without regard to the mileage haul, entitle one carrier to a greater or less proportion than another carrier of the joint rate, fare, or charge."

ing divisions violated § 15 (6) because they allocated to Northern lines a lesser share of the revenues from the joint rates than would be warranted by their share of the expenditures made in providing the joint service. 325 I. C. C. 1, 50.

The Southern lines brought suit before a three-judge District Court to enjoin and to set aside the Commission's order. The District Court set aside the Commission's order and remanded the case for further proceedings. 270 F. Supp. 695. We noted probable jurisdiction. 390 U. S. 940.

Both Northern and Southern lines used Rail Form A as their basic formula, that form being a rail freight formula for determining freight service costs which utilizes the expenses and statistics for a given year as reported to the Commission by the carriers and supplemented by special studies of the carriers.

The Southern lines proposed 12 adjustments, five of which the Commission accepted and seven of which it rejected. The year 1956 was the one both Southern and Northern lines used in the final cost analysis. The cost level for that year, said the Commission, was higher in the North than in the South for like services; and it concluded that that situation would most likely continue in the immediate future. In that year the Northern lines received 44.64% of the revenue while incurring 46.35318% of the fully distributed costs. Accordingly, the Commission prescribed new divisions based on the fully distributed costs and divided the revenues in the same proportion to those costs. The shift in revenues resulting from the new divisions was approximately $8,000,000 a year, giving the Northern lines an overall increase in revenue from the traffic involved of 3.5% and a reduction in revenues of Southern lines of about 3%.

When the Southern lines sued to set aside the new divisions, the Northern lines intervened as defendants. The District Court held that the Commission's order was not supported by substantial evidence and reasoned findings within the meaning of §§ 8 (b)[2] and 10 (e)[3] of the Administrative Procedure Act and, as noted, remanded the case for further proceedings.

The present problem of divisions deals only with North-South traffic which represents 6% of the total traffic of the North and 21.4% of the total traffic of the South. The costs of that North-South traffic are not isolated in the findings. The average costs used relate to all Northern traffic and to all Southern traffic. Nearly 80% of the total Northern traffic is intra-territorial and handled entirely in the North and, it is therefore argued, that that traffic has the dominant influence on the Northern average. As the District Court said, it is difficult to maintain that these intra-territorial Northern costs are the same or approximately the same as Northern costs in handling traffic between North and South. In another division case, the Commission ruled that "territorial average costs are entitled to little weight

[2] Section 8 (b), now 5 U. S. C. § 557 (c), provides in relevant part:

"The record shall show the ruling on each finding, conclusion, or exception presented. All decisions, including initial, recommended, and tentative decisions, are a part of the record and shall include a statement of—

"(A) findings and conclusions, and the reasons or basis therefor, on all the material issues of fact, law, or discretion presented on the record; and

"(B) the appropriate rule, order, sanction, relief, or denial thereof."

[3] Section 10 (e), now 5 U. S. C. § 706, provides in relevant part:

". . . The reviewing court shall . . :

"(2) hold unlawful and set aside agency action, findings, and conclusions found to be . . .

"(E) unsupported by substantial evidence . . . ."

in determining the costs of handling particular movements." *Increased Freight Rates*, 332 I. C. C. 280, 294. The use of "unsifted averages" of costs do not necessarily establish greater costs either in rate cases (*ICC* v. *Mechling*, 330 U. S. 567, 583) or in division cases. The ruling of the District Court was not that territorial average costs were irrelevant or that Rail Form A was not a usable and useful tool for cost determination, but that territorial average costs could not be used consistently with the statutory requirements for precise and relevant findings without any evidence relating the territorial average cost to North-South traffic. While Southern roads had offered evidence showing the costs of handling North-South traffic in the South, there was not always any such Northern offer; nor did the Commission always exercise its undoubted authority to gather it on its own.

On the question whether territorial average costs represent costs of the North-South traffic, the Commission only replies that where particular traffic uses physical facilities and employees' services in common with other traffic "and has been shown to have no distinguishing characteristics," the application of Rail Form A costs is proper. Yet the Commission stated "its exclusive standard" for resolving this divisions question to be "the relevant cost of handling the specific freight traffic to which the divisions apply." 270 F. Supp., at 710.

We agree with the District Court that there is no substantial evidence that territorial average costs are necessarily the same as the comparative costs incurred in handling North-South freight traffic. If we were to reverse the District Court, we would in effect be saying that the expertise of the Commission is so great that when it says that average territorial costs fairly represent the costs of North-South traffic, the controversy is at an end, even though the record does not reveal what the nature of that North-South traffic is. The requirement

for administrative decisions based on substantial evidence and reasoned findings—which alone make effective judicial review possible—would become lost in the haze of so-called expertise. Administrative *expertise* would then be on its way to becoming "a monster which rules with no practical limits on its discretion." *Burlington Truck Lines* v. *United States Lines*, 371 U. S. 156, 167. That is impermissible under the Administrative Procedure Act. If indeed that lax procedure were sanctioned in a North-South divisions case, whose solution turns solely on costs, the class rate discrimination in favor of the North and against the South which we condemned in *New York* v. *United States*, 331 U. S. 284, could well flourish in another form.

Rail Form A was used in *Chicago & N. W. R. Co.* v. *Atchison, T. & S. F. R. Co.*, 387 U. S. 326, and we approved its use. Moreover, ever since the *New England Divisions Case*, 261 U. S. 184, at 196–197, it has been held that mathematical exactness in dividing each rate of each carrier is not necessary, because practical necessities demand otherwise. In addition we repeat what we said in *Chicago & N. W. R. Co.* v. *Atchison, T. & S. F. R. Co., supra.*, at 358, that there are no "mechanical restrictions on the range of remedies from which the Commission may choose" in solving a divisions case or making its expert judgment as to what scale of costs should be used in making the allocation. Precision and exactitude in the mathematical sense are not possible. Yet the nature and volume of the traffic in question must be known and exposed, if the costs of other traffic are to govern a division of rates. Moreover, where Rail Form A costs are shown to be a distortion when applied to the particular traffic over which the divisions dispute arises, some effort must be exerted to make an adjustment which fairly reflects the difference in the costs or to make clear that there is in fact no basic, material difference. The

Commission states to us that it cannot be expected to know whether peculiar characteristics may exist respecting the traffic involved in the division dispute or whether special studies may be needed. Yet if that is true, the Commission's *expertise* is not equal to the task and the opposed carriers must be directed to expose the various versions of the conflict so that the Commission may make its informed decision. That was done on aspects of the present case (325 I. C. C., at 25) and no reason is apparent why it cannot be done on other aspects of the controversy.

The Commission in its argument before us says that Rail Form A territorial average costs were "adjusted" to reflect the costs attributable to the North-South traffic issue, which is true as respects five[4] of the 12 adjustments proposed by the Southern lines.

On remand of the case to the Commission we think specific findings must be made on the several items of so-called "adjustment" of average territorial costs to which we now turn.

One is the question of commuter deficits, which swell the average territorial costs in the North while they are less important in the South that does not yet have substantial commuter operations. Passenger deficits generally are considered as part of the costs of providing freight service, since the common facilities that support each must be maintained for both types of service. There is, however, evidence that in some territories as much as one-half of the track facilities are maintained solely because of the company's suburban service and even a larger proportion of other facilities such as stations, terminals,

[4] These five included way and through train separation, platform costs, switching and terminal companies, short lines (Class II railroads), train tonnage adjustment—all as discussed in Appendix B to the Commission's opinion. 325 I. C. C., at 55 *et seq.*

coach yards, and repair shops are maintained exclusively for commuter service.

The Commission, however, ruled that costs of commuter service "includes common costs which must be incurred to provide freight service or intercity passenger service" and that the deficit from suburban operations was properly included in "the constant costs." The Commission on the other hand found that "many individual items of suburban service can be considered solely related . . . to suburban service." 325 I. C. C., at 78. How these two findings can be reconciled is not apparent. The Commission in its argument before us rests primarily on revenue needs—"Such losses must be recovered from railroad freight operations if railroads are to remain solvent." Section 15 (6) makes plain that revenue needs come into focus in division cases. Revenue problems under § 15 (6) at times have resulted in putting a part of one area's transportation costs upon other sections of the country. See *New England Divisions Case*, 261 U. S. 184, 191–195. But that issue is not presented in these cases. The issue in the present case was costs, not revenue.[5] The allocation either to the North or to the South of costs peculiar to its territorial traffic is a task with which the Commission is familiar. Thus in this very case it excluded certain platform deficits incurred by the Northern lines because they were not related to North-South freight traffic. 325 I. C. C., at 56. There is no apparent reason why costs related solely to commuter service in the North cannot be determined.

As to the costs of interchanging cars in North-South traffic at territorial border points, there is evidence in

[5] On revenue needs the Commission said:

"We find that no affirmative reasons appear in this record which would warrant any adjustment of the divisions in question over and above the relative costs of service, either on the grounds of greater revenue needs or otherwise." 325 I. C. C., at 49.

the record that the interchange operations performed by Northern lines are no more costly than those performed by Southern lines. Yet the Commission allowed the Northern lines a border interchange cost that is 58% higher than the one allowed the Southern lines. That apparently was done solely because Rail Form A showed higher interchange costs when all territorial interchanges were considered. We cannot bridge the gap by blind reliance on expertise which in this instance would be a mere assertion that no difference means a substantial difference.

The empty freight car return ratios is another example of deficient findings. There is evidence that higher costs of Northern lines result from the Commission's use of higher Northern territorial average empty return ratios. There was no attempt made to show that the latter were at all applicable to North-South traffic. The problem arises in the North by reason of boxcars on shuttle from Detroit to automobile plants, most of which are in the North. These shuttle-box-returns return empty to Detroit. We know from the record that this is a major cost item as 800,000 carloads of automobile parts move out of Detroit each year. The record does not show the extent to which these empty return swell the territorial average costs in the North, though it does show that Northern use of these shuttle boxcars is substantially higher than the Southern proportion. The District Court concluded the territorial average boxcar empty return ratios could not be said, absent specific findings, to reflect the costs of the North-South freight traffic relevant to this problem of divisions.

There are other proposed adjustments[6] on which we think the Commission's findings are adequate.

---

[6] *Car costs.* The Southern lines sought to substitute average car costs for the entire country in lieu of Rail Form A territorial average. The Commission concluded that the "use of a national average car

The judgment of the District Court is modified and as modified it is

cost conceals territorial differences in cost which are important in the consideration of divisions between the two involved territories. 325 I. C. C., at 64.

Cars interchanged between rail and water carriers at posts. The Southern and Northern lines submitted opposed evidence and views and the Commission concluded that the count of cars in Rail Form A was warranted. 325 I. C. C., 58–60, 91–94.

Transit commodities. They move under a single published rate and receive some kind of storage or processing in transit and the rate covers the movement of the raw material into and the movement of the finished product beyond the transit or processing point. The Southern lines would include deficits on pulpwood and wet phosphate rock which they claim to be related in transit to the outbound movement of paper products and dry phosphate rock. But these were intraterritorial costs of the Southern lines which the Commission found were not properly transferable to the interterritorial costs, the only costs pertinent to this divisions case. 325 I. C. C., at 80.

Switching costs. The Southern lines made special studies of switching costs which the Commission reviewed at length. 325 I. C. C. 71–77. The Northern lines sought to discredit the studies and the sample on which they rested. The Commission took Rail Form A territorial average switching costs as the most accurate measure of the relative switching costs, saying:

"Territorial average costs are particularly appropriate to the traffic in this case because it is a large and varied body of traffic moving to and coming from terminals in all parts of both territories. In our opinion, and we so find, the depressing effect, if any, of volume switching commodities on the average would affect both territories and, for purposes of comparison, would be largely offsetting." 325 I. C. C., at 76. Contrary to the District Court, we believe these are adequate findings.
